	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the chiller EXV and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the chiller EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the chiller EXV and the wire harness connector termina l of the Super Integrated Module connector (device side) to verify if the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: B101B1C-TMS

Fault code	Description
B101B1C	EWP (Battery Water Pump) Power Supply Failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling system lines. B Check the battery cooling system lines for foreign objects.
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to the normal level.	
No》》》 Go to step 3.	
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 5.	
Step 5 Check the water pump relay.	

© 2026, All rights reserved

B10DMTMS1211043

A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.

No 》》》 Replace the water pump relay.

Yes 》》》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connec tor).

TMS05 Super Integrated Module Connector

B10DMTMS1211047

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumpe r wire to short-circuit pins 30# and 87# of the water pump r elay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard val ue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211048	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of the wiring harness connector TMS05 of the Super Integrated Module connector and the body ground to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 8.
Step 8 Check the wiring harness between the battery water pump connector and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the battery water pump. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the battery water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to Step 9.
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes 》 》 》 System normal.

DTC: B101E71-TMS

Fault code	Description
B101E71	5-way water valve 1 stall fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the 5-way water valve.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the water pump relay.	
	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.	
Yes》》》 Go to step 5.	

© 2026, All rights reserved

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

5-way water valve power supply

B10DMTMS1211055

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

5-Way Water Valve Ground

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: B101998-TMS

Fault code	Description
B101998	Battery chiller side electronic expansion valve over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the chiller EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the chiller EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the motor cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there are any leaks in the motor cooling syste m hoses. B Check the motor cooling system hoses for foreign objects .
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to th e normal level.	
No》》》 Go to step 3.	
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply fuse of the electric water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electric water pump fuse FF22. Fuse specification: FF22 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 5.	
Step 5 Check the water pump relay.	

© 2026, All rights reserved

A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.

No 》》》 Replace the water pump relay.

Yes 》》》
Go to step 6.

Step 6 Check the power supply wiring harness of the electric water pump (Super Integrated Module connec tor).

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumpe r wire to short-circuit pins 30# and 87# of the water pump r elay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 6 of the harness connector TMS05 of the super integrated module connector and the v ehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard val ue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the ground wire harness of the electric water pump (Super Integrated Module connector).

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the rear defroster relay.

B10DMTMS1211043

A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the rear defrost relay RELY4. Connect the battery positive powe r supply to one side of the coil terminal of the rear defrost r elay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch c ontacts.

No》》》 Replace the rear defroster relay.

Yes》》》
Go to step 3.

Step 3 Check the rear defroster relay control circuit.

EL135 Thermal Management Controller

B10DMTMS1211092

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Remove the rear defrost relay RELY4.
D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 7 of the wire harness connector EL135 of the thermal management controller and slot 85# of the rear defrost relay RELY4 is nor mal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the thermal management controller.

A Replace the thermal management controller.
B After replacing the thermal management controller, is the fault cleared?

Yes》》》 System normal.

DTC: U14C087-TMS

Fault code	Description
U14C087	Water pump power supply relay drive communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the water pump relay.

B10DMTMS1211043

A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.

No 》》》 Replace the water pump relay.

Yes 》》》
Go to step 3.

Step 3 Check the water pump relay control circuit.

EL135 Thermal Management Controller

B10DMTMS1211084

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Remove the water pump relay RELY2.
D Using a multimeter, select the resistance range, and meas ure the resistance between terminal 23 of the wire harness connector EL135 of the thermal management controller and socket 85# of the water pump relay RELY2 to check if it is n ormal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the thermal management controller.

A Replace the thermal management controller.
B After replacing the thermal management controller, is the fault cleared?

Yes 》》》 System normal.

© 2026, All rights reserved

Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B103C12-TMS

Fault code	Description
B103C12	Electromagnetic shut-off valve 3 (normally open) fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse for the electromagnetic shut-off valve 3-normally open.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuse FF20 for electromagnetic shut-off valve 3 - no rmally open. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the power supply wiring harness of the electromagnetic shut-off valve 3 - normally open (Sup er Integrated Module connector).	
TMS05 Super Integrated Module Connector  Solenoid shutoff valve power supply B10DMTMS1211069	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 15 of the wiring harness c onnector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if the voltage is norm al. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the wiring harness between the Super Integrated Module connector and the Thermal Manage ment Controller.	
TMS05 Super Integrated Module Connector  B10DMTMS1211076 EL135 Thermal Management Controller  B10DMTMS1211077	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Disconnect the harness connector EL135 of the thermal m anagement controller. D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 17 of the wiring harness connector TMS05 of the Super Integrated Module and termi nal 8 of the wiring harness connector EL135 of the Thermal Management Controller to check whether the resistance val ue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the electromagnetic shutoff valve 3-normally open and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the solenoid s hut-off valve 3 - normally open. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and check whether the resistance between the wire harness connector terminal of the electromagnetic shut-off valve 3-normally o pen and the wire harness connector terminal of the super in tegrated module connector (device end) is normal.

© 2026, All rights reserved

	Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211041

TMS05 Super Integrated Module Connector

B10DMTMS1211042

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of the thermal management controller harness connector EL135 and terminal 14 of the Super Integrated Module harness connector TMS05 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the electric water pump connector and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the electric water pump.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the motor water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device side) to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the rear defroster relay.

B10DMTMS1211043

A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the rear defrost relay RELY4. Connect the battery positive powe r supply to one side of the coil terminal of the rear defrost r elay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch c ontacts.

No》》》 Replace the rear defroster relay.

Yes》》》
Go to step 3.

Step 3 Check the rear defroster relay control circuit.

EL135 Thermal Management Controller

B10DMTMS1211092

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Remove the rear defrost relay RELY4.
D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 7 of the wire harness connector EL135 of the thermal management controller and slot 85# of the rear defrost relay RELY4 is nor mal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the thermal management controller.

A Replace the thermal management controller.
B After replacing the thermal management controller, is the fault cleared?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the diagnostic trouble codes for the electric compressor assembly.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the electric c ompressor assembly, and record them.
C Check for relevant diagnostic trouble codes.

Yes》》》 Prioritize the repair of faults related to the electric compressor assembly.

No》》》
Go to step 3.

Step 3 Check the CAN communication wiring harness between the thermal management controller and the electric compressor assembly.

EL135 Thermal Management Controller

B10DMTMS1211062

EL136-1 Electric Compressor Assembly

B10DMTMS1211063

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Disconnect the wiring harness connector EL136-1 of the electric compressor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector EL135 of the thermal management controller and ter minal 5 of the wire harness connector EL136-1 of the electri c compressor assembly to check whether it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 10 of harness connector EL 135 of the thermal management controller and terminal 1 o f harness connector EL136-1 of the electric compressor ass embly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the electric compressor assembly.

A Check whether the power supply ground circuit of the ele ctric compressor assembly is normal.

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wiring harness connector EL135 of the thermal management controller and terminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the chiller EXV and the super integrated module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the chiller EXV wiring harness connector.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure the resistance between the wire harness connector terminal of the chiller EXV and the wire harness connector terminal of the Super Integrated Module connector (device side) to verify if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the chiller EXV.	
	A Check whether the power ground circuit of the chiller EX V is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B110101-TMS

Fault code	Description
B110101	Compressor overload status

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the diagnostic trouble codes for the electric compressor assembly.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the electric c ompressor assembly, and record them.
C Check for relevant diagnostic trouble codes.

Yes 》》》 Prioritize the repair of faults related to the electric compressor assembly.

No 》》》
Go to step 3.

Step 3 Check the CAN communication wiring harness between the thermal management controller and the electric compressor assembly.

EL135 Thermal Management Controller

B10DMTMS1211062

EL136-1 Electric Compressor Assembly

B10DMTMS1211063

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Disconnect the wiring harness connector EL136-1 of the electric compressor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector EL135 of the thermal management controller and ter minal 5 of the wire harness connector EL136-1 of the electri c compressor assembly to check whether it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 10 of harness connector EL 135 of the thermal management controller and terminal 1 o f harness connector EL136-1 of the electric compressor ass embly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the electric compressor assembly.

A Check whether the power supply ground circuit of the ele ctric compressor assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wiring harness connector EL135 of the thermal management controller and terminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the evaporator EXV.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between the wire harness connector terminals of the evaporator EXV and the wire harness connector terminals of the super integrated module connector (device end) to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN communication wiring harness between the thermal management controller and the multi-domain fusion controller.

EL135 Thermal Management Controller

B10DMTMS1211079

EL215-4 Multi-Domain Fusion Controller

B10DMTMS1211080

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and terminal 3 of wiring harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: U14C287-TMS

Fault code	Description
U14C287	5-way water valve 1 communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211041

TMS05 Super Integrated Module Connector

B10DMTMS1211042

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of the thermal management controller harness connector EL135 and terminal 14 of the Super Integrated Module harness connector TMS05 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

Yes》》》
Go to step 2.

Step 2 Check the CAN communication wiring harness between the thermal management controller and the multi-domain fusion controller.

EL135 Thermal Management Controller

B10DMTMS1211079

EL215-4 Multi-Domain Fusion Controller

B10DMTMS1211080

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and terminal 3 of wiring harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

DTC: B104D17-TMS

Fault code	Description
B104D17	Condenser fan overvoltage or undervoltage fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the electric fan assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electronic fan assembly fuse SF01. Fuse specification: SF01 40A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the power supply harness of the electronic fan assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL160 of the electronic fan assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 of wire harness connect or EL160 of the electric fan assembly and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.

Step 5 Check the ground wire harness of the electric fan assembly.

EL160 Electric Fan Assembly

B10DMTMS1211106

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of harness conn ector EL160 of the electronic fan assembly and the body gr ound is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.

Step 6 Check whether the LIN harness between the electronic fan assembly and the thermal management c ontroller is working properly.

EL160 Electric Fan Assembly

B10DMTMS1211107

EL135 Thermal Management Controller

B10DMTMS1211108

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Disconnect the harness connector EL135 of the thermal m anagement controller.
D. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 3 of harness con nector EL160 of the electronic fan assembly and terminal 11 of harness connector EL135 of the thermal management co ntroller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 7.
Step 7 Replace the electric fan assembly.	
	A Replace the electric fan assembly. B After replacing the electric fan assembly, is the fault clear ed?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

Yes 》 》 》
Go to step 5.

Step 5 Check the ground wire harness of the active grille shutter assembly.

EL036 Active Grille Assy

B10DMTMS1211097

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL036 of the active grille shutter assembly.
C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 4 of wire harness connector EL036 of the active grille shutter assembly and the body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.

Step 6 Check whether the LIN harness between the Active Grille Shutter Assembly and the Thermal Management Controller is working properly.

EL135 Thermal Management Controller

B10DMTMS1211094

EL036 Active Grille Assy

B10DMTMS1211095

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL036 of the active grille shutter assembly.
C Disconnect the harness connector EL135 of the thermal management controller.
D Use a multimeter set to the resistance range to measure the resistance between terminal 3 of harness connector EL036 of the active grille shutter assembly and terminal 11 of harness connector EL135 of the thermal management controller, and check whether the resistance is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 7.
Step 7 Replace the active grille shutter assembly.	
	A Replace the Active Grille Assembly. B After replacing the active grille shutter assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 5 of harness connector EL119-2A of the instrument display and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the harness connector EL119-2A of the instrument display screen and terminal 13 of the harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN communication wiring harness between the thermal management controller and the multi-domain fusion controller.

EL135 Thermal Management Controller

B10DMTMS1211079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and ter

DTC: U14EA83-TMS

Fault code	Description
U14EA83	ICU_0x247 Message CRC Check Error Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN communication harness between the instrument display and the multi-domain fusion controller.

EL119-2A Instrument Display

B10DMTMS1211102

EL215-3 Multi-Domain Fusion Controller

B10DMTMS1211103

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL119-2A of the instrument display.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 5 of harness connector EL119-2A of the instrument display and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the harness connector EL119-2A of the instrument display screen and terminal 13 of the harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

6.1.6 TECHNICAL PARAMETERS

TIGHTENING TORQUE TABLE

Fastener name	Torque (N·m)
Left footwell air duct assembly fixing screw	1.5±0.4
Fixed screws of the right footwell air duct assembly	1.5±0.4
Retaining nut of the left footwell air duct assembly	6±1
Mounting nuts for the automatic HVAC assembly to the vehicle body	5±1
Mounting bolts for the automatic HVAC assembly and instrument pan el crosscar beam	6±1
Thermal management controller mounting bolt	5±1
Fixing bolt of the compressor cable assembly	9±1
Fixing bolt of the electric compressor cast bracket	23±2
Electric compressor mounting bolts	23±2
Compressor high-pressure pipe and compressor fixing bolts	23±2
Compressor low-pressure line and compressor mounting bolt	23±2
Mounting bolt for the compressor ground wire harness	9±1
Fixing bolt of the condenser liquid outlet pipe	9±1
Condenser inlet pipe fixing bolt	9±1
Fixing bolts/nuts of the high and low pressure inlet and outlet pipe as sembly	9±1
Front evaporator outlet pipe fixing bolt	9±1
Fixing bolt of the front evaporator liquid inlet pipe	9±1
Indoor condenser liquid outlet pipe mounting bolt	9±1
Mounting bolt for the interior condenser inlet pipe	9±1

6.1.7 MAINTENANCE TOOLS

GENERAL TOOLS

Serial No.	Tool name	Tool Outline Drawing	Description
1	Socket wrench		Removal and Installation of Fixing Bolt
2	Wrench		Removal and installation of fi xing bolts/nuts
3	Screwdriver		Removal and installation of t he fixing screw
4	Trim clip remover		Remove the retaining clip
5	Refrigerant recovery and rec harging equipment		Recover, recharge refrigeran t, and evacuate

© 2026, All rights reserved

Serial No.	Tool name	Tool Outline Drawing	Description
6	Refrigerant gauge		Measure A/C pressure
7	Thermometer		Measure A/C temperature
8	Slip-joint pliers		Remove the clamp

6.1.8 SERVICE AND REPAIR GUIDANCE

HVAC WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the HVAC wiring harness assembly.

a. Disconnect 1 connector between the HVAC harness assembly and the engine compartment harness -Arrow A-, and disconnect 1 connector between the HVAC harness assembly and the speed control module -Arrow B-.
b. Disconnect 1 connector between the HVAC harness assembly and the evaporator temperature sensor - arrow C -, and disconnect 1 connector between the HVAC harness assembly and the air duct temperature sensor - arrow D -.
c. Disconnect the 1 connector between the HVAC harness assembly and the right temperature actuator - arrow E -, and release the 1 retaining clip of the HVAC assembly - arrow F -.
   Recommended tool: Clip remover

d. Disconnect 1 connector -arrow A- between the HVAC harness assembly and the blower motor fan assembly, and disconnect 1 connector -arrow B- between the HVAC harness assembly and the recirculation door motor.
e. Disconnect the 1 connector between the HVAC wiring harness assembly and the mode flap motor - arrow C -, and release the 3 retaining clips of the HVAC wiring harness assembly - arrow D -.

© 2026, All rights reserved

f. Disconnect 1 connector between the HVAC harness assembly and the defrost flap motor - Arrow A -, and disconnect 1 connector between the HVAC harness assembly and the aspirator assembly - Arrow B -.
g. Disconnect the 1 connector between the HVAC harness assembly and the thermal management controller - arrow C -, and release the 6 retaining clips of the HVAC harness assembly - arrow D -, - arrow E -.
Recommended tool: Clip remover
h. Remove the HVAC wiring harness assembly ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:
   a. After installation, check that the relevant electrical equipment is working properly.

© 2026, All rights reserved

CLAMP PLATE MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the pressure plate mounting bracket.

a. Unscrew the 1 fixing screw -arrow- of the pressure plate fixing bracket, and remove the pressure plate fixing bracket ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

RIGHT FOOTWELL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the air duct temperature sensor (right footwell air duct).
   See:Duct Temperature Sensor (Right Footwell Air Duct) (page 5357)
5. Remove the right footwell air duct assembly.

a. Unscrew 1 fixing screw of the right footwell air duct assembly -Arrow A-, and disconnect 1 fixing clip connecting the right footwell air duct assembly to the HVAC -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the right footwell air duct assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

COMPRESSOR LOW-PRESSURE LINE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the compressor low-pressure pipe.

a. Unscrew 1 fixing nut of the compressor low-pressure line and the high- and low-pressure inlet and outlet line assembly - arrow A -.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt between the compressor low-pressure pipe and the electric compressor assembly -arrow B-, and remove the compressor low-pressure pipe ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

RIGHT TEMPERATURE BLEND MOTOR AND LINKAGE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
4. Remove the right heating and cooling motor and moving components.

a. Disconnect the 1 connector -arrow A- between the HVAC wiring harness assembly and the right temperature blend motor and actuator assembly, and unscrew the 2 mounting screws -arrow B- of the right temperature blend motor and actuator assembly.
   Recommended tool: Phillips screwdriver
b. Remove the right blend door motor and linkage ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the right temperature blend door motor and moving components are working properly.

© 2026, All rights reserved

CONDENSER LIQUID OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
5. Remove the condenser liquid outlet pipe.

a. Remove the 1 fixing bolt - arrow A - between the condenser liquid outlet pipe and the outdoor heat exchanger assembly.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- between the condenser liquid outlet pipe and the Super Integrated Module, and remove the condenser liquid outlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

PRESSURE PLATE SEALING FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the pressure plate sealing sponge.

a. Remove the pressure plate sealing sponge ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

CONDENSER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
5. Remove the condenser inlet pipe.

a. Unscrew 1 fixing bolt between the condenser inlet pipe and the outdoor heat exchanger assembly - arrow A -.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt - arrow B - between the condenser inlet pipe and the Super Integrated Module, and remove the condenser inlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

FRONT EVAPORATOR OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the battery assembly.
   See:Battery Assembly (page)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the front evaporator outlet pipe.

a. Unscrew 1 mounting bolt securing the front evaporator outlet pipe to the evaporator housing -arrow A-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- securing the front evaporator outlet pipe to the super integrated module, and remove the front evaporator outlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

FRONT EVAPORATOR LIQUID INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the battery assembly.
   See:Battery Assembly (page)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the front evaporator liquid inlet pipe.

a. Unscrew the 1 retaining bolt between the front evaporator liquid inlet pipe and the evaporator housing -arrow A-, and move aside the front evaporator gas outlet pipe.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew 1 fixing bolt -arrow B- between the front evaporator liquid inlet pipe and the super integrated module, and remove the front evaporator liquid inlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

COMPRESSOR HIGH-PRESSURE LINE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the compressor high-pressure line.

a. Disconnect the 1 connector plug between the engine compartment wiring harness and the compressor high-voltage pipe - arrow A -, and release the 1 fixing clip of the compressor cable - arrow B -.
   Recommended tool: Clip remover
b. Unscrew 1 mounting bolt -Arrow C- between the compressor high-pressure line and the electric compressor assembly.
   Recommended tool: 10mm socket
   Torque: 23±2N m
c. Unscrew 1 fixing nut -arrow D- securing the compressor high-pressure line to the high- and low-pressure inlet and outlet line assembly, and remove the compressor high-pressure line ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

> **ATTENTION**

© 2026, All rights reserved

> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

b. After installation, check that the air conditioning system operates normally.

HOUSING AND EVAPORATOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the HVAC wiring harness assembly.
   See:HVAC wiring harness assembly (page 5316)
5. Remove the recirculation door actuator.
   See:Recirculation door motion assembly (page 5351)
6. Remove the defrost door actuator.
   See:Defrost door motion assembly (page 5360)
7. Remove the mode door actuator assembly.
   See:Mode Door Actuator Assembly (page 5348)
8. Remove the right heating and cooling motor and moving components.
   See:Right temperature blend motor and linkage (page 5321)
9. Remove the left footwell air duct assembly.
   See:Left footwell air duct assembly (page 5340)
10. Remove the right footwell air duct assembly.
    See:Right footwell air duct assembly (page 5319)
11. Remove the left air intake vent.
    See:Left air intake vent (page 5352)
12. Remove the blower motor fan assembly.
    See:Blower motor fan blade assembly (page 5361)
13. Remove the air filter.
    See:Air filter (page 5347)
14. Remove the evaporator temperature sensor.
    See:Evaporator temperature sensor (page 5353)
15. Remove the speed control module.
    See:Speed control module (page 5358)
16. Remove the air intake.
    See:Air intake (page 5335)
17. Remove the interior condenser.
    See:Indoor condenser (page 5336)
18. Remove the outside air seal sponge.
    See:Outside air sealing sponge (page 5334)
19. Remove the pressure plate sealing sponge.
    See:Pressure plate sealing foam (page 5323)
20. Remove the housing and evaporator assembly.

© 2026, All rights reserved

a. Remove the case and evaporator assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTERIOR CONDENSER COVER

REMOVAL PROCEDURE

1. Activate Lift Mode (the operation steps on the center display are: Settings - Driving - Suspension Control - Lift Mode).
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the interior condenser cover.

a. Unscrew the 4 fixing screws of the interior condenser cover -arrow-, and remove the interior condenser cover ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

AIR DUCT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
4. Remove the interior temperature sensor.
   See:Interior temperature sensor (page 5339)
5. Remove the air duct.

a. Release 1 retaining clip of the air duct - arrow A -, disconnect the air duct from the suction device - arrow B -, and remove the air duct ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTERIOR CONDENSER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the battery assembly.
   See:Battery Assembly (page)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the interior condenser inlet pipe.

a. Unscrew the 1 fixing bolt -Arrow A- between the indoor condenser inlet pipe and the evaporator case, and move aside the indoor condenser liquid outlet pipe.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- between the indoor condenser inlet pipe and the Super Integrated Module, and remove the indoor condenser inlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

OUTSIDE AIR SEALING SPONGE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the outside air seal sponge.

a. Remove the outside air seal sponge ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

AIR INTAKE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
4. Remove the air intake.

a. Disconnect the breather from the air duct -arrow A-, release the 2 fixing clips of the breather -arrow B-, and remove the breather ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

INDOOR CONDENSER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the pressure plate sealing sponge.
   See:Pressure plate sealing foam (page 5323)
5. Remove the interior condenser.

a. Unscrew 1 fixing screw -arrow A- of the pressure plate mounting bracket, and remove the pressure plate mounting bracket ①.
   Recommended tool: Phillips screwdriver
b. Unscrew the 4 fixing screws of the indoor condenser cover -arrow B-, and remove the indoor condenser cover ②.
   Recommended tool: Phillips screwdriver
c. Remove the interior condenser ③.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      ATTENTION

      Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. Check that the HVAC assembly operates normally.

INTERIOR CONDENSER LIQUID OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the battery assembly.
   See:Battery Assembly (page)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the interior condenser liquid outlet pipe.

a. Unscrew the 1 fixing bolt -arrow A- between the indoor condenser liquid outlet pipe and the evaporator housing.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- between the indoor condenser liquid outlet pipe and the super integrated module, and remove the indoor condenser liquid outlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      > **ATTENTION**
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

OUTDOOR TEMPERATURE SENSOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the ambient temperature sensor assembly.

a. Disconnect the 1 connector between the engine compartment wiring harness and the outdoor temperature sensor assembly -arrow-, and remove the outdoor temperature sensor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the ambient temperature sensor assembly is working properly.

© 2026, All rights reserved

INTERIOR TEMPERATURE SENSOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
4. Remove the interior temperature sensor.

a. Disconnect the 1 connector between the HVAC wiring harness assembly and the interior temperature sensor -arrow A-, and detach the interior temperature sensor from the air duct -arrow B-.

b. Release the 2 retaining clips - arrows - of the interior temperature sensor, and remove the interior temperature sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the interior temperature sensor is working properly.

© 2026, All rights reserved

LEFT FOOTWELL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the left footwell air duct assembly.

a. Unscrew 1 retaining nut - arrow A - of the left footwell air duct assembly, and unscrew 1 retaining screw - arrow B - of the left footwell air duct assembly.
   Recommended tools: 10mm socket, Phillips screwdriver
   -Arrow A-Torque: 6±1N m
   -Arrow B-Torque: 1.5±0.4N m
b. Release the 3 retaining clips - Arrow C - connecting the left footwell air duct assembly to the HVAC, and remove the left footwell air duct assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

ELECTRIC COMPRESSOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment undercover assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
5. Remove the electric compressor assembly.

a. Disconnect the 1 connector between the electric compressor and the engine compartment wiring harness -arrow A-, and unscrew the 1 fixing bolt between the electric compressor assembly and the compressor ground wiring harness -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 2 fixing bolts of the high and low pressure pipes of the compressor -arrow C-, disconnect the high and low pressure pipes of the compressor and move them aside.
   Recommended tool: 10mm socket
   Torque: 23±2N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

b. Disconnect the 1 connector plug between the electric compressor and the compressor cable assembly -arrow A-, and unscrew the 3 fixing bolts of the electric compressor assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 23±2N m
c. Remove the electric compressor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Install a new O-ring.
   b. Before installing the sealing ring, apply a small amount of refrigerant oil.

© 2026, All rights reserved

c. Fill with refrigerant oil.
   See:Adding Refrigerant Oil (page 208)
d. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 226)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

e. After installation, check that the air conditioning system operates normally.
f. Replacing the controller requires following these steps to ensure software version compatibility:
   - Record the old version: Before disassembly, read and record the software version number of the old controller.
   - Check for new version: After installing the new controller, first read its software version number.

   Version Comparison and Processing:
   - If the new version is greater than or equal to the old version, the replacement process will be completed normally.
   - If the new version is lower than the old version, the new controller software must first be updated to the old version or a higher version before it can be put into use.
g. After installation, check whether the cooling/heating function works properly.
h. After replacing the electric compressor assembly, use a diagnostic tool to perform the following operations:
   - After replacement, the VIN must be written. The diagnostic tool operation is as follows: Select the corresponding vehicle model - System Diagnostics - Electric Compressor Assembly (CCM) - Data Writing - Write VIN.

   > **ATTENTION**
   >
   > After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

© 2026, All rights reserved

ELECTRIC COMPRESSOR CAST BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment undercover assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the electric compressor casting bracket.

a. Unscrew the 3 fixing bolts -arrow- of the electric compressor assembly, and remove the electric compressor.
   Recommended tool: 10mm socket
   Torque: 23±2N m

b. Unscrew the 2 fixing bolts -arrow- of the electric compressor cast bracket.
   Recommended tool: 10mm socket
   Torque: 23±2N m

c. Unscrew 1 fixing bolt -arrow A- securing the compressor cable assembly to the electric compressor cast bracket, and remove the compressor cable assembly.
   Recommended tool: 8mm socket
   Torque: 9±1N m
d. Unscrew the 2 fixing bolts of the electric compressor cast bracket -arrow B-, and remove the electric compressor cast bracket ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

THERMAL MANAGEMENT CONTROLLER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5670)
4. Remove the thermal management controller.

a. Disconnect the 1 connector between the engine compartment harness and the thermal management controller - Arrow A -, and disconnect the 1 connector between the HVAC harness and the thermal management controller - Arrow B -.
b. Release the 1 retaining clip of the HVAC harness -arrow C-, unscrew the 3 retaining nuts of the thermal management controller -arrow D-, and remove the thermal management controller ①.
   Recommended tools: 10mm socket, clip remover
   Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the thermal management controller is working properly.
   b. Replacing the controller requires following these steps to ensure software version compatibility:
      - Record the old version: Before disassembly, read and record the software version number of the old controller.
      - Check for new version: After installing the new controller, first read its software version number.

      Version Comparison and Processing:
      - If the new version is greater than or equal to the old version, the replacement process will be completed normally.
      - If the new version is lower than the old version, the new controller software must first be updated to the old version or a higher version before it can be put into use.
   c. After replacing the controller, use the diagnostic tool to perform the following operations:
      - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnosis - Thermal Management Controller (TMS) - Data Write - Write VIN.
      - Write the EOL configuration. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Thermal Management Controller (TMS) - EOL Configuration - Configuration Selection - Write.

ATTENTION

AIR CONDITIONING CHARGING LABEL

REMOVAL PROCEDURE

1. Open the front engine compartment cover assembly.
2. Remove the A/C recharge label.

a. Remove the A/C charging label ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

AIR FILTER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the center console left extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
3. Remove the air filter.

a. Release the 1 retaining clip -arrow- of the filter cover, and remove the filter cover ①.

b. Remove the air filter ①.

> **NOTE**
>
> The air filter is divided into two parts: upper and lower. Exercise caution when removing them.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing, first install the upper air filter in place, and then install the lower air filter.
   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

MODE DOOR ACTUATOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
4. Remove the mode door actuator assembly.

a. Disconnect the 1 connector between the HVAC harness assembly and the mode door actuator assembly - arrow A -, and unscrew the 3 mounting screws of the mode door actuator assembly - arrow B -.
   Recommended tool: Phillips screwdriver
b. Release the 1 retaining clip - arrow C - between the HVAC harness assembly and the mode door actuator assembly, and remove the mode door actuator assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the mode door actuator assembly is working properly.

DRIP TUBE

REMOVAL PROCEDURE

1. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
2. Remove the center console right extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
3. Remove the right lower A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
4. Remove the drip tube.

a. Remove the drain tube sealing plug ①.

b. Lift the front part of the driver's carpet ①.

c. Disconnect the drain tube from the automatic HVAC assembly -arrow A-, disconnect the 1 grommet of the drain tube -arrow B-, and remove the drain tube ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the drip tube is properly installed.

© 2026, All rights reserved

DRAIN HOSE RUBBER SEAL PLUG

REMOVAL PROCEDURE

1. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
2. Remove the sealing plug of the drain tube.

a. Remove the drain tube sealing plug ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the rubber sealing plug of the water drain tube is properly installed.

© 2026, All rights reserved

RECIRCULATION DOOR MOTION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the recirculation door actuator.

a. Disconnect the 1 connector between the HVAC harness assembly and the recirculation flap actuator - arrow A -, and unscrew the 3 fixing screws of the recirculation flap actuator - arrow B -.
   Recommended tool: Phillips screwdriver
b. Detach the recirculation flap actuator from the 1 retaining clip on the left air intake -arrow C-, and remove the recirculation flap actuator ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is complete, check whether the recirculation flap actuator is functioning properly.

© 2026, All rights reserved

LEFT AIR INTAKE VENT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the outside air seal sponge.
   See:Outside air sealing sponge (page 5334)
5. Remove the left air intake vent.

a. Disconnect the linkage rod of the recirculation flap actuator assembly from the left air intake -arrow A-, and unscrew the 2 fixing screws of the left air intake -arrow B-.
   Recommended tool: Phillips screwdriver

b. Release the 2 retaining clips securing the HVAC wiring harness to the left air inlet -arrow A-, and unscrew the 2 retaining screws of the left air inlet -arrow B-.
   Recommended tool: Phillips screwdriver
c. Remove the left air inlet ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

EVAPORATOR TEMPERATURE SENSOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right extension panel assembly of the center console.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
4. Remove the evaporator temperature sensor.

a. Disconnect the 1 connector between the HVAC harness and the evaporator temperature sensor -arrow A-, and release the 2 retaining clips of the evaporator temperature sensor -arrow B-.
b. Remove the evaporator temperature sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the evaporator temperature sensor is working properly.

© 2026, All rights reserved

HIGH AND LOW PRESSURE INLET AND OUTLET LINE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
6. Remove the high- and low-pressure inlet and outlet line assembly.

a. Unscrew the 1 fixing bolt between the high- and low-pressure inlet and outlet pipeline assembly and the super integrated module -arrow -.
   Recommended tool: 8mm socket
   Torque: 9±1N m

b. Unscrew 1 fixing nut -arrow A- securing the high- and low-pressure inlet and outlet line assembly to the compressor high- and low-pressure lines, and move the compressor high- and low-pressure lines away.
   Recommended tool: 10mm socket
   Torque: 9±1N m
c. Unscrew the 1 fixing bolt securing the high and low voltage inlet and outlet pipeline assembly to the front crossmember of the three-electric frame - Arrow B -
   Recommended tool: 8mm socket
   Torque: 9±1N m
d. Unscrew the 1 fixing bolt -Arrow C- between the high- and low-pressure inlet and outlet pipeline assembly and the super integrated module, and remove the high- and low-pressure inlet and outlet pipeline assembly ①.
   Recommended tool: 8mm socket

© 2026, All rights reserved

Torque: 9±1N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Fill with refrigerant oil.
      See:Adding Refrigerant Oil (page 208)
   b. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 226)

      ATTENTION

      Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   c. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

AIR DUCT TEMPERATURE SENSOR (RIGHT FACE-LEVEL AIR DUCT)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the air duct temperature sensor.

a. Reach in from the lower right cover of the instrument panel to disconnect 1 connector -arrow- of the air duct temperature sensor, and remove the air duct temperature sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the air duct temperature sensor is working properly.

© 2026, All rights reserved

DUCT TEMPERATURE SENSOR (RIGHT FOOTWELL AIR DUCT)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the air duct temperature sensor.

a. Disconnect the 1 connector of the air duct temperature sensor -arrow A-, and release the 2 retaining clips of the air duct temperature sensor -arrow B-.
b. Remove the air duct temperature sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the air duct temperature sensor is working properly.

© 2026, All rights reserved

SPEED CONTROL MODULE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right extension panel assembly of the center console.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
4. Remove the speed control module.

a. Disconnect the 1 connector between the HVAC harness and the speed control module -arrow-.

b. Unscrew the 2 fixing screws of the speed control module -arrow-, and remove the speed control module ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the speed control module operates normally.

© 2026, All rights reserved

FILTER COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the center console left extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
3. Remove the filter cover.

a. Release the 1 retaining clip -arrow- of the filter cover, and remove the filter cover ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

DEFROST DOOR MOTION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
4. Remove the defrost door actuator.

a. Disconnect the 1 connector plug - arrow A - between the HVAC harness assembly and the defroster flap actuator assembly, and unscrew the 2 fixing screws - arrow B - of the defroster flap actuator assembly.
   Recommended tool: Phillips screwdriver
b. Remove the defrost door actuator ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the defrost door actuator assembly is working properly.

© 2026, All rights reserved

BLOWER MOTOR FAN BLADE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the left air intake vent.
   See:Left air intake vent (page 5352)
5. Remove the blower motor fan assembly.

a. Disconnect the 1 connector -Arrow A- between the HVAC harness and the blower motor fan assembly, and unscrew the 3 mounting screws -Arrow B- of the blower motor fan assembly.
   Recommended tool: Phillips screwdriver
b. Remove the blower motor fan blade assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the blower motor fan assembly is working properly.

© 2026, All rights reserved

AUTOMATIC HVAC ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the instrument panel crossbeam assembly.
   See:Instrument Panel Cross Car Beam Assembly (page 5738)
6. Remove the left footwell air duct assembly.
   See:Left footwell air duct assembly (page 5340)
7. Remove the right footwell air duct assembly.
   See:Right footwell air duct assembly (page 5319)
8. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
9. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
10. Remove the automatic HVAC assembly.

a. Unscrew 1 fixing bolt -arrow- of the interior condenser liquid outlet pipe, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m

b. Unscrew the 1 fixing bolt -arrow- of the front evaporator outlet pipe, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m

© 2026, All rights reserved

c. Remove the drain tube sealing plug ①.

d. Detach 1 grommet of the drip tube -arrow-.

e. Disconnect the connector - arrow A - between the HVAC harness and the thermal management controller, and release the retaining clip - arrow B - of the HVAC harness.
Recommended tool: Clip remover

f. Disconnect 1 connector -Arrow A- between the HVAC harness and the engine compartment harness, and unscrew 1 fixing nut -Arrow B- of the automatic HVAC assembly.
Recommended tool: 10mm socket
Torque: 5±1N m

g. Disconnect the automatic HVAC assembly from the left and right rear footwell air ducts -Arrow C-, and remove the automatic HVAC assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. When installing, check whether the O-ring ① of the air conditioning pipeline is damaged or deformed. If so, replace it.
b. Fill with refrigerant oil.
   See:Adding Refrigerant Oil (page 208)
c. Recharge the refrigerant.
   See:Recharging refrigerant (page 226)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

d. Check that the HVAC assembly operates normally.

© 2026, All rights reserved

6.2 MOTOR COOLING SYSTEM

6.2.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Do not open the expansion tank cap when the engine is hot, as opening the expansion tank cap when the engine is hot may cause hot coolant or steam to spray out, resulting in personal injury. Wait until the coolant temperature drops below 40℃ before opening the expansion tank cap.
2. When disconnecting the cooling system lines, a dedicated container should be used to collect the residual coolant.
3. Coolant is toxic. If no longer in use, keep it out of reach of children and pets, and dispose of it in accordance with regulations.
4. When disconnecting the cooling system hoses, do not allow debris to enter the cooling system hoses, otherwise the cooling system may be damaged.
5. When disconnecting the cooling system pipe joints. To prevent dirt or impurities from entering, the pipe openings can be sealed with caps.
6. Coolants of different brands may have different formulations. If mixed, chemical reactions are highly likely to occur among the various additives, resulting in coolant failure.
7. The shelf life of coolant is typically two years, and when adding it, ensure the product is within its shelf life.
8. When replacing, drain the old coolant, thoroughly flush the cooling system, and refill with new coolant.
9. Use qualified coolant.
10. When the ambient temperature is below 0℃, the coolant freezing point should be checked regularly.

© 2026, All rights reserved

6.2.2 OVERVIEW AND INTRODUCTION TO PRINCIPLES

INTRODUCTION TO THE STRUCTURE AND WORKING PRINCIPLE OF THE MOTOR COOLING SYSTEM

Motor Cooling System Overview:

1. The motor cooling system is controlled by the thermal management controller, and the cooled components include the motor controller and the drive motor, which undergoes heat exchange through the oil cooler.
2. When the temperature of the high-voltage components in the circuit is too high, the coolant pump is triggered to start, and the coolant circulates to cool the components.
3. The coolant pump is controlled by the Thermal Management Controller via a duty cycle signal. Upon power-on, the Thermal Management Controller drives the coolant pump to operate at a low duty cycle. As the coolant pump runs, it circulates the coolant sequentially through the motor controller, oil cooler, and radiator assembly, and then returns it to the coolant pump to form a circulation circuit. The temperature signal from the coolant circuit is transmitted to the Thermal Management Controller in real time. The Thermal Management Controller controls the speed of the coolant pump according to its internal control strategy. If the temperature is too high, it activates the electric fan for rapid cooling to ensure normal system operation.

