	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C200D92-IBC

Fault code	Description
C200D92	Pedal travel sensor 2 is in an impossible state

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: C200D4B-IBC

Fault code	Description
C200D4B	Simulate Solenoid Valve Over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C200D04-IBC

Fault code	Description
C200D04	Brake hydraulic system error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the brake fluid level.	
	A Check whether the brake fluid level is too low.
Yes 》 》 》 Inspect and repair brake fluid leaks; add brake fluid to the standard level.	
	No 》 》 》 Go to step 3.
Step 3 Bleed the brake system.	
	A. Connect the diagnostic tool to the OBD port. B. Bleed the brake system according to the prompts on the diagnostic tool. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》 》 》 System normal.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

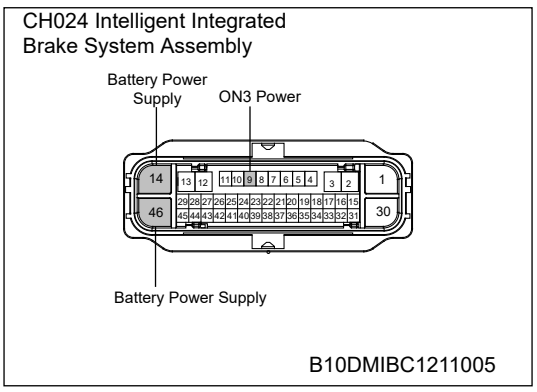
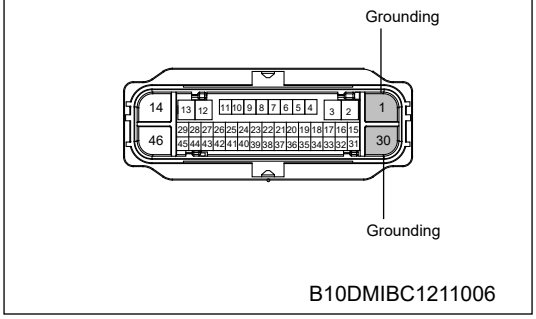
DTC: C212B16-IBC

Fault code	Description
C212B16	Low V5_2 supply voltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

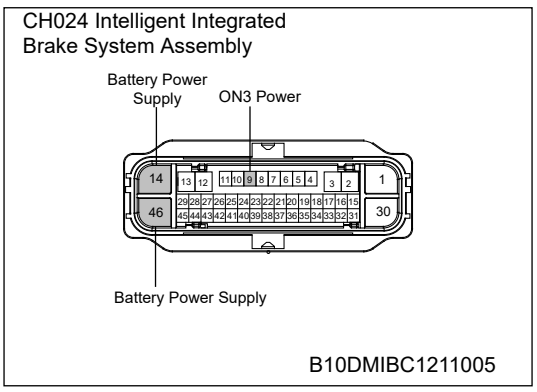
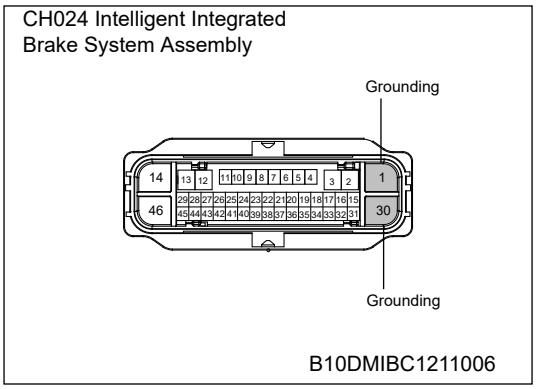
DTC: C213E16-IBC

Fault code	Description
C213E16	Low charge pump supply voltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

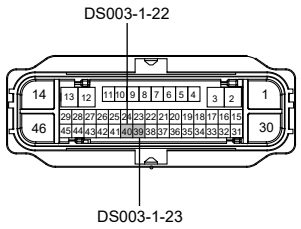
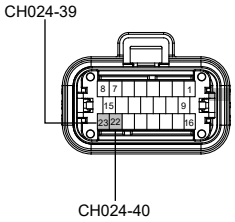
Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003- 1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

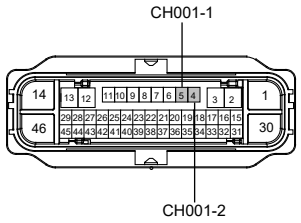
DTC: C21A012-IBC

Fault code	Description
C21A012	Front left wheel speed sensor low side short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

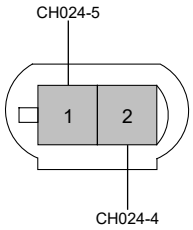
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intel ligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and terminal 2 of wire harness connector CH001 of th e left front intelligent wheel speed sensor to check if the res istance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector CH024 of the Smart Integrated Brake System assem bly and terminal 1 of the wire harness connector CH001 of t he front left smart wheel speed sensor to check if it is norm al.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 1 and 2 of the wiring harn ess connector CH001 for the front left intelligent wheel spe ed sensor and the vehicle body ground to check whether it i s normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front left intelligent wheel speed sensor.

A Replace the front left intelligent wheel speed sensor.

© 2026, All rights reserved

	B After replacing the front left intelligent wheel speed sens or, is the fault cleared?
	Yes 》 》 》 System normal.

Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C21B016-IBC

Fault code	Description
C21B016	Left front wheel speed sensor supply voltage low

1. Simplified Circuit Diagram

2. Diagnostic Steps

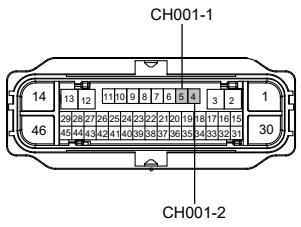
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

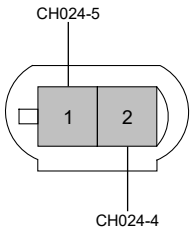
Step 2 Check the power supply and ground of the Intelligent Integrated Brake System assembly.



A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.



Step 3 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

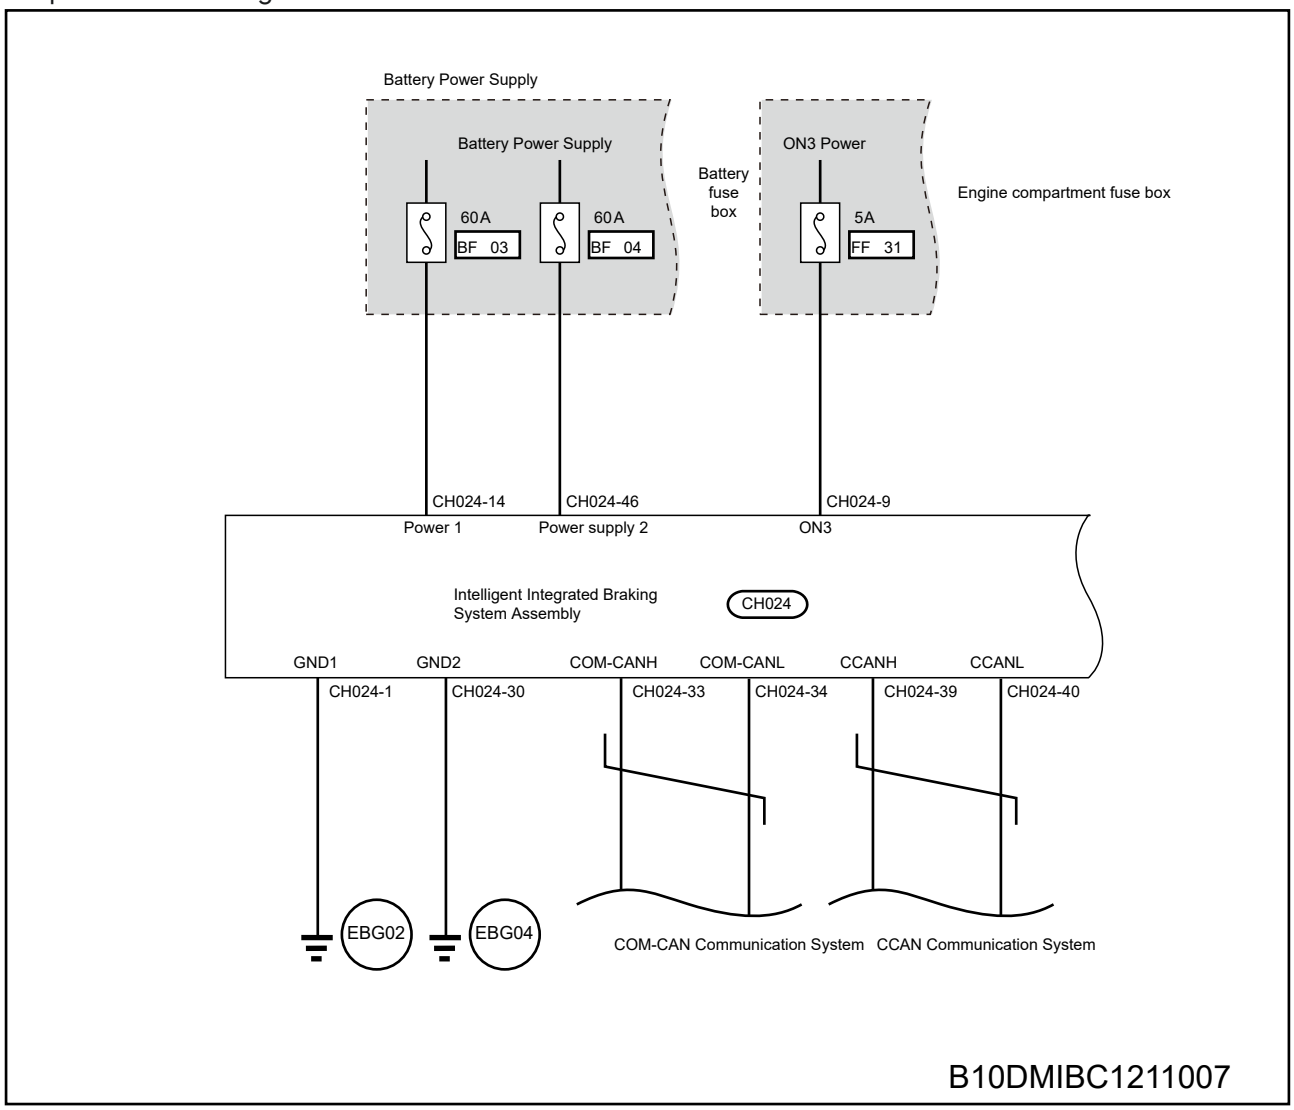
B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of wire harness connector CH001 of the left front intelligent wheel speed sensor to check if the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the wire harness connector CH024 of the Smart Integrated Brake System assembly and terminal 1 of the wire harness connector CH001 of the front left smart wheel speed sensor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the harness connector CH001 for the left front intelligent wheel speed sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

© 2026, All rights reserved



Step 4 Replace the front left intelligent wheel speed sensor.	
	A Replace the front left intelligent wheel speed sensor. B After replacing the front left intelligent wheel speed sens or, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: C211B4B-IBC

Fault code	Description
C211B4B	Motor winding over-temperature error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Re-flash the software program.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to reflash the software program and perform cali bration. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 System normal.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

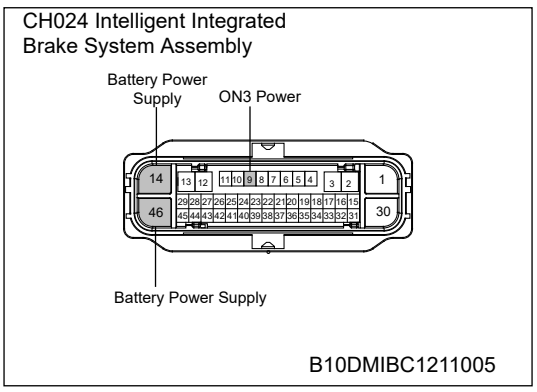
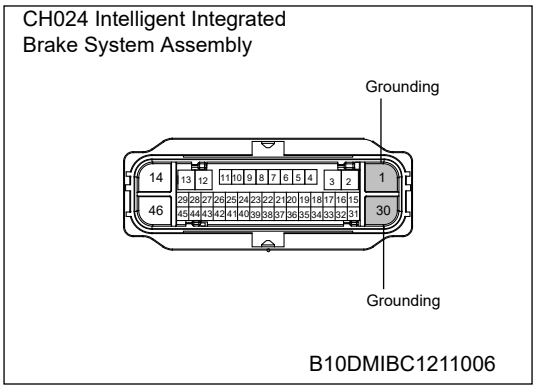
DTC: C21E2A1-IBC

Fault code	Description
C21E2A1	System voltage abnormal



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

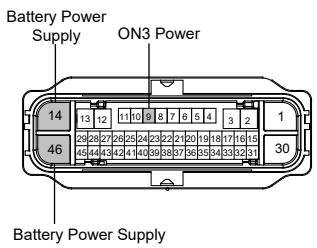
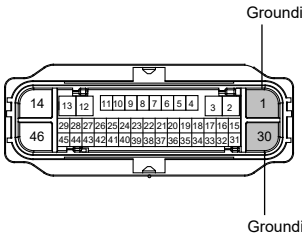
DTC: C2270A1-IBC

Fault code	Description
C2270A1	Abnormal system voltage causes ECU self-test interruption



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Cycle the power and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Replace the wheel speed sensor.	
	A. Replace the wheel speed sensors one by one, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C253B55-IBC

Fault code	Description
C253B55	Pressure sensor uncalibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Perform the pressure sensor calibration procedure.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to perform the pressure sensor calibration proce dure. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