Motor cooling system circuit diagram:

Battery Thermal Management System Overview:

© 2026, All rights reserved

1. The battery thermal management system adopts liquid cooling and liquid heating. Components include liquid cooling plates, plastic water pipes, connecting pipes, and thermally conductive adhesive. The liquid cooling plate is tightly bonded to the bottom of the battery cells via thermally conductive adhesive to dissipate excess heat generated by the cells.
2. Battery heating principle: When battery heating is requested, the battery circuit and the motor circuit are connected in series, and the antifreeze in the circuit is heated by the heat generated by the motor. The heated antifreeze undergoes heat exchange with the low-temperature battery coolant, and the warmed battery antifreeze flows through the battery, thereby heating the battery. The maximum temperature of the antifreeze for heating the battery is 40℃; throughout the entire heating process, the heat source is the heat generated by the motor, without using traditional PTC heating, resulting in high system integration.
3. Battery cooling principle: The battery coolant is cooled through heat exchange in the air conditioning system and the chiller component. The cooled low-temperature battery antifreeze then flows through the battery pack to cool it down.
4. Cooling Control Strategy:
   - Fast charging mode: The cooling function is turned on when the cell temperature ≥35℃; the cooling function is turned off when the cell temperature ≤30℃.
   - Slow charging mode: When the cell temperature is ≥37℃, the cooling function is turned on; when the cell temperature is ≤32℃, the cooling function is turned off.
   - Driving mode: When the cell temperature is ≥ 35℃, the cooling function is turned on; when the cell temperature is ≤ 30℃, the cooling function is turned off.
   - ATTENTION

     When the maximum cell temperature exceeds 50℃, the battery output power will be limited; when the maximum cell temperature exceeds 60℃, charging and discharging of the battery are not allowed.
5. Heating control strategy:
   - Fast charging mode: When the cell temperature ≤10℃, the heating function is turned on; when the cell temperature ≥25℃, the heating function is turned off.
   - Slow charging mode: When the cell temperature ≤15℃, the heating function is turned on; when the cell temperature ≥20℃, the heating function is turned off.
   - Driving mode: When the cell temperature is ≤1℃, the heating function is turned on; when the cell temperature is ≥5℃, the heating function is turned off.
   - ATTENTION

     If the minimum cell temperature is below -20℃, direct charging is not allowed, and the battery must first be heated using the charging station; if the minimum cell temperature is below -30℃, the battery cannot be heated using the charging station; if the minimum cell temperature is below -30℃, discharging is not allowed.

6.2.7 SERVICE AND REPAIR GUIDANCE

UPPER MOUNTING BRACKET OF COOLING MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
3. Remove the mounting bracket installed on the cooling module assembly.

a. Unscrew the 4 fixing bolts -arrow- of the upper mounting bracket on the cooling module assembly, and remove the upper mounting bracket ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LOW TEMPERATURE RADIATOR OUTLET WATER PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the low-temperature radiator outlet hose.

a. Disconnect 1 fixing connector between the low-temperature radiator outlet hose and the Super Integrated Module -arrow A-, and loosen 1 fixing clamp between the low-temperature radiator outlet hose and the low-temperature radiator assembly -arrow B-.
   Recommended tools: Flathead screwdriver, slip-joint pliers
b. Remove the low-temperature radiator outlet hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

OBC+DCDC WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the OBC+DCDC water inlet pipe.

a. Loosen 1 fixing clamp -arrow A- between the OBC+DCDC water inlet pipe and the 2-in-1 power assembly, and disconnect 1 fixing connector -arrow B- between OBC+DCDC water inlet pipe 1 and the OBC+DCDC water inlet pipe.
   Recommended tool: Slip-joint pliers
b. Unscrew the 1 fixing bolt of the OBC+DCDC water inlet pipe -arrow C-, and disconnect the 2 fixing hose clamps of the OBC+DCDC water inlet pipe -arrow D-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Remove the OBC+DCDC water inlet pipe ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

© 2026, All rights reserved

LOW TEMPERATURE RADIATOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5386)
4. Remove the low-temperature radiator assembly.

a. Disconnect the 8 retaining clips -arrow- between the low-temperature radiator assembly and the electronic fan, and remove the low-temperature radiator assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

OBC+DCDC WATER INLET PIPE 1

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the OBC+DCDC water inlet pipe 1.

a. Loosen 1 fixing clamp -Arrow A- between OBC+DCDC water inlet pipe 1 and the rear motor nylon water inlet pipe, and disconnect 1 fixing connector -Arrow B- between OBC+DCDC water inlet pipe 1 and the OBC+DCDC water inlet pipe.
   Recommended tool: Slip-joint pliers
b. Disconnect the 2 retaining hose clamps on OBC+DCDC inlet hose 1 -arrow C-, and remove OBC+DCDC inlet hose 1 ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

LOW TEMPERATURE RADIATOR WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the water inlet hose of the low-temperature radiator.

a. Disconnect 1 fixing connector between the low-temperature radiator inlet hose and the super integrated module -Arrow A-, and loosen 1 fixing clamp between the low-temperature radiator inlet hose and the low-temperature radiator assembly -Arrow B-.
   Recommended tools: Flathead screwdriver, slip-joint pliers
b. Remove the low-temperature radiator inlet water hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

OBC+DCDC WATER OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the OBC+DCDC water outlet pipe.

a. Loosen 1 fixing clamp -arrow A- between the OBC+DCDC outlet hose and the 2-in-1 power assembly, and disconnect 1 fixed connector -arrow B- between the OBC+DCDC outlet hose and the rear motor inlet hose.
   Recommended tool: Slip-joint pliers
b. Release the 2 retaining hose clamps of the OBC+DCDC outlet hose -arrow C-, and remove the OBC+DCDC outlet hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR MOTOR NYLON WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
5. Remove the left lower cover assembly.
   See:Left lower undercover assembly (page 5511)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
7. Remove the nylon water inlet pipe of the rear motor.

a. Loosen 1 fixing clamp -arrow A- securing the rear motor water inlet hose 1 to the rear motor nylon water inlet pipe, and loosen 1 fixing clamp -arrow B- securing the OBC+DCDC water inlet pipe 1 to the rear motor nylon water inlet pipe.
   Recommended tool: Slip-joint pliers
b. Release the 9 retaining clips of the rear motor nylon water inlet pipe -Arrow C-, and remove the rear motor nylon water inlet pipe ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR MOTOR WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the water inlet pipe of the rear motor.

a. Loosen 1 fixing clamp - arrow A - between the rear motor water inlet pipe and the electric drive assembly, and disconnect 1 fixing connector - arrow B - between the rear motor water inlet pipe and the 2-in-1 power supply.
   Recommended tools: Slip-joint pliers, flathead screwdriver
b. Unscrew 1 fixing bolt of the rear motor water inlet pipe -arrow C-, detach 1 fixing hose clamp of the rear motor water inlet pipe -arrow D-, and remove the rear motor water inlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR EDU WATER OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the rear EDU water outlet pipe.

a. Loosen 1 fixing clamp - arrow A - between the rear EDU outlet water pipe and the electric drive assembly, and loosen 1 fixing clamp - arrow B - between the rear EDU outlet water pipe and the rear EDU outlet nylon pipe.
   Recommended tool: Slip-joint pliers
b. Disconnect the 1 retaining clip of the rear EDU outlet pipe -Arrow C-, and unscrew the 2 fixing bolts of the rear EDU outlet pipe -Arrow D-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Remove the rear EDU water outlet pipe ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

COOLING MODULE ASSEMBLY HEAT PUMP

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the storage box mounting bracket assembly.
   See:Storage Box Mounting Bracket Assembly (page 6635)
5. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
6. Drain coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
7. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
8. Remove the cooling module assembly heat pump.

a. Disconnect the 1 connector between the engine compartment wiring harness and the electronic fan -arrow A-.
b. Loosen 1 fixing clamp -arrow B- on the low-temperature radiator outlet hose, and loosen 1 fixing clamp -arrow C- on the low-temperature radiator inlet hose.
   Recommended tool: Slip-joint pliers

c. Unscrew the 1 fixing bolt -Arrow A- securing the condenser liquid outlet pipe to the outdoor heat exchanger assembly, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m
d. Unscrew the 1 fixing bolt - arrow B - between the condenser inlet pipe and the outdoor heat exchanger assembly, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

© 2026, All rights reserved

e. Unscrew the 4 fixing bolts -arrow- of the upper mounting bracket on the cooling module assembly, and remove the upper mounting bracket ①.
Recommended tool: 10mm socket
Torque: 9±1N m
f. Remove the heat pump ② from the cooling module assembly.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing the cooling module assembly heat pump, ensure proper alignment of the shock pad ① at its lower end.
b. After installation, fill coolant.
See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

c. Check the cooling system for leaks.
d. After installation, recharge the refrigerant.
See:Recharging refrigerant (page 226)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

e. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

REAR EDU WATER OUTLET NYLON TUBE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
5. Remove the right lower cover assembly.
   See:Left lower undercover assembly (page 5511)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
7. Remove the rear EDU water outlet nylon tube.

a. Loosen 1 retaining clamp - arrow A - between the rear motor coolant outlet hose 2 and the rear EDU coolant outlet nylon tube, and loosen 1 retaining clamp - arrow B - between the rear EDU coolant outlet pipe and the rear EDU coolant outlet nylon tube.
   Recommended tool: Slip-joint pliers
b. Detach the 9 fixing hose clamps -Arrow C- of the rear EDU outlet nylon pipe, and remove the rear EDU outlet nylon pipe ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

© 2026, All rights reserved

REAR MOTOR WATER INLET HOSE 1

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
5. Remove the battery assembly.
   See:Battery Assembly (page)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
7. Remove the water inlet hose 1 for the rear motor.

a. Disconnect 1 fixing connector between the DSP water inlet pipe and the Super Integrated Module -Arrow A-, and loosen 1 fixing clamp between rear motor water inlet hose 1 and the rear motor nylon water inlet pipe -Arrow B-.
   Recommended tool: Slip-joint pliers
b. Detach the 2 retaining clamps -arrow C- for rear motor water inlet hose 1, and remove rear motor water inlet hose 1 ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

© 2026, All rights reserved

REAR MOTOR WATER OUTLET HOSE 2

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
5. Remove the rear motor water outlet hose 2.

a. Disconnect the 1 fixed connector -Arrow A- between the rear motor water outlet hose 2 and the Super Integrated Module, and loosen the 1 fixed clamp -Arrow B- between the rear motor water outlet hose 2 and the battery pack assembly.
   Recommended tools: Flathead screwdriver, slip-joint pliers
b. Release the 2 retaining hose clamps -arrow C- of the rear motor outlet hose 2, and remove the rear motor outlet hose 2 ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

ELECTRIC FAN ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5386)
4. Remove the low-temperature radiator assembly.
   See:Low temperature radiator assembly (page 5379)
5. Remove the electric fan assembly.

a. Release the 8 retaining clips -arrow- between the outdoor heat exchanger assembly and the electric fan, and remove the electric fan assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the electric fan is working properly.

© 2026, All rights reserved

OUTDOOR HEAT EXCHANGER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5386)
4. Remove the low-temperature radiator assembly.
   See:Low temperature radiator assembly (page 5379)
5. Remove the outdoor heat exchanger assembly.

a. Release the 8 retaining clips -arrow- between the outdoor heat exchanger assembly and the electric fan, and remove the outdoor heat exchanger assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

SEALING RETAINING PLATE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
4. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
5. Remove the seal pressure plate.

a. Unscrew the 2 fixing nuts of the sealing pressure plate -arrow-.
   Recommended tool: 10mm socket
   Torque: 7±1N m

b. Remove the sealing pressure plate ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

BATTERY PACK INLET AND OUTLET WATER PIPE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
5. Drain the battery pack coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
6. Remove the battery pack inlet and outlet water pipe assembly.

a. Release the 2 retaining clamps -Arrow A- securing the battery pack coolant inlet and outlet pipe assembly to the battery pack assembly, and disconnect the 2 retaining connectors -Arrow B- between the battery pack coolant inlet and outlet pipe assembly and the Super Integrated Module.
   Recommended tools: Slip-joint pliers, flathead screwdriver
b. Detach the 2 retaining clamps of the battery pack inlet and outlet water pipe assembly - arrow C -, and remove the battery pack inlet and outlet water pipe assembly ①.
   Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

SUPER INTEGRATED MODULE UPPER BRACKET

REMOVAL PROCEDURE

1. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
2. Remove the upper bracket of the super integrated module.

a. Unscrew the 6 mounting bolts -arrow- of the super integrated module upper bracket, and remove the super integrated module upper bracket ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

INTEGRATED MODULE WIRING HARNESS

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5397)
4. Remove the integrated module wiring harness.

B10SRMEL4003015

a. Disconnect the 4 connectors of the integrated module wiring harness -arrow A-, and release the 5 retaining clips of the integrated module wiring harness -arrow B-.
   Recommended tool: Clip remover

B10SRMEL4003016

b. Disconnect the 10 connectors of the integrated module wiring harness - arrow A -, and release the 3 retaining clips of the integrated module wiring harness - arrow B -.
   Recommended tool: Clip remover
c. Remove the integrated module wiring harness ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

SUPER INTEGRATED MODULE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the upper bracket of the super integrated module.
   See:Super Integrated Module Upper Bracket (page 5395)
5. Remove the high- and low-pressure inlet and outlet line assembly.
   See:High and low pressure inlet and outlet line assembly (page 5354)
6. Drain coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)
7. Recover refrigerant.
   See:Refrigerant Recovery (page 227)
8. Remove the super integrated module.

a. Disconnect 1 connector -Arrow A- between the engine compartment wiring harness and the integrated module wiring harness, and release 1 retaining clip -Arrow B- of the integrated module wiring harness.
   Recommended tool: Clip remover
b. Disconnect the 2 fixing connectors of the inlet and outlet water hoses for the low-temperature radiator - arrow C -, and move the hoses aside.
   Recommended tool: Flathead screwdriver
c. Unscrew the 6 fixing bolts - arrow D - of the A/C line and the Super Integrated Module, and remove the A/C line.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

© 2026, All rights reserved

d. Disconnect the 4 fixing arrows - arrows - connecting the rear of the Super Integrated Module to the water pipe, and remove the Super Integrated Module ①.
Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing the Super Integrated Module, ensure proper alignment of the shock absorber pad ① at the lower end of the Super Integrated Module.
b. After installation, fill coolant.
See:Replace the coolant for the air conditioning, drive motor, and power battery (page 214)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

c. Check the cooling system for leaks.
d. After installation, recharge the refrigerant.
See:Recharging refrigerant (page 226)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

e. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

INTEGRATED MODULE SHOCK PAD (LOWER)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5397)
4. Remove the integrated module damper pad (lower).

a. Remove the integrated module damper pad (lower) ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTEGRATED MODULE BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5397)
4. Remove the integrated module wiring harness.
   See:Integrated module wiring harness (page 5396)
5. Remove the integrated module body.

a. Remove the integrated module body ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTEGRATED MODULE DAMPER PAD (UPPER)

REMOVAL PROCEDURE

1. Remove the upper bracket of the super integrated module.
   See:Super Integrated Module Upper Bracket (page 5395)
2. Remove the integrated module shock pad (upper).

a. Remove the integrated module damper pad (upper) ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

7 INTERIOR AND EXTERIOR TRIM SYSTEM

7.1 FRONT BUMPER AND ACCESSORY SYSTEM

7.1.1 PRECAUTIONS

PRECAUTIONS

1. When removing the bumper assembly, exercise caution to avoid damaging the bumper retaining tabs.
2. Use an interior trim pry tool to assist with removal, do not pry with metal tools, to avoid damaging the bumper.
3. When disconnecting the bumper assembly wiring harness connector, be careful not to tear or damage the connector or other components.
4. The bumper placement area should be clean and flat to avoid scratching the paint surface.
5. After installing the bumper, adjust the gap and flush according to the specified values.

7.1.6 SERVICE AND REPAIR GUIDANCE

FRONT LICENSE PLATE FRAME TRIM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.

a. Unscrew the 4 mounting screws of the front license plate frame trim -arrow A-.
   Recommended tool: Phillips screwdriver
b. Detach the 6 retaining clips connecting the front license plate frame trim to the front bumper upper body -arrow B-.
   Recommended tool: Flathead screwdriver

c. Remove the front license plate frame trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LEFT MOUNTING BRACKET 2

NOTE

This section describes the removal and installation of the front bumper left mounting bracket 2, and the removal and installation of the front bumper right mounting bracket 2 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the front bumper left mounting bracket 2.

a. Unscrew the 1 fixing bolt -arrow- of the front bumper left mounting bracket 2, and remove the front bumper left mounting bracket 2 ①.
   Recommended tool: 8mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BUMPER LOWER BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
6. Remove the left/right side trim panel of the front bumper.
   See:Front bumper left trim panel (page 5420)
7. Remove the front bumper lower trim.
   See:Front bumper lower trim panel (page 5414)
8. Remove the front bumper lower cover.

a. Unscrew the 4 fixing screws -arrow A- on the lower part of the front bumper, and disengage the 8 retaining clips -arrow B- on the lower part of the front bumper.
Recommended tool: Phillips screwdriver

b. Remove the front bumper lower body ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

LEFT FRONT BUMPER MOLDING

REMOVAL PROCEDURE

NOTE

This section describes the removal and installation of the left front bumper trim, and the removal and installation of the right front bumper trim can generally be performed by referring to the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the front towing hook cover.
   See:Front tow hook cover (page 5412)
6. Remove the left front bumper trim.

a. Detach the 11 retaining clips connecting the left front bumper trim to the front bumper upper main body -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT TOW HOOK COVER

REMOVAL PROCEDURE

1. Remove the front towing hook cover.

a. Use a flat-head screwdriver to detach the front towing hook cover ① - arrow -, and remove the front towing hook cover ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LEFT MOUNTING BRACKET ASSEMBLY 1

NOTE

This section describes the removal and installation of the front bumper left mounting bracket assembly 1, and the removal and installation of the front bumper right mounting bracket assembly 1 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the front bumper left mounting bracket assembly 1.

a. Unscrew the 3 fixing bolts -arrow- of the front bumper left mounting bracket assembly 1, and remove the front bumper left mounting bracket assembly 1 ①.
   Recommended tool: 8mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BUMPER LOWER TRIM PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
6. Remove the front bumper lower trim panel.

B10SRMIE5001105

a. Unscrew the 4 fixing screws of the lower front bumper trim -Arrow A-, and release the 6 fixing clips of the lower front bumper trim -Arrow B-.
   Recommended tools: Phillips screwdriver, flathead screwdriver

B10SRMIE5001106

b. Release the 3 retaining clips connecting the front bumper lower trim to the front bumper upper main body -arrow-.
   Recommended tool: Flathead screwdriver

B10SRMIE5001107

c. Remove the front bumper lower trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER UPPER BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
6. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
7. Remove the front bumper lower cover.
   See:Front bumper lower body (page 5410)
8. Remove the front bumper wiring harness assembly.
   See:Front bumper wiring harness assembly (page 9991)
9. Remove the blind spot monitoring radar (front bumper).
   See:Blind Spot Detection Radar (Front Bumper) (page 9889)
10. Remove the front bumper wiring harness assembly.
    See:Front bumper wiring harness assembly (page 9991)
11. Remove the reverse ultrasonic sensor (front bumper).
    See:Reverse ultrasonic sensor (front bumper) (page)
12. Remove the front towing hook cover.
    See:Front tow hook cover (page 5412)
13. Remove the ACC mounting bracket.
    See:ACC mounting bracket (page 5424)
14. Remove the front surround-view camera assembly.
    See:Front surround view camera assembly (page 9570)
15. Remove the upper left mounting bracket of the front bumper.
    See:Front Bumper Upper Left Mounting Bracket (page 5418)
16. Remove the left/right side trim panel of the front bumper.
    See:Front bumper left trim panel (page 5420)
17. Remove the upper part of the front bumper.

a. Unscrew the 4 retaining screws -arrow A- on the upper part of the front bumper, and disengage the 8 retaining clips -arrow B- on the upper part of the front bumper.
   Recommended tools: Phillips screwdriver, flathead screwdriver

© 2026, All rights reserved

b. Remove the upper body ① of the front bumper.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

LEFT FRONT BUMPER ENERGY-ABSORBING FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the left energy-absorbing foam of the front bumper.

a. Release the 2 retaining clips -arrow- of the left front bumper energy-absorbing foam, and remove the left front bumper energy-absorbing foam ①.
   Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER UPPER LEFT MOUNTING BRACKET

NOTE

This section describes the removal and installation of the upper left mounting bracket of the front bumper. The removal and installation of the upper right mounting bracket of the front bumper can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
3. Remove the ACC mounting bracket.
   See:ACC mounting bracket (page 5424)
4. Remove the front bumper wiring harness assembly.
   See:Front bumper wiring harness assembly (page 9991)
5. Remove the front surround-view camera assembly.
   See:Front surround view camera assembly (page 9570)
6. Remove the upper mounting bracket of the front bumper.
   See:Front bumper upper mounting bracket (page 5425)
7. Remove the upper trim panel of the front bumper.
   See:
8. Remove the upper left mounting bracket of the front bumper.

a. Unscrew the 1 fixing screw -arrow A- of the front bumper upper left mounting bracket, and disengage the 2 fixing clips -arrow B- of the front bumper upper left mounting bracket.
   Recommended tool: Phillips screwdriver

b. Release the 4 retaining clips - arrow - between the front bumper upper left mounting bracket and the front bumper upper mounting bracket.
c. Remove the front bumper upper left mounting bracket ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LEFT TRIM PANEL

REMOVAL PROCEDURE

NOTE

This section describes the removal and installation of the left trim panel of the front bumper, with the removal and installation of the right trim panel generally following the procedures for the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the left trim panel of the front bumper.

a. Detach the 4 retaining clips on the front bumper left side trim panel -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front sealing strip of the front cover.
   See:Hood front weatherstrip (page 6690)
4. Remove the front bumper assembly.

a. Unscrew the 3 fixing screws on the left side of the front bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

b. Unscrew the 3 fixing screws on the right side of the front bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

c. Unscrew the 6 fixing screws at the bottom of the front bumper assembly - arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
d. Unscrew the 4 fixing bolts at the bottom of the front bumper assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
e. Release the 3 retaining clips of the front bumper assembly - arrow C -.
   Recommended tool: Clip remover

© 2026, All rights reserved

f. Unscrew the 8 fixing bolts of the front bumper assembly -arrow-.
Recommended tool: 10mm socket
Torque: 5±1N m

g. Detach the 10 retaining clips -arrow- connecting the front bumper assembly to the front bumper left mounting bracket and the front left position turn signal assembly.

h. Release the 10 retaining clips connecting the front bumper assembly to the front bumper right mounting bracket and the right front position turn signal lamp assembly -Arrow A-.
i. Disconnect the 2 connectors between the front bumper wiring harness and the engine compartment wiring harness -arrow B-, -arrow C-, and remove the front bumper assembly ①.

j. Disconnect the 1 connector -arrow- between the front bumper wiring harness and the front surround view camera assembly, and remove the front bumper assembly with the active grille assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- If painting is required, it is recommended to use pre-sale paint. The film thickness should be controlled within the normal TDS range to meet the radar wave attenuation requirements (one-way attenuation ≤ 1.5 dB, one-way reflection ≤ -15 dB).
- Screws and bolts should be stored in a box to prevent loss.
- Tighten the fixing bolts and screws to the specified torque.

© 2026, All rights reserved

- After installation, check whether the relevant electrical components function properly.

© 2026, All rights reserved

ACC MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the ACC mounting bracket.

a. Disconnect the 1 connector of the forward collision radar -arrow A-, and unscrew the 2 fixing screws of the ACC mounting bracket -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the forward collision radar with ACC mounting bracket ①.

c. Release the 4 retaining clips -arrow- between the forward collision avoidance radar and the ACC mounting bracket, and remove the ACC mounting bracket ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- After installation is completed, the following operations need to be performed on the forward collision avoidance radar:
  - Write the VIN. The diagnostic tool operation is: MRS-Data Write-VIN.
  - Angle calibration. Diagnostic tool operation: After angle calibration, go to MRS - Routine Control - Angle Write, and write the deviation angle after angle calibration.
  - Target corner reflector detection. Diagnostic tool operation: MRS-Routine Control-Target Corner Reflector Detection Test.
- Calibrate the forward collision avoidance radar.
  See:Calibration (page)
- After calibration is completed, check that the forward collision avoidance radar is functioning properly.

© 2026, All rights reserved

FRONT BUMPER UPPER MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front surround-view camera assembly.
   See:Front surround view camera assembly (page 9570)
5. Remove the ACC mounting bracket.
   See:ACC mounting bracket (page 5424)
6. Remove the upper mounting bracket of the front bumper.

B10SRMIE5001103

a. Unscrew the 6 mounting screws connecting the front bumper upper mounting bracket to the front bumper upper main body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Release the 7 retaining clips connecting the front bumper upper mounting bracket to the front bumper upper body - arrow B -.

B10SRMIE5001104

c. Disconnect the 1 connector between the front bumper wiring harness and the front surround view camera -Arrow A-, and release the 9 wiring harness retaining clips of the front bumper wiring harness -Arrow B-.
   Recommended tool: Clip remover
d. Unscrew the 4 fixing screws of the upper mounting bracket on the front bumper -Arrow C-.
   Recommended tool: Phillips screwdriver
e. Release the 6 retaining clips - arrow D - of the front bumper upper mounting bracket, and remove the front bumper upper mounting bracket ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LOWER GRILLE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page)
4. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page)
5. Remove the front bumper lower grille.

a. Unscrew the 4 retaining screws of the front bumper lower grille -arrow-.
   Recommended tool: Phillips screwdriver

b. Release the 17 retaining clips -arrow- between the front bumper lower grille and the front bumper upper body and lower body, and remove the front bumper lower grille ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

7.2 REAR BUMPER AND ACCESSORY SYSTEM

7.2.1 PRECAUTIONS

FRONT LICENSE PLATE FRAME TRIM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.

a. Unscrew the 4 mounting screws of the front license plate frame trim -arrow A-.
   Recommended tool: Phillips screwdriver
b. Detach the 6 retaining clips connecting the front license plate frame trim to the front bumper upper body -arrow B-.
   Recommended tool: Flathead screwdriver

c. Remove the front license plate frame trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

FRONT BUMPER LEFT MOUNTING BRACKET 2

NOTE

This section describes the removal and installation of the front bumper left mounting bracket 2, and the removal and installation of the front bumper right mounting bracket 2 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the front bumper left mounting bracket 2.

a. Unscrew the 1 fixing bolt -arrow- of the front bumper left mounting bracket 2, and remove the front bumper left mounting bracket 2 ①.
   Recommended tool: 8mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BUMPER LOWER BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
6. Remove the left/right side trim panel of the front bumper.
   See:Front bumper left trim panel (page 5420)
7. Remove the front bumper lower trim.
   See:Front bumper lower trim panel (page 5414)
8. Remove the front bumper lower cover.

a. Unscrew the 4 fixing screws -arrow A- on the lower part of the front bumper, and disengage the 8 retaining clips -arrow B- on the lower part of the front bumper.
   Recommended tool: Phillips screwdriver

b. Remove the front bumper lower body ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

LEFT FRONT BUMPER MOLDING

REMOVAL PROCEDURE

NOTE

This section describes the removal and installation of the left front bumper trim, and the removal and installation of the right front bumper trim can generally be performed by referring to the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the front towing hook cover.
   See:Front tow hook cover (page 5412)
6. Remove the left front bumper trim.

a. Detach the 11 retaining clips connecting the left front bumper trim to the front bumper upper main body -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT TOW HOOK COVER

REMOVAL PROCEDURE

1. Remove the front towing hook cover.

a. Use a flat-head screwdriver to detach the front towing hook cover ① - arrow -, and remove the front towing hook cover ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

FRONT BUMPER LEFT MOUNTING BRACKET ASSEMBLY 1

NOTE

This section describes the removal and installation of the front bumper left mounting bracket assembly 1, and the removal and installation of the front bumper right mounting bracket assembly 1 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the front bumper left mounting bracket assembly 1.

a. Unscrew the 3 fixing bolts -arrow- of the front bumper left mounting bracket assembly 1, and remove the front bumper left mounting bracket assembly 1 ①.
   Recommended tool: 8mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BUMPER LOWER TRIM PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
6. Remove the front bumper lower trim panel.

B10SRMIE5001105

a. Unscrew the 4 fixing screws of the lower front bumper trim -Arrow A-, and release the 6 fixing clips of the lower front bumper trim -Arrow B-.
   Recommended tools: Phillips screwdriver, flathead screwdriver

B10SRMIE5001106

b. Release the 3 retaining clips connecting the front bumper lower trim to the front bumper upper main body -arrow-.
   Recommended tool: Flathead screwdriver

B10SRMIE5001107

c. Remove the front bumper lower trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

FRONT BUMPER UPPER BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
6. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
7. Remove the front bumper lower cover.
   See:Front bumper lower body (page 5410)
8. Remove the front bumper wiring harness assembly.
   See:Front bumper wiring harness assembly (page 9991)
9. Remove the blind spot monitoring radar (front bumper).
   See:Blind Spot Detection Radar (Front Bumper) (page 9889)
10. Remove the front bumper wiring harness assembly.
    See:Front bumper wiring harness assembly (page 9991)
11. Remove the reverse ultrasonic sensor (front bumper).
    See:Reverse ultrasonic sensor (front bumper) (page)
12. Remove the front towing hook cover.
    See:Front tow hook cover (page 5412)
13. Remove the ACC mounting bracket.
    See:ACC mounting bracket (page 5424)
14. Remove the front surround-view camera assembly.
    See:Front surround view camera assembly (page 9570)
15. Remove the upper left mounting bracket of the front bumper.
    See:Front Bumper Upper Left Mounting Bracket (page 5418)
16. Remove the left/right side trim panel of the front bumper.
    See:Front bumper left trim panel (page 5420)
17. Remove the upper part of the front bumper.

a. Unscrew the 4 retaining screws -arrow A- on the upper part of the front bumper, and disengage the 8 retaining clips -arrow B- on the upper part of the front bumper.
   Recommended tools: Phillips screwdriver, flathead screwdriver

© 2026, All rights reserved

b. Remove the upper body ① of the front bumper.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

LEFT FRONT BUMPER ENERGY-ABSORBING FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the left energy-absorbing foam of the front bumper.

a. Release the 2 retaining clips -arrow- of the left front bumper energy-absorbing foam, and remove the left front bumper energy-absorbing foam ①.
   Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER UPPER LEFT MOUNTING BRACKET

NOTE

This section describes the removal and installation of the upper left mounting bracket of the front bumper. The removal and installation of the upper right mounting bracket of the front bumper can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
2. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5417)
3. Remove the ACC mounting bracket.
   See:ACC mounting bracket (page 5424)
4. Remove the front bumper wiring harness assembly.
   See:Front bumper wiring harness assembly (page 9991)
5. Remove the front surround-view camera assembly.
   See:Front surround view camera assembly (page 9570)
6. Remove the upper mounting bracket of the front bumper.
   See:Front bumper upper mounting bracket (page 5425)
7. Remove the upper trim panel of the front bumper.
   See:
8. Remove the upper left mounting bracket of the front bumper.

a. Unscrew the 1 fixing screw -arrow A- of the front bumper upper left mounting bracket, and disengage the 2 fixing clips -arrow B- of the front bumper upper left mounting bracket.
   Recommended tool: Phillips screwdriver

b. Release the 4 retaining clips - arrow - between the front bumper upper left mounting bracket and the front bumper upper mounting bracket.
c. Remove the front bumper upper left mounting bracket ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LEFT TRIM PANEL

REMOVAL PROCEDURE

NOTE

This section describes the removal and installation of the left trim panel of the front bumper, with the removal and installation of the right trim panel generally following the procedures for the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5408)
5. Remove the left trim panel of the front bumper.

a. Detach the 4 retaining clips on the front bumper left side trim panel -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front sealing strip of the front cover.
   See:Hood front weatherstrip (page 6690)
4. Remove the front bumper assembly.

a. Unscrew the 3 fixing screws on the left side of the front bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

b. Unscrew the 3 fixing screws on the right side of the front bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

c. Unscrew the 6 fixing screws at the bottom of the front bumper assembly - arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
d. Unscrew the 4 fixing bolts at the bottom of the front bumper assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
e. Release the 3 retaining clips of the front bumper assembly - arrow C -.
   Recommended tool: Clip remover

© 2026, All rights reserved

f. Unscrew the 8 fixing bolts of the front bumper assembly -arrow-.
Recommended tool: 10mm socket
Torque: 5±1N m

g. Detach the 10 retaining clips -arrow- connecting the front bumper assembly to the front bumper left mounting bracket and the front left position turn signal assembly.

h. Release the 10 retaining clips connecting the front bumper assembly to the front bumper right mounting bracket and the right front position turn signal lamp assembly -Arrow A-.
i. Disconnect the 2 connectors between the front bumper wiring harness and the engine compartment wiring harness -arrow B-, -arrow C-, and remove the front bumper assembly ①.

j. Disconnect the 1 connector -arrow- between the front bumper wiring harness and the front surround view camera assembly, and remove the front bumper assembly with the active grille assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- If painting is required, it is recommended to use pre-sale paint. The film thickness should be controlled within the normal TDS range to meet the radar wave attenuation requirements (one-way attenuation ≤ 1.5 dB, one-way reflection ≤ -15 dB).
- Screws and bolts should be stored in a box to prevent loss.
- Tighten the fixing bolts and screws to the specified torque.

© 2026, All rights reserved

- After installation, check whether the relevant electrical components function properly.

© 2026, All rights reserved

ACC MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the ACC mounting bracket.

a. Disconnect the 1 connector of the forward collision radar -arrow A-, and unscrew the 2 fixing screws of the ACC mounting bracket -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the forward collision radar with ACC mounting bracket ①.

c. Release the 4 retaining clips -arrow- between the forward collision avoidance radar and the ACC mounting bracket, and remove the ACC mounting bracket ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- After installation is completed, the following operations need to be performed on the forward collision avoidance radar:
  - Write the VIN. The diagnostic tool operation is: MRS-Data Write-VIN.
  - Angle calibration. Diagnostic tool operation: After angle calibration, go to MRS - Routine Control - Angle Write, and write the deviation angle after angle calibration.
  - Target corner reflector detection. Diagnostic tool operation: MRS-Routine Control-Target Corner Reflector Detection Test.
- Calibrate the forward collision avoidance radar.
  See:Calibration (page)
- After calibration is completed, check that the forward collision avoidance radar is functioning properly.

FRONT BUMPER UPPER MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front surround-view camera assembly.
   See:Front surround view camera assembly (page 9570)
5. Remove the ACC mounting bracket.
   See:ACC mounting bracket (page 5424)
6. Remove the upper mounting bracket of the front bumper.

B10SRMIE5001103

a. Unscrew the 6 mounting screws connecting the front bumper upper mounting bracket to the front bumper upper main body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Release the 7 retaining clips connecting the front bumper upper mounting bracket to the front bumper upper body - arrow B -.

B10SRMIE5001104

c. Disconnect the 1 connector between the front bumper wiring harness and the front surround view camera -Arrow A-, and release the 9 wiring harness retaining clips of the front bumper wiring harness -Arrow B-.
   Recommended tool: Clip remover
d. Unscrew the 4 fixing screws of the upper mounting bracket on the front bumper -Arrow C-.
   Recommended tool: Phillips screwdriver
e. Release the 6 retaining clips - arrow D - of the front bumper upper mounting bracket, and remove the front bumper upper mounting bracket ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

7.2.6 SERVICE AND REPAIR GUIDANCE

REAR BUMPER LEFT TRIM

NOTE

This section describes the removal and installation of the left rear bumper trim. The removal and installation of the right rear bumper trim can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the left rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5513)
2. Remove the left rear bumper trim.

a. Use a tool to detach the 2 retaining rivets -arrow- of the left rear bumper trim, and remove the left rear bumper trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the fixing rivets are properly installed.

© 2026, All rights reserved

REAR BUMPER UPPER BODY

REMOVAL PROCEDURE

1. Turn off all electrical loads, and tap Vehicle Maintenance Power On on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
4. Remove the rear parking ultrasonic sensor (rear bumper).
   See:Reversing ultrasonic sensor (rear bumper) (page 9890)
5. Remove the blind spot monitoring radar (rear bumper).
   See:Blind spot detection radar (rear bumper) (page 9887)
6. Remove the license plate lamp.
   See:License plate light (page 9910)
7. Remove the rear surround view camera assembly.
   See:Rear surround view camera assembly (page 9581)
8. Remove the rear bumper wiring harness assembly.
   See:Rear Bumper Wiring Harness Assembly (page 9993)
9. Remove the upper body of the rear bumper.

B10SRMIE5002056

a. Unscrew the 6 fixing screws -Arrow A- on the upper body of the rear bumper, and release the 14 fixing clips -Arrow B- between the lower body and the upper body of the rear bumper.
   Recommended tools: Phillips screwdriver, flathead screwdriver
   Torque: 2±0.2N m

B10SRMIE5002057

b. Remove the upper body of the rear bumper ①.

SETUP

1. The installation procedure is performed in reverse order, while observing the above precautions:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR TOW HOOK COVER

REMOVAL PROCEDURE

1. Remove the rear towing hook cover.

a. Press the arrow position to detach the rear towing hook cover ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

REAR BUMPER MOUNTING BRACKET ASSEMBLY 4

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear bumper mounting bracket assembly 4.

a. Unscrew the 2 fixing bolts at the lower part of the rear bumper mounting bracket assembly 4 -arrow A-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Unscrew the 4 fixing bolts at the top of the rear bumper mounting bracket assembly 4 -arrow B-, and remove the rear bumper mounting bracket assembly 4 ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR BUMPER LOWER BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
4. Remove the left/right lower trim panel of the rear bumper.
   See:Rear bumper lower trim panel (page 5455)
5. Remove the left/right rear fog lamp assembly.
   See:Rear left fog lamp reflector assembly (page 9906)
6. Remove the rear bumper lower body.

a. Unscrew the 6 mounting screws of the lower rear bumper -arrow A-, and release the 14 retaining clips between the lower and upper rear bumpers -arrow B-.
   Recommended tools: Phillips screwdriver, flathead screwdriver
   Torque: 2±0.2N m

b. Remove the rear bumper lower body ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

REAR BUMPER LEFT MOUNTING BRACKET ASSEMBLY 1

NOTE

This section describes the removal and installation of the rear bumper left mounting bracket assembly 1, and the removal and installation of the rear bumper right mounting bracket assembly 1 can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
2. Remove the rear bumper left mounting bracket assembly 1.

a. Unscrew the 6 fixing screws of the rear bumper left mounting bracket assembly 1 -arrow-, and remove the rear bumper left mounting bracket assembly 1 ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR BUMPER LOWER TRIM PANEL

NOTE

This section describes the removal and installation of the rear bumper lower left trim panel, and the removal and installation of the rear bumper lower right trim panel can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
3. Remove the rear bumper lower trim panel.

B10SRMIE5002058

a. Unscrew the 2 retaining screws of the rear bumper lower trim - Arrow A -, and release the 14 retaining clips of the rear bumper lower trim - Arrow B -.
Recommended tools: Phillips screwdriver, interior trim removal tool

B10SRMIE5002059

b. Release the 2 retaining clips -arrow- connecting the rear bumper lower trim and the rear bumper lower main body.