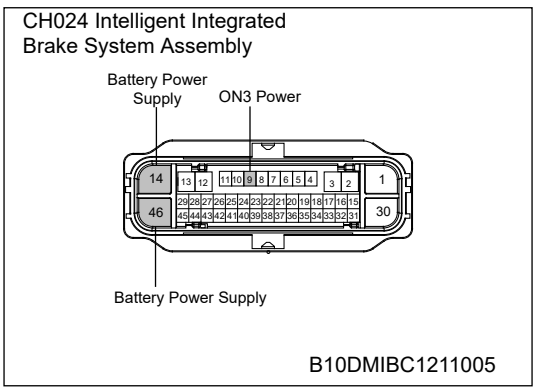
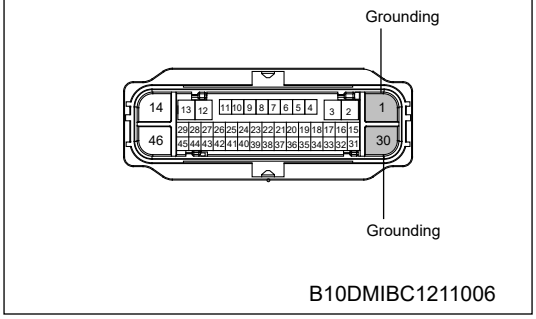
DTC: C2600A3-IBC

Fault code	Description
C2600A3	High system voltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: C253F77-IBC

Fault code	Description
C253F77	System pressure reset to zero failed

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

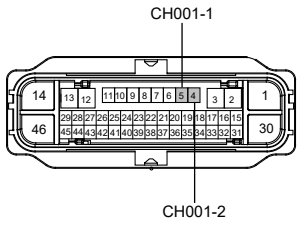
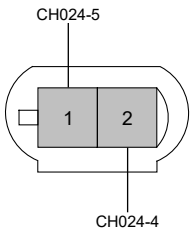
DTC: C21F029-IBC

Fault code	Description
C21F029	Left front wheel speed sensor value out of range





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A After cycling the power, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intel ligent integrated brake system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211003 CH001 Front left intelligent wheel speed sensor  B10DMIBC1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and terminal 2 of wire harness connector CH001 of th e left front intelligent wheel speed sensor to check if the res istance value is normal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector CH024 of the Smart Integrated Brake System assem bly and terminal 1 of the wire harness connector CH001 of t he front left smart wheel speed sensor to check if it is norm al. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the ha rness connector CH001 for the left front intelligent wheel s peed sensor and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 1 and 2 of the wir e harness connector CH001 of the front left intelligent whe el speed sensor and the vehicle body ground is normal.

© 2026, All rights reserved

	Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front left intelligent wheel speed sensor.	
	A Replace the front left intelligent wheel speed sensor. B After replacing the front left intelligent wheel speed sens or, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: C26C455-IBC

Fault code	Description
C26C455	Pedal travel sensor not calibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Perform the pedal travel sensor calibration procedure.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic instrument to perform the pedal travel sensor calibra tion procedure. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 System normal.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

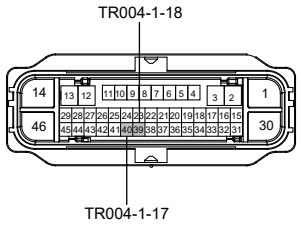
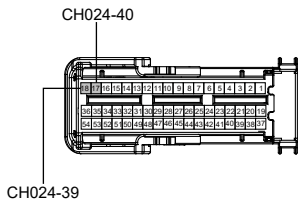
DTC: C260C83-IBC

Fault code	Description
C260C83	Communication fault: ACU233 message checksum abnormality





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

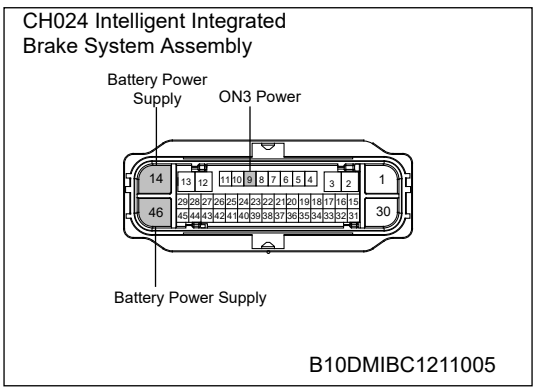
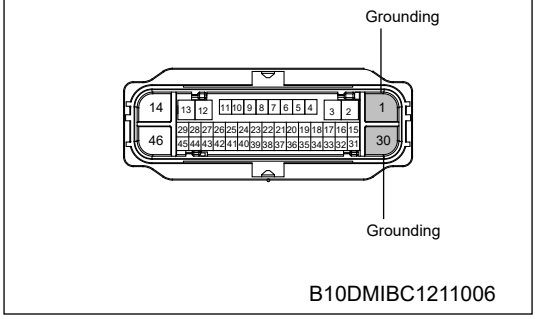
DTC: C2602A1-IBC

Fault code	Description
C2602A1	System voltage abnormal



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Re-run the vehicle configuration information writing procedure.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and re-execute the vehicle configur ation information writing procedure according to the prom pts of the diagnostic instrument. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C200068-IBC

Fault code	Description
C200068	Factory Mode Detection

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Exit "Production Mode".	
	A. Connect the diagnostic tool to the OBD port. B. Power on the vehicle and exit "Production Mode" as pro mpted by the diagnostic tool. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C200153-IBC

Fault code	Description
C200153	MCU self-test failed

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

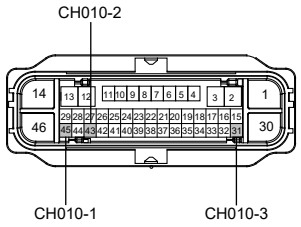
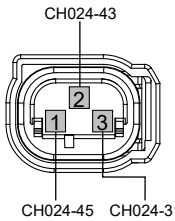
DTC: C20007B-IBC

Fault code	Description
C20007B	Brake fluid level is slightly low

1. Simplified Circuit Diagram





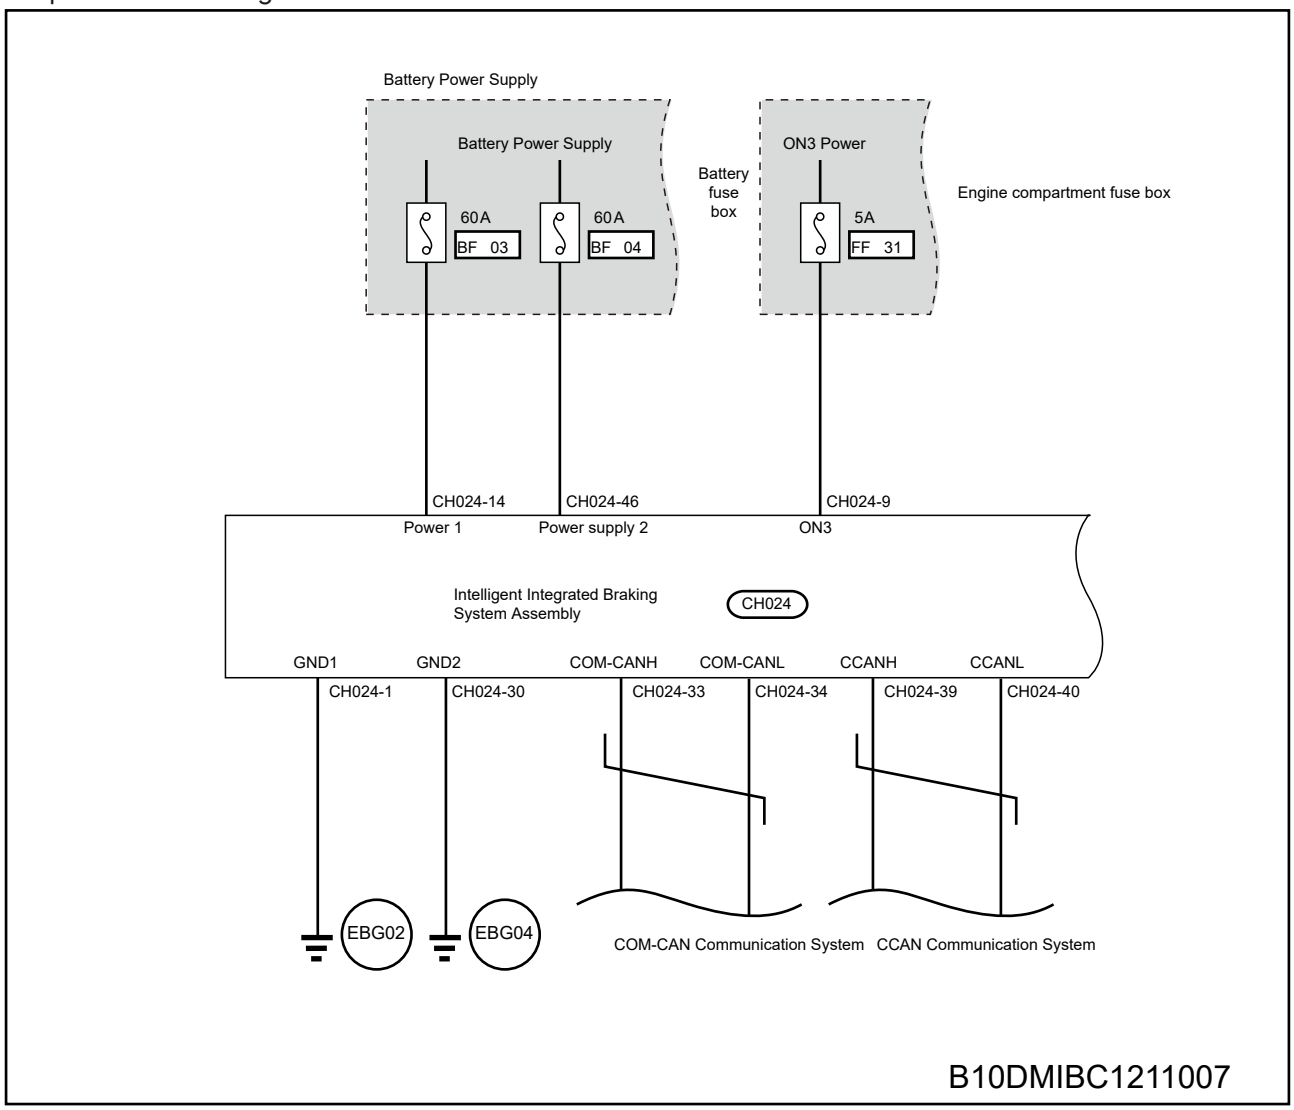
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the brake fluid level.	
	A Check whether the brake fluid level is too low.
	No》》》 Go to step 5.
	Yes》》》 Go to step 3.
Step 3 Check the brake system lines.	
	A. Check the brake system lines for leaks.
	Yes》》》 Replace the damaged pipe.
	No》》》 Go to step 4.
Step 4 Check the brake pads and brake discs.	
	A. Check whether the brake pads and brake discs are excessively worn and have reached the replacement standard.
	Yes》》》 Replace the brake friction pads or brake discs.
	No》》》 Go to step 5.
Step 5 Check the wiring harness connector of the brake fluid level sensor.	
	A. Check the brake fluid level sensor harness connector for looseness, terminal push-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 6.
Step 6 Check whether the wiring harness between the brake fluid level sensor and the Intelligent Integrated Brake System assembly is normal.	

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211032 CH010 Brake Fluid Level Sensor  B10DMIBC1211033	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH010 of the brake fluid level sensor. D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal. F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: C200009-IBC

Fault code	Description
C200009	EPB ASIC Fault 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Clear the fault codes, and after power cycling, check whether the EPB function is normal and whether the fault is resolved.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

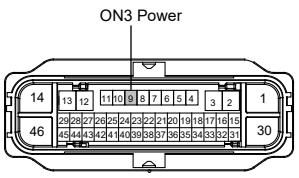
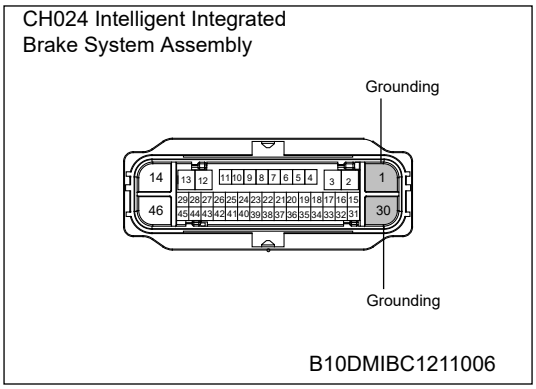
DTC: C200001-IBC

Fault code	Description
C200001	KL15 hardwire fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the ON3 power supply fuse of the Intelligent Integrated Brake System assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the FF31 fuse of the intelligent integrated brake sy stem assembly. Fuse specification: FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the ON3 power supply harness of the intelligent integrated braking system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211020	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 9 of the wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

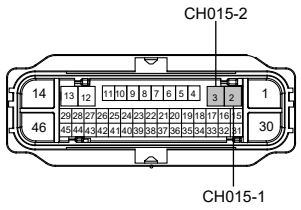
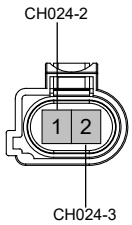
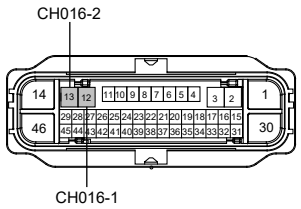
DTC: C200097-IBC

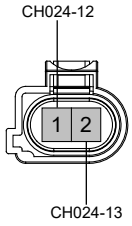
Fault code	Description
C200097	EPB cannot be engaged





1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Clear the fault codes, and after power cycling, check whether the EPB function is normal and whether the fault is resolved.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211022 CH015 Left Drive Brake Motor  B10DMIBC1211023	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH015 of the left drive brake motor. D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 1 of the wiring harness connector CH015 of the left drive brake motor to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of wire harness connector CH015 of the left drive brake motor to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and measure the resistance between terminals 1 and 2 of harness connector CH015 for the left drive brake motor and the vehicle body ground to check if the resistance value is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wire harness

© 2026, All rights reserved

	connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal. Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrate d Brake System assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211024 CH016 Right Drive Brake Motor  B10DMIBC1211025	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the wire harness connector CH016 of the righ t drive brake motor. D. Use a multimeter set to the resistance range to measure t he resistance between terminal 12 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH016 o f the right drive brake motor to check whether the resistanc e value is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 16 of the right drive brake motor to check if it is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wi re harness connector CH016 for the right drive brake motor and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wiring harne ss connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal . Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.