B10SRMIE5002060

b. Remove the rear bumper lower trim panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

REAR BUMPER LEFT MOUNTING BRACKET ASSEMBLY 2

NOTE

This section describes the removal and installation of the rear bumper left mounting bracket assembly 2, and the removal and installation of the rear bumper right mounting bracket assembly 2 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
2. Remove the rear bumper left mounting bracket assembly 2.

a. Unscrew the 3 fixing screws -arrow- of the rear bumper left mounting bracket assembly 2, and remove the rear bumper left mounting bracket assembly 2①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR BUMPER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear bumper assembly.

a. Unscrew the 4 fixing screws on the left side of the rear bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

b. Unscrew the 4 fixing screws on the right side of the rear bumper assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

c. Unscrew the 4 mounting screws at the bottom of the rear bumper assembly -Arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
d. Unscrew the 4 fixing bolts at the bottom of the rear bumper assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
e. Unscrew the 2 fixing screws at the bottom of the rear bumper assembly -arrow C-.
   Recommended tool: Flathead screwdriver

© 2026, All rights reserved

f. Open the liftgate assembly.
g. Unscrew the 2 fixing bolts of the rear bumper assembly -arrow-.
Recommended tool: 5mm hexagon socket wrench
Torque: 5±1N m

h. Detach the 12 retaining clips on the left side of the rear bumper assembly -arrow-.

i. Detach the 12 retaining clips on the right side of the rear bumper assembly -arrow A-, and disconnect the 1 connector between the rear bumper wiring harness and the floor wiring harness -arrow B-.
j. Remove the rear bumper assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

7.3 REARVIEW MIRROR SYSTEM

7.3.1 PRECAUTIONS

PRECAUTIONS

1. When removing glass components, wear protective gloves and safety goggles to avoid injury to the skin or eyes.
2. When removing the glass, handle it with care and place it securely to prevent damage to the glass during the operation.
3. When prying the latch tongue and pawl, do not apply excessive force to avoid damaging the latch tongue or pawl.

© 2026, All rights reserved

7.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

The rearview mirror system consists of the following components:

1. Upper mirror housing
2. Lens assembly
3. Mirror bezel
4. Left and right turn signal lamp assemblies
5. Lower mirror housing
6. Exterior rearview mirror assembly
7. Interior rearview mirror assembly

Operating principle of power-folding exterior rearview mirrors:

1. The power exterior rearview mirror consists of the rearview mirror adjustment switch (integrated in the central control panel), reflective mirror glass, motor, control unit, and communication network.
2. The Main Zone Controller receives the exterior rearview mirror folding signal from the Multi-domain Fusion Controller/Telematics Host via CAN communication, and controls the exterior rearview mirror to perform the folding operation.

Exterior rearview mirror heating principle:

1. The main zone controller receives the exterior rearview mirror heating request signal from the multi-domain fusion controller/telematics host via CAN communication, and controls the operation of the exterior rearview mirror heating wire to achieve rapid defogging and defrosting.

Schematic diagram of exterior rearview mirror adjustment principle:

1. The Main Zone Controller receives the exterior rearview mirror adjustment signal from the Multi-Domain Fusion Controller/Telematics Host via CAN communication, and controls the exterior rearview mirror glass for position adjustment.

7.3.7 SERVICE AND REPAIR GUIDANCE

RIGHT TRIANGULAR EXTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right triangular outer trim panel assembly, and the removal and installation of the left triangular outer trim panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the right outer triangular trim panel assembly.

a. Release the 3 retaining clips of the right triangular outer trim panel assembly, and remove the right triangular outer trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

RIGHT EXTERIOR REARVIEW MIRROR ASSEMBLY

NOTE

This section describes the removal and installation of the right exterior rearview mirror assembly. The removal and installation of the left exterior rearview mirror assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right front door interior trim panel assembly.
   See:Right Front Door Interior Trim Panel Assembly (page 5542)
4. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6860)
5. Remove the right exterior rearview mirror assembly.

a. Lower the right front door window to the bottom position.
b. Disconnect the 2 connectors -Arrow A- and -Arrow B- of the right exterior rearview mirror assembly wiring harness, and release the 1 retaining clip -Arrow C- of the rearview mirror wiring harness.
c. Detach the 1 grommet of the wiring harness for the right exterior rearview mirror assembly -arrow D-, and unscrew the 3 mounting bolts of the right exterior rearview mirror assembly -arrow E-.
   Recommended tool: 8mm socket
   Torque: 9±1N m

d. Remove the right exterior rearview mirror assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the wiring harness, check whether the pins of the wiring harness connector are damaged. If damaged, replace the wiring harness with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

c. After installation, the camera must be calibrated.
   See:Calibration (page)

RIGHT TURN SIGNAL ASSEMBLY

NOTE

This section describes the removal and installation of the right turn signal assembly, and the removal and installation of the left turn signal assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper right mirror housing.
   See:Right upper mirror housing (page 5470)
4. Remove the right turn signal assembly.

a. Disconnect the 1 connector of the right turn signal lamp assembly -arrow A-, and unscrew the 3 fixing screws of the right turn signal lamp assembly -arrow B-.
   Recommended tool: Phillips screwdriver
b. Release the 1 retaining clip -arrow C- of the right turn signal lamp assembly, and remove the right turn signal lamp assembly ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the right turn signal lamp assembly is working properly.

© 2026, All rights reserved

RIGHT UPPER MIRROR HOUSING

NOTE

This section describes the removal and installation of the upper right mirror shell. The removal and installation of the upper left mirror shell can generally refer to the procedure for the right side.

REMOVAL PROCEDURE

1. Remove the upper right mirror housing.

a. Release the 8 retaining clips - arrows - on the upper right mirror housing, and remove the upper right mirror housing ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

RIGHT MIRROR RING

NOTE

This section describes the removal and installation of the right mirror bezel. The removal and installation of the left mirror bezel can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right mirror glass assembly.
   See:Right lens body assembly (page 5475)
4. Remove the right mirror bezel.

a. Unscrew the 4 fixing screws -Arrow A- of the right mirror bezel, and disengage the 7 fixing clips -Arrow B- of the right mirror bezel.
   Recommended tool: Phillips screwdriver
b. Remove the right mirror ring ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

LEFT AND RIGHT SURROUND VIEW CAMERA ASSEMBLY

NOTE

This section describes the removal and installation of the right surround-view camera assembly, and the removal and installation of the left surround-view camera assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper right mirror housing.
   See:Right upper mirror housing (page 5470)
4. Remove the right mirror glass assembly.
   See:Right lens body assembly (page 5475)
5. Remove the left and right surround view camera assemblies.

Unscrew the 4 fixing screws - Arrow A - of the right mirror bezel, disengage the 7 fixing clips - Arrow B - of the right mirror bezel, and remove the right mirror bezel assembly ①.
Recommended tool: Phillips screwdriver

b. Disconnect the 1 connector -arrow A- of the right turn signal assembly, unscrew the 3 fixing screws -arrow B- of the right turn signal assembly, and remove the right turn signal assembly ①.
   Recommended tool: Phillips screwdriver
c. Release the 1 retaining clip -arrow C- of the right turn signal lamp assembly, and remove the right turn signal lamp assembly ①.
   Recommended tool: Clip remover

d. Disconnect 1 connector of the left and right surround view camera assembly -arrow A-, unscrew 1 fixing screw of the right surround view camera bracket -arrow B-, and remove the right surround view camera bracket with the left and right surround view camera assembly ①.
   Recommended tool: Phillips screwdriver

© 2026, All rights reserved

e. Unscrew the 2 mounting screws - arrow - between the left and right surround view camera assembly and the right surround view camera bracket, and remove the left and right surround view camera assembly ①.
Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the left and right surround view camera assemblies.
   See:Calibration (page)
   b. After calibration is completed, check that the left and right surround-view camera assemblies are functioning properly.

© 2026, All rights reserved

INTERIOR REARVIEW MIRROR ASSEMBLY

REMOVAL PROCEDURE

1. Remove the blind cover.
   See:Plug cover (page 5622)
2. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5616)
3. Remove the interior rearview mirror assembly.

a. Rotate the interior rearview mirror assembly 60° counterclockwise along the arrow to unscrew it, and remove the interior rearview mirror assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Rotate the interior rearview mirror assembly counterclockwise by 60° (toward the front of the vehicle), align it with the mounting hole, then press it into the mounting base on the windshield, and rotate it clockwise by 60° to complete the installation.

RIGHT LENS BODY ASSEMBLY

NOTE

This section describes the removal and installation of the right mirror glass body assembly, and the removal and installation of the left mirror glass body assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right mirror glass assembly.

a. Use a tool to release the 8 retaining clips - arrow - of the right mirror glass body assembly, and slowly remove the right mirror glass body assembly ①.
Recommended tool: Interior trim removal tool

ATTENTION

The lens body is fragile, so please handle with care during installation and removal.

b. Disconnect the 2 connectors for the heating coil of the right mirror glass body assembly - Arrow A -, disconnect the 1 connector for the right blind spot warning assembly - Arrow B -, and remove the right mirror glass body assembly ①.

ATTENTION

The lens body is fragile, so please handle with care during installation and removal.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When removing the lens, handle it with care to avoid damaging it during the operation.

7.4.6 SERVICE AND REPAIR GUIDANCE

RIGHT REAR DOOR EXTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right rear door exterior trim panel assembly. The removal and installation of the left rear door exterior trim panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Open the right rear door.
2. Remove the right rear door exterior trim assembly.

a. Detach the 2 retaining clips -arrow- of the right rear door wheel arch weatherstrip, and peel back the lower end of the right rear door wheel arch weatherstrip.
Recommended tool: Clip remover

b. Unscrew 1 fixing screw -arrow- of the right rear door outer trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

c. Release the 6 waterproof clips of the right rear door exterior trim panel assembly, and remove the right rear door exterior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

RIGHT SIDE SKIRT ASSEMBLY

NOTE

This section describes the removal and installation of the right side skirt panel assembly, and the removal and installation of the left side skirt panel assembly can generally be performed by referring to the right side.

REMOVAL PROCEDURE

1. Open the front right/rear right doors.
2. Remove the right side skirt assembly.

a. Detach the 2 retaining clips -Arrow A- of the right side skirt trim assembly, and unscrew the 9 fixing screws -Arrow B- of the right side skirt trim assembly.
Recommended tools: Clip remover, Phillips screwdriver
Torque: 2±0.2N m

b. Release the 12 retaining clips of the right side skirt panel assembly, and remove the right side skirt panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

7.5.6 SERVICE AND REPAIR GUIDANCE

LEFT HINGE TRIM PANEL

NOTE

This section describes the removal and installation of the left hinge trim panel, and the removal and installation of the right hinge trim panel can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the left water shield foam.
   See:Left water-blocking foam (page 5496)
3. Remove the left hinge trim panel.

a. Unscrew the 4 mounting screws -arrow- of the left hinge trim panel, and remove the left hinge trim panel ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT END COVER OF VENTILATION WINDOW COVER

NOTE

This section describes the removal and installation of the left end cover of the ventilation window cover, and the removal and installation of the right end cover of the ventilation window cover can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the left end cover of the ventilation window cover.

a. Release the 2 double-sided clips - Arrow A - on the left end cover of the ventilation window cover, and release the 6 retaining clips - Arrow B - on the left end cover of the ventilation window cover.
b. Remove the left end cover ① of the ventilation window cover.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

COWL GRILLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right hinge trim panel.
   See:Left hinge trim panel (page 5490)
4. Remove the left/right end covers of the ventilation window cover plate.
   See:Left end cover of ventilation window cover (page 5491)
5. Remove the driver/passenger wiper blade assembly.
   See:Main wiper arm blade assembly (page 9948)
6. Remove the rear seal of the front cover.
   See:Hood front weatherstrip (page 6690)
7. Remove the cowl panel grille assembly.

a. Release the 4 retaining clips of the ventilation window cover assembly -arrow A-.
   Recommended tool: Clip remover
b. Unscrew the 2 mounting bolts -arrow B- of the ventilation window cover assembly, and remove the ventilation window cover assembly ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

LEFT C-PILLAR OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left C-pillar outer trim panel assembly, and the removal and installation of the right C-pillar outer trim panel assembly can generally follow the procedures for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6687)
4. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6682)
5. Remove the left outer trim panel assembly of the C-pillar.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 mounting screws -arrow- of the left C-pillar outer trim panel assembly, and remove the left C-pillar outer trim panel assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

REAR FULL-WIDTH LAMP LOWER TRIM PANEL

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the liftgate upper inner panel assembly.
   See:Liftgate upper interior trim panel assembly (page 5563)
3. Remove the liftgate left interior trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5636)
4. Remove the right interior trim panel assembly of the liftgate.
   See:Left liftgate interior trim panel assembly (page 5560)
5. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5564)
6. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9912)
7. Remove the left/right trim panel of the rear through-type lamp.
   See:Rear full-width light left trim panel (page 9902)
8. Remove the liftgate microswitch.
   See:Liftgate micro switch (page 9063)
9. Remove the license plate lamp.
   See:License plate light (page 9910)
10. Remove the lower trim panel of the rear full-width lamp.

a. Unscrew the 9 mounting screws -arrow-connecting the lower trim panel of the rear full-width lamp to the rear full-width combination lamp, and remove the lower trim panel of the rear full-width lamp ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT COMPARTMENT STORAGE BOX ASSEMBLY

REMOVAL PROCEDURE

1. Remove the front compartment storage box assembly.

a. Release the 4 retaining clips - arrow - of the screw plug cover, and remove the screw plug cover.

b. Unscrew the 6 fixing bolts -arrow- of the front compartment storage box assembly, and remove the front compartment storage box assembly ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT WATER-BLOCKING FOAM

NOTE

This section describes the removal and installation of the left water deflector foam, and the removal and installation of the right water deflector foam can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the left water shield foam.

a. Release the 2 retaining clips -arrow- of the left water baffle foam, and remove the left water baffle foam ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

WIPER SHAFT SEALING BUSHING

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5492)
3. Remove the wiper shaft seal bushing.

a. Remove the wiper shaft seal sleeve ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

B-PILLAR FRONT LEFT OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the B-pillar left front outer trim panel assembly, and the removal and installation of the B-pillar right front outer trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front left door outer belt molding.
   See:Front left door outer belt molding (page 6685)
4. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6678)
5. Remove the left front B-pillar outer trim panel assembly.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 fixing screws - arrow - of the B-pillar front left outer trim panel assembly, and remove the B-pillar front left outer trim panel assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

© 2026, All rights reserved

REAR LEFT B-PILLAR OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the B-pillar rear left outer trim panel assembly, and the removal and installation of the B-pillar rear right outer trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6687)
4. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6682)
5. Remove the rear left door glass assembly.
   See:Rear left door glass assembly (page 6660)
6. Remove the B-pillar left rear outer trim panel assembly.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 mounting screws -arrow- of the B-pillar rear left outer trim panel assembly, and remove the B-pillar rear left outer trim panel assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

LEFT SPOILER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left spoiler trim panel assembly, and the removal and installation of the right spoiler trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5563)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5636)
5. Remove the spoiler assembly.

a. Release the 7 retaining clips -arrow- of the left spoiler trim panel assembly, and remove the left spoiler trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

WIPER SHAFT SEAL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the driver/passenger wiper blade assembly.
   See:Main wiper arm blade assembly (page 9948)
4. Remove the wiper shaft seal.

a. Remove the wiper shaft seal ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

SPOILER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5563)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5560)
5. Remove the spoiler assembly.

a. Disconnect the connector between the high-mounted brake lamp and the liftgate wiring harness -arrow A-, and detach the grommet -arrow B-.
b. Unscrew the 8 fixing bolts of the spoiler assembly -arrow C-.
   Recommended tool: 8mm socket
   Torque: 6±1N m

c. Release the 6 waterproof clips of the spoiler assembly, and remove the spoiler and accessory assembly ①.
   Recommended tool: Interior trim removal tool

d. Unscrew the 4 fixing screws -arrow- of the high-mounted brake lamp, and detach the spoiler assembly ① and the high-mounted brake lamp ②.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
e. Remove the spoiler assembly ②.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

7.6 TRIM PANELS AND PROTECTION PANELS SYSTEM

7.6.1 PRECAUTIONS

PRECAUTIONS

1. When removing the underbody cover, a transmission jack must be used to support the underbody cover, or two technicians must work together to remove and install it, to prevent the underbody cover from falling suddenly and causing injury.
2. After removing the wheelhouse liner, check the fixing clips for damage and replace them if necessary.
3. When removing the wheel arch liner, a professional removal wedge must be used to avoid damaging the liner surface with other tools.

7.6.6 SERVICE AND REPAIR GUIDANCE

REAR LEFT WHEEL SPOILER

NOTE

This section describes the removal and installation of the left rear wheel spoiler, and the removal and installation of the right rear wheel spoiler can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the left rear wheel spoiler.

a. Use a tool to detach the 3 retaining rivets -arrow- of the left rear wheel spoiler, and remove the left rear wheel spoiler ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR UNDERBODY SHIELD BRACKET ASSEMBLY 2

REMOVAL PROCEDURE

1. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
2. Remove rear underbody shield bracket assembly 2.

a. Unscrew the 2 fixing bolts -arrow- of the rear underbody protector bracket assembly 2, and remove the rear underbody protector bracket assembly 2 ①.
   Recommended tool: 13mm socket
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR UNDERBODY SPOILER 1

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear underbody cover spoiler 1.

a. Use a tool to remove the 9 fixing rivets -arrow- of the rear underbody spoiler 1, and remove the rear underbody spoiler 1 ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT LOWER UNDERCOVER ASSEMBLY

NOTE

This section describes the removal and installation of the left lower splash shield assembly, and the removal and installation of the right lower splash shield assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the left lower cover assembly.

a. Unscrew the 3 retaining screws of the left lower trim panel assembly -arrow A-.
Recommended tool: 10mm socket
Torque: 5±1N m
b. Unscrew the 11 retaining bolts of the left lower cover assembly -arrow B-, and disengage the 3 retaining clips of the left lower cover assembly -arrow C-.
Recommended tools: Phillips screwdriver, trim clip remover
Torque: 2±0.2N m
c. Remove the left lower cover assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

FRONT LEFT WHEEL SPOILER

NOTE

This section describes the removal and installation of the left front wheel spoiler, and the removal and installation of the right front wheel spoiler can generally refer to that of the left side.

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the front left wheel spoiler.

a. Use a tool to remove the 4 retaining rivets - arrow - of the left front wheel spoiler, and remove the left front wheel spoiler ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT REAR WHEELHOUSE TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left rear wheelhouse liner assembly, and the removal and installation of the right rear wheelhouse liner assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 3072)
2. Remove the left rear wheelhouse liner assembly.

a. Unscrew the 10 fixing screws of the left rear wheelhouse liner assembly -arrow A-, and disengage the 4 fixing clips of the left rear wheelhouse liner assembly -arrow B-.
Recommended tools: Phillips screwdriver, trim clip remover
Torque: 2±0.2N m

b. Unscrew the 7 plastic nuts -arrow- of the left rear wheelhouse liner assembly, and remove the left rear wheelhouse liner assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

REAR COMPARTMENT UNDER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear underbody cover spoiler 1.
   See:Rear underbody spoiler 1 (page 5510)
3. Remove the rear compartment lower cover assembly.

a. Unscrew the 17 fixing bolts of the rear compartment bottom protective panel assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Unscrew the 8 fixing screws - Arrow B - of the rear compartment bottom cover assembly, and remove the rear compartment bottom cover assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

FRONT COMPARTMENT LOWER SHIELD ASSEMBLY

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the front compartment bottom shield assembly.

a. Unscrew the 18 fixing bolts of the front compartment lower cover assembly -Arrow A-, -Arrow B-.
Recommended tool: 10mm socket
Torque at arrow A: 5±1N m
Torque at Arrow B: 4±1N m

b. Unscrew the 15 fixing screws -Arrow C- of the front compartment lower cover assembly, and remove the front compartment lower cover assembly ①.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

FRONT LEFT WHEEL ARCH LINER ASSEMBLY

NOTE

This section describes the removal and installation of the left front wheelhouse liner assembly, and the removal and installation of the right front wheelhouse liner assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left wheel assembly.
   See:Wheel Assembly (page 3072)
2. Remove the front left wheel arch liner assembly.

a. Unscrew the 13 fixing screws of the left front wheelhouse liner assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

b. Unscrew the 2 plastic nuts -arrow A- of the left front wheelhouse liner assembly, and disengage the 12 retaining clips -arrow B- of the left front wheelhouse liner assembly.
   Recommended tool: Clip remover
c. Remove the left front wheelhouse liner assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

REAR UNDERBODY SHIELD BRACKET ASSEMBLY 1

REMOVAL PROCEDURE

1. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5514)
2. Remove the rear underbody shield bracket assembly 1.

a. Unscrew the 2 fixing bolts -arrow- of the rear underbody protector bracket assembly 1, and remove the rear underbody protector bracket assembly 1 ①.
   Recommended tool: 13mm socket
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

7.7 EMBLEM AND EXTERIOR ACCESSORY SYSTEM

7.7.1 PRECAUTIONS

PRECAUTIONS

1. When removing exterior accessories, handle with care to avoid damaging the retaining tabs of the trim.
2. When removing, use an interior trim pry tool to assist, do not pry with metal tools, to avoid damaging the trim panel.
3. When disconnecting the wiring harness connectors, take care not to damage the connectors or other components.
4. Exercise caution when removing and installing the front and rear badges to avoid scratching the paint surface.

7.7.6 SERVICE AND REPAIR GUIDANCE

RIGHT REAR LETTER EMBLEM

REMOVAL PROCEDURE

1. Remove the right rear emblem.

a. Release the fixing adhesive securing the right rear emblem to the liftgate assembly, and remove the right rear emblem ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the right rear emblem with the corresponding position, apply it, and press it down firmly.

© 2026, All rights reserved

HOUSING

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the ambient temperature sensor assembly.
   See:Outdoor temperature sensor assembly (page 5338)
6. Remove the cover.

a. Unscrew the 2 fixing screws connecting the cover and the air guide cover -Arrow A-, and disengage the 2 fixing clips connecting the cover and the air guide cover -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Release the 6 retaining clips connecting the cover to the air guide cover -Arrow C-, and remove the cover ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BADGE

REMOVAL PROCEDURE

1. Remove the front hood insulation pad.
   See:Front hood insulation pad (page 5797)
2. Remove the front badge.

a. Unscrew the 3 retaining nuts -Arrow A- securing the front emblem to the hood, and disengage the 2 retaining clips -Arrow B- of the front emblem.
Recommended tools: 10mm socket, interior trim removal tool
Torque: 5±1N m

b. Remove the front badge ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the front badge with the corresponding position, attach it, and press it down firmly.

© 2026, All rights reserved

CENTER AND REAR EMBLEMS

REMOVAL PROCEDURE

1. Remove the center and rear letter emblems.

a. Release the fixing adhesive between the center and rear badges and the liftgate assembly, and remove the center and rear badges ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the center and rear emblems with the corresponding positions and attach them, then press down firmly until fully adhered.

RIGHT BLIND SPOT CAMERA TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right blind-spot camera trim panel assembly, and the removal and installation of the left blind-spot camera trim panel assembly can generally follow the same procedure as the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right blind spot camera trim panel assembly.

a. Release the 6 retaining clips of the right blind spot camera trim panel assembly, and remove the right blind spot camera trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

ACTUATOR MOTOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
5. Remove the cover.
   See:Housing (page 5524)
6. Remove the actuator motor.

a. Remove the motor retaining pin ①-arrow-.

d. Unscrew the 8 fixing screws -arrow- securing the left/right pressure rod to the active grille shutter housing and the front bumper assembly, and remove the left/right pressure rod ①.
Recommended tool: Phillips screwdriver

© 2026, All rights reserved

d. Remove the left/right driven vane ① in the direction of the arrow, and remove the active grille shutter housing ②.

d. Release the 2 retaining clips -arrow- between the actuator motor and the linkage, and remove the motor ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

EV BADGE

REMOVAL PROCEDURE

1. Remove the EV badge.

a. Detach the adhesive securing the EV badge to the left side outer panel, and remove the EV badge ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the center and rear emblems with the corresponding positions and attach them, then press down firmly until fully adhered.

ACTIVE GRILLE SHUTTER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the active grille assembly.

a. Disconnect 1 connector -arrow A- between the front bumper wiring harness and the active grille shutter assembly, and release 1 retaining clip -arrow B- of the front bumper wiring harness.
   Recommended tool: Clip remover
b. Unscrew the 7 fixing bolts connecting the active grille shutter assembly to the front bumper assembly - Arrow C -.
   Recommended tool: 10mm socket
   Torque: 5±1N m
c. Unscrew the 4 mounting screws connecting the active grille shutter assembly to the front bumper assembly - arrow D -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

d. Release the 22 retaining clips -Arrow A-, -Arrow B- between the active grille shutter assembly and the lower front bumper grille.
   Recommended tool: Clip remover
e. Remove the active grille assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

RIGHT FENDER LINER ASSEMBLY

NOTE

This section describes the removal and installation of the right fender liner assembly, and the removal and installation of the left fender liner assembly can generally be performed by referring to the right side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the right side skirt assembly.
   See:Right side skirt assembly (page 5482)
3. Remove the right fender liner assembly.

a. Release the 5 retaining clips -arrows- of the right fender liner assembly, and remove the right fender liner assembly ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clips or retaining clips are damaged, they must be replaced with new double-sided clips or retaining clips.

© 2026, All rights reserved

AIR GUIDE COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the hood latch mounting bracket.
   See:Hood latch mounting bracket (page 6638)
5. Remove the front bumper reinforcement assembly.
   See:Front bumper beam assembly (page 6623)
6. Remove the ambient temperature sensor assembly.
   See:Outdoor temperature sensor assembly (page 5338)
7. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5531)
8. Remove the air guide cover.

a. Disconnect the 5 retaining clips of the engine compartment wiring harness - Arrow A -.
   Recommended tool: Clip remover
b. Unscrew the 9 fixing bolts of the air guide cover -arrow B-, and remove the air guide cover ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

SIDE PANEL VENT FRAME

NOTE

This section describes the removal and installation of the left side panel ventilation grille. The removal and installation of the right side panel ventilation grille can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5457)
2. Remove the side panel ventilation frame.

a. Release the 4 retaining clips of the side panel ventilation grille -arrow-, and remove the side panel ventilation grille ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

REAR RIGHT DOOR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right rear door trim panel assembly, and the removal and installation of the left rear door trim panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page)
3. Remove the right rear door switch panel assembly.
   See:Right rear door switch panel assembly (page 5552)
4. Remove the plug of the right rear door handle box.
   See:Right rear door handle recess cover (page 5554)
5. Remove the right rear door inner triangular panel assembly.
   See:Right rear door inner quarter trim panel assembly (page 5553)
6. Remove the right rear door interior trim panel assembly.

a. Unscrew the 2 fixing screws -arrow- of the right rear door interior trim panel assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.8±0.5N m

b. Release the 11 retaining clips of the right rear door interior trim panel assembly.
   Recommended tool: Interior trim removal tool
c. Disconnect the connection between the right rear door inside handle cable and the inside handle -Arrow A-, -Arrow B-.
d. Disconnect the 1 connector - Arrow C - between the right rear door wiring harness and the right rear door trim panel wiring harness, and remove the right rear door interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

RIGHT REAR DOOR HANDLE CUP SCREW RUBBER PAD

NOTE

This section describes the removal and installation of the screw rubber pads for the right rear door pull handle box, and the removal and installation of the screw rubber pads for the left rear door pull handle box can generally refer to the right side.

REMOVAL PROCEDURE

1. Open the left rear door.
2. Remove the rubber pad of the screw in the right rear door handle recess.

a. Detach the right rear door handle box screw rubber pad at the arrow, and remove the right rear door handle box screw rubber pad ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

RIGHT REAR DOOR SWITCH PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right rear door switch panel assembly, and the removal and installation of the left rear door switch panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the right rear door switch panel assembly.

a. Release the 11 retaining clips -arrow- of the right rear door switch panel assembly, and remove the right rear door switch panel assembly with the single door window switch assembly ①.
   Recommended tool: Interior trim removal tool

b. Disconnect 1 connector of the single door window control switch -arrow-.

c. Release the 4 retaining clips -arrow- of the single door window control switch, and remove the right rear door switch panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

RIGHT REAR DOOR INNER QUARTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right rear door inner triangular panel assembly, and the removal and installation of the left rear door inner triangular panel assembly can generally be performed by referring to the right side.

REMOVAL PROCEDURE

1. Open the left rear door.
2. Remove the right rear door inner triangular panel assembly.

a. Release the 3 retaining clips of the right rear door inner triangular panel assembly, and remove the right rear door inner triangular panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

RIGHT REAR DOOR HANDLE RECESS COVER

NOTE

This section describes the removal and installation of the plug for the right rear door inner door handle bezel. The removal and installation of the plug for the left rear door inner door handle bezel can generally refer to the right side.

REMOVAL PROCEDURE

1. Open the left rear door.
2. Remove the plug of the right rear door handle box.

a. Detach the right rear door handle bezel plug at the arrow, and remove the right rear door handle bezel plug ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

7.10 LIFTGATE INTERIOR TRIM PANEL AND ACCESSORY SYSTEM

7.10.1 PRECAUTIONS

PRECAUTIONS

1. When removing the liftgate trim panel, use a specialized removal wedge to avoid damaging the surface of the liftgate trim panel with other tools.
2. After removing the liftgate trim panel, check whether the retaining clips on the liftgate trim panel are damaged, and replace them if necessary.

© 2026, All rights reserved

7.10.2 COMPONENT LOCATION DIAGRAM

COMPONENT LOCATION DIAGRAM

7.10.6 SERVICE AND REPAIR GUIDANCE

LEFT LIFTGATE INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the tailgate left interior trim panel assembly, and the removal and installation of the tailgate right interior trim panel assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5563)
3. Remove the liftgate left interior trim panel assembly.

a. Unscrew 1 fixing screw -arrow- on the left interior trim panel assembly of the liftgate.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Release the 2 retaining clips of the liftgate left interior trim panel assembly, and remove the liftgate left interior trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

WINDOW REGULATOR SWITCH BLANKING CAP

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the power window switch cover.

a. Release the 2 retaining clips -arrow- of the window regulator switch blanking cover, and remove the window regulator switch blanking cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

ESCAPE COVER

NOTE

If the liftgate cannot be opened, fold down the second-row seatbacks, remove the escape cover from the inside, and release the liftgate latch.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the escape cover.

a. Release the 1 retaining clip of the escape cover -arrow-, and remove the escape cover ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LIFTGATE UPPER INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the upper interior trim panel assembly of the liftgate.

a. Release the 6 retaining clips of the liftgate upper interior trim panel assembly, and remove the liftgate upper interior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

TAILGATE HANDLE ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the liftgate handle assembly.

a. Release the 1 retaining clip of the glove box cover -arrow-.
Recommended tool: Flathead screwdriver

b. Unscrew 1 fixing bolt -arrow- of the liftgate handle assembly, and remove the liftgate handle assembly ①.
Recommended tool: 8mm socket
Torque: 3.5±1.5N • m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

TAILGATE LOWER INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5563)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5560)
5. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5564)
6. Remove the power liftgate switch.
   See:Power trunk lid switch (page 9064)
7. Remove the lower interior trim panel assembly of the liftgate.

a. Unscrew the 2 fixing screws of the liftgate upper interior trim panel assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Release the 16 retaining clips of the liftgate lower interior trim panel assembly, and remove the liftgate lower interior trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

7.11.4 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-AAC

A diagnostic scanner can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the AAC data list and reading the data list displayed on the diagnostic scanner, you can read switch and sensor values without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved

VISUAL INSPECTION-AAC

1. Confirm fault symptoms
   a. The most difficult situation in troubleshooting is when no symptoms appear. In this case, the fault described by the user must be thoroughly analyzed. Then, simulate the same or similar conditions and environment as when the fault occurred in the customer's vehicle. Regardless of how experienced or skilled the technician is, if troubleshooting is performed without confirming the fault symptoms, some important things will be overlooked during the repair, and incorrect guesses will be made in some places. This will lead to the inability to proceed with troubleshooting.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST-AAC

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B104216	Supply voltage below lower limit	Vehicle power supply voltage too low	Vehicle power supply voltage too low
B104317	Supply voltage exceeds upper limit	Vehicle power supply voltage too high	Vehicle power supply voltage too high
U007388	CAN Bus Off	CAN communication line abnormality (e.g., short circuit between CAN H and L)	Check the CAN communication line
B1E8049	Ultrasonic detection system fault	Ultrasonic system self-test fault	Ultrasonic system self-test fault
B1E8149	Tilt detection system fault	Tilt detection self-test fault	Tilt detection self-test fault
B1E8249	EAH alarm system fault	Anti-theft alarm system self-check fault	Anti-theft alarm system self-check fault
B1E8A87	EAH disconnection fault	Anti-theft alarm system communication failure	Anti-theft alarm system communication failure
B1E9355	Configuration parameters not written	End-of-line configuration parameter writing not performed	Execute configuration parameter writing

© 2026, All rights reserved

DTC: B1E9355-AAC

Fault code	Description
B1E9355	Configuration parameters not written

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Rewrite configuration information.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and rewrite the configuration inform ation as prompted by the diagnostic tool. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》 》 》 System normal.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the power supply and ground of the anti-theft alarm controller.	
	A Check whether the power supply and ground of the anti-theft alarm controller are normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replace the anti-theft alarm controller.	
	A Replace the anti-theft alarm controller. B After replacing the anti-theft alarm controller, is the fault resolved?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: U007388-AAC

Fault code	Description
U007388	CAN Bus Off

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the battery voltage.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal.
Standard voltage: 11~14V
C Confirm whether the voltage value meets the standard value.

No》》》 Replace the battery, check the charging system;
Measure the sleep current to check whether the vehicle body leaks electricity.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness of the anti-theft alarm controller is normal.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL292 of the anti-theft alarm controller.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 7 and body ground, and between terminal 8 and body ground, respectively, at harness connector EL292 of the anti-theft alarm controller.
Voltage standard value: approximately 5V in total.
E Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power supply and ground of the anti-theft alarm controller.

A Check whether the power supply and ground of the anti-theft alarm controller are normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the anti-theft alarm controller.	
	A Replace the anti-theft alarm controller. B After replacing the anti-theft alarm controller, is the fault resolved?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B104317-AAC

Fault code	Description
B104317	Supply voltage exceeds upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No 》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》》》 Go to step 3.
Step 3 Check the power supply fuse of the anti-theft alarm controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the anti-theft alarm controller fuse RF13. Fuse specification: RF13 5A C. Confirm whether the fuse is blown.
	Yes 》》》 Replace the fuse with one of the same rating.
	No 》》》 Go to step 4.
Step 4 Check the power supply harness of the anti-theft alarm controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL292 of the anti-theft alarm controller. C Connect the negative terminal of the battery, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 4 of harness connector EL292 of the anti-theft alarm controller and the body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

DTC: B1E8149-AAC

Fault code	Description
B1E8149	Tilt detection system fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the anti-theft alarm controller.	
	A Check whether the power supply and ground of the anti-theft alarm controller are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the anti-theft alarm controller.	
	A Replace the anti-theft alarm controller. B After replacing the anti-theft alarm controller, is the fault resolved?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B104317-AAC

Fault code	Description
B104317	Supply voltage exceeds upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the anti-theft alarm controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the anti-theft alarm controller fuse RF13. Fuse specification: RF13 5A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the power supply harness of the anti-theft alarm controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL292-1 of the anti-theft alarm controller. C Connect the negative terminal of the battery, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 4 of harness connector EL292-1 of the anti-theft alarm controller and the body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the anti-theft alarm controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL292-1 of the anti-theft alarm controller. C. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of harness connector EL292-1 of the anti-theft alarm controller and the body gro und to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replace the anti-theft alarm controller.	
	A Replace the anti-theft alarm controller. B After replacing the anti-theft alarm controller, is the fault resolved?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U007388-AAC

Fault code	Description
U007388	CAN Bus Off

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the battery voltage.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal.
Standard voltage: 11~14V
C Confirm whether the voltage value meets the standard value.

No》》》 Replace the battery, check the charging system;
Measure the sleep current to check whether the vehicle body leaks electricity.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness of the anti-theft alarm controller is normal.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL292-1 of the anti-theft alarm controller.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 7 and vehicle body ground, and between terminal 8 and vehicle body ground, of harness connector EL292-1 for the anti-theft alarm controller.
Voltage standard value: approximately 5V in total.
E Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power supply and ground of the anti-theft alarm controller.