DTC: C200124-IBC

Fault code	Description
C200124	Front right wheel speed sensor high-side or low-side power supply st uck

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C200096-IBC

Fault code	Description
C200096	EPB disables the IOA function via diagnostic commands.

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Clear the fault codes, and after power cycling, check whether the EPB function is normal and whether the fault is resolved.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

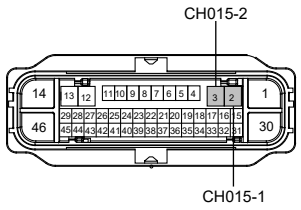
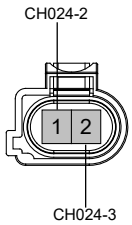
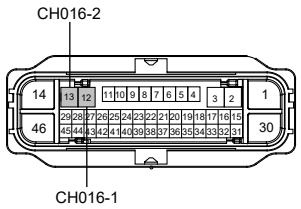
DTC: C200197-IBC

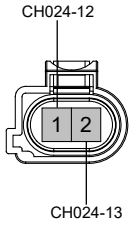
Fault code	Description
C200197	EPB cannot be released





1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Clear the fault codes, and after power cycling, check whether the EPB function is normal and whether the fault is resolved.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211022 CH015 Left Drive Brake Motor  B10DMIBC1211023	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH015 of the left drive brake motor. D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 1 of the wiring harness connector CH015 of the left drive brake motor to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of wire harness connector CH015 of the left drive brake motor to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and measure the resistance between terminals 1 and 2 of harness connector CH015 for the left drive brake motor and the vehicle body ground to check if the resistance value is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wire harness

© 2026, All rights reserved

	connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal. Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrate d Brake System assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211024 CH016 Right Drive Brake Motor  B10DMIBC1211025	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the wire harness connector CH016 of the righ t drive brake motor. D. Use a multimeter set to the resistance range to measure t he resistance between terminal 12 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH016 o f the right drive brake motor to check whether the resistanc e value is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 16 of the right drive brake motor to check if it is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wi re harness connector CH016 for the right drive brake motor and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wiring harne ss connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal . Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.

DTC: C200414-IBC

Fault code	Description
C200414	Front left dump valve fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

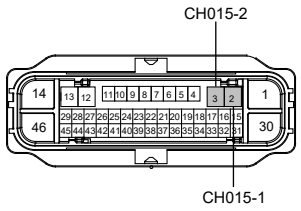
DTC: C200309-IBC

Fault code	Description
C200309	EPB Motor Circuit Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

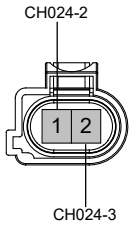
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

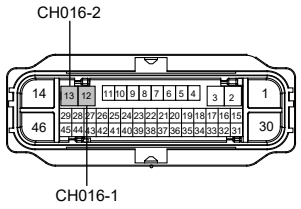
CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

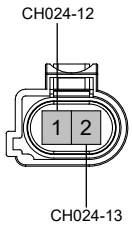
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of harness conn ector CH015 for the left drive brake motor and the vehicle b ody ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wire harness connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left drive brake motor or the right drive brake motor.

A Replace the left drive brake motor or the right drive brake motor.

© 2026, All rights reserved

	B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

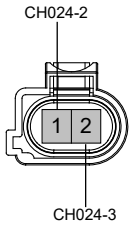
Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

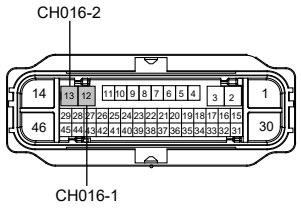
CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

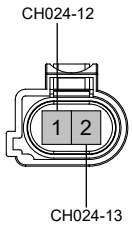
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of harness conn ector CH015 for the left drive brake motor and the vehicle b ody ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wire harness connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left drive brake motor or the right drive brake motor.

A Replace the left drive brake motor or the right drive brake motor.

© 2026, All rights reserved

	B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

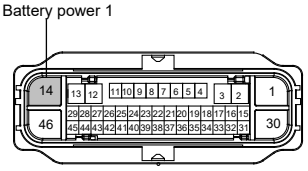
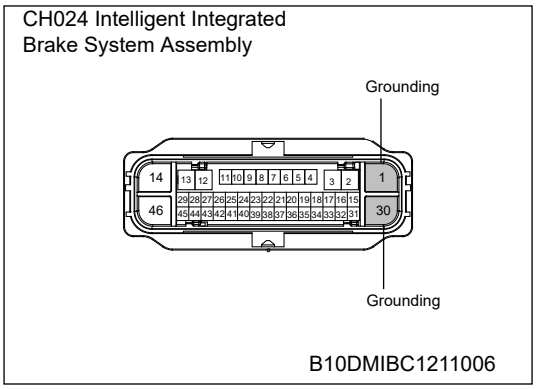
DTC: C200417-IBC

Fault code	Description
C200417	KL30_1 voltage too high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the Power Supply 1 fuse for the Intelligent Integrated Braking System assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the intelligent integrated brake system assembly fu se BF03. Fuse specification: BF03 60A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 1 wiring harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211029	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 14 of the wire harness con nector CH024 of the Intelligent Integrated Brake System ass embly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: C200377-IBC

Fault code	Description
C200377	DUMP valve operation does not achieve the expected effect

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

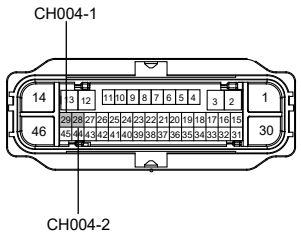
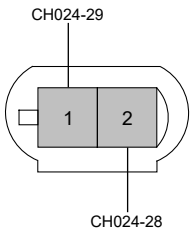
DTC: C200303-IBC

Fault code	Description
C200303	Rear right wheel speed sensor direction error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the installation of the right rear intelligent wheel speed sensor.	
	A Check whether the rear right intelligent wheel speed sens or is installed correctly.
	No 》 》 》 Reinstall and test again.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211015 CH004 Right rear smart wheel speed sensor  B10DMIBC1211016	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear right intelligent wheel speed sensor.	
	A Replace the rear right intelligent wheel speed sensor. B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

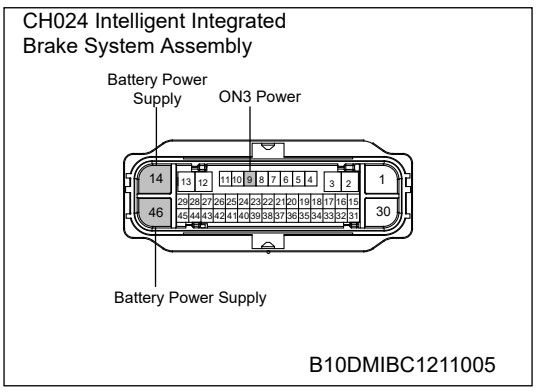
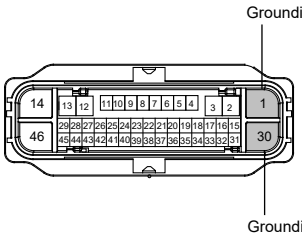
DTC: C200401-IBC

Fault code	Description
C200401	DC request timeout



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

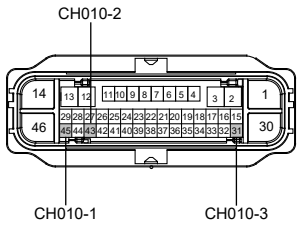
DTC: C200491-IBC

Fault code	Description
C200491	Brake fluid level sensor signal is in an implausible range

1. Simplified Circuit Diagram

2. Diagnostic Steps

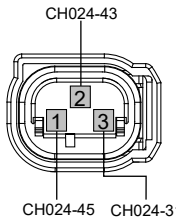
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the brake fluid level sensor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211032

CH010 Brake Fluid Level Sensor

B10DMIBC1211033

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH010 of the brake fluid level sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal.
F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System Assembly and the vehicle body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and the body ground to check if it is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	K Confirm whether the voltage value meets the standard va lue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.	

© 2026, All rights reserved

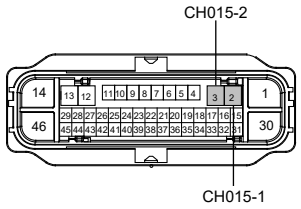
DTC: C200591-IBC

Fault code	Description
C200591	Inconsistent left and right caliper status

1. Simplified Circuit Diagram

2. Diagnostic Steps

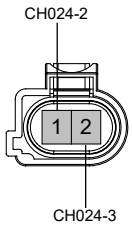
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



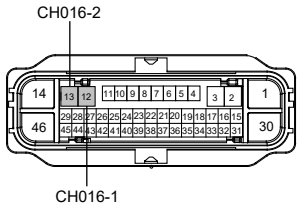
Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

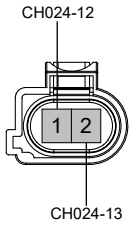


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrate d Brake System assembly is normal.

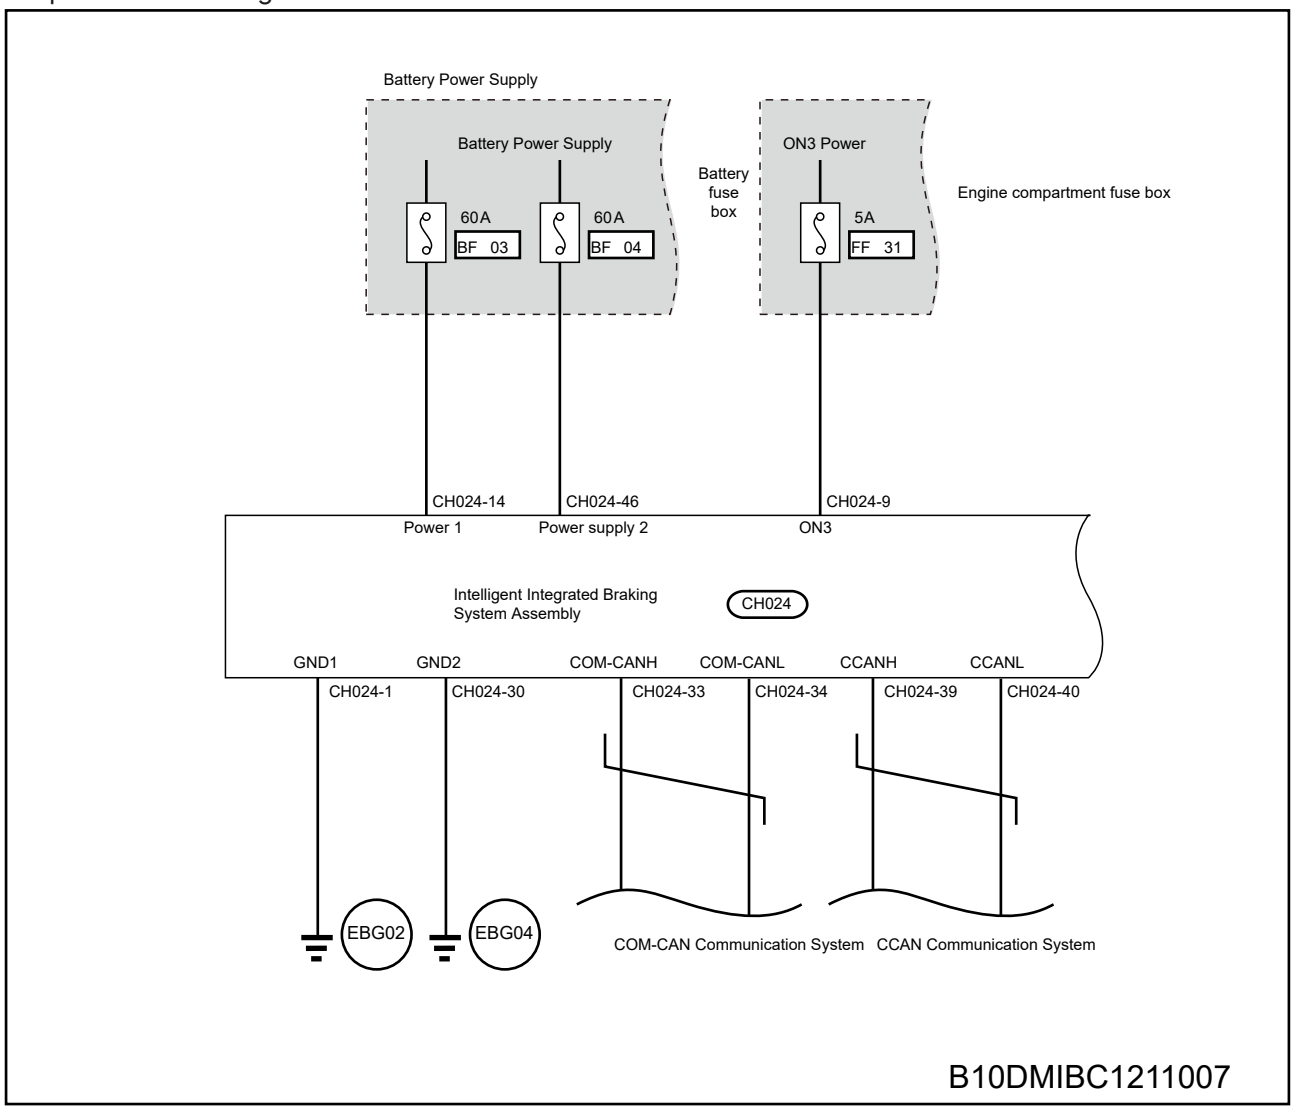


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the righ t drive brake motor.
D. Use a multimeter set to the resistance range to measure t he resistance between terminal 12 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH016 o f the right drive brake motor to check whether the resistanc e value is normal.