A Check whether the power supply and ground of the anti-theft alarm controller are normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the anti-theft alarm controller.	
	A Replace the anti-theft alarm controller. B After replacing the anti-theft alarm controller, is the fault resolved?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

7.11.6 MAINTENANCE TOOLS

GENERAL TOOLS

Serial No.	Tool name	Tool Outline Drawing	Description
1	Socket wrench		Removal and installation of fi xing bolts/nuts
2	Interior trim removal tools		Remove interior trim clips
3	Screwdriver		Removal and installation of t he fixing screw

© 2026, All rights reserved

7.11.7 SERVICE AND REPAIR GUIDANCE

MONOCULAR LOWER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Remove the blind cover.
   See:Plug cover (page 5622)
2. Remove the monocular lower cover assembly.

a. Release the 4 retaining clips of the monocular lower cover assembly, and remove the monocular lower cover assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

MONOCULAR UPPER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5616)
4. Remove the interior rearview mirror assembly.
   See:Interior rearview mirror assembly (page 5474)
5. Remove the blind cover.
   See:Plug cover (page 5622)
6. Remove the monocular upper cover assembly.

a. Release the 12 retaining clips of the mono upper cover assembly, and remove the mono upper cover assembly with accessory ①.
   Recommended tool: Interior trim removal tool

b. Disconnect 1 connector of the front left dome lamp - arrow A -, and disconnect 1 connector of the front right dome lamp - arrow B -.
c. Disconnect 1 connector -Arrow C- from the overhead switch assembly, and disconnect 1 connector -Arrow D- from the single microphone assembly.

d. Unscrew the 2 fixing screws of the anti-theft alarm control unit -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.2±0.2N m
e. Release the 16 retaining clips for the front left dome lamp ①, front right dome lamp ②, overhead switch assembly ③, single microphone assembly ④, and anti-theft alarm controller ⑤ - Arrow B.
   Recommended tool: Interior trim removal tool
f. Remove the monocular upper cover assembly ⑥.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

LEFT C-PILLAR CENTER BRACKET

NOTE

This section describes the removal and installation of the left C-pillar center bracket, and the removal and installation of the right C-pillar center bracket can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
2. Remove the left C-pillar middle bracket.

a. Unscrew the 2 fixing screws -arrow- of the left C-pillar middle bracket, and remove the left C-pillar middle bracket ①.
   Recommended tool: T25 Torx wrench
   Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT ROOF BRACKET

NOTE

This section describes the removal and installation of the left roof bracket, and the removal and installation of the right roof bracket can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
4. Remove the midrange speaker assembly (D-pillar).
   See:Midrange speaker assembly (D-pillar) (page 9929)
5. Remove the left roof bracket.

a. Unclip 1 retaining clip of the floor wiring harness - arrow A -, and unscrew the 4 fixing screws of the left roof bracket - arrow B -.
   Recommended tools: T25 Torx wrench, trim clip remover
   Torque: 2±0.2N m
b. Remove the left roof bracket ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT B-PILLAR LOWER INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left lower B-pillar interior trim panel assembly, and the removal and installation of the right lower B-pillar interior trim panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the lower left A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
4. Remove the left B-pillar lower interior trim panel assembly.

a. Disengage the 3 retaining clips of the left rear door sill trim, and lift up the left rear door sill trim in the direction of the -arrow-.
   Recommended tool: Interior trim removal tool

b. Adjust the front driver's seat to the foremost position.
c. Press the release buckle -arrow A- of the front left seat belt assembly to disconnect 1 fixing buckle -arrow B- of the front left seat belt assembly.
d. Unscrew the 2 retaining screws -arrow C- of the lower left B-pillar interior trim panel assembly.
   Recommended tool: T25 Torx wrench
   Torque: 2±0.2N m
e. Release the 6 retaining clips of the left lower B-pillar interior trim panel assembly, and remove the left lower B-pillar interior trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

PLUG COVER

REMOVAL PROCEDURE

1. Remove the blind cover.

a. Release the 2 retaining clips of the cover -arrow-, and remove the cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

RIGHT LOWER A-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right A-pillar lower trim panel assembly, and the removal and installation of the left A-pillar lower trim panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the right lower A-pillar interior trim panel assembly.

a. Unscrew the 1 retaining screw -arrow- of the lower right A-pillar trim panel assembly, and disengage the 6 retaining clips of the lower right A-pillar trim panel assembly.
   Recommended tools: T25 Torx wrench, interior trim removal tools
   Torque: 2±0.2N m
b. Remove the right A-pillar lower interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

LEFT UPPER C-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left upper C-pillar interior trim panel assembly, and the removal and installation of the right upper C-pillar interior trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
4. Remove the left C-pillar upper interior trim panel assembly.

a. Unscrew the 4 fixing screws -arrow- of the left C-pillar upper interior trim panel assembly, and disengage the 4 fixing clips of the left C-pillar upper interior trim panel assembly.
   Recommended tools: T25 Torx wrench, interior trim removal tools
   Torque: 2±0.2N m
b. Remove the left C-pillar upper interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

LEFT LOWER C-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left C-pillar lower trim panel assembly, and the removal and installation of the right C-pillar lower trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:
3. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6594)
4. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
5. Remove the luggage compartment partition assembly.
   See:Trunk partition assembly (page 5628)
6. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5636)
7. Remove the left C-pillar lower interior trim panel assembly.

a. Unscrew the 3 fixing screws of the left C-pillar lower interior trim panel assembly -arrow A-.
   Recommended tool: T25 Torx wrench
   Torque: 2±0.2N m
b. Unscrew the 3 fixing bolts -arrow B- of the lower left C-pillar interior trim panel assembly.
   Recommended tool: 10mm socket
   Torque: 5±1N m

c. Release the 4 retaining clips on the lower left C-pillar interior trim panel assembly, and release the 8 double-sided clips on the lower left C-pillar interior trim panel assembly.
   Recommended tool: Interior trim removal tool
d. Remove the lower left C-pillar interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

RIGHT UPPER A-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right A-pillar upper interior trim panel assembly, and the removal and installation of the left A-pillar upper interior trim panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the right A-pillar upper interior trim panel assembly.

a. Release the 2 retaining clips -Arrow A- of the right A-pillar upper trim panel assembly.
Recommended tool: Interior trim removal tool

b. Disconnect the 1 connector of the DMS camera assembly -arrow B-, and unscrew the 2 fixing screws of the DMS camera assembly -arrow C-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

c. Remove the right A-pillar upper interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT B-PILLAR UPPER INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left B-pillar upper interior trim panel assembly, and the removal and installation of the right B-pillar upper interior trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
4. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
5. Remove the left B-pillar upper interior trim panel assembly.

a. Adjust the front driver's seat to the foremost position.
b. Press the release buckle -arrow A- of the front left seat belt assembly to disconnect 1 fixing buckle -arrow B- of the front left seat belt assembly.

c. Disengage the 2 retaining clips -arrow A- of the left B-pillar upper interior trim panel assembly, and remove the left B-pillar upper interior trim panel assembly ① in the direction of -arrow B-.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

TRUNK PARTITION ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left seat back lock assembly (page 6603)
2. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6594)
3. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
4. Remove the luggage compartment partition assembly.

a. Unscrew the 4 fixing screws of the luggage compartment cover assembly -arrow-.
   Recommended tool: T25 Torx wrench
   Torque: 1.5±0.2N m

b. Unscrew the 4 fixing bolts -arrow- of the luggage compartment cover assembly, and remove the luggage compartment cover assembly ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

7.12 DOOR SILL INTERIOR TRIM SYSTEM

7.12.1 PRECAUTIONS

PRECAUTIONS

1. When removing the interior trim panel, a specialized removal wedge must be used to avoid damaging the trim surface with other tools.
2. After removing the interior trim panel, check whether the retaining clips on the inner trim panel are damaged, and replace them if necessary.

7.12.6 SERVICE AND REPAIR GUIDANCE

REAR LEFT SILL TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the rear left door sill trim panel assembly, and the removal and installation of the rear right door sill trim panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
2. Remove the rear left sill interior trim panel assembly.

a. Disengage the 2 retaining clips of the lower left C-pillar trim panel assembly -Arrow A-, and pull off the lower left C-pillar trim panel assembly in the direction of -Arrow B-.
Recommended tool: Interior trim removal tool

b. Unscrew 1 retaining screw -arrow- of the left rear door sill trim panel assembly.
Recommended tool: T25 Torx wrench
Torque: 2±0.2N m
c. Disengage the 3 retaining clips of the left rear door sill trim panel assembly, and remove the left rear door sill trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

REAR LEFT SILL BRACKET

NOTE

This section describes the removal and installation of the rear left door sill bracket, and the removal and installation of the rear right door sill bracket can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
4. Remove the rear seat cushion EPP assembly.
   See:Rear seat cushion EPP assembly (page 5779)
5. Remove the rear left sill interior trim panel assembly.
   See:Rear left sill trim panel assembly (page 5634)
6. Remove the rear left sill bracket.

a. Unclip the 3 retaining clips of the floor wiring harness -arrow A-, and unscrew the 1 plastic nut of the left rear sill bracket -arrow B-.
b. Unscrew the 2 mounting screws -arrow C- of the left rear rocker panel bracket, and remove the left rear rocker panel bracket ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

LIFTGATE SILL INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
2. Remove the liftgate sill trim panel assembly.

a. Unscrew the 3 fixing bolts of the liftgate sill interior trim panel assembly - arrow -.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Release the 6 retaining clips of the liftgate sill trim assembly, and remove the liftgate sill trim assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

7.13 INSTRUMENT PANEL AND ACCESSORIES SYSTEM

7.13.1 PRECAUTIONS

PRECAUTIONS

1. When repairing the instrument panel, whether on the vehicle or on a workbench, a ground wire connected to the vehicle body should be attached to discharge static charges into the ground.
2. Storage of components: Spare components for the instrument panel are stored in nickel-plated packaging bags, and should be removed during installation, not in advance. When removing them, do not touch the conductive contacts.
3. After removing the instrument panel, cover it with a protective cover to prevent it from being scratched.
4. When repairing or removing the airbag, the airbag must always be placed facing upwards.
5. When replacing any airbag component, perform a self-diagnostic operation to thoroughly check whether the airbag system is functioning properly.
6. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

7.13.6 SERVICE AND REPAIR GUIDANCE

AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel body and accessories assembly (page 5667)
7. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5662)
8. Remove the air vent panel.

a. Unscrew the 6 fixing screws -arrow- of the air outlet panel, and disengage the 16 double-sided clips of the air outlet panel.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the air outlet panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

© 2026, All rights reserved

LEFT AIR OUTLET MOTOR

NOTE

This section describes the removal and installation of the left air outlet motor; the removal and installation of the right air outlet motor can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5681)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5654)
9. Remove the left air outlet motor.

a. Disconnect the 1 connector of the left air outlet motor -arrow A-, and unscrew the 2 fixing screws of the left air outlet motor -arrow B-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m
b. Remove the left air outlet motor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET MOTOR

NOTE

This section describes the removal and installation of the center air outlet motors for certain parts. The removal and installation of the center air outlet motors for other parts can generally be performed with reference to this document.

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
2. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
5. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
6. Remove the center display screen.
   See:Central control display (page 8837)
7. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
8. Remove the center air outlet motor.

a. Disconnect 1 connector of the center air outlet motor -arrow A-.
b. Unscrew the 2 fixing screws -arrow B- and remove the center air outlet motor ①.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

WINDSHIELD FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel and accessories assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the windshield sponge.

a. Remove the windshield foam ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT STORAGE BOX MAT

REMOVAL PROCEDURE

1. Remove the front storage box mat.

a. Remove the front storage box pad ①.

SETUP

1. The installation procedure is performed in reverse order.

LEFT AIR OUTLET PANEL

NOTE

This section describes the removal and installation of the left air outlet panel. The removal and installation of the right air outlet panel can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5681)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5654)
9. Remove the left air outlet panel.

a. Unscrew 1 retaining screw -arrow A- of the left air outlet panel, and disengage the 3 retaining clips -arrow B- of the left air outlet panel.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m

b. Release the 4 retaining clips -arrows- of the center A/C vent panel, and remove the left A/C vent panel ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
7. Remove the screen mounting bracket assembly.
   See:Screen mounting bracket assembly (page 5684)
8. Remove the trim panel assembly.

a. Unscrew the 4 fixing screws of the trim panel assembly -arrows-, and disengage the 16 double-sided clips of the trim panel assembly.
   Recommended tools: Phillips screwdriver, interior trim removal tool
   Torque: 1.5±0.4N m
b. Remove the trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

HOOD RELEASE HANDLE ASSEMBLY

REMOVAL PROCEDURE

1. Remove the center console right extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
2. Remove the right trim panel assembly of the center console.
   See:Center console right trim panel assembly (page 5718)
3. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
5. Remove the front hood release handle assembly.

a. Press 1 retaining clip -Arrow A- of the hood release handle assembly, and detach the hood release handle assembly in the direction of -Arrow B-.

b. Remove the front compartment cover handle assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the front hood release handle assembly to ensure it functions normally.

© 2026, All rights reserved

AIR DAMPING

REMOVAL PROCEDURE

1. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
2. Remove the air damper.

a. Unscrew the 2 fixing screws -arrow- of the air damper, and remove the air damper ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

LEFT AIR OUTLET ASSEMBLY

NOTE

This section describes the removal and installation of the left air outlet assembly, and the removal and installation of the right air outlet assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5681)
8. Remove the left air outlet assembly.

a. Disconnect the 1 fixing connector -arrow A- between the left air outlet assembly and the instrument wire harness assembly.
   Recommended tool: Interior trim removal tool
b. Unscrew the 4 retaining screws -arrow B- on the left air outlet panel, and remove the left air outlet assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

SPEAKER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
2. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Right Upper A-Pillar Interior Trim Panel Assembly (page 5626)
3. Remove the speaker cover assembly.

a. Release the 24 double-sided clips of the speaker cover assembly.
   Recommended tool: Interior trim removal tool
b. Disconnect the 3 fixing connectors -arrow- of the speaker cover assembly, and remove the speaker cover assembly with the speaker assembly ①.

c. Unscrew the 2 mounting screws connecting the speaker to the speaker cover assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Release the 6 clips -Arrow B- connecting the tweeter assembly to the speaker cover assembly.
   Recommended tool: Interior trim removal tool
e. Remove the speaker cover assembly ①, tweeter assembly ②, and speaker ③.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

CENTER AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5662)
10. Remove the center air outlet panel.

a. Unscrew the 2 fixing screws of the center air outlet panel -arrow-.
   Recommended tool: T25 Torx wrench
   Torque: 1.5±0.4N m

b. Unscrew the 3 retaining screws of the center air outlet panel -Arrow A-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m
c. Disengage the 8 retaining clips -Arrow B- of the center air outlet panel, and remove the center air outlet panel ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET HOUSING ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5662)
10. Remove the center air outlet wiring harness assembly.
    See:Center air outlet wiring harness assembly (page 5683)
11. Remove the center air outlet housing assembly.

a. Unscrew the 2 fixing screws of the center air outlet housing assembly -arrow-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m

b. Unscrew the 3 fixing screws of the center air outlet housing assembly -arrow A-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m
c. Release the 8 retaining clips -arrow B- of the center air outlet housing assembly, and remove the center air outlet housing assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

LEFT INSTRUMENT PANEL TRIM ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
2. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
5. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
6. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5670)
7. Remove the left instrument panel trim assembly.
   See:Left instrument panel trim assembly (page 5659)
8. Remove the outer cover of the glove box.
   See:Glove box outer cover (page 5673)
9. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5676)
10. Remove the left instrument panel trim assembly.

a. Unscrew the 3 fixing screws -arrow- of the left instrument panel trim assembly, and remove the left instrument panel trim assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

INSTRUMENT PANEL LOWER RIGHT TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
2. Remove the trunk lamp.
   See:Trunk light (page 9909)
3. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page)
4. Remove the center console right extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
5. Remove the right trim panel assembly of the center console.
   See:Center console right trim panel assembly (page 5718)
6. Remove the lower right trim panel assembly of the instrument panel.

a. Unscrew 1 fixing bolt from the lower right trim panel assembly of the instrument panel -arrow A-, and disconnect the front cover lock cable from the front cover handle assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Release the 2 retaining clips -arrow C- of the diagnostic tester connector, and pull the diagnostic tester connector away.

c. Unscrew the 5 mounting screws -arrow- of the instrument panel lower right trim panel assembly, and disengage the 7 retaining clips of the instrument panel lower right trim panel assembly.
   Recommended tools: Phillips screwdriver, interior trim removal tool
   Torque: 1.5±0.4N m
d. Remove the lower right instrument panel trim with the front hood release handle assembly ①.

e. Press 1 retaining clip -Arrow A- of the hood release handle assembly, and detach the hood release handle assembly in the direction of -Arrow B-.
f. Remove the lower right instrument panel trim assembly ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the center air outlet assembly.

a. Unscrew the 5 fixing screws -arrows- of the center air outlet assembly, and remove the center air outlet assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

SCREEN TRIM COVER ASSEMBLY

REMOVAL PROCEDURE

1. Remove the screen trim cover assembly.

a. Release the 3 double-sided clips of the screen trim cover assembly, and remove the screen trim cover assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

INSTRUMENT PANEL RIGHT END COVER ASSEMBLY

NOTE

This section describes the removal and installation of the instrument panel right end cover assembly. The removal and installation of the instrument panel left end cover assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the instrument panel right end cover assembly.

a. Release the 7 retaining clips of the instrument panel right end cover assembly, and remove the instrument panel right end cover assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

COMBINATION INSTRUMENT COVER

REMOVAL PROCEDURE

1. Remove the combination instrument cover.

a. Release the 3 double-sided clips on the combination instrument cover, and remove the combination instrument cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

RIGHT GLOVE BOX LOCK ROD SLEEVE

NOTE

This section describes the removal and installation of the right glove box lock rod sleeve, and the removal and installation of the left glove box lock rod sleeve can generally refer to the right side.

REMOVAL PROCEDURE

1. Open the glove box cover assembly.
2. Remove the right glove box lock rod sleeve.

a. Disengage the 3 retaining clips -arrow- of the right glove box lock rod cover, and remove the right glove box lock rod cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INSTRUMENT PANEL BODY AND ACCESSORIES ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the combination instrument cover.
   See:Combination instrument cover (page 5665)
5. Remove the lower steering column cover assembly.
   See:Steering Column Lower Cover Assembly (page 5689)
6. Remove the combination switch.
   See:Combination switch (page 9067)
7. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Right Upper A-Pillar Interior Trim Panel Assembly (page 5626)
8. Remove the speaker cover assembly.
   See:Speaker cover assembly (page 5655)
9. Remove the midrange speaker assembly.
   See:Midrange Speaker Assembly (Instrument Panel) (page 9928)
10. Remove the instrument panel left/right end cover assembly.
    See:Instrument Panel Right End Cover Assembly (page 5664)
11. Remove the glove box lower cover assembly.
    See:Glove box lower trim panel assembly (page 5670)
12. Remove the front hood release handle assembly.
    See:Hood release handle assembly (page 5652)
13. Remove the lower right trim panel assembly of the instrument panel.
    See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
14. Remove the screen trim cover assembly.
    See:Screen trim cover assembly (page 5663)
15. Remove the center display screen.
    See:Central control display (page 8837)
16. Remove the instrument panel center air outlet panel assembly.
    See:Instrument panel center air outlet panel assembly (page 5687)
17. Remove the outer cover of the glove box.
    See:Glove box outer cover (page 5673)
18. Remove the glove box bin assembly.
    See:Glove box bin assembly (page 5676)
19. Remove the screen mounting bracket assembly.
    See:Screen mounting bracket assembly (page 5684)
20. Remove the left instrument panel trim cover assembly.
    See:Left instrument panel trim cover assembly (page 5688)
21. Remove the air vent panel.
    See:Air outlet panel (page 5644)
22. Remove the left air duct temperature sensor.
    See:Duct Temperature Sensor (Right Footwell Air Duct) (page 5357)

© 2026, All rights reserved

23. Remove the right air duct temperature sensor.
    See:Air duct temperature sensor (right face-level air duct) (page 5356)
24. Remove the filter assembly.
    See:Filter Assembly (page 5690)
25. Remove the instrument panel body and accessory assembly.

a. Release the 9 retaining clips of the instrument panel wiring harness -arrow A-, -arrow B-, and move the instrument panel wiring harness away.
   Recommended tools: 10mm socket, clip remover
   Torque: 5±0.5N m

b. Unscrew the 3 mounting bolts on the left side of the instrument panel body and accessories assembly -Arrow A-, and unscrew the 1 mounting screw of the instrument panel body and accessories assembly -Arrow B-.
   Recommended tools: 10mm socket, Phillips screwdriver
   -Arrow A- Torque: 5±0.5N m
   -Arrow B-Torque: 1.5±0.4N m

c. Unscrew the 3 mounting bolts on the right side of the instrument panel body and accessories assembly -Arrow A-, and unscrew the 1 mounting screw of the instrument panel body and accessories assembly -Arrow B-.
   Recommended tools: 10mm socket, Phillips screwdriver
   -Arrow A- Torque: 5±0.5N m
   -Arrow B-Torque: 1.5±0.4N m

d. Disconnect the 1 connector -arrow A- between the instrument panel wiring harness and the front passenger airbag assembly.
   Recommended tool: Clip remover
e. Unscrew the 2 mounting screws -arrow B- and the bolt -arrow C- of the front passenger airbag assembly.
   Recommended tools: 13mm socket, Phillips screwdriver
   -Arrow B-Torque: 1.5±0.4N m
   - Arrow C - Torque: 23±2N m

© 2026, All rights reserved

f. Release the 5 retaining clips connecting the instrument panel wire harness to the instrument panel body and accessory assembly -Arrow A-, -Arrow B-, -Arrow C-.
Recommended tool: Clip remover
g. Unscrew the 10 mounting bolts of the instrument panel body and accessory assembly - Arrow D -.
Recommended tool: 10mm socket
Torque: 5±1N m
h. Remove the instrument panel body and accessory assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.
   d. After installation, test the relevant electrical components to ensure they function properly.

GLOVE BOX LOWER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the center console right extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
4. Remove the glove box lower cover assembly.

a. Release the 5 double-sided clips of the glove box lower trim panel assembly, and disconnect the 1 connector of the luggage compartment lamp -arrow-.
   Recommended tool: Interior trim removal tool
b. Remove the glove box lower cover assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET MECHANISM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5662)
10. Remove the center air outlet panel.
    See:Center air outlet panel (page 5656)
11. Remove the center air outlet wiring harness assembly.
    See:Center air outlet wiring harness assembly (page 5683)
12. Remove the center air outlet motor.
    See:Center air outlet motor (page 5646)
13. Remove the center air outlet mechanism assembly.

a. Remove the center air outlet mechanism assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT AIR OUTLET MECHANISM ASSEMBLY

NOTE

This section describes the removal and installation of the left air outlet mechanism assembly, and the removal and installation of the right air outlet mechanism assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page)
9. Remove the left air outlet wiring harness assembly.
   See:Left air outlet wiring harness assembly (page)
10. Remove the left air outlet motor.
    See:Left air outlet motor (page)
11. Remove the left air outlet panel.
    See:Left air outlet panel (page)
12. Remove the left air outlet mechanism assembly.

a. Remove the left air outlet mechanism assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

GLOVE BOX OUTER COVER

REMOVAL PROCEDURE

1. Remove the center console right extension panel assembly.
   See:Center console body and accessory assembly (page 5698)
2. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5670)
3. Remove the glove box cover assembly.

a. Detach the 2 retaining pins at the bottom of the glove box cover assembly -arrow-, and open the glove box cover assembly.

b. Disconnect the glove box cover assembly from the air damper cable -arrow-, and remove the glove box cover assembly ①.

> **ATTENTION**
>
> After disconnecting the air damper cable, a flathead screwdriver can be used to secure the cable for installation.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

STEERING COLUMN UPPER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the combination instrument cover.
   See:Combination instrument cover (page 5665)
4. Remove the steering column upper shroud assembly.

a. Release the 6 retaining clips - arrows - between the cargo cover and the upper steering column shroud assembly, and remove the cargo cover.
   Recommended tool: Interior trim removal tool

b. Unscrew the 2 fixing bolts of the instrument display -Arrow A-, disconnect the 2 connectors of the instrument display -Arrow B-, -Arrow C-.
   Recommended tool: 7mm socket
   Torque: 5±1N m

c. Release the 3 retaining clips on the left side of the steering column upper shroud assembly -arrow-.
   Recommended tool: Interior trim removal tool

c. Release the 3 retaining clips on the right side of the steering column upper cover assembly -Arrow B-, and remove the steering column upper cover with instrument display assembly ①.
   Recommended tool: Interior trim removal tool

© 2026, All rights reserved

c. Unscrew the 2 fixing screws -arrow- of the instrument display screen, and remove the instrument display screen ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
d. Remove the steering column upper cover assembly ②.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

GLOVE BOX BIN ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
7. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5670)
8. Remove the left instrument panel trim assembly.
   See:Left instrument panel trim assembly (page 5659)
9. Remove the outer cover of the glove box.
   See:Glove box outer cover (page 5673)
10. Remove the glove box bin assembly.

a. Unscrew the 3 fixing screws on the side of the glove box bin assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

c. Unscrew the 8 fixing screws - arrows - of the glove box bin assembly, and disengage the 4 retaining clips of the glove box bin assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Remove the glove box bin assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

FRONT DEFROSTER UPPER BODY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the windshield sponge.
   See:Windshield foam (page 5647)
6. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
7. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
8. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5681)
9. Remove the front defroster upper body assembly.

a. Unscrew the 9 mounting screws between the front defroster upper body assembly and the instrument panel main frame assembly - Arrow A -.
   Recommended tool: Phillips screwdriver
   -Arrow B-Torque: 1.5±0.4N m
b. Release the 4 retaining clips of the front defroster upper body assembly - Arrow B -.
   Recommended tool: Interior trim removal tool

c. Remove the front defroster upper body assembly ①

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT AIR OUTLET WIRING HARNESS ASSEMBLY

NOTE

This section describes the removal and installation of the left air outlet wiring harness assembly. The removal and installation of the right air outlet wiring harness assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5681)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5654)
9. Remove the left air outlet wiring harness assembly.

a. Disconnect the 2 connectors of the left air outlet wiring harness assembly -arrow-, and remove the left air outlet wiring harness assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

REAR LEFT FOOTWELL AIR DUCT

NOTE

This section describes the removal and installation of the left rear footwell air duct. The removal and installation of the right rear footwell air duct can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the right lower A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
5. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
6. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
7. Remove the rear left footwell air duct.

a. Lift up the front left part of the driver's carpet ①.

b. Unscrew the 2 fixing screws of the left rear footwell air duct -arrow A-, and disconnect the left rear footwell air duct from the evaporator assembly -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m
c. Remove the rear left footwell air duct ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

© 2026, All rights reserved

FACE AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel and accessories assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.

a. Unscrew the 9 mounting screws -arrow- of the face-level air duct assembly, and remove the face-level air duct assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

INSTRUMENT PANEL UPPER TRIM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5685)
7. Remove the instrument panel upper trim assembly.

a. Unscrew the 4 fixing screws - arrows - connecting the instrument panel upper trim assembly to the front defroster upper body assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Unscrew the 6 mounting screws - arrows - connecting the instrument panel upper trim assembly to the instrument panel main frame assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

c. Unscrew the 12 fixing screws -arrow A- connecting the instrument panel upper trim assembly to the instrument panel main frame assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Release the 7 clips of the instrument panel upper trim assembly -Arrow B-.
   Recommended tool: Interior trim removal tool

© 2026, All rights reserved

e. Remove the instrument panel upper trim assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the center air outlet wiring harness assembly.

a. Disconnect the 4 connectors of the air outlet motor -arrow A-.
b. Release the 8 retaining clips of the center air outlet wiring harness assembly -Arrow B-, and remove the center air outlet wiring harness assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

SCREEN MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
2. Remove the screen trim cover.
   See:Screen trim cover assembly (page 5663)
3. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
4. Remove the screen mounting bracket assembly.

a. Unscrew the 3 fixing screws of the display mounting bracket assembly - arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Unscrew the 2 fixing bolts -Arrow B- of the screen mounting bracket assembly, and remove the screen mounting bracket assembly ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

LEFT DEFROST DUCT

NOTE

This section describes the removal and installation of the left defroster duct, and the removal and installation of the right defroster duct can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel and accessories assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5680)
6. Remove the left defroster air duct.

a. Unscrew the 2 fixing screws of the left defroster duct -arrow-, and remove the left defroster duct ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

CENTRAL AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
9. Remove the front storage box mat.
   See:Front storage box mat (page 5648)
10. Remove the center air outlet panel.

a. Remove the center air outlet panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

INSTRUMENT PANEL CENTER AIR OUTLET PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5663)
7. Remove the center display screen.
   See:Central control display (page 8837)
8. Remove the front storage box mat.
   See:Front storage box mat (page 5648)
9. Remove the instrument panel center air outlet panel assembly.

a. Disconnect the 1 fixing connector -arrow A- of the instrument panel center air outlet panel assembly.
b. Unscrew the 8 fixing screws of the instrument panel center air outlet panel assembly -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Release the 14 double-sided clips of the instrument panel center air outlet panel assembly, and remove the instrument panel center air outlet panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

LEFT INSTRUMENT PANEL TRIM COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5687)
7. Remove the screen mounting bracket assembly.
   See:Screen mounting bracket assembly (page 5684)
8. Remove the instrument panel left trim cover assembly.

a. Unscrew the 3 fixing screws -arrow- of the left instrument panel trim cover assembly, and disengage the 12 double-sided clips of the left instrument panel trim cover assembly.
   Recommended tools: Phillips screwdriver, interior trim removal tool
   Torque: 1.5±0.4N m
b. Remove the instrument panel left trim cover assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

STEERING COLUMN LOWER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Center console body and accessory assembly (page 5698)
4. Remove the left trim panel assembly of the center console.
   See:Center console right trim panel assembly (page 5718)
5. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5674)
6. Remove the instrument panel lower left trim panel assembly.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
7. Remove the steering wheel assembly.
   See:Steering wheel assembly (page 6516)
8. Remove the lower steering column cover assembly.

a. Unscrew the 2 fixing screws -arrow A- of the steering column lower cover assembly and the combination switch.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Unscrew the 1 retaining bolt -arrow B- between the lower steering column cover assembly and the steering column, and remove the lower steering column cover assembly ①.
   Recommended tool: 10mm socket
   Torque: 3.5±0.5N m

SETUP

1. The installation procedure is performed in reverse order.

FILTER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the filter assembly.

a. Disconnect 1 connector of the filter assembly -arrow A-, unscrew 2 fixing screws of the filter assembly -arrow B-, and remove the filter assembly ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

7.14 CENTER CONSOLE AND ACCESSORY SYSTEM

7.14.1 PRECAUTIONS

PRECAUTIONS

1. When repairing the center console, whether on the vehicle or on the workbench, a grounding wire should be connected to the vehicle body to discharge static charges to the ground.
2. Storage of components: Spare components for the center console are stored in nickel-plated packaging bags, and should be removed during installation, not in advance, and do not touch the conductive contacts when removing them.
3. After removing the center console, cover it with a protective cover to prevent the instrument panel from being scratched.
4. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

9. Remove the sub-instrument panel body and accessory assembly.

B10SRMIE5015156

a. Unscrew 1 fixing screw on the right side of the center console body and accessory assembly - arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Unscrew the 2 fixing bolts on the right side of the center console body and accessory assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m

B10SRMIE5015157

c. Unscrew the 1 retaining screw on the left side of the center console body and accessory assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Unscrew the 2 mounting bolts on the left side of the center console body and accessory assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m

© 2026, All rights reserved

e. Disconnect 1 connector between the center console switch and the instrument panel harness - Arrow A -.
f. Disconnect 1 connector -arrow B- of the low-frequency antenna integrated in the vehicle interior for IMMO.
g. Disconnect the 1 clip - Arrow C - between the center console body and accessories assembly and the instrument panel wiring harness.
Recommended tool: Clip remover

g. Unscrew the 2 fixing screws -arrow- connecting the left side of the center console body and accessory assembly to the center console rear mounting bracket assembly.
Recommended tool: 10mm socket
Torque: 5±1N m

NOTE

When removing and installing the bolts on the left and right sides at the rear of the center console body and accessory assembly, adjust the driver and front passenger seats to the foremost position.

h. Unscrew the 2 fixing screws -arrow- on the right side of the center console body and accessories assembly that connect to the center console rear mounting bracket assembly.
Recommended tool: 10mm socket
Torque: 5±1N m

NOTE

When removing and installing the bolts on the left and right sides at the rear of the center console body and accessory assembly, adjust the driver and front passenger seats to the foremost position.

CENTER CONSOLE LOWER LEFT TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the lower left trim panel assembly of the center console, and the removal and installation of the lower right trim panel assembly of the center console can generally follow the left side procedure.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5729)
7. Remove the center console left center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5709)
8. Remove the lower left trim panel assembly of the center console.

a. Unscrew the 3 fixing bolts at the rear end of the center console lower left trim panel assembly -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Unscrew the 5 fixing screws -arrow- of the lower left trim panel assembly of the center console, and disengage the 21 double-sided clips of the lower left trim panel assembly of the center console.
   Recommended tools: Phillips screwdriver, interior trim removal tool
   Torque: 1.5±0.4N m
c. Remove the lower left trim panel assembly ① of the center console.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. After installation, check whether all retaining clips are properly installed.
b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE REAR PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5725)
4. Remove the rear panel assembly of the center console.
   a. Release the 8 double-sided clips of the center console rear panel assembly, and disconnect the 1 connector for the rear USB charging from the instrument wiring harness -arrow-.
   Recommended tool: Interior trim removal tool
   b. Remove the center console rear panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE FRAME ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5729)
7. Remove the left/right center console center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5709)
8. Remove the center console upper body assembly.
   See:Center Console Upper Body Assembly (page 5721)
9. Remove the left/right lower trim panel assembly of the center console.
   See:Center Console Lower Left Trim Panel Assembly (page 5701)
10. Remove the rear front face air duct assembly.
    See:Rear Front Face-Level Air Duct Assembly (page 5719)
11. Remove the rear face air duct assembly.
    See:Rear face-level air duct assembly (page 5710)
12. Remove the center console armrest assembly.
    See:Center console armrest assembly (page 5724)
13. Remove the front storage box mat on the center console.
    See:Center Console Front Storage Box Mat (page 5726)
14. Remove the center console armrest pad.
    See:Center console armrest pad (page 5708)
15. Remove the center console upper body assembly.

a. Remove the center console frame assembly ①

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE REAR MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the rear front face air duct assembly.
   See:Rear Front Face-Level Air Duct Assembly (page 5719)
5. After removing the center console, install the rear mounting bracket assembly.

a. Release the 3 retaining clips - Arrow A - connecting the instrument panel wiring harness to the rear mounting bracket assembly of the center console, and move the wiring harness aside.
   Recommended tool: Clip remover
b. Unscrew the 4 mounting bolts -Arrow B- of the center console rear mounting bracket assembly, and remove the center console rear mounting bracket assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

CENTER CONSOLE REAR STORAGE BOX ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear storage box assembly of the center console.
   a. Open the rear storage box assembly behind the center console.
   b. Detach the rear center console storage box assembly in the direction of the arrow, and remove the rear center console storage box assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

ARMREST FRAME

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5725)
3. Remove the armrest frame.

a. Open the center console armrest assembly.
b. Release the 14 double-sided clips on the armrest frame, and remove the armrest frame ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE LEFT CENTER TRIM ASSEMBLY

NOTE

This section describes the removal and installation of the left center trim panel assembly of the center console. The removal and installation of the right center trim panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5729)
7. Remove the left center trim panel assembly of the center console.

a. Unscrew the 7 mounting bolts of the left center trim panel assembly of the center console -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Release the 8 double-sided clips of the center console lower left trim panel assembly, and remove the center console left center trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

REAR FACE-LEVEL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5725)
4. Remove the rear panel assembly of the center console.
   See:Center console rear panel assembly (page 5703)
5. Remove the rear face air duct assembly.

a. Unscrew the 3 fixing screws -arrow- of the rear face-blowing rear air duct assembly, and remove the rear face-blowing rear air duct assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

WATERPROOF COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the left/right front seat assembly.
   See:Front right seat assembly (page 6549)
5. Remove the rear front face air duct assembly.
   See:Rear Front Face-Level Air Duct Assembly (page 5719)
6. Remove the waterproof cover.

a. Lift the front part of the carpet assembly ①.

b. Release the 2 retaining clips connecting the instrument panel wiring harness to the waterproof cover - arrow A -.
c. Unscrew the 3 fixing screws on the right side of the waterproof cover -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m

b. Unscrew the 3 fixing screws on the left side of the waterproof cover -arrow-, and remove the waterproof cover ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m

SETUP

1. The installation procedure is performed in reverse order.

LOCK MECHANISM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5729)
7. Remove the lock mechanism.

a. Unscrew the 4 fixing screws -arrow- connecting the lock mechanism to the upper body assembly on the center console.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the lock mechanism ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

USB MOUNTING PLATE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the USB mounting plate.

a. Release the 8 retaining clips of the USB mounting plate -arrow-, and remove the USB mounting plate and accessory assembly ①.
Recommended tool: Interior trim removal tool

b. Disconnect the 2 connectors of the front USB -arrow A-, -arrow B-, disconnect the 1 connector of the backup power supply -arrow C-, and remove the USB fixing plate and accessory assembly ①.

c. Press the 4 retaining clips of the front USB -arrow A-, and remove the front USB ①.
d. Release the 2 retaining clips of the backup power supply -Arrow B-, and remove the backup power supply ②.

e. Press the 2 retaining clips -arrow- of the auxiliary power supply bracket, and remove the auxiliary power supply bracket ①.
f. .Remove the USB retaining plate ②.

© 2026, All rights reserved

SETUP

1. After installation, check whether all retaining clips are properly installed.

BUTTON

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5729)
7. Remove the button.

a. Unscrew the 2 fixing screws of the button -arrow-, and remove the button ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

CUP HOLDER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the integrated IMMO low-frequency antenna inside the vehicle.
   See:In-vehicle integrated IMMO low-frequency antenna (page)
6. Remove the cup holder assembly.

a. Unscrew the 4 fixing screws -arrow- of the cup holder assembly, and remove the cup holder assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

CENTER CONSOLE RIGHT TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the right trim panel assembly of the center console, and the removal and installation of the left trim panel assembly of the center console can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the center console right extension panel assembly.
   See:Right Extension Plate Assembly of the Auxiliary Instrument Panel (page 5728)
2. Remove the right trim panel assembly of the center console.

a. Unscrew the 2 fixing screws -arrow- of the right trim panel assembly of the center console.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Disengage the 12 double-sided clips of the center console right side trim panel assembly, and remove the center console right side trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

REAR FRONT FACE-LEVEL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the rear front face air duct assembly.

a. Unscrew the 4 fixing screws of the rear front face-level air duct assembly -Arrow A-, and disconnect the 1 connecting clip between the rear front face-level air duct assembly and the rear face-level rear air duct assembly -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the rear front face air duct assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

WIRELESS CHARGING PAD ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the wireless charging pad assembly.

a. Release the 5 retaining clips of the wireless charging pad assembly -Arrow A-, and remove the wireless charging pad assembly and accessory ① in the direction of -Arrow B-.
   Recommended tool: Interior trim removal tool

b. Disconnect the connector -arrow- of the wireless charging module assembly, and remove the wireless charging pad assembly and accessories ①.

c. Unscrew the 4 fixing screws -arrow- of the wireless charging module assembly, and separate the wireless charging pad assembly ① from the wireless charging module assembly ②.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Remove the wireless charging pad assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

CENTER CONSOLE UPPER BODY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5722)
5. Remove the armrest frame.
   See:Armrest frame (page 5707)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center console rear panel assembly (page 5703)
7. Remove the left/right center console center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5709)
8. Remove the lock mechanism.
   See:Lock mechanism (page 5713)
9. Remove the center console upper body assembly.

a. Unscrew the 5 fixing bolts of the upper body assembly on the center console -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Remove the upper body assembly ① on the center console.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

PASSENGER INSTRUMENT PANEL FRONT UPPER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right trim panel assembly of the center console.
   See:Center console right trim panel assembly (page 5718)
4. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5720)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
6. Remove the center console front upper trim panel assembly.

a. Unscrew the 2 fixing screws on the left side of the front upper trim panel assembly of the center console -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Unscrew the 2 fixing screws -arrow- on the right side of the center console front upper trim panel assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

c. Unscrew the 2 fixing screws -arrow- of the center console front upper trim panel assembly, and disengage the 14 double-sided clips of the center console front upper trim panel assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Remove the front upper trim panel assembly ① of the center console.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE ARMREST ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5725)
4. Remove the rear panel assembly of the center console.
   See:Center console rear panel assembly (page 5703)
5. Remove the rear face air duct assembly.
   See:Rear face-level air duct assembly (page 5710)
6. Remove the center console armrest assembly.

a. Unscrew the 7 fixing screws -arrow- connecting the center console armrest assembly to the center console frame assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

c. Press the arrow button to open the center console armrest assembly ①.
d. Remove the center console armrest assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

PASSENGER INSTRUMENT PANEL AIR OUTLET ASSEMBLY

REMOVAL PROCEDURE

1. Remove the passenger side air outlet assembly.

a. Release the 5 retaining clips of the center console air outlet assembly, and remove the center console air outlet assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

RIGHT EXTENSION PLATE ASSEMBLY OF THE AUXILIARY INSTRUMENT PANEL

NOTE

This section describes the removal and installation of the center console right extension panel assembly. The removal and installation of the center console left extension panel assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
2. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
3. Remove the center console right extension panel assembly.

a. Release the 3 double-sided clips of the center console right extension panel assembly -Arrow A-, and remove the center console right extension panel assembly ① in the direction of -Arrow B-.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

CENTER CONSOLE REAR UPPER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right trim panel assembly of the center console.
   See:Center console right trim panel assembly (page 5718)
4. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5720)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
6. Remove the armrest frame.
   See:Armrest frame (page 5707)
7. Remove the rear upper trim panel assembly of the center console.

a. Unscrew the 10 mounting screws -arrow- of the center console rear upper trim panel assembly, and disengage the 2 double-sided clips of the center console rear upper trim panel assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the center console rear upper trim panel assembly and accessories ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

INSTRUMENT TRIM COVER

NOTE

This section describes the removal and installation of the left instrument panel trim cover, and the removal and installation of the right instrument panel trim cover can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the instrument panel trim cover.

a. Release the 6 clips -arrow- of the instrument panel trim cover, and remove the instrument panel trim cover ①.