© 2026, All rights reserved



CH016 Right Drive Brake Motor  B10DMIBC1211025	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the left drive brake motor or the right drive brake motor.	
	A Replace the left drive brake motor or the right drive brake motor. B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

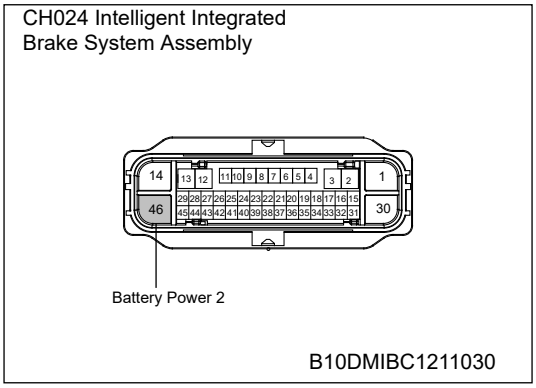
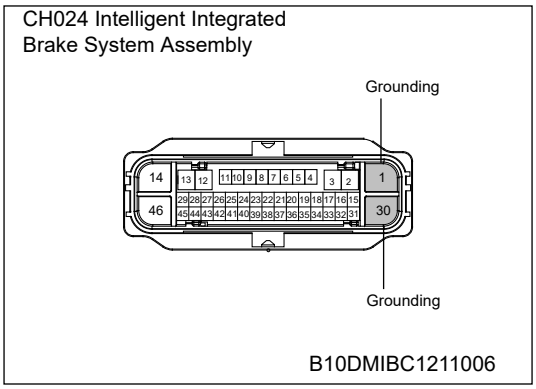
DTC: C200716-IBC

Fault code	Description
C200716	KL30_2 voltage low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 2 fuse for the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the intelligent integrated brake system assembly fuse BF04. Fuse specification: BF04 60A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness for Power Supply 2 of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 46 of harness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

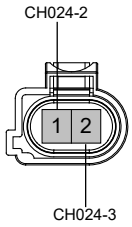
Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of harness conn ector CH015 for the left drive brake motor and the vehicle b ody ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wire harness connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

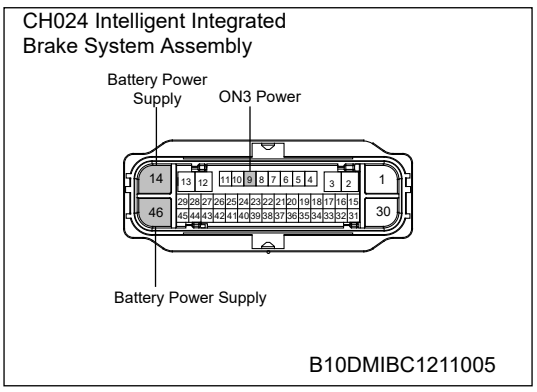
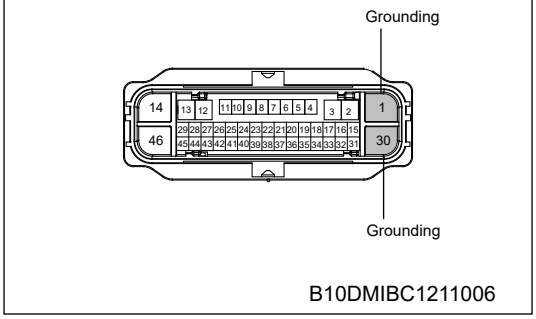
DTC: C200817-IBC

Fault code	Description
C200817	V5_3 supply voltage high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

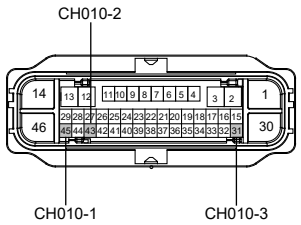
DTC: C20082F-IBC

Fault code	Description
C20082F	Brake fluid level sensor signal E2E protection abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

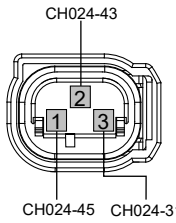
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the brake fluid level sensor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211032

CH010 Brake Fluid Level Sensor

B10DMIBC1211033

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH010 of the brake fluid level sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal.
F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System Assembly and the vehicle body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and the body ground to check if it is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	K Confirm whether the voltage value meets the standard va lue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: C200711-IBC

Fault code	Description
C200711	Rear right ISO valve drive coil short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

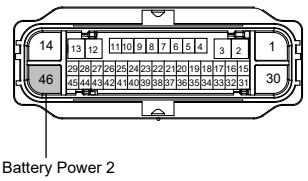
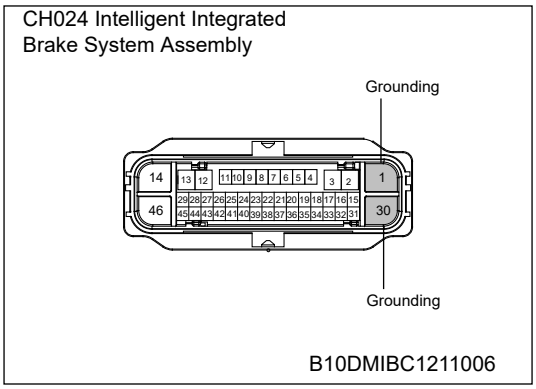
DTC: C200517-IBC

Fault code	Description
C200517	KL30_2 Overvoltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 2 fuse for the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the intelligent integrated brake system assembly fuse BF04. Fuse specification: BF04 60A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness for Power Supply 2 of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  Battery Power 2 B10DMIBC1211030	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 46 of harness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

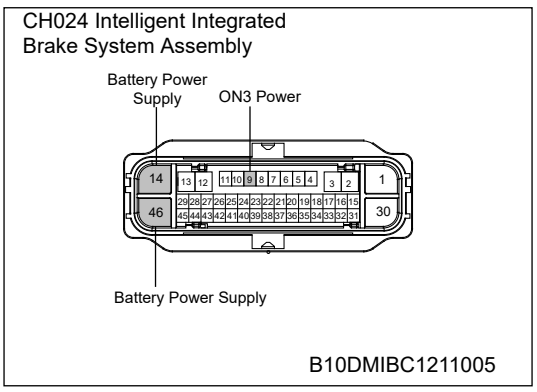
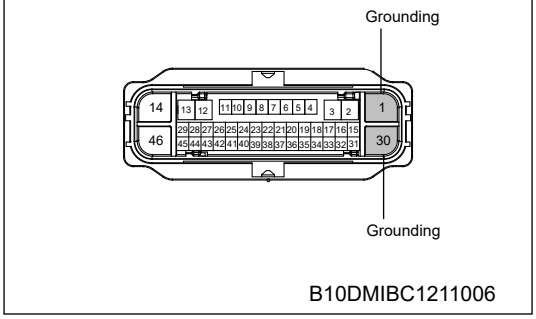
DTC: C2699A2-IBC

Fault code	Description
C2699A2	System voltage repeatedly low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

Fault code	Description
C21262F	Unstable pressure sensor signal

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Perform the pressure sensor calibration procedure.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to perform the pressure sensor calibration proce dure. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

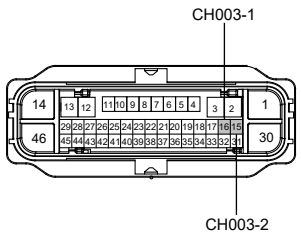
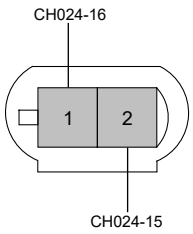
DTC: C21322F-IBC

Fault code	Description
C21322F	Rear left wheel speed sensor signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the installation of the rear left intelligent wheel speed sensor.	
	A Check whether the rear left intelligent wheel speed senso r is installed correctly.
	No 》 》 》 Reinstall and test again.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the wiring harness between the rear left intelligent wheel speed sensor and the intell igent integrated brake system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211012 CH003 Rear left intelligent wheel speed sensor  B10DMIBC1211013	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector CH003 of the rear left i ntelligent wheel speed sensor. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of the wiring harnes s connector CH024 of the Smart Integrated Brake System a ssembly and terminal 2 of the wiring harness connector CH 003 of the left rear smart wheel speed sensor to check whet her it is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 16 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 1 of the wire harness c onnector CH003 of the left rear intelligent wheel speed sen sor is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear left intelligent wheel speed sensor.	
	A Replace the left rear intelligent wheel speed sensor. B After replacing the left rear intelligent wheel speed senso r, is the fault cleared?

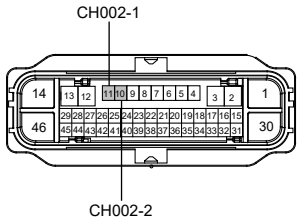
© 2026, All rights reserved

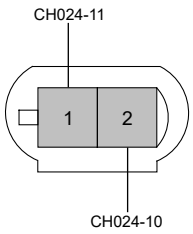
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: C21412F-IBC

Fault code	Description
C21412F	Front right wheel speed sensor signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the installation of the front right intelligent wheel speed sensor.	
	A Check whether the right front intelligent wheel speed sen sor is installed correctly.
	No 》 》 》 Reinstall and test again.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211009 CH002 Front right intelligent wheel speed sensor  B10DMIBC1211010	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal. E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right smart wheel speed sensor.	
	A Replace the front right intelligent wheel speed sensor. B After replacing the front right intelligent wheel speed sen sor, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

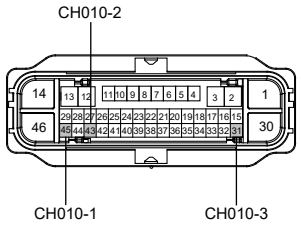
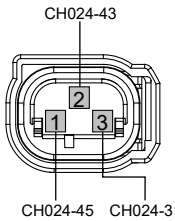
DTC: C25137A-IBC

Fault code	Description
C25137A	Low brake fluid level

1. Simplified Circuit Diagram





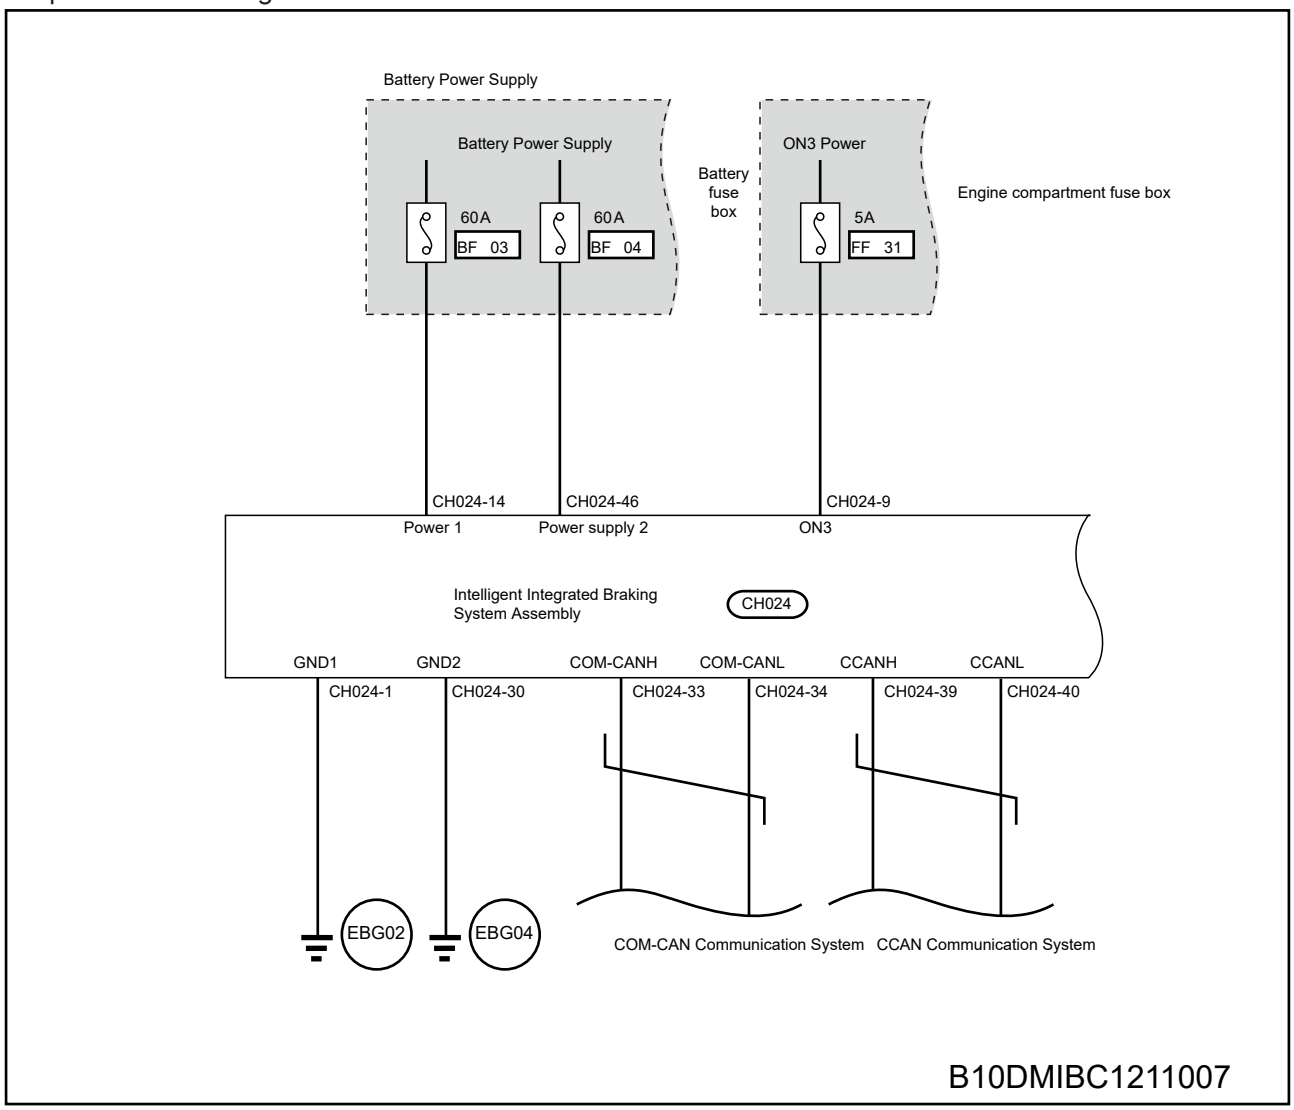
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the brake fluid level.	
	A Check whether the brake fluid level is too low.
	No》》》 Go to step 5.
	Yes》》》 Go to step 3.
Step 3 Check the brake system lines.	
	A. Check the brake system lines for leaks.
	Yes》》》 Replace the damaged pipe.
	No》》》 Go to step 4.
Step 4 Check the brake pads and brake discs.	
	A. Check whether the brake pads and brake discs are excessively worn and have reached the replacement standard.
	Yes》》》 Replace the brake friction pads or brake discs.
	No》》》 Go to step 5.
Step 5 Check the wiring harness connector of the brake fluid level sensor.	
	A. Check the brake fluid level sensor harness connector for looseness, terminal push-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 6.
Step 6 Check whether the wiring harness between the brake fluid level sensor and the Intelligent Integrated Brake System assembly is normal.	

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211032 CH010 Brake Fluid Level Sensor  B10DMIBC1211033	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH010 of the brake fluid level sensor. D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal. F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: C23114B-IBC

Fault code	Description
C23114B	Front right ISO valve drive coil over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C21602F-IBC

Fault code	Description
C21602F	Front left wheel speed sensor signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

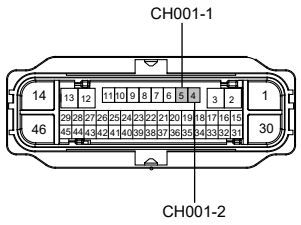
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

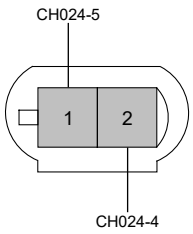
Step 2 Check the installation of the front left intelligent wheel speed sensor.



A Check whether the front left intelligent wheel speed sens or is installed correctly.

No 》 》 》 Reinstall and test again.

Yes 》 》 》
Go to step 3.



Step 3 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intel ligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and terminal 2 of wire harness connector CH001 of th e left front intelligent wheel speed sensor to check if the res istance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector CH024 of the Smart Integrated Brake System assem bly and terminal 1 of the wire harness connector CH001 of t he front left smart wheel speed sensor to check if it is norm al.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Replace the front left intelligent wheel speed sensor.

A Replace the front left intelligent wheel speed sensor.
B After replacing the front left intelligent wheel speed sens or, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: C22164B-IBC

Fault code	Description
C22164B	Drive axle over-temperature error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Re-flash the software program.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to reflash the software program and perform calibration. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 System normal.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

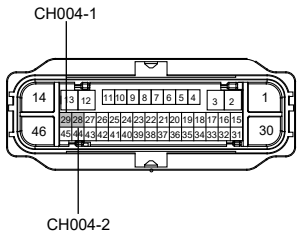
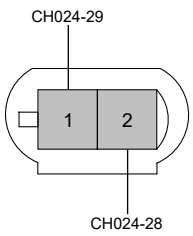
DTC: C21332F-IBC

Fault code	Description
C21332F	Rear right wheel speed sensor signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the installation of the right rear intelligent wheel speed sensor.	
	A Check whether the rear right intelligent wheel speed sens or is installed correctly.
	No 》 》 》 Reinstall and test again.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211015 CH004 Right rear smart wheel speed sensor  B10DMIBC1211016	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear right intelligent wheel speed sensor.	
	A Replace the rear right intelligent wheel speed sensor. B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

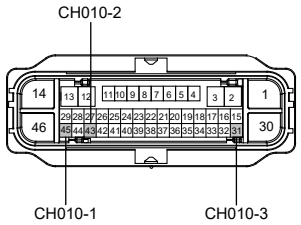
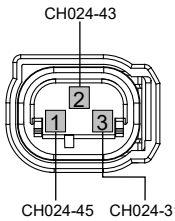
DTC: C25127B-IBC

Fault code	Description
C25127B	Low brake fluid level

1. Simplified Circuit Diagram





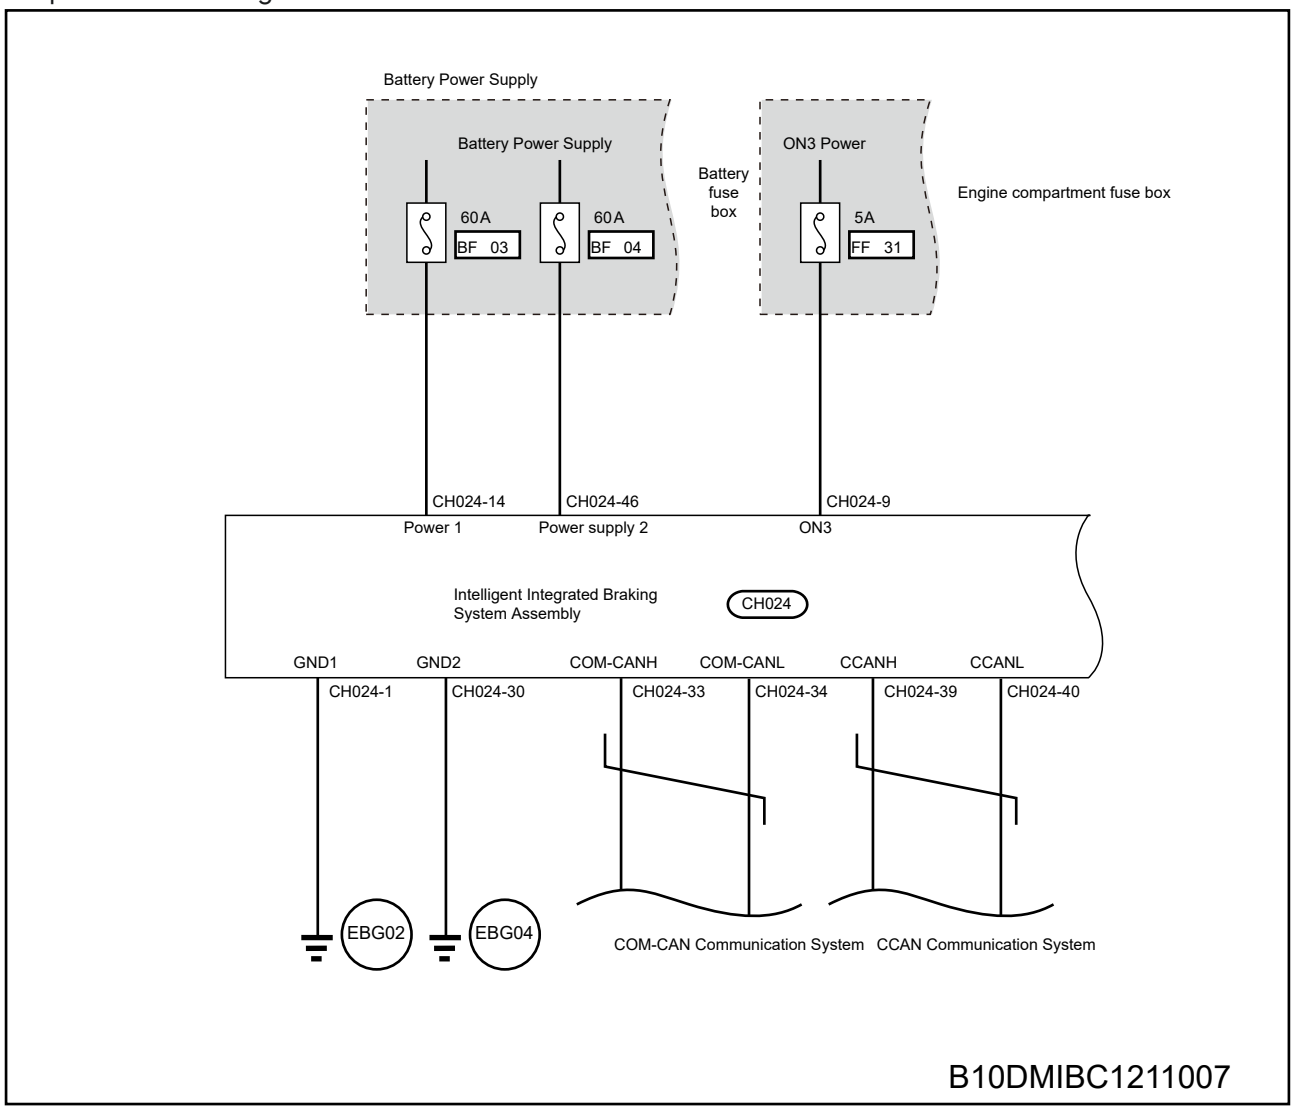
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the brake fluid level.	
	A Check whether the brake fluid level is too low.
	No 》》》 Go to step 5.
	Yes 》》》 Go to step 3.
Step 3 Check the brake system lines.	
	A. Check the brake system lines for leaks.
	Yes 》》》 Replace the damaged pipe.
	No 》》》 Go to step 4.
Step 4 Check the brake pads and brake discs.	
	A. Check whether the brake pads and brake discs are excessively worn and have reached the replacement standard.
	Yes 》》》 Replace the brake friction pads or brake discs.
	No 》》》 Go to step 5.
Step 5 Check the wiring harness connector of the brake fluid level sensor.	
	A. Check the brake fluid level sensor harness connector for looseness, terminal push-out, corrosion, or poor contact.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 6.
Step 6 Check whether the wiring harness between the brake fluid level sensor and the Intelligent Integrated Brake System assembly is normal.	

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211032 CH010 Brake Fluid Level Sensor  B10DMIBC1211033	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH010 of the brake fluid level sensor. D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal. F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 8.
Step 8 Diagnosis complete.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

Fault code	Description
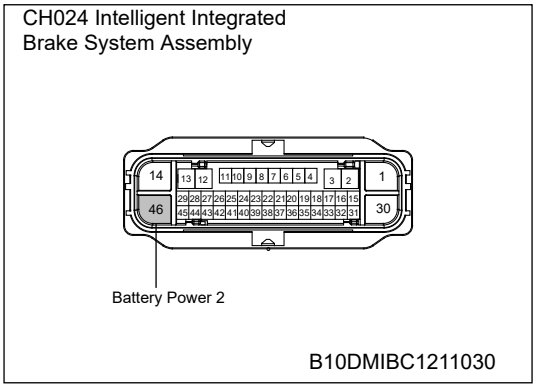
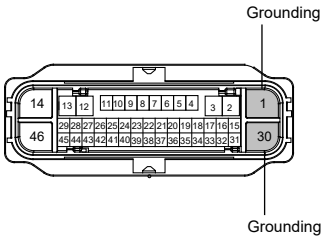
C200916	KL30_2 voltage is extremely low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 2 fuse for the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the intelligent integrated brake system assembly fuse BF04. Fuse specification: BF04 60A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness for Power Supply 2 of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 46 of harness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

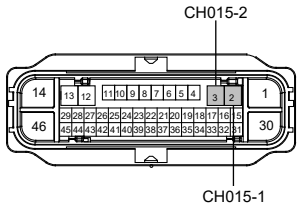
DTC: C201309-IBC

Fault code	Description
C201309	PBC Fault_Actuator Status Unknown_L

1. Simplified Circuit Diagram

2. Diagnostic Steps

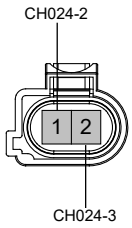
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



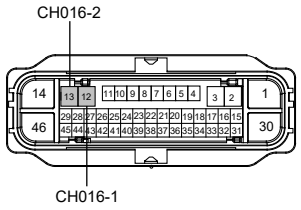
Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

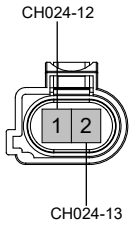


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrate d Brake System assembly is normal.