SETUP

1. The installation procedure is performed in reverse order.

7.15 INSTRUMENT PANEL CROSSBEAM SYSTEM

7.15.1 PRECAUTIONS

PRECAUTIONS

1. When repairing the instrument panel, whether on the vehicle or on a workbench, a ground wire connected to the vehicle body should be attached to discharge static charges into the ground.
2. Storage of components: Spare components for the instrument panel are stored in nickel-plated packaging bags, and should be removed during installation, not in advance. When removing them, do not touch the conductive contacts.
3. After removing the instrument panel, cover it with a protective cover to prevent it from being scratched.
4. When repairing or removing the airbag, the airbag must always be placed facing upwards.
5. When replacing any airbag component, perform a self-diagnostic operation to thoroughly check whether the airbag system is functioning properly.
6. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

INSTRUMENT PANEL CROSSBEAM LOWER RIGHT BRACKET

NOTE

This section describes the removal and installation of the lower right bracket of the instrument panel crossmember, and the removal and installation of the lower left bracket of the instrument panel crossmember can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
5. Remove the right lower A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
6. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5627)
7. Remove the lower right bracket of the instrument panel cross beam.

a. Lift up the front left part of the carpet assembly ①.

b. Release the 1 retaining clip of the instrument wiring harness - arrow A -, and unscrew the 2 retaining bolts on the lower right bracket of the instrument panel crossmember - arrow B -.
   Recommended tools: 13mm socket, clip remover
   Torque: 23±2N m
c. Unscrew the 2 fixing nuts of the lower right bracket of the instrument panel crossmember - Arrow C -, and remove the lower right bracket of the instrument panel crossmember ①.

© 2026, All rights reserved

Recommended tool: 13mm socket
Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. Tighten the bolts/nuts to the specified torque.

INSTRUMENT PANEL CROSS CAR BEAM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the mechanical steering column with intermediate shaft assembly.
   See:Mechanical steering gear with tie rod assembly (page 3207)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
6. Remove the waterproof cover.
   See:Waterproof cover (page 5711)
7. Remove the 4G integrated antenna assembly.
   See:4G Integrated Antenna Assembly (page)
8. Remove the telematics control unit.
   See:Telematics Control Unit (page 8844)
9. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5492)
10. Remove the front wiper motor and linkage assembly.
    See:Front wiper motor and linkage assembly (page 9946)
11. Remove the left/right front seat assembly.
    See:Front right seat assembly (page 6549)
12. Remove the headliner assembly.
    See:Headliner assembly (full blackout headliner) (page 5755)
13. Remove the left/right lower bracket of the instrument panel crossmember.
    See:Instrument panel crossbeam lower right bracket (page 5736)
14. Remove the combination switch assembly.
    See:Combination switch (page 9067)
15. Remove the instrument panel crossbeam assembly.

a. Disconnect the 2 connectors - Arrow A - between the instrument panel wiring harness and the liftgate wiring harness, and release the connector retaining clips.
   Recommended tool: Clip remover
b. Disconnect the 1 connector between the instrument panel wiring harness and the left side curtain airbag -Arrow B-, and release the 13 retaining clips of the instrument panel wiring harness -Arrow C-.
   Recommended tool: Clip remover

© 2026, All rights reserved

c. Disconnect the 1 connector between the instrument wiring harness and the right side curtain airbag -Arrow A-, and release the 6 retaining clips between the instrument wiring harness and the vehicle body -Arrow B-, -Arrow C-.
Recommended tool: Clip remover

d. Unscrew the 2 fixing bolts of the ground wire for the instrument panel wiring harness -Arrow A-, and disconnect the 1 connector between the instrument panel wiring harness and the rain and light sensor -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

e. Disconnect the 1 connector -arrow C- between the instrument panel harness and the forward-facing monocular camera assembly, and release the 26 retaining clips -arrow D- of the instrument panel harness.
Recommended tool: Clip remover

f. Disconnect the 1 connector between the instrument wire harness and the engine compartment wire harness -Arrow A-, and release the 5 retaining clips of the instrument wire harness -Arrow B-, -Arrow C-, -Arrow D-.
Recommended tool: Clip remover

g. Disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow A-, and unscrew the 2 fixing bolts of the ground wire of the instrument wiring harness -Arrow B-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

h. Disconnect the 6 retaining clips of the instrument wiring harness - arrow C -.
Recommended tool: Clip remover

© 2026, All rights reserved

i. Disconnect the 9 connectors between the instrument panel wiring harness and the multi-domain fusion controller - Arrow A -, - Arrow B -.

j. Disconnect 1 connector between the instrument panel wire harness and the floor wire harness - arrow A -, and disconnect 1 connector between the instrument panel wire harness and the engine compartment wire harness - arrow B -.

k. Release the 14 retaining clips of the instrument panel wiring harness -Arrow C-, -Arrow D-.

Recommended tool: Clip remover

l. Unscrew the 1 fixing nut -arrow- connecting the engine compartment wiring harness to the instrument panel wiring harness fuse box, and move the engine compartment wiring harness aside.

Recommended tool: 10mm socket

Torque: 15±1.5N m

m. Disconnect the 1 connector between the instrument wiring harness and the 4G integrated antenna - Arrow A -, and release the connector retaining clip.

n. Disconnect the 4 connectors between the instrument wiring harness and the DAB head unit -arrow B-, -arrow C-, -arrow D-, -arrow E-, and detach the 3 retaining clips of the instrument wiring harness -arrow F-.

Recommended tool: Clip remover

© 2026, All rights reserved

B10SRMEL8071132

o. Unscrew the 1 fixing bolt for the ground wire of the instrument wiring harness -Arrow A-, and disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

p. Disconnect the 4 connection plugs between the instrument harness and the telematics host -arrow C-, -arrow D-, -arrow E-, -arrow F-, and unscrew the 1 fixing nut of the instrument harness fuse box -arrow G-.
Recommended tool: 10mm socket
Torque: 9±1N m

q. Unscrew the 1 mounting bolt of the instrument panel harness fuse box -Arrow H-, and release the 10 retaining clips of the instrument panel harness -Arrow I-, -Arrow J-.
Recommended tools: 10mm socket, clip remover
Torque: 9±1N m

B10SRMIE5016003

r. Unscrew the 1 fixing bolt -arrow- connecting the instrument panel cross car beam assembly to the dash panel assembly.
Recommended tool: 13mm socket
Torque: 23±2N m

B10SRMIE5016046

s. Unscrew the 4 mounting bolts -Arrow A- connecting the instrument panel crossmember assembly to the housing and evaporator assembly.
Recommended tools: 10mm socket, 8mm socket
—Arrow A-Torque: 6±1N m
—Arrow B-Torque: 6±1N m

t. Unscrew the 4 mounting bolts -Arrow B- connecting the instrument panel cross car beam assembly to the vehicle body, and remove the instrument panel cross car beam assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   c. After installation, check whether the relevant electrical components can function properly.

7.16.6 SERVICE AND REPAIR GUIDANCE

MOUNT B

NOTE

This section describes the removal and installation of the left fixed seat B. The removal and installation of the right fixed seat B can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove mounting bracket B.

a. Flip down the left sun visor, release 1 retaining clip -arrow- of the mounting bracket B screw cover, and open the mounting bracket B screw cover.

b. Unscrew the 1 fixing screw -arrow- of mounting bracket B, and remove mounting bracket B ①.
Recommended tool: Phillips screwdriver
Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR FOLDING ROOF LEFT HANDLE ASSEMBLY

NOTE

This section describes the removal and installation of the left handle assembly for the rear folding roof, and the removal and installation of the right handle assembly for the rear folding roof can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the left handle assembly of the rear folding roof.

a. Release the 2 retaining clips (- arrow -) of the bolt cover for the rear folding roof left handle assembly, and open the bolt cover.

b. Unscrew the 2 mounting bolts -arrow- of the rear folding roof left handle assembly, and remove the rear folding roof left handle assembly ①.
Recommended tool: T25 Torx wrench
Torque: 3±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

LEFT SUN VISOR ASSEMBLY

NOTE

This section describes the removal and installation of the left sun visor assembly; the removal and installation of the right sun visor assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the cover of mounting base A.
   See:Fixed seat A cover (page 5761)
4. Remove the left sun visor assembly.

a. Fold down the left sun visor and unscrew the 2 mounting screws of the left sun visor assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 5±1N m
b. Release the 1 retaining clip -arrow B- between the left sun visor assembly and retainer B, and remove the left sun visor assembly ①.
c. Disconnect 1 connector of the left sun visor assembly -arrow C-, and remove the left sun visor assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

FRONT PASSENGER FOLDING ROOF HANDLE ASSEMBLY

REMOVAL PROCEDURE

1. Remove the front passenger's folding roof handle assembly.

a. Release the 2 retaining clips - arrow - of the bolt cover for the front passenger folding roof handle assembly, and open the bolt cover.

b. Unscrew the 2 mounting bolts -arrow- of the front passenger folding roof grab handle assembly, and remove the front passenger folding roof grab handle assembly ①.
Recommended tool: T25 Torx wrench
Torque: 3±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

HEADLINER ASSEMBLY (FULL BLACKOUT HEADLINER)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Right Upper A-Pillar Interior Trim Panel Assembly (page 5626)
4. Remove the left/right upper B-pillar interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5627)
5. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
6. Remove the left/right mounting bracket B.
   See:Mount B (page 5751)
7. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5753)
8. Remove the rear roof left/right grab handle mounting bracket assembly.
   See:Rear roof left grab handle mounting bracket assembly (page 5760)
9. Remove the front passenger's folding roof handle assembly.
   See:Front passenger folding roof handle assembly (page 5754)
10. Remove the monocular upper cover.
    See:Monocular upper cover assembly (page 5617)
11. Remove the headliner assembly.

a. Unscrew the 2 mounting bolts of the headliner assembly -arrow A-, and disengage the 1 retaining clip of the headliner assembly -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 5±1N m

b. Release the 2 retaining clips of the headliner assembly, release the 2 hook-and-loop fasteners of the headliner assembly -arrow-, and remove the headliner assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

HEADLINER ASSEMBLY (PANORAMIC ROOF)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Right Upper A-Pillar Interior Trim Panel Assembly (page 5626)
4. Remove the left/right upper B-pillar interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5627)
5. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
6. Remove the left/right mounting bracket B.
   See:Mount B (page 5751)
7. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5753)
8. Remove the rear roof left/right grab handle mounting bracket assembly.
   See:Rear roof left grab handle mounting bracket assembly (page 5760)
9. Remove the front passenger's folding roof handle assembly.
   See:Front passenger folding roof handle assembly (page 5754)
10. Remove the monocular upper cover.
    See:Monocular upper cover assembly (page 5617)
11. Remove the headliner assembly.

a. Unscrew the 2 fixing screws -Arrow A- of the headliner assembly, and disengage the 1 retaining clip -Arrow B- of the headliner assembly.
   Recommended tool: Phillips screwdriver
   Torque: 5±1N m

b. Release the 2 retaining clips of the headliner assembly, release the 15 hook-and-loop fasteners -arrow- of the headliner assembly, and remove the headliner assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

FRONT PASSENGER HEADLINER GRAB HANDLE MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page 5755)
4. Remove the front passenger roof grab handle mounting bracket assembly.

a. Release the 2 retaining clips -arrow- of the instrument panel wiring harness, and move the instrument panel wiring harness aside.
   Recommended tool: Clip remover

b. Unscrew the 5 fixing bolts -arrow- of the front passenger roof grab handle mounting bracket assembly, and remove the front passenger roof grab handle mounting bracket assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolt to the specified torque.

REAR ROOF LEFT GRAB HANDLE MOUNTING BRACKET ASSEMBLY

NOTE

This section describes the removal and installation of the rear roof left grab handle mounting bracket assembly, and the removal and installation of the rear roof right grab handle mounting bracket assembly can generally follow the procedures for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page 5755)
4. Remove the rear roof left grab handle mounting bracket assembly.

a. Release the 2 retaining clips -arrow A- of the instrument panel wiring harness, and move the instrument panel wiring harness aside.
   Recommended tool: Clip remover
b. Unscrew the 5 fixing bolts -Arrow B- of the rear roof left handle mounting bracket assembly, and remove the rear roof left handle mounting bracket assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolt to the specified torque.

FIXED SEAT A COVER

NOTE

This section describes the removal and installation of the left fixed seat A cover, and the removal and installation of the right fixed seat A cover can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the cover of mounting base A.

a. Flip down the left sun visor, release the 4 retaining clips of the mounting bracket A cover -arrow-, and remove the mounting bracket A cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

DRIVER FLOOR CARPET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. Remove the left/right front seat assembly.
   See:Front right seat assembly (page 6549)
5. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
6. Remove the left/right lower B-pillar interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
7. Remove the left/right rear door sill trim panel assembly.
   See:Rear left sill trim panel assembly (page 5634)
8. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
9. Remove the driver's carpet assembly.

a. Remove the driver's carpet assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

LUGGAGE COMPARTMENT COVER ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the luggage compartment cover assembly.

a. Remove the luggage compartment cover assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

TOOL BOX

REMOVAL PROCEDURE

1. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
2. Remove the tool box.

a. Release the 1 retaining clip of the tool box - arrow -, and remove the tool box ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

REFLECTIVE VEST

REMOVAL PROCEDURE

1. Open the glove box cover assembly.
2. Remove the reflective vest.

a. Remove the reflective vest ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

EMERGENCY HAMMER

REMOVAL PROCEDURE

1. Remove the emergency hammer.

B10SRMIE5019043

a. Open the left front door assembly, and remove the emergency hammer ① under the left front seat.

B10SRMIE5019044

b. Release the retaining clip of the packaging box -arrow- and open the emergency hammer packaging box.

B10SRMIE5019045

b. Remove the emergency hammer ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

WARNING TRIANGLE

REMOVAL PROCEDURE

1. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
2. Remove the warning triangle.

a. Remove the warning triangle ①.

SETUP

1. The installation procedure is performed in reverse order.

CARGO COVER ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the cargo cover assembly.

a. Release the retaining clip of the cargo cover assembly -Arrow A-, and retract the cargo cover.
b. Detach both ends of the cargo cover assembly from the vehicle body in the direction of arrow B, and remove the cargo cover assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. Release the retaining clip of the cargo cover assembly -Arrow A-, and retract the cargo cover.
b. When installing the cargo cover, ensure it is securely installed to prevent injury to occupants in the event of an emergency.
c. The removed cargo cover must be stored properly to avoid injuring occupants in the event of an emergency.
d. Do not place any items on the cargo cover to avoid damaging it and injuring occupants in the event of an emergency.
e. When retracting the cargo cover fabric, ensure it is fully retracted. Insert the fixing slot of the cargo cover fabric - arrow A - into the fixing clip of the cargo cover - arrow B - to avoid damaging the cargo cover and causing abnormal noises while driving.

REAR SEAT CUSHION EPP ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
4. Remove the left/right rear door sill trim panel assembly.
   See:Rear left sill trim panel assembly (page 5634)
5. Remove the fixing clips at the front of the rear seat cushion.
   See:Rear seat cushion front fixing bracket (page 6599)
6. Remove the rear seat cushion EPP assembly.

a. Lift the rear part of the driver's floor carpet ①.

b. Unscrew 1 fixing nut of the DCDC positive wire harness assembly - Arrow A -, and move aside the DCDC wire harness assembly and the rear seat belt buckle.
   Recommended tool: 13mm socket
   Torque: 15±1N m
c. Unscrew the 4 fixing bolts -Arrow B- of the rear seat cushion EPP assembly, and remove the rear seat cushion EPP assembly ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, test the relevant electrical components to ensure they function properly.

7.19.5 SERVICE AND REPAIR GUIDANCE

REAR FLOOR OUTER SOUND INSULATION PAD

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear subframe assembly.
   See:Rear subframe assembly (page 3044)
4. Remove the outer sound insulation pad of the rear floor.

a. Disconnect 1 connector between the floor wiring harness and the battery pack -arrow A-, and unscrew 1 fixing bolt of the floor wiring harness ground wire harness -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Release 1 retaining clip of the floor wire harness -Arrow C-, and release 4 single-groove tube clamps of the right rear No. 2 brake hard pipe assembly -Arrow D-.
   Recommended tool: Clip remover
c. Unscrew the 13 plastic nuts of the outer rear floor sound insulation pad - Arrow E -, and remove the outer rear floor sound insulation pad ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

LEFT REAR INNER WHEELHOUSE SOUND INSULATION PAD

NOTE

This section describes the removal and installation of the rear left inner wheelhouse sound insulation pad, and the removal and installation of the rear right inner wheelhouse sound insulation pad can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
4. Remove the rear left sill bracket.
   See:Rear left sill bracket (page 5635)
5. Remove the left mounting bracket assembly of the rear seatback.
   See:Rear seat backrest left mounting bracket assembly (page 6604)
6. Remove the subwoofer assembly.
   See:Subwoofer Assembly (page 9934)
7. Remove the left rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5513)
8. Remove the rear left inner wheelhouse soundproofing pad.

a. Disconnect the 1 connector -arrow A- between the floor wiring harness assembly and the drive brake motor, and release the 2 retaining clips -arrow B- of the floor wiring harness assembly.
b. Disconnect the 1 connector between the floor wiring harness assembly and the rear left intelligent wheel speed sensor -arrow C-, and release the 3 retaining clips of the floor wiring harness assembly -arrow D-.
   Recommended tool: Clip remover

c. Unscrew the 1 mounting bolt of the floor wiring harness ground wire -Arrow A-, and release the 7 retaining clips of the floor wiring harness assembly -Arrow B-, -Arrow C-.
   Recommended tools: 8mm socket, clip remover
   Torque: 9±1N m
d. Disconnect 1 grommet of the floor wiring harness assembly -Arrow D-, and move the floor wiring harness assembly aside.

© 2026, All rights reserved

e. Unscrew the 3 plastic nuts of the left rear inner wheelhouse sound insulation pad -Arrow E-, and release the 2 retaining clips of the left rear inner wheelhouse sound insulation pad -Arrow F-.
Recommended tool: Clip remover
f. Remove the left rear inner wheelhouse sound insulator ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

INNER DASH PANEL SOUND INSULATION PAD

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. After removing the center console, install the rear mounting bracket assembly.
   See:Center console rear mounting bracket assembly (page 5705)
5. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
6. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5362)
7. Remove the thermal management controller.
   See:Thermal Management Controller (page 5344)
8. Remove the brake pedal assembly.
   See:Brake Pedal Assembly (page 3321)
9. Remove the electronic accelerator pedal assembly.
   See:Electronic Accelerator Pedal Assembly (page 3320)
10. Remove the left/right lower A-pillar interior trim panel assembly.
    See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
11. Remove the main zone controller.
    See:Master Zone Controller (page 6918)
12. Remove the multi-domain fusion controller.
    See:Multi-domain fusion controller (page 8839)
13. Remove the electric power steering column with intermediate shaft assembly.
    See:Electric Power Steering Column with Intermediate Shaft Assembly (page 3204)
14. Remove the inner dash panel sound insulation pad.

a. Disconnect the 4 connectors between the floor wiring harness and the front left door wiring harness -Arrow A-, and unscrew the 1 fixing bolt of the floor wiring harness ground wire -Arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the 1 connector between the floor wiring harness and the engine compartment wiring harness -arrow C-, and release the 3 retaining clips of the floor wiring harness -arrow D-.
   Recommended tool: Clip remover
c. Release the 2 retaining clips of the engine compartment wiring harness -arrow E-.
   Recommended tool: Clip remover

© 2026, All rights reserved

B10SRMIE5020036

d. Disconnect the 1 connector between the engine compartment wiring harness and the floor wiring harness -arrow A-, release the 2 retaining clips of the floor wiring harness -arrow B-, and release the connector retaining clip.
Recommended tool: Clip remover

e. Unscrew the 1 fixing bolt of the ground wire of the engine compartment wiring harness -Arrow C-, and unclip the 4 fixing clips of the engine compartment wiring harness -Arrow D-, -Arrow E-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

B10SRMIE5020010

f. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.

B10SRMIE5020074

g. Disconnect the 3 connectors between the floor wire harness and the right front door wire harness -arrow A-, and disconnect the 1 connector between the engine compartment wire harness and the floor wire harness -arrow B-.

h. Unscrew the 1 mounting bolt of the floor wire harness ground wire -Arrow C-, and release the 3 retaining clips of the floor wire harness -Arrow D-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

i. Unscrew the 1 fixing nut connecting the engine compartment wiring harness and the floor wiring harness - arrow E -, and disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness - arrow F -.
Recommended tool: 13mm socket
Torque: 15±1.5N m

j. Disconnect the 6 retaining clips of the engine compartment wiring harness - arrow G -.

© 2026, All rights reserved

Recommended tool: Clip remover

k. Unscrew the 15 plastic nuts -arrow- of the front dash inner sound insulation pad, and remove the front dash inner sound insulation pad ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

DASH PANEL OUTER HEAT SHIELD

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5698)
4. After removing the center console, install the rear mounting bracket assembly.
   See:Center console rear mounting bracket assembly (page 5705)
5. Remove the lower right trim panel assembly of the instrument panel.
   See:Instrument Panel Lower Right Trim Panel Assembly (page 5660)
6. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
7. Remove the right rear footwell air duct.
   See:Rear left footwell air duct (page 5679)
8. Remove the left/right front seat assembly.
   See:Front right seat assembly (page 6549)
9. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
10. Remove the front compartment storage box assembly.
    See:Front compartment storage box assembly (page 5495)
11. Remove the cowl panel grille assembly.
    See:Cowl Grille Assembly (page 5492)
12. Remove the battery assembly.
    See:Battery Assembly (page)
13. Remove the battery tray.
    See:Battery tray (page)
14. Remove the super integrated module.
    See:Super Integrated Module (page 5397)
15. Remove the interior condenser liquid outlet pipe.
    See:Interior condenser liquid outlet pipe (page 5337)
16. Remove the interior condenser inlet pipe.
    See:Interior condenser inlet pipe (page 5333)
17. Remove the front evaporator outlet pipe.
    See:Front evaporator outlet pipe (page 5325)
18. Remove the front evaporator liquid inlet pipe.
    See:Front evaporator liquid inlet pipe (page 5326)
19. Remove the dash panel outer insulator.

a. Unscrew the 1 fixing bolt for the ground wire of the engine compartment wiring harness -Arrow A-, and disconnect the 1 connector between the engine compartment wiring harness and the instrument panel wiring harness -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m
b. Disconnect 1 connector between the engine compartment harness and the HVAC harness - arrow C -, disconnect 1 connector between the engine compartment harness and the floor harness - arrow D -, and release the connector clip.
c. Release the 4 retaining clips of the engine compartment wiring harness -Arrow E-, -Arrow F-.
Recommended tool: Clip remover

d. Disconnect 1 connector between the engine compartment harness and the floor harness -arrow A-, disconnect 1 connector between the engine compartment harness and the instrument panel harness -arrow B-, and release the connector retaining clips.
e. Disconnect the 1 connector between the engine compartment harness and the thermal management controller -Arrow C-, and unclip the 5 retaining clips of the engine compartment harness -Arrow D-, -Arrow E-.
Recommended tool: Clip remover
f. Detach 1 grommet from the engine compartment wiring harness - Arrow F -, and feed out the left engine compartment wiring harness.

g. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.

© 2026, All rights reserved

h. Unscrew the 1 fixing nut connecting the engine compartment wiring harness to the floor wiring harness -arrow A-, and disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness -arrow B-.
Recommended tool: 13mm socket
Torque: 15±1.5N m

i. Unscrew 1 fixing nut of the fuse box for the engine compartment harness and instrument harness -Arrow C-, and disconnect the 2 connectors between the engine compartment harness and the integrated motor controller -Arrow D-, -Arrow E-.
Recommended tool: 13mm socket
Torque: 15±1.5N m

j. Disconnect the connector between the engine compartment wiring harness and the electronic accelerator pedal -Arrow F-, and disconnect the connector between the engine compartment wiring harness and the brake light switch -Arrow G-.

k. Unscrew the 1 fixing bolt of the engine compartment wiring harness ground wire -Arrow H-, and disconnect the 4 fixing clips of the engine compartment wiring harness -Arrow I-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

l. Detach 1 grommet - arrow J - from the engine compartment wiring harness, and feed out the right engine compartment wiring harness.

m. Release the 2 retaining clamps for the brake lines - arrow A -, and release the 4 retaining clips for the engine compartment wiring harness - arrow B -.
Recommended tool: Clip remover

© 2026, All rights reserved

n. Release the 6 retaining clips -arrow- of the outer dash panel heat insulator, and remove the outer dash panel heat insulator ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

TRUNK SOUND INSULATION PAD

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right lower C-pillar interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
4. Remove the luggage compartment partition assembly.
   See:Trunk partition assembly (page 5628)
5. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5773)
6. Remove the tool box.
   See:Tool box (page 5774)
7. Remove the power liftgate controller.
   See:Power Liftgate Controller (page 6816)
8. Remove the trunk sound insulation pad.

a. Remove the sound insulation pad ① in the luggage compartment.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT SOUND ABSORBER

NOTE

This section describes the removal and installation of the sound-absorbing cotton on the left side, and the removal and installation of the sound-absorbing cotton on the right side can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
4. Remove the subwoofer assembly.
   See:Subwoofer Assembly (page 9934)
5. Remove the left sound insulation cotton.

a. Remove the left sound absorber ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT HOOD INSULATION PAD

REMOVAL PROCEDURE

1. Open the hood.
2. Remove the front hood insulation pad.

a. Release the 14 retaining clips -arrow- of the front bonnet insulation pad, and remove the front bonnet insulation pad ①.

SETUP

1. The installation procedure is performed in reverse order.

7.20 STEERING WHEEL AND AIRBAG SYSTEM

7.20.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

WARNING

- During maintenance or replacement, improper or incorrect operations may cause unintended airbag deployment, resulting in personal injury or vehicle damage. Meanwhile, improper maintenance may also lead to airbag failure. Therefore, only professionally trained technicians are qualified to service and replace the airbag system.
- Except for the operations described in this manual, it is prohibited to use electrical equipment to operate any circuit of the airbag system. The airbag system circuits can be identified by the yellow wiring harness or connectors.

ATTENTION

- Faults in the airbag system are difficult to diagnose, and the diagnostic trouble codes stored in the memory by the self-diagnostic system are an important source of information for troubleshooting. Therefore, before inspecting and troubleshooting the airbag system, the diagnostic trouble codes must be read before disconnecting the negative battery cable.
- The inspection must be performed after the vehicle is powered off and the negative battery terminal has been disconnected for 90s or longer. Because the airbag control unit has a backup power supply, performing the inspection within 90s after disconnecting the battery terminal may cause the airbag to deploy accidentally.

NOTE

The backup power supply in the airbag control unit is provided to ensure the airbag system remains functional after the power output from the vehicle battery and alternator is cut off. It consists of a power control circuit and several capacitors.

1. Both the airbag and its connectors are equipped with a shorting bar (copper spring clip) mechanism to prevent inadvertent airbag deployment. Its function is to automatically short the two lead terminals of the plug or socket on the side adjacent to the airbag igniter when the connector is disconnected. This structure prevents the ignition circuit from being closed by static electricity or inadvertent energization, thereby avoiding accidental airbag deployment.
2. The airbag system has stringent requirements for its components, all of which are single-use components. Damaged airbag-related components must never be repaired and reused. Airbag-related components include the driver airbag assembly, front passenger airbag assembly, seat belt pretensioner, airbag control module assembly, etc.
3. After the vehicle is involved in a collision and the airbag has been deployed, the airbag assembly must be replaced immediately.
4. Unauthorized modification of the following equipment may affect the airbag system.

© 2026, All rights reserved

- Install devices such as mobile two-way radio communication devices, cassette tape players, or small record players;
- Modify the suspension system, modify the front-end structure;
- Install grille protection devices (push bars, kangaroo bars, etc.) or attach other equipment to the front end.

5. The airbag is a precision component. Therefore, when disconnecting or connecting the airbag connector, the airbag must be secured first; otherwise, the airbag function may fail.
6. Do not modify, disassemble, strike, or open any components during maintenance, such as the steering wheel, driver airbag cover, front passenger airbag, or airbag control module; otherwise, it will result in sudden airbag deployment or system failure.
7. When removing or handling the airbag assembly, the airbag trim cover side must face upward. Do not stack the airbag assemblies on top of each other to prevent accidental airbag deployment, which could cause serious accidents.

© 2026, All rights reserved

7.20.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Steering wheel operating instructions:

- The steering wheel heating switch is located on the operation page of the central display. By tapping the steering wheel heating switch on the operation interface, you can turn the steering wheel heating on or off.

Working principle of steering wheel heating:

- The steering wheel is heated by supplying power to the heating wires in the heating pad located between the leather cover and the foam. The heating pad is positioned at the steering wheel rim, allowing you to feel the heat in the grip area during heating.

Airbag System Overview

- The vehicle airbag system is an important supplemental protective system, in the event of a severe collision with an obstacle, the airbags will rapidly deploy to form a gas-filled cushion or activate the pretensioners to tighten the seat belts, so that when the occupants move due to inertia, it reduces the impact on them and absorbs collision energy, thereby mitigating the severity of injuries to the driver and passengers.
- If the severity of a collision is below the specified threshold, the airbag will not deploy.
- When a severe collision occurs and the impact severity exceeds the specified threshold, the airbag electronic control unit will quickly activate the ignition circuit of the corresponding airbag to ignite the inflator. The inflator generates a large amount of gas to rapidly inflate and expand the airbag.
- Upon impact, the airbag automatically deflates immediately, without obstructing the escape of vehicle occupants or affecting the visibility of others. A backup power supply is installed inside the airbag control unit to ensure that the propellant in the airbag can still be ignited at the moment of a collision even if the power supply is cut off. Additionally, the crash trigger device continuously and automatically monitors the system to ensure that the entire system is in a ready state at all times.

ATTENTION

- After the airbag is deployed, the inflator becomes hot. Please do not touch the inflator immediately.
- The inflated airbag will deflate quickly to avoid obstructing visibility.
- After the airbag is deployed, you may see a smoke-like substance, which is actually powder on the airbag surface and is harmless to the human body. However, if it gets into your eyes or onto your skin, wash it off immediately.
- Once an airbag has been deployed, it will not deploy again.
- After airbag deployment, the airbag control unit and related parts must be replaced promptly and cannot be reused.

Airbag system composition

1. Left and right impact sensors;
2. Airbag control unit;
3. Driver airbag assembly;
4. Front passenger airbag assembly;
5. Left and right side airbag assemblies;
6. Left and right side curtain airbag assembly;
7. Driver and front passenger weight sensors.

© 2026, All rights reserved

Working principle:

- The airbag control unit determines whether to deploy the airbags and cut off the high voltage of the power battery by receiving the crash acceleration detected by the crash sensors.
- In the event of a frontal collision, the crash sensors and airbag control unit will detect the collision signal and issue a command to deploy the frontal airbags and seat belts. Similarly, when the side of the vehicle is struck by another vehicle, the crash sensors and airbag control unit will detect the collision signal and then issue a command to deploy the side airbags and side curtain airbags.
- The airbags and seat belts will only be deployed when the impact speed of a frontal or side collision exceeds the specified speed.

7.20.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-SWB

By using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the SWB data list, the function of reading switch and sensor values can be performed without removing any parts by reading the data list displayed on the diagnostic tool. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved

VISUAL INSPECTION - SWB

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC: B228017-SWB

Fault code	Description
B228017	Overvoltage of power supply

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the battery voltage.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal.
Standard voltage: 11~14V
C Confirm whether the voltage value meets the standard va lue.

No》》》 Replace the battery, check the charging system;
Measure the sleep current to check whether the vehicle body leaks electricity.

Yes》》》
Go to step 3.

Step 3 Check the power supply voltage of the steering wheel button assembly.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the steering wheel switch assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 and terminal 4 of the co mbination switch (the combination switch mated with the st eering wheel button assembly) to check if the voltage is nor mal.
Standard voltage: approximately 12V
E Confirm whether the voltage value meets the standard val ue.

Yes》》》 Go to step 8.

No》》》
Go to step 4.

Step 4 Check the wiring harness between the combination switch and the main zone controller.

EL249-5 Main Zone Controller

B10DMSWB1211005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combination switch.
C Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector EL091-2 of the combination switch and terminal 14 of harness connector EL249-6 of the main zone controller to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 10 of harness connector EL091-2 of the combination switch and terminal 36 of harness connector EL249-5 of the main zone controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the wiring harness between the steering wheel button assembly and the combination switch.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combination switch.
C Disconnect the wiring harness connector of the steering wheel switch assembly.
D Use a multimeter, select the resistance range, and measure the resistance between the terminal of the combination switch EL091-2 (device side) and the terminal of the combination switch (where the combination switch connects to the steering wheel button assembly) to check if it is normal.

Step 2 Check the steering wheel buttons.	
	A Check the steering wheel buttons for any foreign objects causing jamming or damage.
Yes 》》》 Remove foreign objects or replace the steering wheel button assembly.	
No 》》》 Go to step 3.	
Step 3 Check the power and ground of the steering wheel button assembly.	
	A Check whether the power ground of the steering wheel b utton assembly is normal.
No 》》》 Go to Step 9.	
Yes 》》》 Go to step 4.	
Step 4 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: U008388-SWB

Fault code	Description
U008388	CAN Bus Off

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No 》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》》》 Go to step 3.
Step 3 Check whether the CAN harness of the steering wheel button assembly is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the steering wheel switch assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 2 and body ground, and be tween terminal 3 and body ground, respectively, at the com bination switch (the mating connector between the combin ation switch and the steering wheel button assembly). Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	Yes 》》》 Go to step 6.
	No 》》》 Go to step 4.
Step 4 Check whether the CAN harness of the combination switch is working properly.	

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL091-2 of the combin ation switch. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 8 and body ground, and be tween terminal 9 and body ground, at the harness connect or EL091-2 of the combination switch. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U122087-SWB

Fault code	Description
U122087	Loss of communication with HPC

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN harness between the combination switch and the multi-domain fusion controller.

EL091-2 Combination Switch

B10DMSWB1211010

EL215-4 Multi-Domain Fusion Controller

B10DMSWB1211011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combination switch.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of harness connector EL091-2 of the combination switch and terminal 4 of harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 9 of harness connector EL091-2 of the combination switch and terminal 3 of harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the CAN harness between the combination switch and the steering wheel button assembly.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combination switch.
C Disconnect the wiring harness connector of the steering wheel switch assembly.
D Use a multimeter, select the resistance range, and measure the resistance between the terminal of the combination switch EL091-2 (device side) and the terminal of the combination switch (where the combination switch connects to the steering wheel button assembly) to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Replace the combination switch.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the steering wheel buttons.	
	A Check the steering wheel buttons for any foreign objects causing jamming or damage.
Yes 》》》 Remove foreign objects or replace the steering wheel button assembly.	
No 》》》 Go to step 3.	
Step 3 Check the power and ground of the steering wheel button assembly.	
	A Check whether the power ground of the steering wheel b utton assembly is normal.
No 》》》 Go to Step 9.	
Yes 》》》 Go to step 4.	
Step 4 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: U122087-SWB

Fault code	Description
U122087	Loss of communication with HPC

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN harness between the combination switch and the multi-domain fusion controller.

EL091-2A Combination Switch

B10DMSWB1211018

EL215-4 Multi-Domain Fusion Controller

B10DMSWB1211019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch harness connector EL 091-2A.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 8 of harness connector EL091-2A for the combination switch and terminal 4 of har ness connector EL215-4 for the multi-domain fusion contro ller to check whether the resistance value is normal.
E. Use a multimeter set to the resistance range to check wh ether the resistance between terminal 9 of harness connect or EL091-2A of the combination switch and terminal 3 of h arness connector EL215-4 of the multi-domain fusion contr oller is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN harness between the combination switch and the steering wheel button assembly.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch harness connector EL 091-2A.
C Disconnect the wiring harness connector of the steering wheel switch assembly.
D. Use a multimeter, set it to the resistance range, and mea sure the resistance between the terminals of the combinati on switch EL091-2A (device side) and the terminals of the c ombination switch (the mating interface between the comb ination switch and the steering wheel button assembly) to c heck whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	No 》》》 Replace the combination switch.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the steering wheel button assembly is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the steering wheel switch assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 2 and body ground, and be tween terminal 3 and body ground, respectively, at the com bination switch (the mating connector between the combin ation switch and the steering wheel button assembly). Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	Yes》》》 Go to step 6.
	No》》》 Go to step 4.
Step 4 Check whether the CAN harness of the combination switch is working properly.

DIAGNOSTIC INSTRUCTIONS-ACU

Using a diagnostic tool, fault codes can be read via the vehicle's OBD diagnostic connector. By utilizing the ACU data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved

VISUAL INSPECTION-ACU

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B00761A	Third row left airbag resistance below lower limit	Low resistance value	Check the airbag
B00761B	Third row left airbag resistance above upper limit	High resistance value	Check the airbag
B007656	Third-Row Left Airbag Invalid Configuration	Actual vehicle ignition circuit does not match controller configuration.	Check the airbag
B007609	Third-row left airbag series connection fault with other circuits	Short circuit between wiring harnesses of different ignition circuits	Short circuit between wiring harnesses of different ignition circuits
B007811	Third row right airbag short to ground	System short-circuit current detected	Check the airbag
B007812	Third-row right airbag short to power	Wiring and Power Connection	Check the airbag
B00781A	Third row right airbag resistance below lower limit	Low resistance value	Check the airbag
B00781B	Third row right airbag resistance exceeds the upper limit.	High resistance value	Check the airbag
B007856	Third-row right airbag invalid configuration	Actual vehicle ignition circuit does not match controller configuration.	Check the airbag
B007809	Third-row right airbag series circuit fault with other circuits	Short circuit between wiring harnesses of different ignition circuits	Eliminate cross-connection of wiring harnesses for different ignition circuits
B002211	Left side curtain airbag second inflator circuit short to ground	System short-circuit current detected	Check the airbag
B002212	Left side curtain airbag second inflator short to power	Wiring and Power Connection	Check the airbag
B00221A	Left side curtain airbag second generator resistance below lower limit	Low resistance value	Check the airbag

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B00221B	The resistance of the second generator of the left side curtain airbag is above the upper limit	High resistance value	Check the airbag
B002256	Invalid configuration of the second inflator of the left side curtain airbag	Actual vehicle ignition circuit does not match controller configuration.	Check the airbag
B002209	Series fault of the second left side curtain airbag inflator with other circuits	Short circuit between wiring harnesses of different ignition circuits	Short circuit between wiring harnesses of different ignition circuits
B002A11	Right side curtain airbag second inflator short to ground	System short-circuit current detected	Check the airbag
B002A12	Right side curtain airbag second inflator short to power	Wiring and Power Connection	Check the airbag
B002A1A	Right side curtain airbag second squib resistance below lower limit	Low resistance value	Check the airbag
B002A1B	Right side curtain airbag second generator resistance above upper limit	High resistance value	Check the airbag
B002A56	Right side curtain airbag second inflator invalid configuration	Actual vehicle ignition circuit does not match controller configuration.	Check the airbag
B002A09	Right side curtain airbag second squib series fault with other circuits	Short circuit between wiring harnesses of different ignition circuits	Eliminate cross-connection of wiring harnesses for different ignition circuits
B005011	Driver seat belt buckle switch short circuit or short to ground	Seat belt buckle switch short circuit or short to ground	Ensure the seat belt buckle switch is properly connected.
B005012	Driver's seat belt buckle switch short to power	The seat belt buckle switch interface is shorted to power through a resistor	Remove the resistor shorted to power

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B005013	Driver seat belt buckle switch open circuit	Seat belt buckle switch open circuit	Ensure the seat belt buckle switch is properly connected.
B00501E	Invalid driver seat belt buckle switch signal range	The seat belt buckle switch current is at an invalid value.	Ensure the current of the seat belt buckle switch is within the valid range
B005009	Driver seat belt buckle switch in series	Seat belt buckle switch in series	Seat belt buckle switch has no series connection
B005056	Invalid Configuration of Front Left Seat Belt Buckle Switch	Incorrect assembly	Connected, but no switch is configured.
B005256	Front Right Seat Belt Buckle Switch Invalid Configuration	Incorrect assembly	Connected, but no switch is configured.
B005356	Second row left occupant seat belt buckle invalid configuration	Incorrect assembly	Connected, but no switch is configured.
B005556	Invalid configuration of the seat belt buckle for the right rear passenger	Incorrect assembly	Connected, but no switch is configured.
B005456	Invalid configuration of the second row center passenger seat belt buckle	Incorrect assembly	Connected, but no switch is configured.
B005656	Third-row left occupant seat belt buckle invalid configuration	This DTC is supported only when this switch is disabled	Connected, but no switch is configured.
B005856	Third-row right occupant seat belt buckle invalid configuration	This DTC is supported only when this switch is disabled	Connected, but no switch is configured.
B005756	Invalid seat belt buckle configuration for the third-row center passenger	This DTC is supported only when this switch is disabled	Connected, but no switch is configured.
B00DF11	Passenger airbag disable switch short circuit or short to ground	Switch short circuit or short to ground	The switch is properly connected

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B00DF12	Passenger airbag disable switch short to power	The switch interface is s horted to the power su pply via a resistor	Remove the resistor shorte d to power
B00DF13	Passenger airbag disable switch open circuit	Switch open circuit	The switch is properly con nected
B00DF1E	Passenger airbag disable switch signal range invalid	Switch current is at an invalid value	Switching current is within the valid range
B00DF09	Passenger airbag deactiva tion switch in series	Switches in Series	Switches not in series
B00DF55	Invalid passenger airbag d isable switch configuratio n	wrong assemly	Connected, but no switch i s configured.
B103955	Invalid Configuration of Fr ont Passenger Detection Switch	wrong assemly	Connected, but no switch i s configured.
B00E011	Driver seat position switc h 1 short circuit or short t o ground	Switch short circuit or s hort to ground	The switch is properly con nected
B00E012	Driver seat position switc h 1 short to power	The switch interface is s horted to the power su pply via a resistor	Remove the resistor shorte d to power
B00E013	Driver seat position switc h 1 open circuit	Switch open circuit	The switch is properly con nected
B00E01E	Invalid signal range of driv er seat position switch 1	Switch current is at an invalid value	Switching current is within the valid range
B00E009	Driver's seat position swit ch 1 in series	Switches in Series	Switches not in series
B00E056	Driver seat position switc h 1 invalid configuration	wrong assemly	Connected, but no switch i s configured.
B00E111	Driver seat position switc h 2 short circuit or short t o ground	Switch short circuit or s hort to ground	The switch is properly con nected
B00E112	Driver seat position switc h 2 short to power	The switch interface is s horted to the power su pply via a resistor	Remove the resistor shorte d to power

DTC: B002812-ACU

Fault code	Description
B002812	Front right airbag circuit short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR007 Front right airbag assembly

B10DMACU1219037

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right airbag assembly wire harness c onnector TR007.
C Connect the simulator to the front right airbag assembly wire harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219038

TR007 Front right airbag assembly

B10DMACU1219039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR007 of the front righ t airbag assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 45 of harness connector TR004-1 of the airbag control module assembly and termin al 1 of harness connector TR007 of the front right airbag as sembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 46 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 2 of the harness connector TR007 of the front right airbag assembly to check whether the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front right airbag assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front right airbag assembly.	
	A Replace the front right airbag assembly. B After replacing the front right airbag assembly, is the faul t cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B007009-ACU

Fault code	Description
B007009	Driver Seat Belt Pretensioner in Series with Other Circuits Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219015

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the driver seat belt pretensioner circuit for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front right seat belt assembly.	
	A Replace the front right seat belt assembly. B After replacing the front right seat belt assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B000156-ACU

Fault code	Description
B000156	Driver front airbag stage 1 invalid configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

EL091-1 Combination Switch

B10DMACU1219006

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness connec tor EL091-1.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 5.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

B10DMACU1219007

EL091-1 Combination Switch

B10DMACU1219008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL091-1 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 24 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 2 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B005009-ACU

Fault code	Description
B005009	Driver seat belt buckle switch in series

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat connector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR035 Front right seat connector

B10DMACU1219049

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 from the right front seat connector.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 50 of the harness connector TR004-1 of the airbag control module assembly and terminal 24 of the harness connector TR035 of the right front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver-side seat belt buckle assembly (right front seat connector).

TR035 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 from the right front seat connector.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 25 of the right front seat harness connector TR035 and the body ground to check whether it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver's side seat belt buckle assembly and the right front sea t connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 from the right fr ont seat connector. C Disconnect the wiring harness connector of the driver's si de seat belt buckle assembly. D Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminal of the right front seat connector (component side) and the har ness connector terminal of the driver side seat belt buckle a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B005012-ACU

Fault code	Description
B005012	Driver's seat belt buckle switch short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat co nnector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR035 Front right seat connector

B10DMACU1219049

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 from the right fr ont seat connector.
D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 50 of the harness connector TR004-1 of the airbag control module as sembly and terminal 24 of the harness connector TR035 of t he right front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver-side seat belt buckle assembly (right front seat connect or).

TR035 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 from the right fr ont seat connector.
C Use a multimeter, select the resistance range, and measur e the resistance between terminal 25 of the right front seat harness connector TR035 and the body ground to check wh ether it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver's side seat belt buckle assembly and the right front sea t connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 from the right fr ont seat connector. C Disconnect the wiring harness connector of the driver's si de seat belt buckle assembly. D Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminal of the right front seat connector (component side) and the har ness connector terminal of the driver side seat belt buckle a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B001056-ACU

Fault code	Description
B001056	Front passenger's front airbag stage 1 invalid configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B002011-ACU

Fault code	Description
B002011	Front left airbag circuit short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR006 Front Left Airbag Assembly

B10DMACU1219034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector TR006 of the front left airbag assembly.
C Connect the simulator to the wiring harness connector of the front left airbag assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front left airbag a ssembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219035

TR006 Front Left Airbag Assembly

B10DMACU1219036

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR006 of the fro nt left airbag assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 41 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR006 of the front left airbag assem bly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 42 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR006 of the f ront left airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front left airbag assembly for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front left airbag assembly.	
	A Replace the front left airbag assembly. B After replacing the front left airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B00201B-ACU

Fault code	Description
B00201B	Front left airbag circuit resistance above upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR006 Front Left Airbag Assembly

B10DMACU1219034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector TR006 of the front left airbag assembly.
C Connect the simulator to the wiring harness connector of the front left airbag assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front left airbag a ssembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219035

TR006 Front Left Airbag Assembly

B10DMACU1219036

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR006 of the fro nt left airbag assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 41 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR006 of the front left airbag assem bly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 42 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR006 of the f ront left airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B002111-ACU

Fault code	Description
B002111	Front left side curtain airbag circuit short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR009 Left Side Curtain Airbag Assembly

B10DMACU1219041

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the left side curtain airbag assembly harness connector TR009.
C Connect the simulator to the left side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219042

TR009 Left Side Curtain Airbag Assembly

B10DMACU1219043

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR009 of the left side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 27 of the harness connector TR004-1 of the airbag control module assembly and terminal 1 of the harness connector TR009 of the left side curtain airbag assembly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 28 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR009 of the left side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B00291B-ACU

Fault code	Description
B00291B	Front right side curtain airbag circuit resistance above upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Test using the simulator.

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219044

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
C Connect the simulator to the right side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》》》 Go to step 4.

Yes 》》》
Go to step 3.

Step 3 Check the connecting harness between the airbag control module assembly and the right side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219045

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219046

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 48 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR008 of the right side curtain airbag assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance value between terminal 47 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR008 of the right side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

Step 2 Test using the simulator.

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219044

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
C Connect the simulator to the right side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.

Step 3 Check the connecting harness between the airbag control module assembly and the right side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219045

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219046

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 48 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR008 of the right side curtain airbag assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance value between terminal 47 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR008 of the right side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the right side curtain airbag assembly for potential short circuits, open circuits, and poor connections; replace the wire harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the right side curtain airbag assembly.	
	A Replace the right side curtain airbag assembly. B After replacing the right side curtain airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B005456-ACU

Fault code	Description
B005456	Invalid configuration of the second row center passenger seat belt bu ckle

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the rear dual latch ass embly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219062

TR050 Rear Dual Latch Assembly

B10DMACU1219063

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 49 of harness con nector TR004-1 for the airbag control module assembly and terminal 3 of harness connector TR050 for the rear dual buc kle assembly is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Inspect the circuit of the second row center seat belt buckle switch for possible short circuits, ope n circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear dual latch assembly.

TR050 Rear Dual Latch Assembly

B10DMACU1219064

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 4 of the wire harness co nnector TR050 of the rear dual latch assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear dual latch assembly.	
	A Replace the rear dual latch assembly. B After replacing the rear dual latch assembly, is the fault cl eared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B001012-ACU

Fault code	Description
B001012	Front Passenger Front Airbag Stage 1 Circuit Short to Power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the rear dual latch assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219059

TR050 Rear Dual Latch Assembly

B10DMACU1219060

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR050 of the rear dual latch assembly.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 31 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR050 of the rear dual buckle assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right second-row seat belt buckle switch for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear dual latch assembly.

TR050 Rear Dual Latch Assembly

B10DMACU1219061

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR050 of the rear dual latch assembly.
C Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the rear dual latch assembly harness connector TR050 and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat co nnector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR035 Front right seat connector

B10DMACU1219049

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 from the right fr ont seat connector.
D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 50 of the harness connector TR004-1 of the airbag control module as sembly and terminal 24 of the harness connector TR035 of t he right front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver-side seat belt buckle assembly (right front seat connect or).

TR035 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 from the right fr ont seat connector.
C Use a multimeter, select the resistance range, and measur e the resistance between terminal 25 of the right front seat harness connector TR035 and the body ground to check wh ether it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver's side seat belt buckle assembly and the right front sea t connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 from the right fr ont seat connector. C Disconnect the wiring harness connector of the driver's si de seat belt buckle assembly. D Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminal of the right front seat connector (component side) and the har ness connector terminal of the driver side seat belt buckle a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B007011-ACU

Fault code	Description
B007011	Driver seat belt pretensioner short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219015

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the driver seat belt pretensioner circuit for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front right seat belt assembly.	
	A Replace the front right seat belt assembly. B After replacing the front right seat belt assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B005011-ACU

Fault code	Description
B005011	Driver seat belt buckle switch short circuit or short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat connector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR035 Front right seat connector

B10DMACU1219049

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 from the right front seat connector.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 50 of the harness connector TR004-1 of the airbag control module assembly and terminal 24 of the harness connector TR035 of the right front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver-side seat belt buckle assembly (right front seat connector).

TR035 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 from the right front seat connector.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 25 of the right front seat harness connector TR035 and the body ground to check whether it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver's side seat belt buckle assembly and the right front sea t connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 from the right fr ont seat connector. C Disconnect the wiring harness connector of the driver's si de seat belt buckle assembly. D Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminal of the right front seat connector (component side) and the har ness connector terminal of the driver side seat belt buckle a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B001011-ACU

Fault code	Description
B001011	Front passenger front airbag stage 1 circuit short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B002809-ACU

Fault code	Description
B002809	Front right airbag circuit in series with other circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR007 Front right airbag assembly

B10DMACU1219037

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right airbag assembly wire harness c onnector TR007.
C Connect the simulator to the front right airbag assembly wire harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219038

TR007 Front right airbag assembly

B10DMACU1219039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR007 of the front righ t airbag assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 45 of harness connector TR004-1 of the airbag control module assembly and termin al 1 of harness connector TR007 of the front right airbag as sembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 46 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 2 of the harness connector TR007 of the front right airbag assembly to check whether the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B005056-ACU

Fault code	Description
B005056	Invalid Configuration of Front Left Seat Belt Buckle Switch

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the left front seat con nector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219052

TR036 Front left seat connector

B10DMACU1219053

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR036 of the left front seat connector.
D Use a multimeter, set it to the resistance range, and meas ure whether the resistance value between terminal 32 of th e harness connector TR004-1 for the airbag control module assembly and terminal 24 of the harness connector TR036 f or the left front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the ground wire harness of the front passenger side seat belt buckle assembly (left front seat connector).

TR036 Front left seat connector

B10DMACU1219054

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the left front seat harness connector TR036.
C Use a multimeter, select the resistance range, and check whether the resistance between terminal 25 of harness con nector TR036 of the left front seat connector and the vehicl e body ground is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Check the wiring harness between the front passenger side seat belt buckle assembly and the left front seat connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the left front seat harness connector TR036. C Disconnect the wiring harness connector of the front passenger side seat belt buckle assembly. D. Use a multimeter, set it to the resistance range, and measure the resistance between the harness connector terminal of the left front seat connector (component side) and the harness connector terminal of the passenger side seat belt buckle assembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the front passenger side seat belt buckle assembly.	
	A Replace the front passenger side seat belt buckle assembly. B After replacing the front passenger side seat belt buckle assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B005356-ACU

Fault code	Description
B005356	Second row left occupant seat belt buckle invalid configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the rear single latch a ssembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219056

TR024 Rear Single Latch Assembly

B10DMACU1219057

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR024 of the re ar single latch assembly.
D Use a multimeter, select the resistance setting, and meas ure the resistance between terminal 22 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR024 of the rear single latch as sembly to check if it is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Inspect the wiring of the rear single latch assembly for possible short circuits, open circuits, or poo r connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear single latch assembly.

TR024 Rear Single Latch Assembly

B10DMACU1219058

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR024 of the re ar single latch assembly.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor TR024 of the rear single latch assembly and the body g round to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

DTC: B00701A-ACU

Fault code	Description
B00701A	Driver seat belt pretensioner circuit resistance below lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219015

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR006 Front Left Airbag Assembly

B10DMACU1219034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector TR006 of the front left airbag assembly.
C Connect the simulator to the wiring harness connector of the front left airbag assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front left airbag a ssembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219035

TR006 Front Left Airbag Assembly

B10DMACU1219036

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR006 of the fro nt left airbag assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 41 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR006 of the front left airbag assem bly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 42 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR006 of the f ront left airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat connector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR035 Front right seat connector

B10DMACU1219049

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 from the right front seat connector.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 50 of the harness connector TR004-1 of the airbag control module assembly and terminal 24 of the harness connector TR035 of the right front seat connector is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver-side seat belt buckle assembly (right front seat connector).

TR035 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 from the right front seat connector.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 25 of the right front seat harness connector TR035 and the body ground to check whether it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver's side seat belt buckle assembly and the right front sea t connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 from the right fr ont seat connector. C Disconnect the wiring harness connector of the driver's si de seat belt buckle assembly. D Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminal of the right front seat connector (component side) and the har ness connector terminal of the driver side seat belt buckle a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B002909-ACU

Fault code	Description
B002909	Front right side curtain airbag circuit in series with other circuits fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219044

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
C Connect the simulator to the right side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.

Step 3 Check the connecting harness between the airbag control module assembly and the right side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219045

TR008 Right Side Curtain Airbag Assembly

B10DMACU1219046

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR008 of the right side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 48 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR008 of the right side curtain airbag assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance value between terminal 47 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR008 of the right side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the right side curtain airbag assembly for potential short circuits, open circuits, and poor connections; replace the wire harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the right side curtain airbag assembly.	
	A Replace the right side curtain airbag assembly. B After replacing the right side curtain airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B00701B-ACU

Fault code	Description
B00701B	Driver seat belt pretensioner circuit resistance above lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219015

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the driver seat belt pretensioner circuit for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front right seat belt assembly.	
	A Replace the front right seat belt assembly. B After replacing the front right seat belt assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B00791A-ACU

Fault code	Description
B00791A	Driver's lap belt pretensioner circuit resistance below lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right seat belt lap pretensioner assembly harness connector TR018.
C Connect the simulator to the wiring harness connector of the front right seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219026

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR018 of the front right seat belt lap pretensioner assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the harness connector TR004-2 of the airbag control module assembly and terminal 2 of the harness connector TR018 of the front right seat belt lap pretensioner assembly to check whether it is normal.
E Using a multimeter, select the resistance range and measure whether the resistance between terminal 15 of harness connector TR004-2 of the airbag control module assembly and terminal 1 of harness connector TR018 of the front right seat belt lap pretensioner assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B007A09-ACU

Fault code	Description
B007A09	Front passenger lap belt pretensioner series circuit fault with other cir cuits

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR019 Front Left Seat
Belt Lap Pretensioner Assembly

B10DMACU1219022

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR019 of the front left seat belt lap pretensioner assembly.
C Connect the simulator to the harness connector of the fro nt left seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front left seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219023

TR019 Front Left Seat
Belt Lap Pretensioner Assembly

B10DMACU1219024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR019 of the front left seat belt lap pretensioner assembly.
D Use a multimeter set to the resistance range to check wh ether the resistance between terminal 18 of harness connec tor TR004-2 of the airbag control module assembly and ter minal 1 of harness connector TR019 of the front left seat be lt lap pretensioner assembly is normal.
E. Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector TR004-2 of the airbag control module assembly and termin al 2 of harness connector TR019 of the front left seat belt la p pretensioner assembly to check whether the resistance va lue is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B009086-ACU

Fault code	Description
B009086	Left Early Collision Sensor Communication Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left impact sensor assembly for interference.

A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B007356-ACU

Fault code	Description
B007356	Invalid Configuration of Second Row Left Seat Belt Pretensioner

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rear left seat belt pretensioner harness co nnector TR020.
C Connect the simulator to the seat belt pretensioner - left rear harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the rear left seat belt pr etensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219030

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219031

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Disconnect the harness connector TR020 of the rear left seat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 2 of the harness connector TR020 of the seat belt pre tensioner - left rear to check whether the resistance value i s normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the airbag control module assembly harness connector TR004-1 and terminal 1 of the seat belt pretensioner - rear left harness connector TR020 to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B009112-ACU

Fault code	Description
B009112	Left side impact sensor short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left impact sensor assembly for interference.

A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B007912-ACU

Fault code	Description
B007912	Driver's lap belt pretensioner circuit short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Test using the simulator.

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right seat belt lap pretensioner assembly harness connector TR018.
C Connect the simulator to the wiring harness connector of the front right seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》》》 Go to step 4.

Yes 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219026

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR018 of the front right seat belt lap pretensioner assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the harness connector TR004-2 of the airbag control module assembly and terminal 2 of the harness connector TR018 of the front right seat belt lap pretensioner assembly to check whether it is normal.
E Using a multimeter, select the resistance range and measure whether the resistance between terminal 15 of harness connector TR004-2 of the airbag control module assembly and terminal 1 of harness connector TR018 of the front right seat belt lap pretensioner assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B007256-ACU

Fault code	Description
B007256	Invalid Configuration of Front Passenger Seat Belt Pretensioner

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger seat belt pretensioner wiring harness connector TR017.
C Connect the simulator to the front passenger seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219019

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR017 of the front passenger seat belt pretensioner.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 51 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR017 of the front passenger seat belt pretensioner is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 52 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wiring harness connector TR017 of the front passenger seat belt pretensioner to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》Inspect the front passenger seat belt pretensioner circuit for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front left seat belt assembly.	
	A Replace the front left seat belt assembly. B After replacing the front left seat belt assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B00731A-ACU

Fault code	Description
B00731A	Second row left seat belt pretensioner circuit resistance below lower l imit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rear left seat belt pretensioner harness co nnector TR020.
C Connect the simulator to the seat belt pretensioner - left rear harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the rear left seat belt pr etensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219030

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219031

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Disconnect the harness connector TR020 of the rear left seat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 2 of the harness connector TR020 of the seat belt pre tensioner - left rear to check whether the resistance value i s normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the airbag control module assembly harness connector TR004-1 and terminal 1 of the seat belt pretensioner - rear left harness connector TR020 to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B00791B-ACU

Fault code	Description
B00791B	Driver lap belt pretensioner circuit resistance above upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Test using the simulator.

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right seat belt lap pretensioner assembly harness connector TR018.
C Connect the simulator to the wiring harness connector of the front right seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》》》 Go to step 4.

Yes 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219026

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR018 of the front right seat belt lap pretensioner assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the harness connector TR004-2 of the airbag control module assembly and terminal 2 of the harness connector TR018 of the front right seat belt lap pretensioner assembly to check whether it is normal.
E Using a multimeter, select the resistance range and measure whether the resistance between terminal 15 of harness connector TR004-2 of the airbag control module assembly and terminal 1 of harness connector TR018 of the front right seat belt lap pretensioner assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B009012-ACU

Fault code	Description
B009012	Left early collision sensor short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

B007512	Second row right seat belt pretensioner short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rear left seat belt pretensioner harness co nnector TR020.
C Connect the simulator to the seat belt pretensioner - left rear harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the rear left seat belt pr etensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219030

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219031

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Disconnect the harness connector TR020 of the rear left seat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 2 of the harness connector TR020 of the seat belt pre tensioner - left rear to check whether the resistance value i s normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the airbag control module assembly harness connector TR004-1 and terminal 1 of the seat belt pretensioner - rear left harness connector TR020 to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B007911-ACU

Fault code	Description
B007911	Driver lap seat belt pretensioner circuit short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right seat belt lap pretensioner assembly harness connector TR018.
C Connect the simulator to the wiring harness connector of the front right seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front right seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219026

TR018 Front Right Seat
Belt Lap Pretensioner Assembly

B10DMACU1219027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR018 of the front right seat belt lap pretensioner assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the harness connector TR004-2 of the airbag control module assembly and terminal 2 of the harness connector TR018 of the front right seat belt lap pretensioner assembly to check whether it is normal.
E Using a multimeter, select the resistance range and measure whether the resistance between terminal 15 of harness connector TR004-2 of the airbag control module assembly and terminal 1 of harness connector TR018 of the front right seat belt lap pretensioner assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B007556-ACU

Fault code	Description
B007556	Invalid configuration of the second row right seat belt pretensioner

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009109-ACU

Fault code	Description
B009109	Left side impact sensor series fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left impact sensor assembly for interference.

A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

Fault code	Description
B009056	Left early collision sensor configuration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

DTC: B009156-ACU

Fault code	Description
B009156	Left side impact sensor configuration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left impact sensor assembly for interference.

A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B00904A-ACU

Fault code	Description
B00904A	Left early crash sensor parameter error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B007A11-ACU

Fault code	Description
B007A11	Front passenger lap belt pretensioner circuit short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR019 Front Left Seat
Belt Lap Pretensioner Assembly

B10DMACU1219022

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR019 of the front left seat belt lap pretensioner assembly.
C Connect the simulator to the harness connector of the fro nt left seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front left seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219023

TR019 Front Left Seat
Belt Lap Pretensioner Assembly

B10DMACU1219024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR019 of the front left seat belt lap pretensioner assembly.
D Use a multimeter set to the resistance range to check wh ether the resistance between terminal 18 of harness connec tor TR004-2 of the airbag control module assembly and ter minal 1 of harness connector TR019 of the front left seat be lt lap pretensioner assembly is normal.
E. Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector TR004-2 of the airbag control module assembly and termin al 2 of harness connector TR019 of the front left seat belt la p pretensioner assembly to check whether the resistance va lue is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger seat belt pretensioner wiring harness connector TR017.
C Connect the simulator to the front passenger seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219019

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR017 of the front passenger seat belt pretensioner.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 51 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR017 of the front passenger seat belt pretensioner is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 52 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wiring harness connector TR017 of the front passenger seat belt pretensioner to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B00751A-ACU

Fault code	Description
B00751A	Second row right seat belt pretensioner circuit resistance below lowe r limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009009-ACU

Fault code	Description
B009009	Left Early Crash Sensor Series Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B103714-ACU

Fault code	Description
B103714	Crash output short to ground or open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219091

EL215-4 Multi-Domain Fusion Controller

B10DMACU1219092

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 26 of harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the power battery pack assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219081

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 30 of the wiring harness connector BA002 of the power battery pack assembly to check whether it is normal.

© 2026, All rights reserved

BA002 Power Battery Pack Assembly

B10DMACU1219082

Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the airbag control module assembly and the main zone controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219083

EL249-5 Main Zone Controller

B10DMACU1219084

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D Using a multimeter, select the resistance range and meas ure whether the resistance value between terminal 16 of th e wire harness connector TR004-1 of the airbag control mo dule assembly and terminal 24 of the wire harness connect or EL249-5 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 5.

Step 5 Check the wiring harness between the airbag control module assembly and the controller assembly.

© 2026, All rights reserved

TR004-1 Airbag Control Module Assembly

B10DMACU1219085

DS003-1 Controller Assembly

B10DMACU1219086

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 19 of harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 6.

Step 6 Check the wiring harness connecting the airbag control module assembly and the telematics control unit.

TR004-1 Airbag Control Module Assembly

B10DMACU1219012

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D. Use a multimeter, set it to the resistance range, and measure whether the resistance between terminal 16 of the harness connector TR004-1 of the airbag control module assembly and terminal 11 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

EL188-1 Telematics Main Unit

B10DMACU1219013

No》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 7.

Step 7 Check the power supply harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 8.

Step 8 Check the ground wire harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to Step 9.	
Step 9 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 10.	
Step 10 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009311-ACU

Fault code	Description
B009311	Left pressure sensor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009813-ACU

Fault code	Description
B009813	Right pressure sensor open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B00964A-ACU

Fault code	Description
B00964A	Right side impact sensor parameter error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

DTC: B009511-ACU

Fault code	Description
B009511	Right early collision sensor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B00DF1E-ACU

Fault code	Description
B00DF1E	Passenger airbag disable switch signal range invalid

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

B10DMACU1219113

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the far-side airbag assembly for possible short circuits, open circuits, and po or connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the far-side airbag assembly.	
	A Replace the far-side airbag assembly. B After replacing the far-side airbag assembly, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B009356-ACU

Fault code	Description
B009356	Left pressure sensor configuration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009649-ACU

Fault code	Description
B009649	Right side impact sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B100512-ACU

Fault code	Description
B100512	Far-side airbag short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

B10DMACU1219113

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

	A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

	A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B00DF12-ACU

Fault code	Description
B00DF12	Passenger airbag disable switch short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

DTC: B009509-ACU

Fault code	Description
B009509	Right Early Crash Sensor Series Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B00DF56-ACU

Fault code	Description
B00DF56	Invalid PADS switch signal data with the central control panel

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B10051B-ACU

Fault code	Description
B10051B	Far-side airbag resistance too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

B10DMACU1219113

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009849-ACU

Fault code	Description
B009849	Right pressure sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

DTC: B009349-ACU

Fault code	Description
B009349	Left pressure sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009513-ACU

Fault code	Description
B009513	Open circuit in right early crash sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B00DF55-ACU

Fault code	Description
B00DF55	Invalid passenger airbag disable switch configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B100049-ACU

Fault code	Description
B100049	ECU internal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No 》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes 》》》 Replace the fuse with one of the same rating.
	No 》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B00954A-ACU

Fault code	Description
B00954A	Right early crash sensor parameter error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the front right crash sensor assembly for interference.

A Check the wiring harness of the right front crash sensor a ssembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 1 of the wire harness connector TR011 of the ri ght front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measur e the resistance between terminal 2 of harness connector T R004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sens or assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circu its, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009611-ACU

Fault code	Description
B009611	Right side impact sensor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009656-ACU

Fault code	Description
B009656	Right side impact sensor configuration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B009386-ACU

Fault code	Description
B009386	Left pressure sensor communication error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B103712-ACU

Fault code	Description
B103712	Crash output short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219091

EL215-4 Multi-Domain Fusion Controller

B10DMACU1219092

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 26 of harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the power battery pack assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219081

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 30 of the wiring harness connector BA002 of the power battery pack assembly to check whether it is normal.

© 2026, All rights reserved

BA002 Power Battery Pack Assembly

B10DMACU1219082

Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the airbag control module assembly and the main zone controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219083

EL249-5 Main Zone Controller

B10DMACU1219084

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D Using a multimeter, select the resistance range and meas ure whether the resistance value between terminal 16 of th e wire harness connector TR004-1 of the airbag control mo dule assembly and terminal 24 of the wire harness connect or EL249-5 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 5.

Step 5 Check the wiring harness between the airbag control module assembly and the controller assembly.

© 2026, All rights reserved

TR004-1 Airbag Control Module Assembly

B10DMACU1219085

DS003-1 Controller Assembly

B10DMACU1219086

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 19 of harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 6.

Step 6 Check the wiring harness connecting the airbag control module assembly and the telematics control unit.

TR004-1 Airbag Control Module Assembly

B10DMACU1219012

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D. Use a multimeter, set it to the resistance range, and measure whether the resistance between terminal 16 of the harness connector TR004-1 of the airbag control module assembly and terminal 11 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

EL188-1 Telematics Main Unit

B10DMACU1219013

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 7.

Step 7 Check the power supply harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 8.

Step 8 Check the ground wire harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 10.	
Step 10 Diagnosis complete.

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

B00DF09	Passenger airbag deactivation switch in series

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B00934A-ACU

Fault code	Description
B00934A	Left pressure sensor parameter error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B100556-ACU

Fault code	Description
B100556	Invalid Far-Side Airbag Configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

B10DMACU1219113

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the far-side airbag assembly for possible short circuits, open circuits, and po or connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the far-side airbag assembly.	
	A Replace the far-side airbag assembly. B After replacing the far-side airbag assembly, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009612-ACU

Fault code	Description
B009612	Right side impact sensor short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the right impact sensor assembly for interference.

A Check the wiring harness of the right side impact sensor a ssembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact s ensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the rig ht side impact sensor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the wire harness con nector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance val ue is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of the wire harness co nnector TR004-1 of the airbag control module assembly an d terminal 2 of the wire harness connector TR013 of the rig ht impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circui ts, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

© 2026, All rights reserved

	B After replacing the right impact sensor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009809-ACU

Fault code	Description
B009809	Right pressure sensor series fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009313-ACU

Fault code	Description
B009313	Left pressure sensor open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the left pressure sensor assembly for interference.

A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219078

TR014 Left Pressure Sensor Assembly

B10DMACU1219079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the left pressure sensor assembly.

A Replace the left pressure sensor assembly.
B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B00DF11-ACU

Fault code	Description
B00DF11	Passenger airbag disable switch short circuit or short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B009856-ACU

Fault code	Description
B009856	Right pressure sensor configuration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the wiring harness of the right pressure sensor assembly for interference.

A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.

Yes 》》》 Remove the source of interference.

No 》》》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.

TR004-2 Airbag Control Module Assembly

B10DMACU1219080

TR015 Right Pressure Sensor Assembly

B10DMACU1219087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR015 of the right pressure sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 4.

Step 4 Replace the right pressure sensor assembly.

A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the center display assembly.

	A Check whether the central control display assembly operates normally.

No 》》》 Troubleshoot the central control display malfunction.

Yes 》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

DTC: B10051A-ACU

Fault code	Description
B10051A	Far-side airbag resistance too low

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

B10DMACU1219113

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B203E00-ACU

Fault code	Description
B203E00	Lateral acceleration exceeds the defined range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the intelligent integrated brake system assembly fault code.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the Intellige nt Integrated Brake System Assembly and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize repair of faults related to the Intelligent Integrated Brake System assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219121

CH024 Intelligent Integrated Brake System Assembly

B10DMACU1219122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector CH024 of the in telligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 39 of the harness connector CH024 of the intelligent i ntegrated braking system assembly to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 17 of the airbag control mo dule assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harne ss connector CH024 to check if the resistance value is norm al.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B105A00-ACU

Fault code	Description
B105A00	Rollover collision - Front and rear

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No 》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes 》》》 Replace the fuse with one of the same rating.
	No 》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U131E87-ACU

Fault code	Description
U131E87	Loss of Communication with ACC

1. Simplified Circuit Diagram

2. Diagnostic Steps

CAUTION

This diagnostic procedure uses vehicles without electric sunshades as an example, and vehicles equip ped with electric sunshades should refer to this procedure.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port.

© 2026, All rights reserved

	B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the communication wiring harness between the front monocular camera assembly and the for ward collision avoidance radar.	
	A Check whether the communication harness between the f ront monocular camera assembly and the forward collision avoidance radar is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the communication wiring harness between the airbag control module assembly and the forw ard-facing monocular camera assembly.	
	A Check whether the communication wiring harness betwe en the airbag control module assembly and the forward-fac ing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the power ground of the forward collision warning radar.	
	A Check whether the power ground of the forward collision avoidance radar is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U130683-ACU

Fault code	Description
U130683	BCM Signal Checksum Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: U130687-ACU

Fault code	Description
U130687	Loss of communication with BCM

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes 》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the integrated motor controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219130

CH020-2 Integrated Motor Controller

B10DMACU1219131

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector CH020-2 of the integrated motor controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 5 of harness connector CH020-2 of the integrated motor controller to check if the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector TR004-1 of the airbag control module assembly and terminal 6 of harness connector CH020-2 of the integrated motor controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply grounding circuit of the integrated motor controller.

A Check whether the integrated motor controller power supply ground circuit is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of integrated motor controller.

Replacement of integrated motor controller.
B After replacing the integrated motor controller and performing the calibration procedure, end soft limit learning, configuration word writing, and VIN writing, is the fault eliminated?

DTC: U007388-ACU

Fault code	Description
U007388	CAN1 Bus Off

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the airbag control module assembly is normal.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219093	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 18 and body ground, and between terminal 17 and body ground, respectively, at harn ess connector TR004-1 of the airbag control module assem bly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A

© 2026, All rights reserved

	C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly.

© 2026, All rights reserved

	B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: B123429-ACU

Fault code	Description
B123429	ECU Internal Sensor Channel Signal Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Repeatedly power cycle the vehicle 10 times to test, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the airbag control module assembly.	
	A Check whether the power supply and ground of the airba g control module assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

DTC: U132783-ACU

Fault code	Description
U132783	CheckSum Error in communication signal with VCU B7

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the controller assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219134

DS003-1 Controller Assembly

B10DMACU1219135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 18 of harness connector TR004-1 on the airbag control module assembly and terminal 23 of harness connector DS003-1 on the controller assembly to check if the value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 22 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power ground circuit of the controller assembly.

A Check whether the power ground circuit of the controller assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the controller assembly.

A Replace the controller assembly.
B After replacing the controller assembly, is the fault eliminated?

Yes 》》》 System normal.

No 》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B104317-ACU

Fault code	Description
B104317	Supply voltage exceeds upper limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B105200-ACU

Fault code	Description
B105200	Seat Belt Pretensioning in Collision

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B203B54-ACU

Fault code	Description
B203B54	IMU not calibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the fault codes of the multi-domain fusion controller.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the Multi-D omain Fusion Controller, and record them. C Check for relevant fault codes.

Yes 》 》 》 Prioritize the repair of faults related to the multi-domain fusion controller.

No 》 》 》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: U130682-ACU

Fault code	Description
U130682	BCM Signal Counter Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B105600-ACU

Fault code	Description
B105800	Pedestrian Protection Collision

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.

DTC: U132182-ACU

Fault code	Description
U132182	Counter Error with Central Control Panel PADS Switch Signal

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring of the front passenger airbag assembly for possible short circuits, open circuits , or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front passenger airbag assembly.	
	A Replace the front passenger airbag assembly. B After replacing the front passenger airbag assembly, is th e fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B105900-ACU

Fault code	Description
B105900	Collision Non-Deployment Event

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B123456-ACU

Fault code	Description
B123456	ECU Algorithm Parameter Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the configuration word.	
	A Use the diagnostic tool to check whether the configuratio n word of the airbag control module assembly is correctly w ritten.
	No 》 》 》 Rewrite the correct configuration word.
	Yes 》 》 》 Go to step 3.
Step 3 Power-off and power-on test.	
	A Repeatedly power cycle the vehicle 10 times to test, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the airbag control module assembly.	
	A Check whether the power supply and ground of the airba g control module assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B203C92-ACU

Fault code	Description
B203C92	Inertial Sensor Internal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the fault codes of the multi-domain fusion controller.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the Multi-D omain Fusion Controller, and record them. C Check for relevant fault codes.