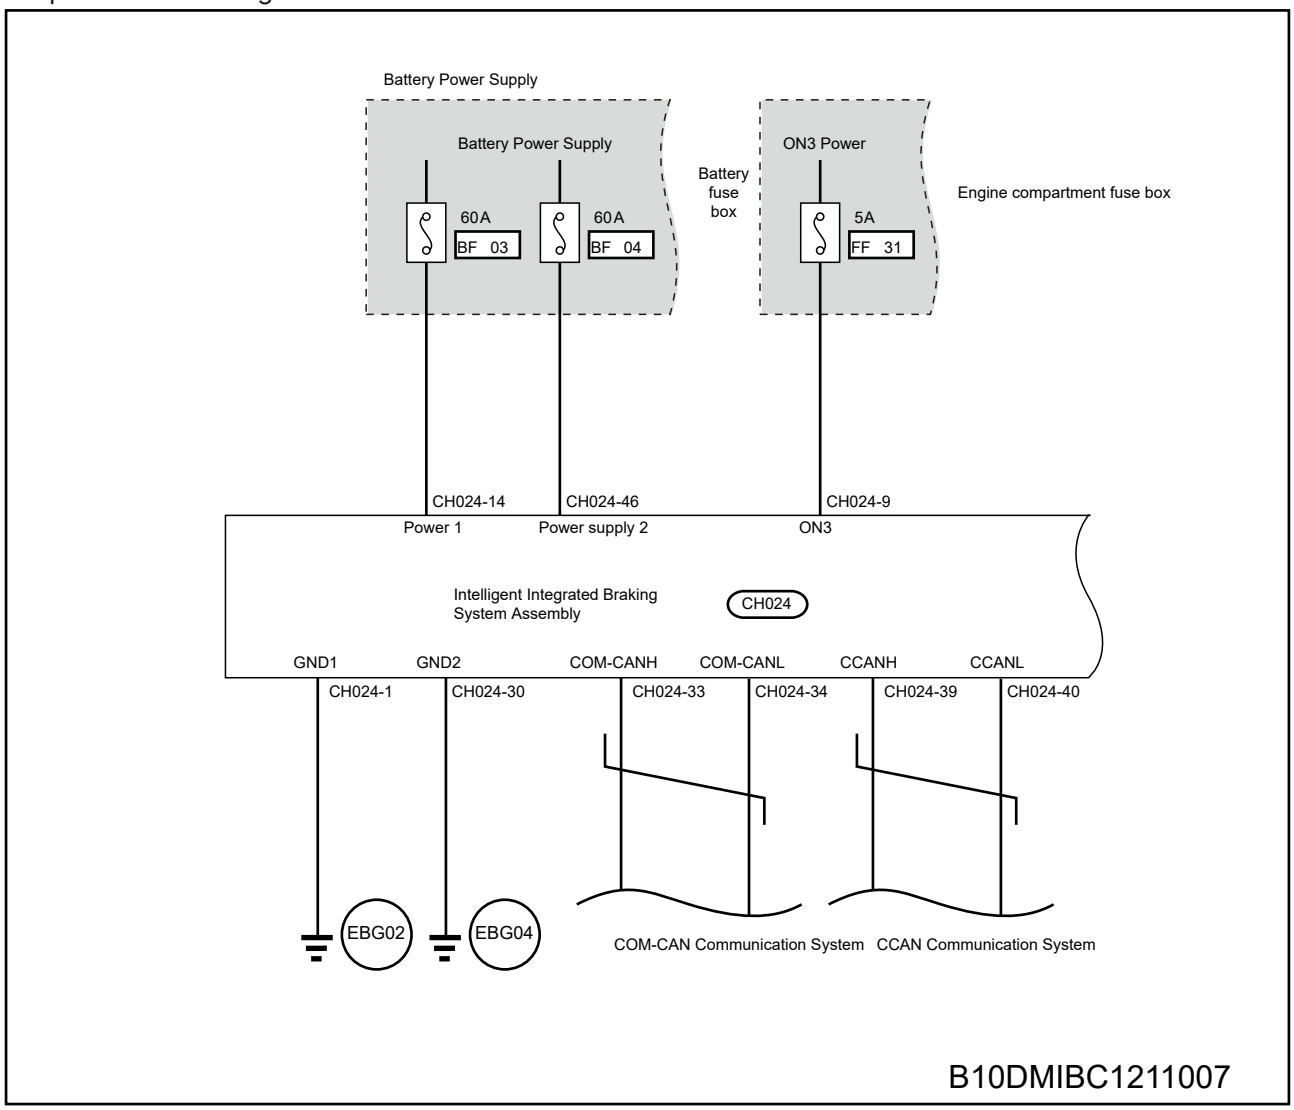


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the righ t drive brake motor.
D. Use a multimeter set to the resistance range to measure t he resistance between terminal 12 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH016 o f the right drive brake motor to check whether the resistanc e value is normal.

© 2026, All rights reserved



CH016 Right Drive Brake Motor  B10DMIBC1211025	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the left drive brake motor or the right drive brake motor.	
	A Replace the left drive brake motor or the right drive brake motor. B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

Fault code	Description
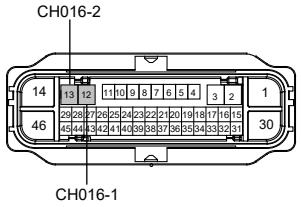
C204909	PBC Fault_Actuator Operating Current Too Low_R

1. Simplified Circuit Diagram

2. Diagnostic Steps

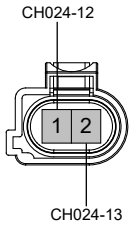
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

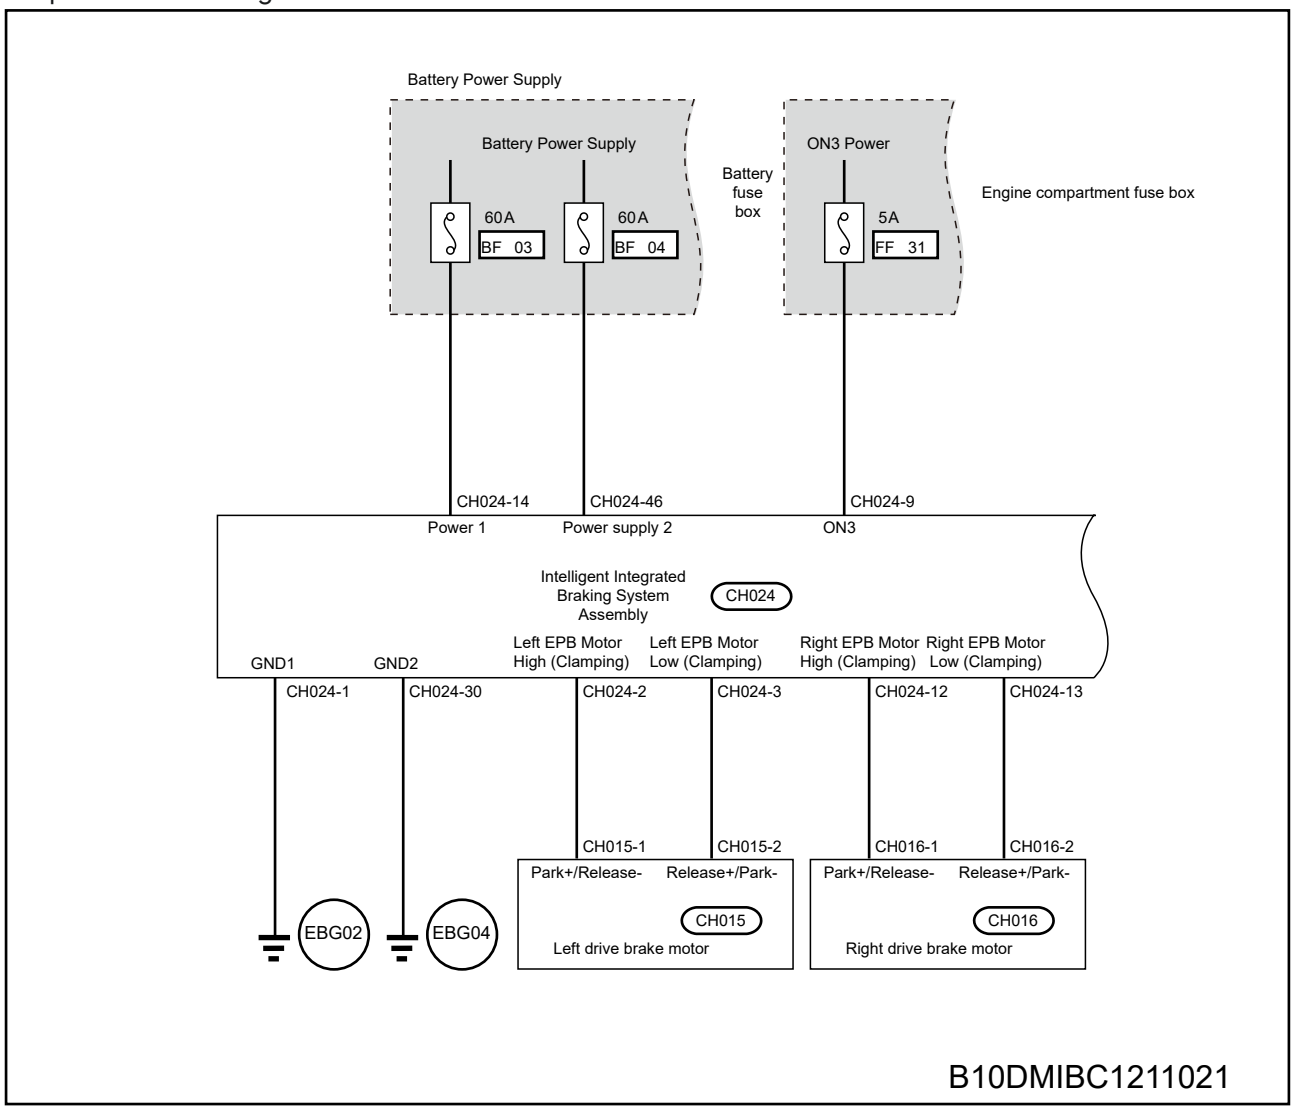
B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

© 2026, All rights reserved



Step 3 Replace the right drive brake motor.	
	A Replace the right drive brake motor. B After replacing the right drive brake motor, is the fault cle ared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

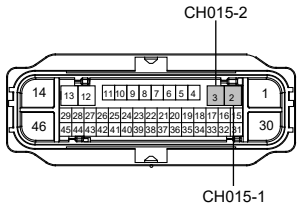
DTC: C205109-IBC

Fault code	Description
C205109	PBC Fault_Actuator Status Unknown_R

1. Simplified Circuit Diagram

2. Diagnostic Steps

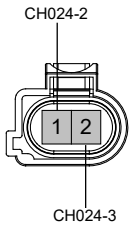
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



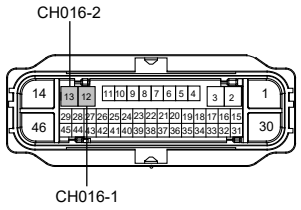
Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

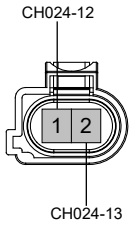


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrate d Brake System assembly is normal.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the righ t drive brake motor.
D. Use a multimeter set to the resistance range to measure t he resistance between terminal 12 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH016 o f the right drive brake motor to check whether the resistanc e value is normal.

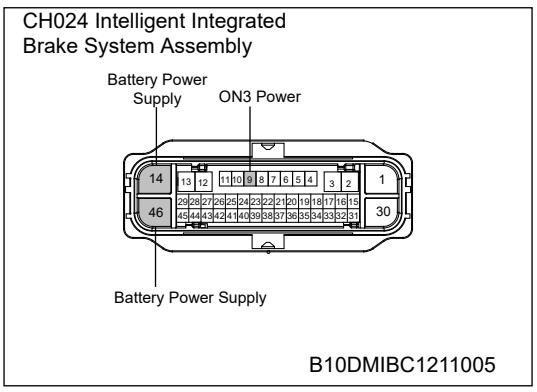
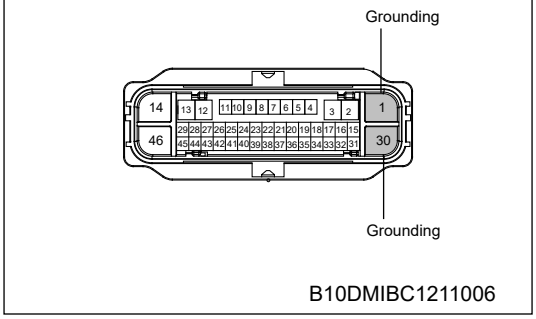
DTC: C202809-IBC

Fault code	Description
C202809	PBC fault_Supply voltage too high_L



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

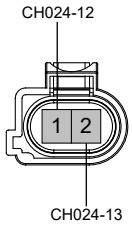
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

May be caused by an intermittent fault. Check for intermittent faults.

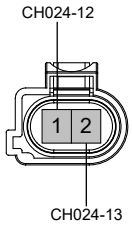
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Exit Service Mode.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and follow the prompts on the diag nostic tool to exit maintenance mode. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

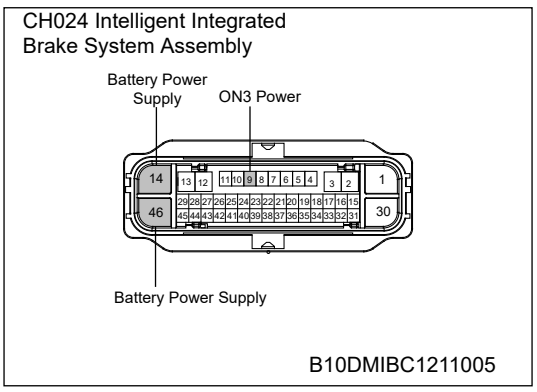
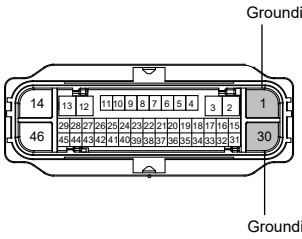
DTC: C206709-IBC

Fault code	Description
C206709	PBC Fault_Supply voltage too low_R



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: C212195-IBC

Fault code	Description
C212195	Front right wheel speed sensor matching error

1. Simplified Circuit Diagram

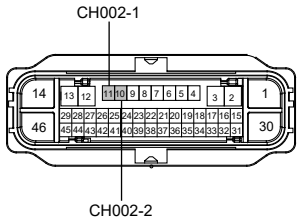
2. Diagnostic Steps

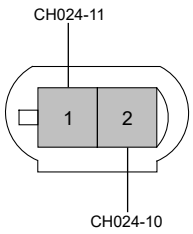
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the model of the front right intelligent wheel speed sensor.

	A Check whether the model of the front right intelligent wh eel speed sensor is correct.

No》》》 Replace the wheel speed sensor with the correct model and recheck.

Yes》》》
Go to step 3.

Step 3 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211009 CH002 Front right intelligent wheel speed sensor  B10DMIBC1211010	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal. E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front right smart wheel speed sensor.

	A Replace the front right intelligent wheel speed sensor. B After replacing the front right intelligent wheel speed sen sor, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

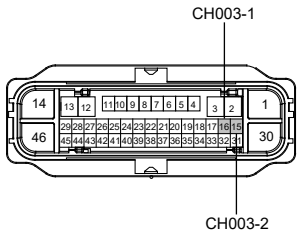
DTC: C211213-IBC

Fault code	Description
C211213	Rear left wheel speed open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

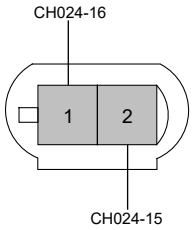
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the rear left intelligent wheel speed sensor and the intell igent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211012

CH003 Rear left intelligent wheel speed sensor

B10DMIBC1211013

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH003 of the rear left i ntelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of the wiring harnes s connector CH024 of the Smart Integrated Brake System a ssembly and terminal 2 of the wiring harness connector CH 003 of the left rear smart wheel speed sensor to check whet her it is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 16 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 1 of the wire harness c onnector CH003 of the left rear intelligent wheel speed sen sor is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear left intelligent wheel speed sensor.