Yes 》 》 》 Prioritize the repair of faults related to the multi-domain fusion controller.

No 》 》 》
Go to step 3.

Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Check the power ground circuit of the multi-domain fusion controller.

	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braking system assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219121

CH024 Intelligent Integrated Brake System Assembly

B10DMACU1219122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of the harness connector TR004-1 of the airbag control module assembly and terminal 39 of the harness connector CH024 of the intelligent integrated braking system assembly to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 17 of the airbag control module assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harness connector CH024 to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

A Check whether the power supply and ground circuit of the intelligent integrated brake system assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.
B After replacing the intelligent integrated braking system assembly, is the fault eliminated?

Yes 》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the controller assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219134

DS003-1 Controller Assembly

B10DMACU1219135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 18 of harness connector TR004-1 on the airbag control module assembly and terminal 23 of harness connector DS003-1 on the controller assembly to check if the value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 22 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power ground circuit of the controller assembly.

A Check whether the power ground circuit of the controller assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the controller assembly.

A Replace the controller assembly.
B After replacing the controller assembly, is the fault eliminated?

Yes 》》》 System normal.

No 》》》

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

B10DMACU1219009

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 4.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 Front Passenger Airbag Assembly

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the controller assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219134

DS003-1 Controller Assembly

B10DMACU1219135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 18 of harness connector TR004-1 on the airbag control module assembly and terminal 23 of harness connector DS003-1 on the controller assembly to check if the value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 22 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power ground circuit of the controller assembly.

A Check whether the power ground circuit of the controller assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the controller assembly.

A Replace the controller assembly.
B After replacing the controller assembly, is the fault eliminated?

Yes 》》》 System normal.

No 》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B105100-ACU

Fault code	Description
B105100	Collision Record Lock

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B203D00-ACU

Fault code	Description
B203D00	Longitudinal acceleration exceeds the defined range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the intelligent integrated brake system assembly fault code.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the Intelligent Integrated Brake System Assembly and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize repair of faults related to the Intelligent Integrated Brake System assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braking system assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219121

CH024 Intelligent Integrated Brake System Assembly

B10DMACU1219122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of the harness connector TR004-1 of the airbag control module assembly and terminal 39 of the harness connector CH024 of the intelligent integrated braking system assembly to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 17 of the airbag control module assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harness connector CH024 to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

A Check whether the power supply and ground circuit of the intelligent integrated brake system assembly is normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》》》
Go to step 2.

Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes 》》》 System normal.

DTC: B105000-ACU

Fault code	Description
B105000	No functions are configured for EOLP

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Reconfigure the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Reconfigure the airbag control module assembly according to the diagnostic tool prompts. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the ground wire harness of the airbag control module assembly.	

© 2026, All rights reserved

TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: U1223FE-ACU

Fault code	Description
U1223FE	Watchdog fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 53 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B000109-ACU

Fault code	Description
B000109	Driver front airbag Stage 1 series fault with other circuits

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

EL091-1 Combination Switch

B10DMACU1219006

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness connec tor EL091-1.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 5.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

B10DMACU1219007

EL091-1 Combination Switch

B10DMACU1219008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL091-1 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 24 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 2 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

EL091-1 Combination Switch

B10DMACU1219006

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness connec tor EL091-1.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 5.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

B10DMACU1219007

EL091-1 Combination Switch

B10DMACU1219008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL091-1 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 24 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 2 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B00011A-ACU

Fault code	Description
B00011A	Driver front airbag stage 1 circuit resistance below lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Test using the simulator.

EL091-1A Combination Switch

B10DMACU1219139

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch harness connector EL 091-1A.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No 》 》 》 Go to step 5.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

B10DMACU1219140

EL091-1A Combination Switch

B10DMACU1219141

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the combination switch harness connector EL 091-1A.
D. Use a multimeter set to the resistance range to measure whether the resistance between terminal 23 of harness con nector TR004-1 of the airbag control module assembly and terminal 1 of harness connector EL091-1A of the combinati on switch is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 24 of the wire harness connector TR004-1 of the airbag control mod ule assembly and terminal 2 of the wire harness connector EL091-1A of the combination switch is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

No 》》》 Inspect the wiring between the airbag control module assembly and the combination switch for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Check the wiring between the combination switch and the driver airbag assembly.	
	A Check the wiring between the combination switch and the driver airbag assembly for short or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 5.	
Step 5 Replace the driver airbag assembly.	
	A Replace the driver's airbag assembly. B After replacing the driver airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U132287-ACU

Fault code	Description
U132287	ECall Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the fault codes of the telematics host.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the telematics host, and record them. C Check for relevant fault codes.

Yes 》 》 》 Prioritize the repair of faults related to the telematics host.

No 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Check the ACAN harness between the multi-domain fusion controller and the connected vehicle host.

© 2026, All rights reserved

EL188-1 Telematics Main Unit  B10DMACU1219117 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219118	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the t elematics main unit. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion con troller to check if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion co ntroller to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the power ground circuit of the telematics host.	
	A Check whether the power ground circuit of the connecte d vehicle host is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?

© 2026, All rights reserved

Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: U130783-ACU

Fault code	Description
U130783	Checksum Error in IBC 182 Communication Signal

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braking system assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219121

CH024 Intelligent Integrated Brake System Assembly

B10DMACU1219122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of the harness connector TR004-1 of the airbag control module assembly and terminal 39 of the harness connector CH024 of the intelligent integrated braking system assembly to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 17 of the airbag control module assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harness connector CH024 to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

A Check whether the power supply and ground circuit of the intelligent integrated brake system assembly is normal.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.
B After replacing the intelligent integrated braking system assembly, is the fault eliminated?

Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

7.20.8 SERVICE AND REPAIR GUIDANCE

CRASH SENSOR ASSEMBLY

NOTE

- This section describes the removal and installation of the left side impact sensor assembly. The removal and installation of the right side impact sensor assembly can generally follow the procedure for the left side.
- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
4. Remove the crash sensor assembly.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)"。

a. Disconnect 1 connector of the crash sensor assembly - Arrow A -, and unscrew 1 mounting bolt of the crash sensor - Arrow B -.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Remove the collision sensor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

ATTENTION

- Check whether the airbag malfunction indicator is illuminated, and if so, troubleshoot the fault.

© 2026, All rights reserved

AIRBAG CONTROL MODULE ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the left/right rear footwell air duct.
   See:Rear left footwell air duct (page 5679)
4. Remove the airbag control module assembly.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)”。

a. Disconnect the 1 connector of the airbag control module assembly -arrow A-, and unscrew the 3 fixing bolts of the airbag control module assembly -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Remove the airbag control module assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The mounting surface of the airbag control module assembly must be free of any debris to ensure the airbag control module assembly is seated securely. Orient the connector port of the airbag control module assembly to the right, ensure that the arrow on the airbag control module assembly label points toward the front of the vehicle, and align the three mounting holes of the airbag control module assembly with the threaded holes on the airbag control module assembly bracket.

© 2026, All rights reserved

b. The airbag control module assembly must be handled with care, avoid dropping the airbag control module assembly from a height, if the airbag control module assembly is accidentally dropped from a height, the airbag control module assembly must be replaced, and it is prohibited to install a potentially damaged airbag control module assembly on the vehicle.
c. Ensure all relevant connectors are securely connected and all wiring harnesses are free from damage.
d. After replacing the module, the module must be matched.
e. Replacing the controller requires following these steps to ensure software version compatibility:
   - Record the old version: Before disassembly, read and record the software version number of the old controller.
   - Check for new version: After installing the new controller, first read its software version number.

   Version Comparison and Processing:
   - If the new version ≥ the old version, the replacement process will be completed normally.
   - If the new version < the old version, the new controller software must first be updated to the old version or a higher version before being put into use.
f. After installation, perform the following operations on the Airbag Control Module:
   - Write the VIN to the new airbag control module. Diagnostic tool operation: ACU - Data Write - VIN.
   - Write the end-of-line configuration to the new airbag control module. The diagnostic tool operation is: ACU-End-of-line configuration-Vehicle model configuration.
   - Calibrate the new airbag control module. Diagnostic tool operation: ACU-Routine Control-IMU Calibration.

     NOTE

     Before starting this step, ensure that the vehicle has undergone a four-wheel alignment or is parked on a level surface.

   - After locking the vehicle, re-enter READY mode and wait for the self-check to complete. If the airbag warning light does not remain illuminated, the procedure is complete.

© 2026, All rights reserved

STEERING WHEEL BUTTON TRIM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6523)
4. Remove the steering wheel button trim.

a. Disconnect the 1 connector -Arrow A- of the steering wheel button assembly, and release the 13 retaining clips -Arrow B- of the steering wheel button assembly.
   Recommended tool: Interior trim removal tool
b. Remove the steering wheel buttons along with the steering wheel button trim ①.

c. Unscrew the 4 mounting screws -Arrow A- of the steering wheel button assembly, and release the 12 retaining clips -Arrow B- of the steering wheel button assembly.
   Recommended tool: T10 Torx wrench
d. Remove the steering wheel button trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check whether the steering wheel button assembly is functioning properly.

STEERING WHEEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6523)
4. Remove the steering wheel assembly.

a. Disconnect 1 connector of the steering wheel switch assembly harness - arrow A -, disconnect 1 connector of the driver airbag harness - arrow B -, and disconnect 1 connector of the steering wheel assembly harness - arrow C -.
b. Unscrew the 1 fixing nut -arrow D- of the steering wheel assembly, and remove the steering wheel assembly ①.
   Recommended tool: 21mm socket
   Torque: 50±5N m

> **NOTE**
>
> Before removal, make alignment marks between the steering wheel and the steering column to facilitate installation.

> **ATTENTION**
>
> After removal, do not rotate the clock spring.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, check whether the clock spring is in the correct position.
   b. Install the steering wheel assembly according to the marks made during removal.

© 2026, All rights reserved

STEERING WHEEL MAIN BODY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the steering wheel assembly.
   See:Steering wheel assembly (page 6516)
4. Remove the steering wheel button assembly.
   See:Steering wheel button assembly (page 6518)
5. Remove the steering wheel main body assembly.

a. Remove the steering wheel main body assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, check whether the clock spring is in the correct position.
   b. Install the steering wheel assembly according to the marks made during removal.

© 2026, All rights reserved

STEERING WHEEL BUTTON ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6523)
4. Remove the steering wheel button assembly.

a. Disconnect the 1 connector of the steering wheel button assembly -arrow A-, and release the 11 retaining clips of the steering wheel button assembly -arrow B-.
   Recommended tool: Interior trim removal tool
b. Remove the steering wheel button and steering wheel V-shaped trim assembly ①.

c. Unscrew the 4 mounting screws -Arrow A- of the steering wheel button assembly, and release the 12 retaining clips -Arrow B- of the steering wheel button assembly.
   Recommended tool: T10 Torx wrench
d. Remove the steering wheel button assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the controller requires following these steps to ensure software version compatibility:
      - Record the old version: Before disassembly, read and record the software version number of the old controller.
      - Check for new version: After installing the new controller, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new controller software must first be updated to the old version or a higher version before being put into use.
   b. After installation, perform the following operations on the steering wheel button assembly:
      - Write the VIN to the new steering wheel button assembly-Diagnostic tool operation: Select corresponding vehicle model-System diagnostics-Steering wheel controller (SWB)-Data writing-Write VIN.
   c. Check whether the steering wheel button assembly is functioning properly.

LEFT SIDE CURTAIN AIRBAG ASSEMBLY

NOTE

- This section describes the removal and installation of the left curtain airbag assembly, and the removal and installation of the right curtain airbag assembly can generally be performed by referring to the left side.
- Static electricity can cause the curtain airbag to deploy accidentally. Before performing maintenance on the protection system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the side curtain airbag and may result in injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page 5755)
4. Remove the left curtain airbag.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)"

a. Disconnect the 1 connector of the left curtain airbag assembly -arrow A-, and unscrew the 4 mounting bolts of the left curtain airbag assembly -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m

© 2026, All rights reserved

b. Unscrew the 4 mounting bolts -arrow- of the left curtain airbag assembly, and remove the left curtain airbag assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- If handled improperly, the new curtain airbag assembly may deploy unexpectedly, causing personal injury. Therefore, when handling it, the deployment direction of the curtain airbag should face upward to minimize potential injury.
- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

© 2026, All rights reserved

FRONT PASSENGER AIRBAG ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5667)
4. Remove the front passenger airbag assembly.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)"。

a. Unscrew the 2 fixing screws of the front passenger airbag assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Detach the 9 retaining clips -arrow B- of the front passenger airbag assembly, and remove the front passenger airbag assembly ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:

   ATTENTION

   - Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.

© 2026, All rights reserved

- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

© 2026, All rights reserved

DRIVER AIRBAG ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5674)
4. Remove the driver airbag assembly.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page)”。

a. Detach the 2 retaining clips -arrows- of the driver airbag assembly from the bottom of the steering wheel assembly.
   Recommended tool: Flathead screwdriver

b. Disconnect the driver airbag assembly ①.

© 2026, All rights reserved

c. Disconnect 1 connector -arrow- of the driver airbag assembly, and remove the driver airbag assembly ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:

ATTENTION

- Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.
- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- Ensure the airbag is fully installed in place. After installation, check whether the airbag fits evenly at the interface with the steering wheel assembly, and if it does not fit evenly, reinstall it.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

7.21 SEAT BELT SYSTEM

7.21.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. When removing and installing the seat belt assembly, avoid bumping the retractor.
2. After installation, check that the retractor function is normal.
3. If the seat belt is damaged, frayed, or the buckle malfunctions, it should be replaced immediately.
4. If the vehicle has been involved in a collision and the seat belt has sustained impact forces, it must be replaced immediately, even if no damage is found.
5. Do not insert any foreign objects into the seat belt buckle, and do not modify or remove the seat belt.
6. When the seat belt is dirty, clean it with a neutral detergent. Do not use corrosive agents, dyes, or dry cleaning agents, otherwise the strength of the seat belt will be severely affected.
7. If the seat belt is damaged, frayed, or stretched and deformed due to chemical action or sun exposure, it must be replaced.
8. If the metal connecting parts of the seat belt are bent, deformed, or corroded, the seat belt must be replaced.
9. Retractor performance requirements: It shall retract smoothly at the installation angle and automatically retract to its original position.
10. Latch performance requirements: The process of inserting the latch bolt and opening the latch must provide a distinct tactile feedback of proper engagement; the latch must not open on its own, and the assembly must not fail.

© 2026, All rights reserved

7.21.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

1. The seat belt system includes the front left and right seat belt assemblies, the second row left and right seat belt assemblies, the second row center seat belt assembly, and the SBR sensor. The SBR sensor is used to detect whether an occupant is present in the occupant seat. Under the following conditions, the seat belt can keep the passenger in the passenger compartment and gradually reduce the impact force:
   a. Frontal impact collision.
   b. Rear impact collision.
   c. Side impact collision.
   d. Rollover collision.
2. Seat belt reminder control description:
   a. When the vehicle is in motion, if the driver or front passenger is not wearing a seat belt, the corresponding seat belt reminder indicator in the combination instrument will illuminate accompanied by a warning chime. The indicator and warning chime will turn off and stop simultaneously once the seat belt is fastened.

7.21.6 SERVICE AND REPAIR GUIDANCE

FRONT RIGHT SEAT BELT ASSEMBLY

NOTE

This section describes the removal and installation of the front right seat belt assembly, and the removal and installation of the front left seat belt assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the B-pillar upper interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5627)
4. Remove the lower B-pillar interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
5. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
6. Remove the front right seat belt assembly.

a. Unscrew 1 fixing bolt -arrow A- of the front right seat belt guide hook.
   Recommended tool: T30 Torx socket wrench
   Torque: 9±1N m
b. Unscrew the 2 fixing bolts of the front right seat belt assembly -arrow B-.
   Recommended tool: 14mm socket
   Torque: 50±5N m
c. Remove the front right seat belt assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR SEAT BELT SINGLE BUCKLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
4. Remove the rear seat belt single buckle assembly.

a. Disconnect the 1 connector - Arrow A - between the rear seat belt single buckle assembly and the floor wiring harness.
b. Unscrew the 1 fixing bolt -arrow B- of the rear seat belt single buckle assembly, and remove the rear seat belt single buckle assembly ①.
   Recommended tool: 14mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

FRONT RIGHT SEAT BELT LAP PRETENSIONER ASSEMBLY

NOTE

This section describes the removal and installation of the front right seat belt lap pretensioner assembly, and the removal and installation of the front left seat belt lap pretensioner assembly can generally follow the procedure for the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Right End Cover Assembly (page 5664)
3. Remove the left A-pillar lower trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
4. Remove the left B-pillar lower trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
5. Remove the front right seat belt lap pretensioner assembly.

a. Disconnect 1 connector of the front right seat belt lap pretensioner assembly -arrow A-.
b. Unscrew 1 fixing nut -Arrow B- of the front right seat belt lap pretensioner assembly, and remove the front right seat belt lap pretensioner assembly ①.
   Recommended tool: 15mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

REAR SEAT BELT DUAL BUCKLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion EPP assembly (page 5779)
4. Remove the rear seat belt dual buckle assembly.

a. Disconnect the 1 connector between the rear seat belt dual buckle assembly and the floor wiring harness -Arrow A-.
b. Unscrew the 1 fixing bolt -Arrow B- of the rear seat belt dual buckle assembly, and remove the rear seat belt dual buckle assembly ①.
   Recommended tool: 14mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR LEFT AND RIGHT SEAT BELT ASSEMBLIES

NOTE

This section describes the removal and installation of the rear left seat belt assembly, and the removal and installation of the rear right seat belt assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
4. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
5. Remove the rear seat cushion EPP assembly.
   See:Rear seat cushion EPP assembly (page 5779)
6. Remove the seat belt assemblies on both sides of the rear seats.

a. Unscrew 1 mounting bolt -arrow- of the seat belt assemblies on both rear sides.
   Recommended tool: 14mm socket
   Torque: 50±5N m

b. Unscrew the 1 fixing bolt -arrow- of both rear seat belt assemblies, and remove both rear seat belt assemblies ①.
   Recommended tool: 14mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

7.22 FRONT SEATS AND ACCESSORY SYSTEM

7.22.1 PRECAUTIONS

PRECAUTIONS

1. The silicone material is soft: Please avoid contact with sharp objects to prevent it from being cut or punctured.
2. When cleaning, avoid using abrasive or hard cleaning tools (such as scouring pads, brass wire brushes, etc.).
3. Avoid prolonged contact between silicone leather and organic solvents such as gasoline, sewing machine oil, and kerosene.
4. When using alcohol or flammable cleaners, keep away from any ignition sources; wear protective gloves and ensure cleaning is performed in a well-ventilated area.
5. When cleaning with agents other than water, avoid leaving cleaning agent residue on the surface, as the residue may affect the service life and should be removed as soon as possible.
6. When using cleaning agents, please use a colorfast towel, cotton cloth, or sponge for cleaning.
7. Before removing the seat, be sure to protect the vehicle body by laying protective pads to prevent scratching the vehicle body during the removal or extraction of the seat.
8. After removing the seat, do not move the seat track to avoid installation difficulties.
9. During installation, align the seat locating pins with the body locating holes, and then insert the seat fixing bolts.

7.22.6 SERVICE AND REPAIR GUIDANCE

FRONT SEAT BELT BUCKLE ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat belt buckle assembly, and the removal and installation of the front right seat belt buckle assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
4. Remove the driver's front seat belt buckle assembly.

a. Disconnect 1 connector -arrow A- of the front seat belt buckle assembly, and release the connector retaining clip.
b. Disconnect the 2 retaining clips -arrow B- of the seat belt buckle wiring harness, and unscrew the 1 fixing bolt -arrow C- of the front seat belt buckle assembly.
   Recommended tool: T50 Torx wrench
   Torque: 50±5N m
c. Remove the front seat belt buckle assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

FRONT LEFT SEAT HEIGHT ADJUSTMENT HANDLE

NOTE

This section describes the removal and installation of the height adjustment handle for the front left seat. The removal and installation of the height adjustment handle for the front right seat can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front left seat back release handle.
   See:Left front backrest release handle (page 6566)
3. Remove the outer cover of the front left seat (manual).
   See:Front right seat outer cover (Manual) (page 6548)
4. Remove the height adjustment handle of the front left seat.

a. Release the 1 retaining clip -arrow- of the front left seat height adjustment handle, and remove the front left seat height adjustment handle ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.

© 2026, All rights reserved

FRONT RIGHT SEATBACK VENTILATION AIRBAG

NOTE

This section describes the removal and installation of the front right backrest ventilation airbag, and the removal and installation of the front left backrest ventilation airbag can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front right seat back trim assembly.
   See:Front right seat backrest trim assembly (page 6578)
3. Remove the front right backrest ventilation airbag.

a. Remove the ventilation air bag ① of the front right backrest.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT SEAT INNER COVER

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the inner cover of the front right seat.

a. Unscrew the 1 fixing screw of the front right seat inner trim cover -arrow A-, and disengage the 5 fixing clips of the front right seat inner trim cover -arrow B-.
   Recommended tool: Phillips screwdriver
b. Remove the inner cover ① of the front right seat.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT OUTER COVER (MANUAL)

NOTE

This section describes the removal and installation of the right front seat outer trim cover. The removal and installation of the left front seat outer trim cover can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front left backrest release handle cover.
   See:Left front seatback release handle cover (page 6565)
2. Remove the front left seat back release handle.
   See:Left front backrest release handle (page 6566)
3. Remove the outer cover of the front right seat.

a. Unscrew the 1 fixing screw -arrow- on the inner side of the outer trim cover of the front right seat.
   Recommended tool: Phillips screwdriver

b. Unscrew 1 fixing screw at the rear end of the outer trim cover of the front right seat -arrow-.
   Recommended tool: Phillips screwdriver

b. Disconnect the 6 retaining clips of the right front seat outer trim cover - arrow A -, and remove the right front seat outer trim cover ① in the direction of - arrow B -.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.

© 2026, All rights reserved

FRONT RIGHT SEAT ASSEMBLY

NOTE

This section describes the removal and installation of the front right seat assembly, and the removal and installation of the front left seat assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.

a. Slide the seat to the foremost position, and unscrew the 2 fixing bolts at the rear of the seat -arrow-.
Recommended tool: T45 Torx key
Torque: 50±5N m

ATTENTION

When removing the seat bolts, do not power off the vehicle; otherwise, the fore-and-aft position of the seat cannot be adjusted, which may prevent the removal of the seat mounting bolts.

b. Adjust the seat to a position that allows the removal of the fixing bolts at the front end of the seat assembly.
c. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
d. Disconnect the battery negative terminal.
See:Battery Disconnection Operation (page 248)
e. Unscrew the 2 fixing bolts at the front end of the front right seat assembly -arrow A-.
Recommended tool: T45 Torx key
Torque: 50±5N m
f. Disconnect the 3 connectors -Arrow B-, -Arrow C-, -Arrow D- between the floor wiring harness and the right front seat assembly, and release the 1 retaining clip -Arrow E- of the floor wiring harness.
Recommended tool: Clip remover

© 2026, All rights reserved

g. Remove the front left seat assembly ①.

ATTENTION

When removing the seat bolts, do not power off the vehicle; otherwise, the fore-and-aft position of the seat cannot be adjusted, which may prevent the removal of the seat mounting bolts.

ATTENTION

After all seat bolts are completely removed, promptly power off the vehicle, and then disconnect the wiring harness connector.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the driver's seat learning must be performed. The diagnostic tool operation is as follows: SCU - Routine Control - Start Driver Seat Calibration.
   b. First connect the wiring harness connector, then power on the vehicle, otherwise the fore-and-aft position of the seat cannot be adjusted, which may prevent the installation of the rear fixing bolts.
   c. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   d. Tighten the fixing bolt to the specified torque.

RIGHT FAR-SIDE AIRBAG ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

> **ATTENTION**
>
> After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
4. Remove the front left seat backrest trim assembly.
   See:Front right seat backrest trim assembly (page 6578)
5. Remove the right far-side airbag assembly.

> **WARNING**
>
> Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)”。

a. Disconnect the 7 retaining clips of the right far-side airbag assembly wiring harness -arrow-.
   Recommended tool: Clip remover

b. Unscrew the 2 fixing nuts -arrow- of the right far-side airbag assembly, and remove the right far-side airbag assembly ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.

© 2026, All rights reserved

b. Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
c. Ensure the airbag is fully installed in place.
d. It is strictly forbidden to use a multimeter to measure airbag resistance.

LUMBAR SUPPORT SWITCH BUTTON

REMOVAL PROCEDURE

1. Remove the lumbar support switch button.

a. Release the 4 retaining clips -arrow- of the lumbar support switch button, and remove the lumbar support switch button ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT ADJUSTMENT SWITCH BUTTON 1

REMOVAL PROCEDURE

1. Remove the front right seat adjustment switch button 1.

a. Release the 4 retaining clips -arrow- of the front right seat adjustment switch button 1, and remove the front right seat adjustment switch button 1 ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT CUSHION VENTILATION AIRBAG

NOTE

This section describes the removal and installation of the front right seat cushion ventilation bladder, and the removal and installation of the front left seat cushion ventilation bladder can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front left seat cushion cover assembly.
   See:Front right seat cushion trim assembly (page 6567)
3. Remove the ventilation airbag of the front right seat cushion.

a. Remove the front right seat cushion ventilation bladder ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT SEAT INNER TRIM COVER

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the inner cover of the front left seat.
   See:Front right seat inner cover (page 6547)
3. Remove the inner trim cover on the inner side of the front right seat.

a. Unscrew the 2 fixing screws -arrow- of the inner trim cover on the inner side of the front right seat, and remove the front right seat inner trim cover ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
3. Remove the right front seat wire harness assembly.

a. Release the two retaining clips at the lower end of the front right seat backrest trim assembly -arrow-, and lift the lower part of the front right seat backrest trim assembly.

b. Release the 5 C-type retaining clips -arrow- of the right front seat backrest trim assembly.
   Recommended tool: Needle-nose pliers

c. Disconnect 1 connector of the backrest adjustment motor -arrow A-, and disconnect 1 connector of the pneumatic lumbar support assembly -arrow B-.
d. Disconnect the 1 connector plug of the front seat backrest heating pad - arrow C -, and disconnect the 1 connector plug of the front right backrest ventilation fan - arrow D -.
e. Detach the 5 retaining clips of the wiring harness -arrow E-, -arrow F-.
   Recommended tool: Clip remover

© 2026, All rights reserved

e. Disconnect 1 connector of the front right seat SBR assembly -Arrow A-, and disconnect 1 connector of the front seat cushion heating pad -Arrow B-.
f. Disconnect 1 connector - arrow C - of the front seat belt buckle assembly, and disconnect 1 connector - arrow D - of the slide rail adjustment motor assembly.
g. Disconnect 1 connector of the height adjustment motor -arrow E-, and disconnect 1 connector of the front right seat cushion ventilation fan -arrow F-.
h. Release the 9 retaining clips - arrow G - of the right front seat wiring harness assembly, and remove the right front seat wiring harness assembly ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

PNEUMATIC LUMBAR SUPPORT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
4. Remove the front left seat backrest trim assembly.
   See:Front right seat backrest trim assembly (page 6578)
5. Remove the lumbar support massage assembly.

a. Disconnect 1 connector -Arrow A- between the left front seat wiring harness assembly and the pneumatic lumbar support assembly, and disconnect 1 connector -Arrow B- between the left front seat wiring harness assembly and the front left seatback ventilation fan.
b. Disconnect the 4 retaining clips connecting the front left seat wiring harness assembly to the pneumatic lumbar support assembly - Arrow C -.
   Recommended tool: Clip remover

d. Disconnect the 1 retaining clip connecting the air pump to the front left seat backrest frame assembly -arrow-.
   Recommended tool: Clip remover

e. Detach the 6 hooks - arrow - connecting the front seatback S-spring to the left front seatback frame assembly, and remove the pneumatic lumbar support assembly with the front seatback S-spring ①.

© 2026, All rights reserved

f. Detach the 5 retaining clips -arrow- connecting the pneumatic lumbar support assembly to the front seatback S-spring, and separate the pneumatic lumbar support assembly ① and the front seatback S-spring ②.
Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

HEIGHT ADJUSTMENT MOTOR ASSEMBLY

NOTE

This section describes the removal and installation of the left height adjustment motor assembly, and the removal and installation of the right height adjustment motor assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front right seat cushion cover assembly.
   See:Front right seat cushion trim assembly (page 6567)
3. Remove the height adjustment motor assembly.

a. Unscrew the 3 mounting nuts of the height adjustment motor assembly -arrow-.
   Recommended tool: 10mm socket
   Torque: 9±1N m

b. Disconnect 1 connector of the height adjustment motor assembly -arrow-, and remove the height adjustment motor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

LUMBAR SUPPORT SWITCH MODULE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
4. Remove the lumbar support switch module.

a. Unscrew the 2 fixing screws -arrow- between the lumbar support switch module and the right front seat outer cover, and remove the lumbar support switch module ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

FRONT RIGHT SEAT BACKREST VENTILATION FAN

NOTE

This section describes the removal and installation of the front right seatback ventilation fan, and the removal and installation of the front left seatback ventilation fan can generally follow the procedure for the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front right seat back trim assembly.
   See:Front right seat backrest trim assembly (page 6578)
3. Remove the front right seat back ventilation fan.

a. Disconnect the 1 connector of the front right seatback ventilation fan -arrow A-, and release the 4 retaining clips of the front right seatback ventilation fan -arrow B-.
b. Remove the front right seat back ventilation fan ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT SEAT BACKREST TRIM

REMOVAL PROCEDURE

1. Remove the trim on the front seat backrest.

a. Detach the 3 retaining clips -arrow- of the front seat backrest upper trim, and remove the front seat backrest upper trim ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT FRONT SEATBACK RELEASE HANDLE COVER

NOTE

This section describes the removal and installation of the left front seatback release handle cover. The removal and installation of the right front seatback release handle cover can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left backrest release handle cover.

a. Release the 3 retaining clips -arrow- of the left front seatback release handle cover, and remove the left front seatback release handle cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT FRONT BACKREST RELEASE HANDLE

NOTE

This section describes the removal and installation of the front left seat backrest release handle. The removal and installation of the front right seat backrest release handle can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left backrest release handle cover.
   See:Left front seatback release handle cover (page 6565)
2. Remove the front left seat back release handle.

a. Unscrew the 2 fixing screws -arrow- of the left front seatback release handle, and remove the left front seatback release handle ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT CUSHION TRIM ASSEMBLY

NOTE

This section describes the removal and installation of the right front seat cushion cover assembly, and the removal and installation of the left front seat cushion cover assembly can generally follow the procedures for the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the inner trim cover on the inner side of the front left seat.
   See:Front right seat inner trim cover (page 6556)
3. Remove the inner trim cover on the outboard side of the front left seat.
   See:Front right seat outer inner trim cover (page 6585)
4. Remove the front right seat cushion cover assembly.

a. Release the two retaining clips at the lower end of the front right seat backrest trim assembly -arrow-, and lift the lower part of the front right seat backrest trim assembly.

b. Disconnect 1 connector of the front right seat SBR assembly -Arrow A-, and disconnect 1 connector of the front seat cushion heating pad -Arrow B-.
c. Detach the 10 retaining clips of the right front seat cushion trim assembly -arrow C-.

d. Remove the front right seat cushion cover assembly ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

HEADREST GUIDE TUBE

NOTE

This section describes the removal and installation of the right front seat headrest guide tube, and the removal and installation of the left front seat headrest guide tube can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the right front headrest assembly.
   See:Front right headrest assembly (page 6577)
3. Remove the headrest conduit.

a. Release the two retaining clips at the lower end of the front right seat backrest trim assembly -arrow-, and lift the lower part of the front right seat backrest trim assembly.

b. Reach in from the lower end of the right front seat backrest cover assembly and press the 4 retaining clips - arrow - of the headrest guide to remove the headrest guide ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. During installation, align the headrest guide tube with the retaining slot of the seat back frame - arrow -.

© 2026, All rights reserved

RIGHT FRONT SEAT BACKREST FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the right front seat backrest frame assembly. The removal and installation of the left front seat backrest frame assembly can generally be performed by referring to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front right seat back trim assembly.
   See:Front right seat backrest trim assembly (page 6578)
3. Remove the front right seat back ventilation fan.
   See:Front right seat backrest ventilation fan (page 6563)
4. Remove the front right airbag assembly.
   See:Front Right Side Airbag Assembly (page 6574)
5. Remove the right far-side airbag assembly.
   See:Right far-side airbag assembly (page 6551)
6. Remove the front right seat backrest frame assembly.

a. Unscrew the 4 fixing bolts -arrow- of the front right seat backrest frame assembly, and remove the front right seat backrest frame assembly ①.
   Recommended tool: T55 Torx bit
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

FRONT RIGHT SEAT CUSHION VENTILATION FAN

NOTE

This section describes the removal and installation of the front right seat cushion ventilation fan. The removal and installation of the front right seat cushion ventilation fan can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front left seat cushion cover assembly.
   See:Front right seat cushion trim assembly (page 6567)
3. Remove the front right seat cushion ventilation fan.

a. Unscrew the 4 mounting screws of the front right seat cushion ventilation fan -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Disconnect the 1 connector -arrow- of the front right seat cushion ventilation fan, and remove the front right seat cushion ventilation fan ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT SEAT SWITCH MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
4. Remove the front right seat switch module assembly.

a. Unscrew the 3 fixing screws -arrow- between the front right seat switch module assembly and the front right seat outer cover, and remove the front right seat switch module assembly ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT SEAT ADJUSTMENT SWITCH BUTTON 2

REMOVAL PROCEDURE

1. Remove the front right seat adjustment switch button 2.

a. Disconnect the 2 retaining clips -arrow- of the front right seat adjustment switch button 2, and remove the front right seat adjustment switch button 2①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SIDE AIRBAG ASSEMBLY

NOTE

This section describes the removal and installation of the front right airbag assembly, and the removal and installation of the front left airbag assembly can generally follow the procedure for the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)

   ATTENTION

   After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
4. Remove the front left seat cushion cover assembly.
   See:Front right seat cushion trim assembly (page 6567)
5. Remove the front right airbag assembly.

   WARNING

   Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5798)”。

a. Disconnect the 9 retaining clips of the wiring harness for the front right airbag assembly -arrows -.
   Recommended tool: Clip remover

b. Unscrew the 2 fixing nuts -arrow- of the front right airbag assembly, and remove the front right airbag assembly ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.
   b. Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
   c. Ensure the airbag is fully installed in place.
   d. It is strictly forbidden to use a multimeter to measure airbag resistance.

RIGHT FRONT SEAT WIRING HARNESS ASSEMBLY (MANUAL)

NOTE

This section describes the removal and installation of the front left seat wiring harness assembly. The removal and installation of the front right seat wiring harness assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the right front seat wire harness assembly.

a. Release the two retaining clips at the lower end of the front right seat backrest trim assembly -arrow-, and lift the lower part of the front right seat backrest trim assembly.

b. Disconnect 1 connector of the front right seat SBR assembly -Arrow A-, and disconnect 1 connector of the front seat belt buckle -Arrow B-.
c. Release the 2 retaining clips -arrow C- of the front right seat wiring harness assembly, and remove the front right seat wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT HEADREST ASSEMBLY

REMOVAL PROCEDURE

1. Remove the right front headrest assembly.

a. Press the fixing clip of the headrest guide tube - arrow A -, and remove the right front headrest assembly ① in the direction of - arrow B -.

> **ATTENTION**
>
> Recline the seatback to facilitate removal of the headrest assembly.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT RIGHT SEAT BACKREST TRIM ASSEMBLY

NOTE

This section describes the removal and installation of the right front seat back trim assembly, and the removal and installation of the left front seat back trim assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the inner trim cover on the outboard side of the right front seat.
   See:Front right seat outer inner trim cover (page 6585)
3. Remove the inner trim cover on the inner side of the front right seat.
   See:Front right seat inner trim cover (page 6556)
4. Remove the headrest conduit.
   See:Headrest guide tube (page 6569)
5. Remove the pneumatic lumbar support assembly.
   See:Pneumatic lumbar support assembly (page 6559)
6. Remove the front right seat back trim assembly.

a. Detach the 2 retaining clips -arrow- at the lower end of the front right seat backrest trim assembly, and lift up the lower part of the front right seat backrest trim assembly.

b. Release the 5 C-type retaining clips -arrow- of the right front seat backrest trim assembly.
   Recommended tool: Needle-nose pliers

© 2026, All rights reserved

c. Disconnect 1 connector of the backrest adjustment motor -arrow A-, and disconnect 1 connector of the pneumatic lumbar support assembly -arrow B-.
d. Disconnect the 1 connector plug of the front seat backrest heating pad - arrow C -, and disconnect the 1 connector plug of the front right backrest ventilation fan - arrow D -.
e. Disconnect 1 connector -arrow E- of the front right airbag assembly, and disconnect 1 connector -arrow F- of the right far-side airbag assembly..
f. Disconnect the 12 retaining clips of the wiring harness -Arrow G-, -Arrow H-.
g. Remove the seat wiring harness ①, front right airbag wiring harness ②, and right far-side airbag wiring harness ③.
Recommended tool: Clip remover

h. Release the 2 retaining clips -arrow- of the front right seat backrest trim assembly.

i. Remove the front right seatback trim assembly ① in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT RIGHT SEAT OUTER COVER

NOTE

This section describes the removal and installation of the right front seat outer trim cover. The removal and installation of the left front seat outer trim cover can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front right seat adjustment switch button 1.
   See:Front right seat adjustment switch button 1 (page 6554)
4. Remove the front right seat adjustment switch button 2.
   See:Front right seat adjustment switch button 2 (page 6573)
5. Remove the outer cover of the front right seat.

a. Unscrew the 1 fixing screw -arrow- on the inner side of the outer trim cover of the front right seat.
   Recommended tool: Phillips screwdriver

b. Detach the 7 retaining clips of the front right seat outer trim cover -arrow A-, and remove the front right seat outer trim cover in the direction of -arrow B-.
   Recommended tool: Interior trim removal tool
c. Disconnect the 1 connector plug - arrow C - between the seat harness and the right front seat switch module assembly.
d. Disconnect the 1 connector between the seat wiring harness and the lumbar support switch module -arrow D-.

e. Unscrew the 3 fixing screws -arrow A- securing the front right seat switch module assembly and the front right seat outer trim cover.
f. Unscrew the 2 fixing screws -arrow B- between the lumbar support switch module and the outer cover of the right front seat.
   Recommended tool: Phillips screwdriver

© 2026, All rights reserved

g. Remove the front right seat outer cover ①, front right seat switch module assembly ②, and lumbar support switch module ③.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

MANUAL SLIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the front left manual slide rail assembly, and the removal and installation of the front right manual slide rail assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front seat belt buckle assembly.
   See:Front seat belt buckle assembly (page 6544)
3. Remove the front end cover of the front outer slide rail.
   See:Front outer slide rail front end cover (page 6586)
4. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
5. Remove the manual slide rail assembly.

a. Unscrew the 4 fixing bolts -arrow- of the manual slide rail assembly, and remove the manual slide rail assembly ①.
   Recommended tool: T50 Torx wrench
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, test the manual slide rail assembly to ensure it operates normally.