A Replace the left rear intelligent wheel speed sensor.
B After replacing the left rear intelligent wheel speed senso r, is the fault cleared?

Yes 》 》 》 System normal.

No 》 》 》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.

© 2026, All rights reserved

	B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

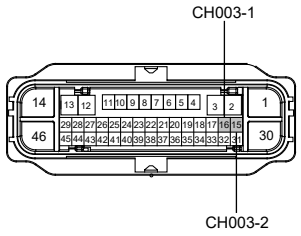
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

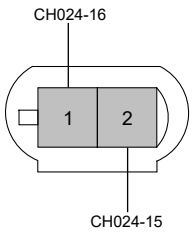
Step 2 Check the model of the rear left intelligent wheel speed sensor.



A Check whether the model of the rear left intelligent wheel speed sensor is correct.

No》》》 Replace the wheel speed sensor with the correct model and recheck.

Yes》》》
Go to step 3.



Step 3 Check whether the wiring harness between the rear left intelligent wheel speed sensor and the intell igent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211012

CH003 Rear left intelligent wheel speed sensor

B10DMIBC1211013

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH003 of the rear left i ntelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of the wiring harnes s connector CH024 of the Smart Integrated Brake System a ssembly and terminal 2 of the wiring harness connector CH 003 of the left rear smart wheel speed sensor to check whet her it is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 16 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 1 of the wire harness c onnector CH003 of the left rear intelligent wheel speed sen sor is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the rear left intelligent wheel speed sensor.

A Replace the left rear intelligent wheel speed sensor.
B After replacing the left rear intelligent wheel speed senso r, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C212095-IBC

Fault code	Description
C212095	Front left wheel speed sensor matching error

1. Simplified Circuit Diagram

2. Diagnostic Steps

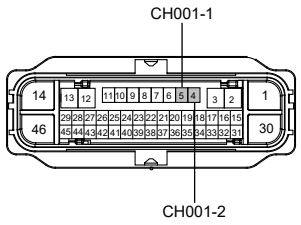
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

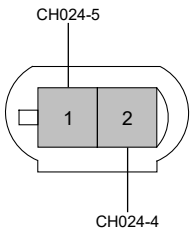
Step 2 Check the model of the front left intelligent wheel speed sensor.



A Check whether the model of the front left intelligent wheel speed sensor is correct.

No 》 》 》 Replace the wheel speed sensor with the correct model and recheck.

Yes 》 》 》
Go to step 3.



Step 3 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intelligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of wire harness connector CH001 of the left front intelligent wheel speed sensor to check if the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the wire harness connector CH024 of the Smart Integrated Brake System assembly and terminal 1 of the wire harness connector CH001 of the front left smart wheel speed sensor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Replace the front left intelligent wheel speed sensor.

A Replace the front left intelligent wheel speed sensor.
B After replacing the front left intelligent wheel speed sensor, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C210904-IBC

Fault code	Description
C210904	ASIC chip fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

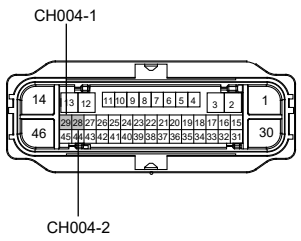
DTC: C211313-IBC

Fault code	Description
C211313	Rear right wheel speed open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

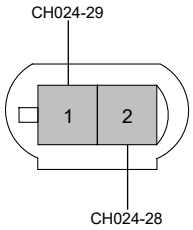
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211015

CH004 Right rear smart wheel speed sensor

B10DMIBC1211016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear right intelligent wheel speed sensor.

A Replace the rear right intelligent wheel speed sensor.
B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.

© 2026, All rights reserved

	B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

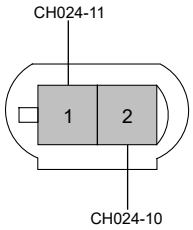
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211009

CH002 Front right intelligent wheel speed sensor

B10DMIBC1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal.
E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front right smart wheel speed sensor.

A Replace the front right intelligent wheel speed sensor.
B After replacing the front right intelligent wheel speed sen sor, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.

© 2026, All rights reserved

	B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

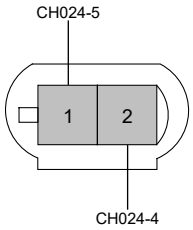
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intel ligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and terminal 2 of wire harness connector CH001 of th e left front intelligent wheel speed sensor to check if the res istance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector CH024 of the Smart Integrated Brake System assem bly and terminal 1 of the wire harness connector CH001 of t he front left smart wheel speed sensor to check if it is norm al.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front left intelligent wheel speed sensor.

A Replace the front left intelligent wheel speed sensor.
B After replacing the front left intelligent wheel speed sens or, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.

© 2026, All rights reserved

	B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.	

© 2026, All rights reserved

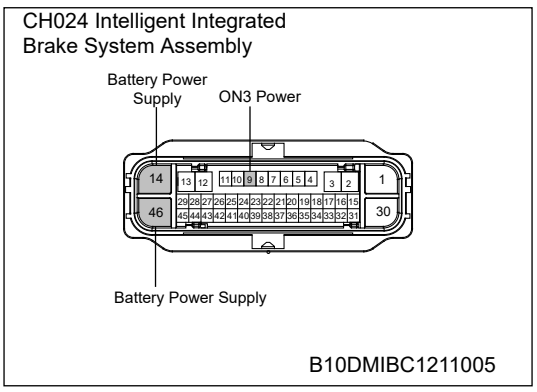
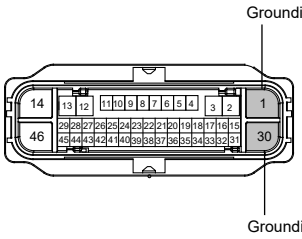
DTC: C212917-IBC

Fault code	Description
C212917	V5_2 supply voltage high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 7.	
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

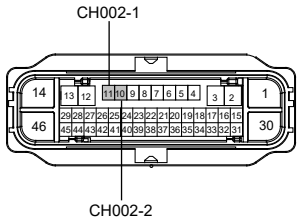
DTC: C216112-IBC

Fault code	Description
C216112	Right front wheel speed sensor low side short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

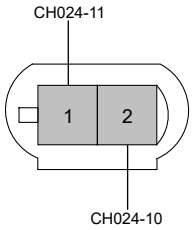
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211009

CH002 Front right intelligent wheel speed sensor

B10DMIBC1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal.
E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Using a multimeter set to the DC voltage range, measure the voltage between terminals 1 and 2 of harness connecto r CH002 for the right front intelligent wheel speed sensor a nd the vehicle body ground to check if the voltage is norma l.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front right smart wheel speed sensor.

A Replace the front right intelligent wheel speed sensor.

© 2026, All rights reserved

	B After replacing the front right intelligent wheel speed sen sor, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

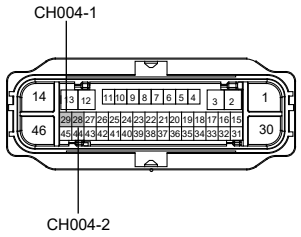
DTC: C214338-IBC

Fault code	Description
C214338	Periodic loss of rear right wheel speed sensor signal or pulse too fast

1. Simplified Circuit Diagram

2. Diagnostic Steps

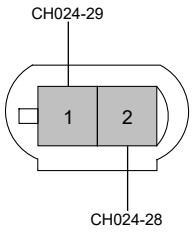
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211015

CH004 Right rear smart wheel speed sensor

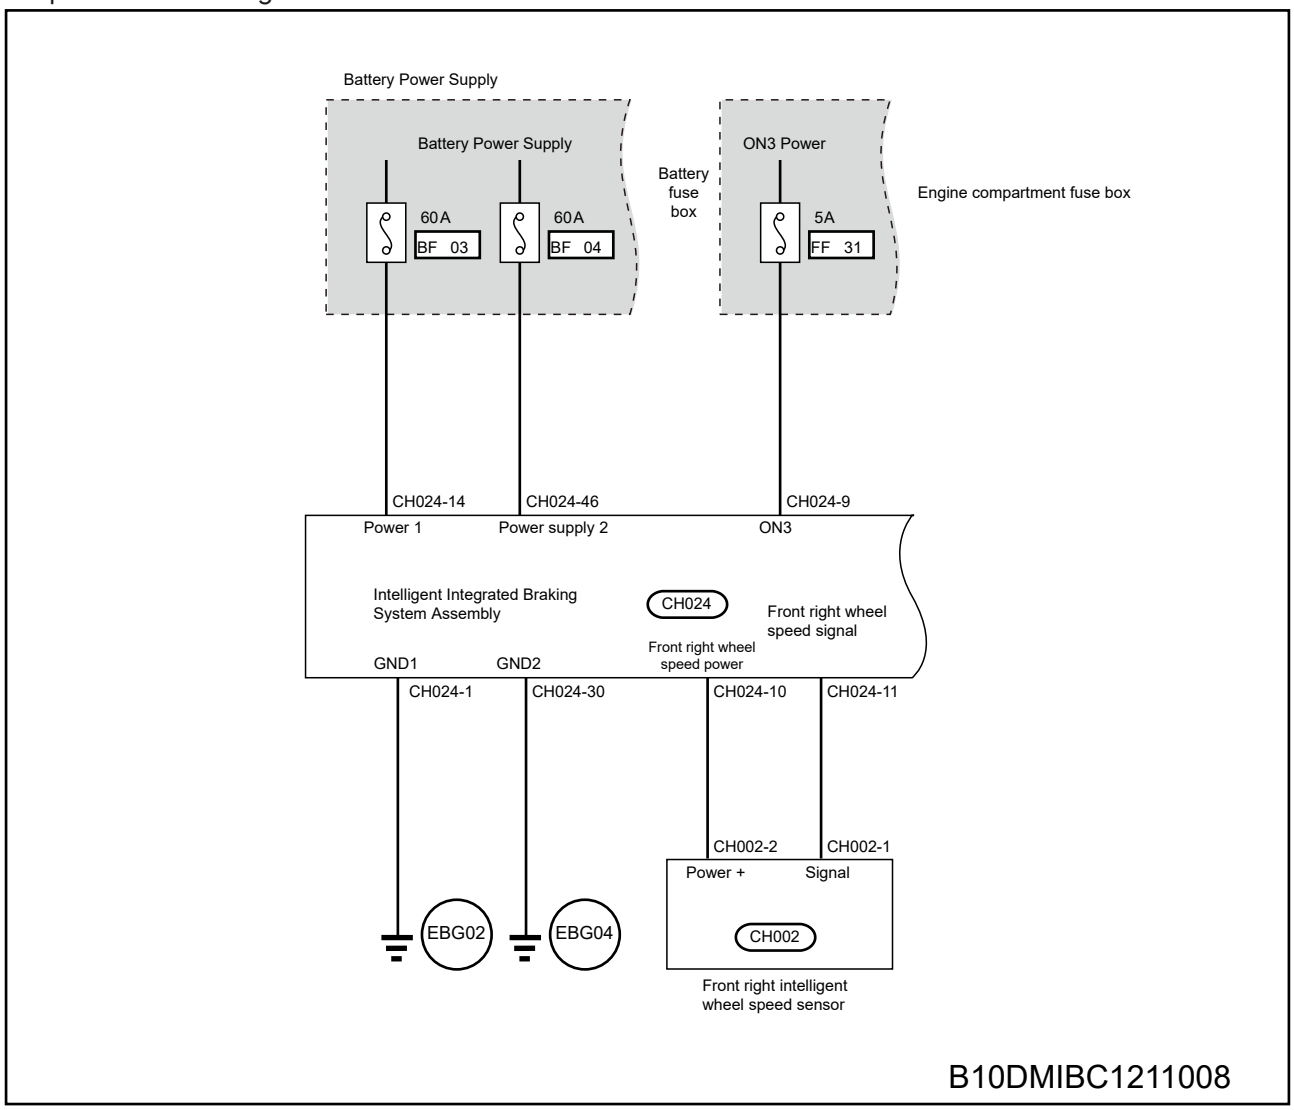
B10DMIBC1211016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and check whether the resistance value between terminals 1 and 2 of t he harness connector CH004 for the right rear intelligent w heel speed sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of harness connect or CH004 of the rear right intelligent wheel speed sensor an d the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Replace the rear right intelligent wheel speed sensor.	
	A Replace the rear right intelligent wheel speed sensor. B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

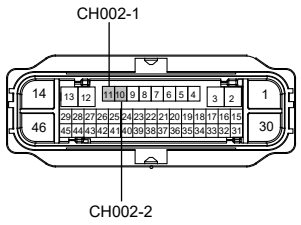
DTC: C213111-IBC

Fault code	Description
C213111	Front right wheel speed sensor electrical signal invalid

1. Simplified Circuit Diagram

2. Diagnostic Steps

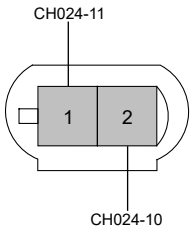
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211009

CH002 Front right intelligent wheel speed sensor

B10DMIBC1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal.
E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of the wiring ha rness connector CH002 of the right front intelligent wheel s peed sensor and the vehicle body ground to check if it is no rmal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of wiring harness c onnector CH002 of the right front intelligent wheel speed s ensor and the vehicle body ground to check whether the vo ltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》

May be caused by an intermittent fault. Check for intermittent faults.