© 2026, All rights reserved

FRONT RIGHT SEAT CUSHION FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the right front seat cushion frame assembly. The removal and installation of the left front seat cushion frame assembly can generally be performed by referring to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front right seat cushion cover assembly.
   See:Front right seat cushion trim assembly (page 6567)
3. Remove the front left seat cushion ventilation fan.
   See:Front right seat cushion ventilation fan (page 6571)
4. Remove the right front seat wire harness assembly.
   See:Front right seat wiring harness assembly (page 6557)
5. Remove the front seat belt buckle assembly.
   See:Front seat belt buckle assembly (page 6544)
6. Remove the front right seat cushion frame assembly.

a. Unscrew the 4 mounting bolts -arrow- of the front right seat cushion frame assembly, and remove the front right seat cushion frame assembly ①.
   Recommended tool: 14mm socket
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

FRONT RIGHT ELECTRIC SLIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the front right power slide rail assembly, and the removal and installation of the front left power slide rail assembly can generally refer to the right side.

REMOVAL PROCEDURE

1. Remove the front right seat assembly.
   See:Front right seat assembly (page 6549)
2. Remove the front seat belt buckle assembly.
   See:Front seat belt buckle assembly (page 6544)
3. Remove the front end cover of the front outer slide rail.
   See:Front outer slide rail front end cover (page 6586)
4. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
5. Remove the front right power slide rail assembly.

a. Disconnect the 1 connector between the slide rail adjustment motor assembly and the seat wiring harness - Arrow A -, and release the wiring harness retaining clip - Arrow B -.
b. Unscrew the 4 fixing bolts -Arrow C- of the front right electric sliding rail assembly, and remove the front right electric sliding rail assembly ①.
   Recommended tool: T50 Torx wrench
   Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. Tighten the fixing bolt to the specified torque.
   c. After installation, check whether the electric slide rail assembly operates normally.

FRONT RIGHT SEAT OUTER INNER TRIM COVER

NOTE

This section describes the removal and installation of the right front seat outer inner trim cover, and the removal and installation of the left front seat outer inner trim cover can generally refer to the right side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the outer trim cover of the left front seat.
   See:Front right seat outer cover (page 6580)
4. Remove the inner trim cover on the outboard side of the right front seat.

a. Unscrew the 2 fixing screws -arrow- of the right front seat outer inner trim cover, and remove the right front seat outer inner trim cover ①.
   Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

FRONT OUTER SLIDE RAIL FRONT END COVER

NOTE

This section describes the removal and installation of the front end cover of the front outer slide rail for the right front seat, and the removal and installation of the front and rear end covers of the front outer slide rail for the left front seat can generally follow the procedure for the right side.

REMOVAL PROCEDURE

1. Adjust the seat to the rearmost position.
2. Remove the front end cover of the front outer slide rail.

a. Release the 4 retaining clips -arrow- of the front outer slide rail front cover, and remove the front outer slide rail front cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

7.23 SECOND-ROW SEATS AND ACCESSORY SYSTEM

7.23.1 PRECAUTIONS

PRECAUTIONS

1. The silicone material is soft: Please avoid contact with sharp objects to prevent it from being cut or punctured.
2. When cleaning, avoid using abrasive or hard cleaning tools (such as scouring pads, brass wire brushes, etc.).
3. Avoid prolonged contact between silicone leather and organic solvents such as gasoline, sewing machine oil, and kerosene.
4. When using alcohol or flammable cleaners, keep away from any ignition sources; wear protective gloves and ensure cleaning is performed in a well-ventilated area.
5. When cleaning with agents other than water, avoid leaving cleaning agent residue on the surface, as the residue may affect the service life and should be removed as soon as possible.
6. When using cleaning agents, please use a colorfast towel, cotton cloth, or sponge for cleaning.
7. Before removing the seat, be sure to protect the vehicle body by laying protective pads to prevent scratching the vehicle body during the removal or extraction of the seat.
8. After removing the seat, do not move the seat track to avoid installation difficulties.
9. During installation, align the seat locating pins with the body locating holes, and then insert the seat fixing bolts.

7.23.6 SERVICE AND REPAIR GUIDANCE

REAR LEFT SEATBACK RELEASE HANDLE TRIM COVER

NOTE

This section describes the removal and installation of the trim cover for the rear left seat backrest unlock handle. The removal and installation of the trim cover for the rear right seat backrest unlock handle can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the trim cover of the rear left backrest release handle.

a. Release the 4 retaining clips -arrows- of the rear left seatback release handle trim cover, and remove the rear left seatback release handle trim cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

REAR RIGHT SEATBACK ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear right seat backrest assembly.

a. Fold down the right rear seatback assembly.
b. Unscrew the 2 fixing bolts -arrow- securing the rear right backrest assembly to the mounting bracket.
   Recommended tool: 13mm socket
   Torque: 50±5N m

c. Remove the rear right seat back assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR LEFT SEATBACK FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the rear left seatback frame assembly, and the removal and installation of the rear right seatback frame assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the rear left seat backrest lock assembly.
   See:Rear left seat back lock assembly (page 6603)
4. Remove the base of the rear left seat back unlock handle.
   See:Rear left seatback release handle base (page 6606)
5. Remove the rear center seat belt assembly.
   See:Rear center seat belt assembly (page 6607)
6. Remove the honeycomb panel on the left seat back.
   See:Rear left seatback honeycomb panel (page 6605)
7. Remove the base of the seat belt guide trim cover.
   See:Seat belt guide trim cover base (page 6612)
8. Remove the left rear seatback frame assembly.

a. Remove the rear left backrest frame assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolts to the specified torque.
   b. If the retaining clip is damaged, it must be replaced with a new one.

HEADREST GUIDE TUBE

NOTE

This section describes the removal and installation of the headrest guide for the left rear seat backrest, and the removal and installation of the headrest guide for the right rear seat backrest can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the rear outboard headrest assembly.
   See:Rear outboard headrest assembly (page 6613)
3. Remove the headrest conduit.

a. Release the row of retaining clips at the lower end of the seatback cover assembly of the second row left seat - Arrow A -.
   Recommended tool: Flathead screwdriver
b. Unzip the zipper on the left/right side of the second-row left seat back trim assembly -Arrow B-, and fold back the second-row left seat back trim assembly.

c. Lift the left seat back cover assembly, press the 4 retaining clips of the headrest guide -arrow-, and remove the headrest guide ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. During installation, align the headrest guide tube with the retaining slot of the seat back frame - arrow -.

© 2026, All rights reserved

ARMREST BRACKET TRIM COVER

REMOVAL PROCEDURE

1. Fold down the rear left seatback assembly.
2. Remove the armrest bracket trim cover.

a. Disengage 1 retaining clip of the armrest bracket trim cover -arrow A-, and remove the armrest bracket trim cover ① in the direction of -arrow B-.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR SEAT CUSHION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6594)
3. Remove the rear seat cushion assembly.

a. Fold down the rear left seatback assembly.
b. Unscrew the 2 fixing bolts -arrow- connecting the rear left backrest assembly to the mounting bracket, and remove the rear left backrest assembly.
   Recommended tool: 13mm socket
   Torque: 50±5N m

c. Release the 2 fixing clips -arrow- of the rear seat cushion assembly, and remove the rear seat cushion assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

REAR SEAT CUSHION FRONT FIXING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6598)
4. Remove the fixing clips at the front of the rear seat cushion.

a. Disengage the 4 retaining clips - arrows - of the front mounting bracket of the rear seat cushion, and remove the front mounting bracket ① of the rear seat cushion.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

SEAT BELT GUIDE TRIM COVER

REMOVAL PROCEDURE

1. Remove the seat belt guide trim cover.

a. Disengage the 2 retaining clips -arrow- of the seat belt guide trim cover, and remove the seat belt guide trim cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

REAR LEFT BACKREST ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6594)
3. Remove the rear left backrest assembly.

a. Fold down the rear left seatback assembly.
b. Unscrew the 2 fixing bolts -arrow- connecting the rear left backrest assembly to the mounting bracket, and remove the rear left backrest assembly.
   Recommended tool: 13mm socket
   Torque: 50±5N m

c. Release the 2 fixing clips -arrow- of the rear seat cushion assembly, and remove the rear seat cushion assembly ①.

d. Unscrew 1 mounting bolt -arrow- of the rear center seat belt assembly.
   Recommended tool: 14mm socket
   Torque: 50±5N m

e. Remove the rear left seatback assembly ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
    a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR LEFT SEAT BACK LOCK ASSEMBLY

NOTE

This section describes the removal and installation of the rear left seatback lock assembly. The removal and installation of the rear right seatback lock assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the rear left seat backrest lock assembly.

B01SRMIE5024026

a. Unscrew the 2 fixing bolts of the rear left backrest lock assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 25±2N m
b. Unscrew 1 fixing screw -arrow B- from the seatback release handle base, and remove the rear left seatback lock and seatback release handle assembly ①.
   Recommended tool: Phillips screwdriver

B01SRMIE5024027

c. Disconnect the connection between the rear left seatback lock cable and the seatback release handle -arrow-, and remove the rear left seatback lock assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR SEAT BACKREST LEFT MOUNTING BRACKET ASSEMBLY

NOTE

This section describes the removal and installation of the left mounting bracket assembly of the rear seat backrest, and the removal and installation of the right mounting bracket assembly of the rear seat backrest can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
4. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5625)
5. Remove the left mounting bracket assembly of the rear seatback.

a. Unscrew the 2 fixing bolts -arrow- of the rear left backrest mounting bracket assembly, and remove the rear left backrest mounting bracket assembly ①.
   Recommended tool: 13mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR LEFT SEATBACK HONEYCOMB PANEL

NOTE

This section describes the removal and installation of the rear left seatback honeycomb panel, and the removal and installation of the rear right seatback honeycomb panel can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the honeycomb panel on the rear left seat backrest.

a. Detach the 12 fixing rivets -arrow- of the left rear seat backrest honeycomb panel, and remove the left rear seat backrest honeycomb panel ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR LEFT SEATBACK RELEASE HANDLE BASE

NOTE

This section describes the removal and installation of the rear left seatback release handle base, and the removal and installation of the rear right seatback release handle base can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the base of the rear left seat back unlock handle.

B01SRMIE5024026

a. Unscrew the 2 fixing bolts of the rear left backrest lock assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 25±2N m
b. Unscrew 1 fixing screw -arrow B- from the seatback release handle base, and remove the rear left seatback lock and seatback release handle assembly ①.
   Recommended tool: Phillips screwdriver

B01SRMIE5024028

c. Disconnect the rear left seatback lock cable from the seatback release handle -arrow-, and remove the rear left seatback release handle base ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR CENTER SEAT BELT ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the base of the seat belt guide trim cover.
   See:Seat belt guide trim cover base (page 6612)
4. Remove the rear center seat belt assembly.

a. Unscrew the 1 fixing nut -arrow- of the rear center seat belt assembly, and remove the rear center seat belt assembly ①.
   Recommended tool: 15mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

SECOND ROW LEFT SEAT BACKREST COVER ASSEMBLY

NOTE

This section describes the removal and installation of the seat back cover assembly for the second-row left seat, and the removal and installation of the seat back cover assembly for the second-row right seat can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the rear outboard headrest assembly.
   See:Rear outboard headrest assembly (page 6613)
3. Remove the rear armrest assembly.
   See:Rear armrest assembly (page 6611)
4. Remove the trim cover of the rear left backrest release handle.
   See:Rear Left Seatback Release Handle Trim Cover (page 6593)
5. Remove the seat belt guide trim cover.
   See:Seat belt guide trim cover (page 6600)
6. Remove the seat back trim assembly of the second row left seat.

a. Release the row of retaining clips at the lower end of the seatback cover assembly of the second row left seat - Arrow A -.
   Recommended tool: Flathead screwdriver
b. Unzip the zipper on the left/right side of the second-row left seat back trim assembly -Arrow B-, and fold back the second-row left seat back trim assembly.

c. Lift the left seat back cover assembly, press the 4 retaining clips of the headrest guide -arrow-, and remove the headrest guide ①.

© 2026, All rights reserved

d. Remove the second row left seat backrest trim assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

REAR SEAT BACKREST CENTER MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
4. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6594)
5. Remove the center mounting bracket of the rear seat backrest.

a. Unscrew the 3 fixing bolts -arrow- of the rear seatback center mounting bracket, and remove the rear seatback center mounting bracket ①.
   Recommended tool: 13mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR ARMREST ASSEMBLY

REMOVAL PROCEDURE

1. Remove the armrest bracket trim cover.
   See:Armrest bracket trim cover (page 6597)
2. Remove the rear armrest assembly.

a. Unscrew the 1 fixing bolt -arrow- of the rear armrest assembly, and remove the rear armrest assembly ①.
   Recommended tool: T40 Torx wrench
   Torque: 4±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

SEAT BELT GUIDE TRIM COVER BASE

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6601)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6608)
3. Remove the base of the seat belt guide trim cover.

a. Release the 4 retaining clips -arrow- of the seat belt guide trim cover base, and remove the seat belt guide trim cover base ①.

SETUP

1. The installation procedure is performed in reverse order.

8.1.6 SERVICE AND REPAIR GUIDANCE

FRONT BUMPER BEAM LEFT CONNECTING PLATE

NOTE

This section describes the removal and installation of the left connecting plate of the front bumper beam, and the removal and installation of the right connecting plate of the front bumper beam can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the left connecting plate of the front bumper reinforcement.

a. Unscrew the 3 fixing bolts connecting the left connecting plate of the front bumper beam to the front/sub bumper beam assembly - arrow -.
   Recommended tool: 13mm socket
   Torque: 23±2N m
b. Remove the left connecting plate ① of the front bumper beam.

SETUP

1. The installation procedure is performed in reverse order.

SECONDARY ANTI-COLLISION BEAM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the cover.
   See:Housing (page 5524)
5. Remove the left/right connection plate of the front bumper beam.
   See:Front bumper beam left connecting plate (page 6621)
6. Remove the front sub anti-collision beam assembly.

a. Unscrew the 4 mounting bolts/nuts connecting the secondary bumper beam assembly to the front subframe assembly -arrow-.
   Recommended tools: 13mm socket, 15mm wrench
   Torque: 45±5N m
b. Remove the secondary bumper beam assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

FRONT BUMPER BEAM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the left/right impact sensor assembly.
   See:Crash Sensor Assembly (page 6511)
5. Remove the hood latch mounting bracket.
   See:Hood latch mounting bracket (page 6638)
6. Remove the left/right connection plate of the front bumper beam.
   See:Front bumper beam left connecting plate (page 6621)
7. Remove the front bumper reinforcement assembly.

a. Detach the 2 retaining clips connecting the front bumper reinforcement assembly to the engine compartment wiring harness assembly - arrow -.
   Recommended tool: Clip remover

b. Unscrew the 4 mounting bolts connecting the front bumper beam assembly to the front end module assembly -Arrow A-.
   Recommended tool: 13mm socket
   Torque: 23±2N m
c. Unscrew the 2 fixing nuts connecting the front bumper beam assembly to the vehicle body - Arrow B -.
   Recommended tool: 15mm socket
   Torque: 45±5N m
d. Unscrew the 6 mounting bolts securing the front bumper beam assembly to the vehicle body -Arrow C-.
   Recommended tool: 15mm socket
   Torque: 45±5N m
e. Remove the front bumper reinforcement assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

8.2.6 SERVICE AND REPAIR GUIDANCE

FRONT RIGHT HEADLAMP CROSSMEMBER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front cover support rod assembly.
   See:Hood prop rod sub-assembly (page 6831)
3. Remove the right front headlight crossmember assembly.

a. Unscrew the 2 fixing bolts -Arrow A- connecting the right front headlamp crossmember assembly to the body.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Unscrew the 2 mounting bolts connecting the right front headlamp crossmember assembly to the front end module assembly -Arrow B-, and remove the right front headlamp crossmember assembly ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is performed in reverse order.

FRONT END MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
4. Remove the left front headlamp crossmember.
   See:Left front headlight crossmember (page 6637)
5. Remove the right front headlight crossmember assembly.
   See:Front right headlamp crossmember assembly (page 6631)
6. Remove the mounting bracket on the left/right cooling module assembly.
   See:Upper mounting bracket of cooling module assembly (page 5376)
7. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
8. Remove the left/right front combination lamp.
   See:Left front combination lamp (page 9904)
9. Remove the left/right front position turn signal and daytime running light assembly.
   See:Front left turn signal and daytime running light assembly (page 9903)
10. Remove the front-end module left/right reinforcement bracket assembly.
    See:Front End Module Left Reinforcement Bracket Assembly (page 6636)
11. Remove the front cover lock.
    See:Hood lock (page 6720)
12. Remove the hood latch mounting bracket.
    See:Hood latch mounting bracket (page 6638)
13. Remove the front bumper reinforcement assembly.
    See:Front bumper beam assembly (page 6623)
14. Remove the cover.
    See:Housing (page 5524)
15. Remove the low tone horn assembly.
    See:Low-tone horn assembly (page 9921)
16. Remove the tweeter assembly.
    See:Tweeter assembly (page 9920)
17. Remove the driving warning horn assembly.
    See:Driving warning horn assembly (page)
18. Remove the air guide cover.
    See:Air guide cover (page 5533)
19. Remove the front end module assembly.

© 2026, All rights reserved

a. Unscrew the 3 fixing bolts connecting the front end module assembly and the front compartment lower cover assembly - arrow -.
Recommended tool: 10mm socket
Torque: 5±1N m

b. Release the 1 retaining clip connecting the hood lock cable assembly to the front end module assembly - arrow -.
Recommended tool: Clip remover

c. Disconnect the 1 fixing clip -arrow- connecting the engine compartment wiring harness assembly to the front end module assembly, and move the engine compartment wiring harness assembly aside.
Recommended tool: Clip remover

d. Disconnect the cooling module assembly heat pump ① from the front end module assembly, and secure the cooling module assembly heat pump ① using a cloth strip, wire, or similar tool.
e. Remove the front end module assembly ②.

SETUP

1. The installation procedure is performed in reverse order.

POWERTRAIN FRAME FRONT CROSSMEMBER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5515)
3. Remove the battery assembly.
   See:Battery Assembly (page)
4. Remove the battery tray.
   See:Battery tray (page)
5. Remove the super integrated module.
   See:Super Integrated Module (page 5397)
6. Remove the three-electric frame front crossmember assembly.

a. Release the 4 retaining clips - arrow - between the three-electric frame front crossmember assembly and the engine compartment wiring harness assembly.
   Recommended tool: Clip remover

b. Unscrew the 1 fixing bolt - Arrow A - connecting the front crossmember assembly of the three-electric system frame to the high- and low-voltage inlet and outlet pipeline assembly.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Unscrew the 2 fixing bolts connecting the three-electric frame front crossmember assembly to the body -Arrow B-, and remove the three-electric frame front crossmember assembly ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP

1. The installation procedure is performed in reverse order.

STORAGE BOX MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5495)
3. Remove the storage box mounting bracket assembly.

a. Unscrew the 2 fixing bolts -arrow- connecting the storage box mounting bracket assembly to the vehicle body.
   Recommended tool: 10mm socket
   Torque: 23±2N m
b. Remove the storage box mounting bracket assembly ①.

SETUP

1. The installation procedure is performed in reverse order.

FRONT END MODULE LEFT REINFORCEMENT BRACKET ASSEMBLY

NOTE

This section describes the removal and installation of the front end module left reinforcement bracket assembly, and the removal and installation of the front end module right reinforcement bracket assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the front-end module left reinforcement bracket assembly.

a. Unscrew the 1 fixing bolt connecting the front end module left reinforcement bracket assembly to the front end module assembly -Arrow A -.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Unscrew the 2 mounting bolts connecting the front end module left reinforcement bracket assembly to the body -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 9±1N m
c. Remove the left reinforcement bracket assembly ① of the front end module.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT FRONT HEADLIGHT CROSSMEMBER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the left front headlamp crossmember.

a. Unscrew the 2 mounting bolts connecting the left front headlamp crossmember to the vehicle body -Arrow A-.
Recommended tool: 10mm socket
Torque: 9±1N m

b. Unscrew the 2 fixing bolts -Arrow B- connecting the left front headlamp crossmember to the front end module assembly, and remove the left front headlamp crossmember ①.
Recommended tool: 10mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

HOOD LATCH MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5421)
4. Remove the hood latch mounting bracket.

a. Unscrew the 4 fixing bolts -arrow- connecting the hood lock mounting bracket, and remove the hood lock mounting bracket ①.
   Recommended tool: 13mm socket
   Torque: 23±2N m

SETUP

1. The installation procedure is performed in reverse order.

8.3 CHARGING PORT FLAP SYSTEM

8.3.1 PRECAUTIONS

PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the parts meet the OEM technical specifications.
2. Do not use metal tools to disassemble the charging port housing assembly to prevent scratching the paint surface.
3. After installation, check the button switch of the charging port housing assembly, the button switch should open and close smoothly, without any sticking.

© 2026, All rights reserved

8.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The charging port protective cover consists of a cover body, a latch, a sealing strip, and other components. The cover body is the main part of the protective cover, typically made of elastic material to closely cover the charging port. The latch is used to secure the protective cover and prevent accidental opening. The sealing strip is located between the cover body and the device to provide water and dust protection.
- It can effectively protect the charging port, preventing dust, moisture, and other contaminants from entering the device, thereby enhancing the durability of the device.
- The protective cover is typically designed for ease of use, making it easy to open and close.

The charging port housing assembly system mainly consists of the following components:

- Charging port housing assembly: Provides sealing to prevent dust, moisture, etc. from entering the device, thereby improving the durability of the device.
- Charging port cover assembly: It can effectively protect the charging port.

8.3.6 SERVICE AND REPAIR GUIDANCE

CHARGING PORT HOUSING ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the charging port cover assembly.
   See:Charging port cover assembly (page 6882)
3. Remove the charging port box assembly.

a. Detach the 1 connection between the dust cover for the fast and slow charging plug and the charging port housing assembly -arrow-, and remove the dust cover ① for the fast and slow charging plug.
   Recommended tool: Interior trim removal tool

b. Use a tool to gently pry open the 4 retaining clips -arrow- connecting the charging port housing assembly to the vehicle body, and disconnect the connection.
   Recommended tool: Interior trim removal tool

> **NOTE**
>
> Do not use metal tools during the removal process to avoid scratching the painted surface or damaging the charging port housing assembly.

c. Remove the charging port housing assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check and confirm that the gap values at all parts around the charging port box assembly are within the respective standard ranges, and adjust them if they do not meet the requirements.

8.4 GLASS SYSTEM

8.4.1 PRECAUTIONS

PRECAUTIONS

1. When removing glass components, wear protective gloves and safety goggles to avoid injury to the skin or eyes.
2. When removing the glass, handle it with care and place it securely to prevent damage to the glass during the operation.
3. If the power window encounters an unexpected obstruction during use, promptly disconnect the battery power supply to prevent the motor from burning out.

8.4.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- Introduction to the front windshield heating function.
  a. The windshield integrates a forward-facing monocular camera with silver paste heating, providing defrost and defog functions for the camera area.

- Introduction to the rear windshield heating function.
  a. The rear windshield integrates silver paste heating and an antenna, providing defrosting, defogging, and radio signal reception functions.

8.4.7 SERVICE AND REPAIR GUIDANCE

REAR WINDSHIELD ASSEMBLY

NOTE

When removing the rear windshield assembly, avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5563)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5560)
5. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5565)
6. Remove the left/right spoiler trim assembly.
   See:Left spoiler trim panel assembly (page 5500)
7. Remove the spoiler assembly.
   See:Spoiler assembly (page 5502)
8. Remove the rear wiper arm and blade assembly.
   See:Rear wiper arm and blade assembly (page 9954)
9. Remove the rear wiper motor.
   See:Rear wiper motor (page 9957)
10. Remove the rear wiper seal.
    See:Rear wiper seal (page 9958)
11. Remove the rear windshield assembly.

a. Disconnect the 2 connectors between the liftgate wiring harness assembly and the rear windshield assembly -arrow-.

© 2026, All rights reserved

b. Use an awl to pierce through the adhesive sealant of the rear windshield assembly.
c. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
d. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.
e. There are 2 locating clips on the rear windshield assembly. Be careful to avoid them when cutting.
f. Cut the bonded glass with the assistance of another technician.
Recommended tools: Glass puller, steel wire

g. Detach the 2 locating clips connecting the rear windshield assembly and the liftgate assembly - arrow -.
Recommended tool: Interior trim removal tool
h. Attach the glass suction cup ① to the rear windshield assembly, and carefully remove the rear windshield assembly ②.
Recommended tool: Glass suction cup

> **NOTE**
>
> When removing the rear windshield assembly, handle it with care to avoid chipping the glass.

SETUP

1. Install the rear windshield assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

   > **ATTENTION**
   >
   > Do not damage the vehicle paint finish.

   b. Clean debris from the vehicle interior, and clean the body mounting surface of the rear windshield assembly.
   c. Use glass cleaner to clean the body mounting surface of the rear windshield assembly.
   d. Apply glass/paint primer evenly to the body mounting surface of the rear windshield assembly.
   Body undercoating model: Huitian 8906P
   e. Use glass cleaner to clean around the rear windshield assembly.
   f. Apply glass/paint primer evenly to the installation surfaces around the perimeter of the rear windshield assembly.
   Glass Primer Model: Huitian 8906G

© 2026, All rights reserved

g. Use a sealant gun to evenly apply the glass sealant on the mounting surface of the rear windshield assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
Glass sealant model: Huitian 8960H

> NOTE
>
> Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Use glass suction cups to carefully fit the rear windshield assembly onto the body mounting surface.
i. Gently press around the edges of the rear windshield assembly to ensure it is securely adhered in place.
j. Use protective tape to secure the rear windshield assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

> WARNING
>
> - When removing the film, take care to avoid injury from scattered debris or glass.
> - After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

> NOTE
>
> - Conduct the rain test 3-4 hours after installing the rear windshield assembly (at around 20°C).
> - If any leakage is found, use sealant to repair and seal the area.

© 2026, All rights reserved

LEFT REAR QUARTER WINDOW GLASS ASSEMBLY

NOTE

- This section describes the removal and installation of the left rear quarter window glass assembly. The removal and installation of the right rear quarter window glass assembly can generally follow the procedure for the left side.
- When removing the left rear quarter window glass assembly, first apply a protective film to mask and protect the side panel sheet metal at the lower end of the quarter window to avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the rear left door assembly.
3. Remove the left rear quarter window glass assembly.

a. Use a tool to cut through the glass bonding adhesive of the left rear quarter window glass assembly.
Recommended tool: Glass puller

ATTENTION

Take protective measures during the steel wire cutting process to avoid scratching the sheet metal parts.

b. Release the 3 locating clips – arrow – connecting the left rear quarter window glass assembly to the body, and remove the left rear quarter window glass assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Use a blade to thoroughly remove the glass sealant from the sheet metal area of the quarter window, and any residual glass sealant on the sheet metal must be removed immediately.

   ATTENTION

   Do not damage the vehicle paint finish.

   b. Use adhesive remover to wipe the sheet metal area of the quarter window clean.
   c. After removing the residual adhesive from the glass, evenly apply the body primer to the body mounting surface of the rear quarter glass assembly.
   Body undercoating model: Huitian 8906P

© 2026, All rights reserved

d. After removing the residual adhesive from the glass, evenly apply the glass primer to the mounting surfaces around the rear quarter window glass assembly.
Glass Primer Model: Huitian 8906G
e. Use a sealant gun to apply the sealant evenly onto the mounting surface of the rear quarter window glass assembly. The sealant bead should be applied evenly and continuously, and its cross-section should preferably be trapezoidal or triangular.
Glass sealant model: Huitian 8960H

> NOTE
>
> Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

f. Install the rear quarter window glass assembly and perform a rain test after the glass adhesive cures.
g. If any leakage is found, use sealant to repair and seal the area.

REAR LEFT DOOR GLASS ASSEMBLY

NOTE

This section describes the removal and installation of the left rear door glass assembly, and the removal and installation of the right rear door glass assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door interior trim panel assembly.
   See:Rear right door interior trim panel assembly (page 5550)
3. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6861)
4. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6687)
5. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6682)
6. Remove the left rear door rear guide rail assembly.
   See:Left Rear Door Rear Guide Rail Assembly (page 6686)
7. Remove the rear left door glass assembly.

a. First, lower the left rear door glass assembly to a position below the midpoint before proceeding to the next disassembly step.

   NOTE

   If a failure of the power window motor assembly prevents the procedure from proceeding, first remove the rear door window regulator mechanism assembly, and then remove the rear door glass assembly.

b. Unscrew the 2 fixing bolts -arrow- connecting the left rear door glass assembly to the left rear door power window regulator assembly.
   Recommended tool: 8mm socket
   Torque: 9±1N m

© 2026, All rights reserved

c. Slowly remove the left rear door glass assembly ①.

> NOTE
>
> When removing the rear door glass assembly, handle it with care to avoid chipping or damaging the glass.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

ROOF GLASS ASSEMBLY

NOTE

Depending on the configuration, the appearance of the roof glass assembly may vary slightly. Please repair or replace it according to the actual condition of the vehicle. When removing the roof glass assembly, avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the headliner assembly.
   See:Headliner assembly (Panoramic roof) (page 5757)
4. Remove the electric sunshade assembly.
   See:Electric sunshade assembly (page 6853)
5. Remove the roof glass assembly.

a. Use an awl to pierce through the adhesive sealant of the roof glass assembly.
b. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
c. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.
d. There are locating clips -arrow- at the two corners of the roof glass assembly, be careful to avoid them when cutting.
e. Cut the bonded glass with the assistance of another technician.
   Recommended tools: Glass puller, steel wire

f. Disconnect the 2 locating clips -arrow- connecting the roof glass assembly to the vehicle body.
   Recommended tool: Interior trim removal tool
g. Install the glass suction cup ① on the roof glass assembly, and carefully remove the roof glass assembly ②.
   Recommended tool: Glass suction cup

SETUP

1. Install the roof glass assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

ATTENTION

© 2026, All rights reserved

Do not damage the vehicle paint finish.

b. Clean debris from the vehicle interior, and clean the body mounting surface of the roof glass assembly.
c. Use glass cleaner to clean the body mounting surface of the roof glass assembly.
d. Apply glass/paint primer evenly to the body mounting surface of the roof glass assembly.
Body undercoating model: Huitian 8906P
e. Use glass cleaner to clean around the roof glass assembly.
f. Apply glass/paint primer evenly to the installation surfaces around the perimeter of the roof glass assembly.
Glass Primer Model: Huitian 8906G
g. Use a glass sealant gun to evenly apply the glass sealant to the mounting surface of the roof glass assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
Glass sealant model: Huitian 8960H

NOTE

Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Use glass suction cups to carefully attach the roof glass assembly to the vehicle body mounting surface.
i. Gently press around the perimeter of the roof glass assembly to ensure it is properly bonded in place.
j. Use protective tape to secure the roof glass assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

WARNING

- When removing the film, take care to avoid injury from scattered debris or glass.
- After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

NOTE

- Perform the rain test 3-4 hours after installing the roof glass assembly (at approximately 20°C).
- If any leakage is found, use sealant to repair and seal the area.

FRONT LEFT DOOR GLASS ASSEMBLY

NOTE

This section describes the removal and installation of the front left door glass assembly, and the removal and installation of the front right door glass assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door interior trim panel assembly.
   See:Right Front Door Interior Trim Panel Assembly (page 5542)
3. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6860)
4. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6678)
5. Remove the front left door glass assembly.

a. First, lower the front left door glass assembly to a position below the halfway point, then proceed to the next disassembly step.

NOTE

If the window regulator motor assembly fails and prevents the procedure from continuing, first remove the front door window regulator mechanism assembly, and then remove the front door glass assembly.

b. Detach the retaining clips -arrow- connecting the left front door glass assembly and the left front door power window regulator assembly on both sides.
c. Slowly remove the front left door glass assembly ①.

NOTE

When removing the front door glass assembly, handle it with care to avoid damaging the glass.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT WINDSHIELD ASSEMBLY

NOTE

When removing the windshield assembly, avoid cutting or scratching the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 248)
3. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5753)
4. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5617)
5. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5616)
6. Remove the interior rearview mirror assembly.
   See:Interior rearview mirror assembly (page 5474)
7. Remove the front monocular camera assembly.
   See:Front-view monocular camera assembly (page 9572)
8. Remove the rain and light sensor.
   See:Rain/light sensor (page)
9. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
10. Remove the left/right end covers of the ventilation window cover plate.
    See:Left end cover of ventilation window cover (page 5491)
11. Remove the cowl panel grille assembly.
    See:Cowl Grille Assembly (page 5492)
12. Remove the front wiper motor and linkage assembly.
    See:Front wiper motor and linkage assembly (page 9946)
13. Remove the front windshield assembly.

a. Disconnect the 2 retaining clips - arrow - connecting the instrument panel wiring harness assembly to the front windshield assembly.
   Recommended tool: Interior trim removal tool

© 2026, All rights reserved

b. Use an awl to pierce through the adhesive sealant of the windshield assembly.
c. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
d. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.
e. The front windshield assembly has 2 locating clips - arrow -. Take care to avoid them when cutting.
f. Cut out the bonded glass with the assistance of another technician.
Recommended tools: Glass puller, steel wire

g. Disconnect the 2 locating clips -arrow- connecting the front windshield assembly to the vehicle body.
Recommended tool: Interior trim removal tool
h. Install the glass suction cup ① on the front windshield assembly, and carefully remove the front windshield assembly ②.
Recommended tool: Glass suction cup

SETUP

1. Install the front windshield assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

   ATTENTION

   Do not damage the vehicle paint finish.

   b. Clean debris from the vehicle interior, and clean the body mounting surface of the front windshield assembly.
   c. Use glass cleaner to clean the body mounting surface of the front windshield assembly.
   d. Apply glass/paint primer evenly to the body mounting surface of the windshield assembly.
   Body undercoating model: Huitian 8906P
   e. Use glass cleaner to clean around the front windshield assembly.
   f. Apply the glass/paint primer evenly to the mounting surfaces around the perimeter of the windshield assembly.
   Glass Primer Model: Huitian 8906G
   g. Use a sealant gun to evenly apply the glass sealant onto the mounting surface of the front windshield assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
   Glass sealant model: Huitian 8960H

   NOTE

© 2026, All rights reserved

Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Carefully fit the front windshield assembly onto the body mounting surface using glass suction cups.
i. Gently press around the perimeter of the front windshield assembly to ensure the windshield is properly bonded in place.
j. Use protective tape to secure the front windshield assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

WARNING

- When removing the film, take care to avoid injury from scattered debris or glass.
- After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

NOTE

- Perform the rain test 3-4 hours after installing the windshield (at approximately 20°C).
- If any leakage is found, use sealant to repair and seal the area.

8.5 SEALING SYSTEM

8.5.1 PRECAUTIONS

PRECAUTIONS

1. During removal and installation, do not scratch or damage the seals; otherwise, such damage may cause poor sealing and lead to water ingress.
2. When installing the weatherstrip, do not twist or fold it.
3. The weatherstrip must fit tightly against the sealing surface and be installed securely.
4. After installing critical seals, a water spray test must be conducted to ensure proper sealing.

8.5.6 SERVICE AND REPAIR GUIDANCE

LIFTGATE SEALING STRIP

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the liftgate weatherstrip.

a. Remove the tailgate sealing strip ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the tailgate weatherstrip, align the joint line of the tailgate weatherstrip with the center of the tailgate striker, and press it into position first; the installation sequence of the tailgate weatherstrip is from bottom to top, and from both sides towards the center, pressing it into place progressively; the final installation endpoint is located in the upper center area.
   b. After installation, if necessary, use a pressing fixture or a soft rubber mallet to seat the U-shaped groove of the weatherstrip in place.
   c. After the interior trim parts are assembled, tear off the pull cord of the rubber strip, and ensure that the lip edge overlaps smoothly.
   d. After assembly, check whether the weatherstrip is properly installed all around, ensuring smooth overlap with the sheet metal and interior trim, with no curling or improper installation.
   e. After installation, press and smooth the weatherstrip to prevent water leakage and appearance defects. Ensure the weatherstrip lip is correctly assembled and not inverted.

REAR LEFT DOOR OPENING WEATHERSTRIP

NOTE

This section describes the removal and installation of the left rear door aperture seal, and the removal and installation of the right rear door aperture seal can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the lower left A-pillar interior trim panel assembly.
   See:Right Lower A-Pillar Interior Trim Panel Assembly (page 5623)
3. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5624)
4. Remove the left B-pillar upper interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5627)
5. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5621)
6. Remove the sealing strip of the rear left door opening.

a. Remove the left rear door opening seal ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Markings:
      - Rear door: Red on the left, green on the right.
   b. Identify the corresponding parts by the color of the marking points to ensure they match the respective doors and prevent incorrect installation.
   c. When installing the rear door aperture weatherstrip, start the installation by aligning the color mark on the weatherstrip parallel to the side panel limiter mounting hole. Snap the weatherstrip into the door aperture flange, and install it in both upward and downward directions. Ensure the weatherstrip is fully seated, install it down to the lower sill position, and finish the installation at the installation stop area.
   d. After installation, if necessary, use a pressing fixture or a soft rubber mallet to seat the U-shaped groove of the weatherstrip in place.
   e. After the interior trim parts are assembled, tear off the pull cord of the rubber strip, and ensure that the lip edge overlaps smoothly.
   f. The weatherstrip is securely snap-fitted to the sheet metal.
   g. Ensure no waviness or dislodgement around the entire circumference, and check the assembly condition at the corners during the process.

FRONT LEFT DOOR INNER WATER DEFLECTOR

NOTE

This section describes the removal and installation of the inner belt weatherstrip for the front left door, and the removal and installation of the inner belt weatherstrip for the front right door can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Lower the front left door glass assembly to the lowest position.
3. Remove the front left door interior trim panel assembly.
   See:Right Front Door Interior Trim Panel Assembly (page 5542)
4. Remove the inner belt weatherstrip of the front left door.