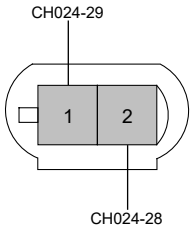
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211015

CH004 Right rear smart wheel speed sensor

B10DMIBC1211016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 1 and 2 of the wire harnes s connector CH004 of the right rear intelligent wheel speed sensor and the vehicle body ground to check whether the v oltage value is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear right intelligent wheel speed sensor.

A Replace the rear right intelligent wheel speed sensor.

© 2026, All rights reserved

	B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

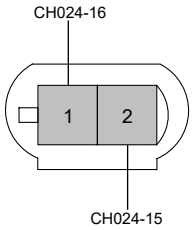
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the rear left intelligent wheel speed sensor and the intell igent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211012

CH003 Rear left intelligent wheel speed sensor

B10DMIBC1211013

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH003 of the rear left i ntelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of the wiring harnes s connector CH024 of the Smart Integrated Brake System a ssembly and terminal 2 of the wiring harness connector CH 003 of the left rear smart wheel speed sensor to check whet her it is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 16 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 1 of the wire harness c onnector CH003 of the left rear intelligent wheel speed sen sor is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 1 and 2 of the harness co nnector CH003 of the left rear intelligent wheel speed sens or and the vehicle body ground to check whether the volta ge is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear left intelligent wheel speed sensor.

A Replace the left rear intelligent wheel speed sensor.

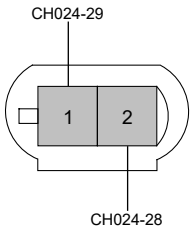
Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the inte lligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211015

CH004 Right rear smart wheel speed sensor

B10DMIBC1211016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 28 of the wiring harnes s connector CH024 of the Intelligent Integrated Brake Syste m assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to ch eck if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 29 of the wiring harness co nnector CH024 of the smart integrated brake system assem bly and terminal 1 of the wiring harness connector CH004 o f the right rear smart wheel speed sensor, and check wheth er the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and check whether the resistance value between terminals 1 and 2 of t he harness connector CH004 for the right rear intelligent w heel speed sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of harness connect or CH004 of the rear right intelligent wheel speed sensor an d the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》

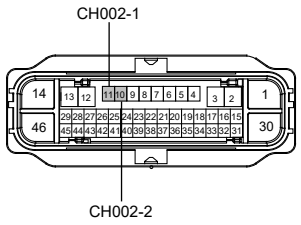
DTC: C215138-IBC

Fault code	Description
C215138	Periodic loss of right front wheel speed sensor signal or pulse rate too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

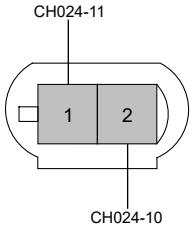
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the right front intelligent wheel speed sensor and the int elligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211009

CH002 Front right intelligent wheel speed sensor

B10DMIBC1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH002 of the fr ont right intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH0 02 of the right front intelligent wheel speed sensor to check if it is normal.
E Using a multimeter set to the resistance range, measure t he resistance between terminal 11 of wiring harness connec tor CH024 of the smart integrated brake system assembly a nd terminal 1 of wiring harness connector CH002 of the rig ht front smart wheel speed sensor to check whether the res istance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of the wiring ha rness connector CH002 of the right front intelligent wheel s peed sensor and the vehicle body ground to check if it is no rmal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of wiring harness c onnector CH002 of the right front intelligent wheel speed s ensor and the vehicle body ground to check whether the vo ltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》

DTC: C217662-IBC

Fault code	Description
C217662	Actual braking torque and braking torque demand are inconsistent

1. Simplified Circuit Diagram

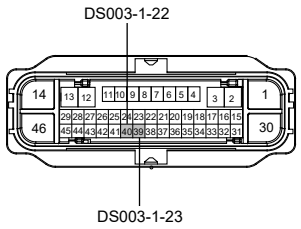
2. Diagnostic Steps

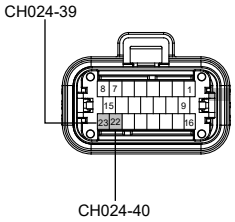
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003- 1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.

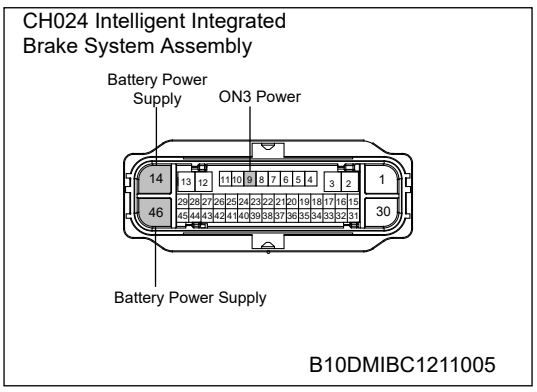
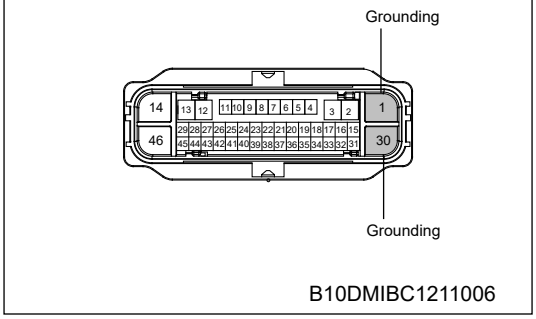
DTC: C219501-IBC

Fault code	Description
C219501	ASIC monitors power supply overcurrent



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: C216316-IBC

Fault code	Description
C216316	Rear Right Wheel Speed Sensor Supply Voltage Low

1. Simplified Circuit Diagram

2. Diagnostic Steps

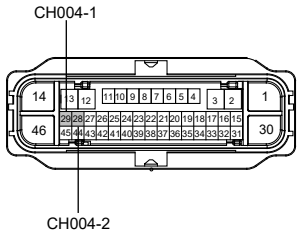
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

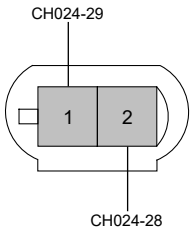
Step 2 Check the power supply and ground of the Intelligent Integrated Brake System assembly.



A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.



Step 3 Check whether the wiring harness between the right rear intelligent wheel speed sensor and the intelligent integrated braking system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211015

CH004 Right rear smart wheel speed sensor

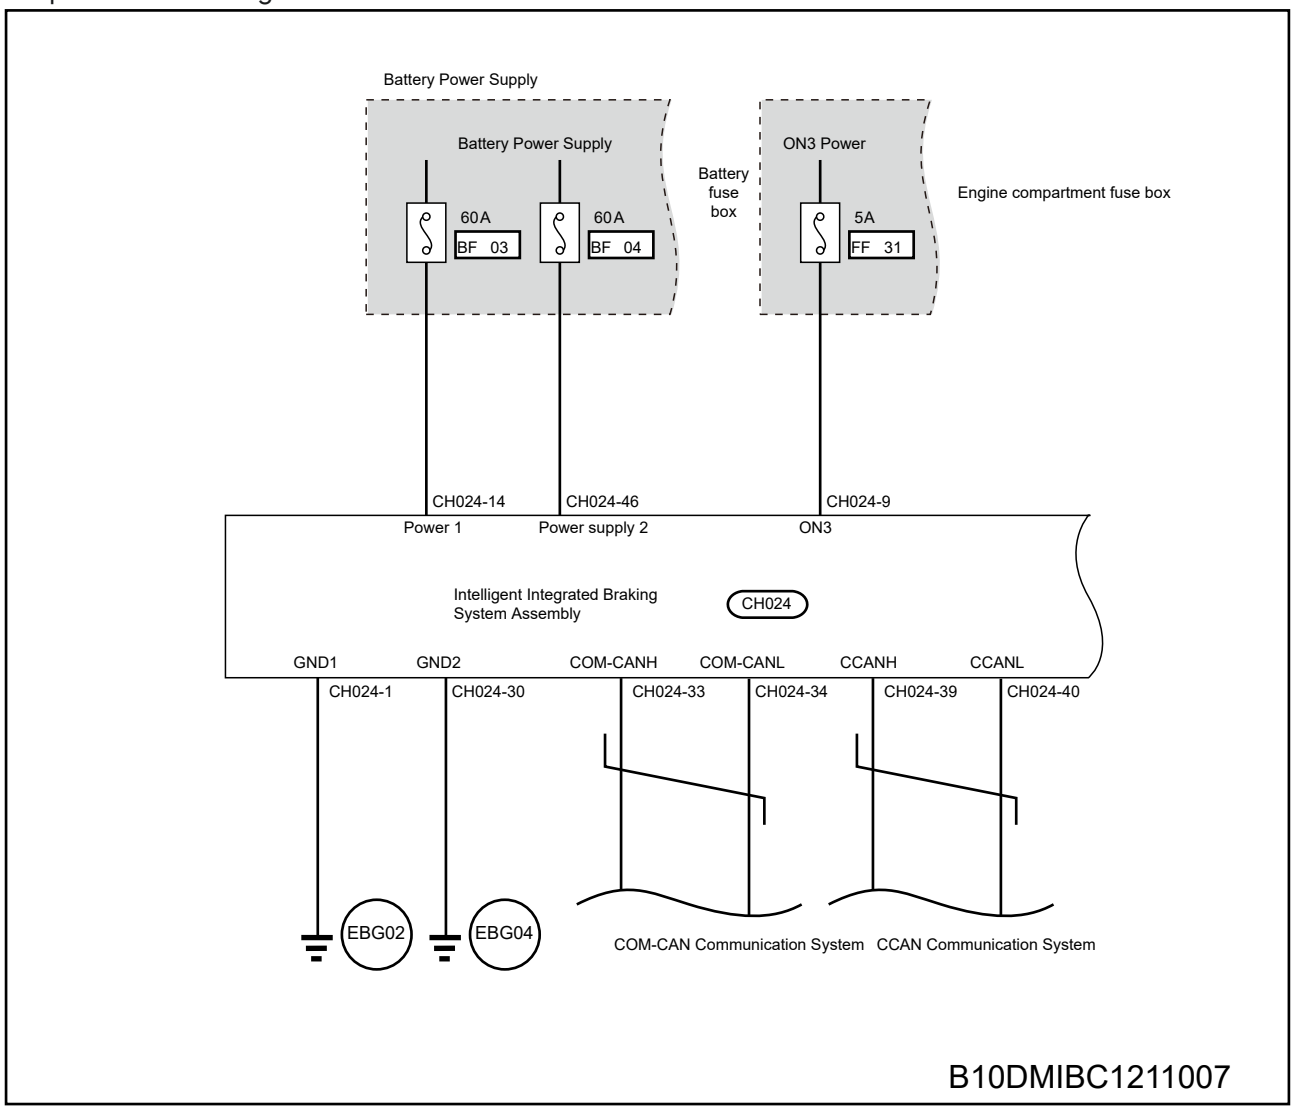
B10DMIBC1211016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector CH004 of the right rear intelligent wheel speed sensor.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 28 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wiring harness connector CH004 of the right rear intelligent wheel speed sensor to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 29 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH004 of the right rear smart wheel speed sensor, and check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and check whether the resistance value between terminals 1 and 2 of the harness connector CH004 for the right rear intelligent wheel speed sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

© 2026, All rights reserved



Step 4 Replace the rear right intelligent wheel speed sensor.	
	A Replace the rear right intelligent wheel speed sensor. B After replacing the rear right intelligent wheel speed sens or, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

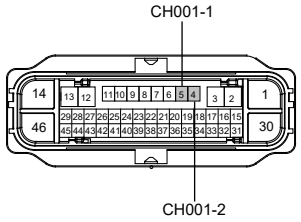
DTC: C219038-IBC

Fault code	Description
C219038	Left front wheel speed sensor signal periodically lost or pulse rate too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

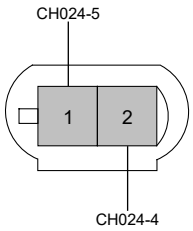
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the front left intelligent wheel speed sensor and the intel ligent integrated brake system assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211003

CH001 Front left intelligent wheel speed sensor

B10DMIBC1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector CH001 of the front left intelligent wheel speed sensor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of wire harness conn ector CH024 of the Intelligent Integrated Brake System asse mbly and terminal 2 of wire harness connector CH001 of th e left front intelligent wheel speed sensor to check if the res istance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector CH024 of the Smart Integrated Brake System assem bly and terminal 1 of the wire harness connector CH001 of t he front left smart wheel speed sensor to check if it is norm al.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the ha rness connector CH001 for the left front intelligent wheel s peed sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 1 and 2 of the wir e harness connector CH001 of the front left intelligent whe el speed sensor and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

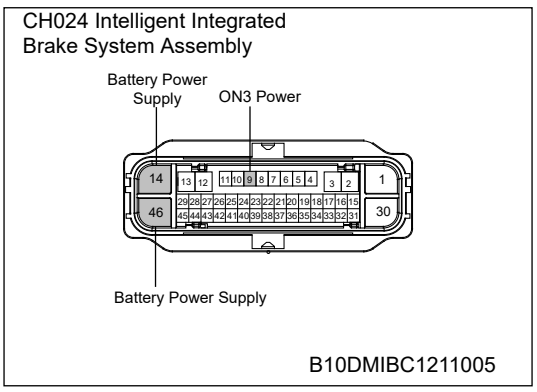
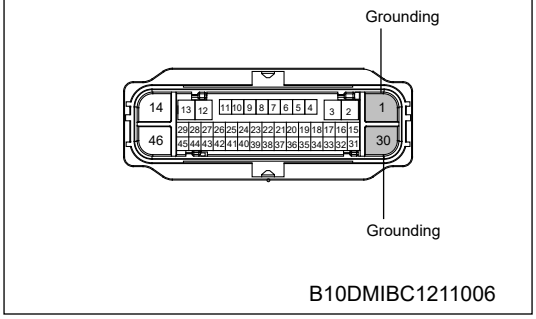
DTC: C251014-IBC

Fault code	Description
C251014	Abnormal power supply to SW control coil



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the intelligent integrated brake system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 9, 14, and 46 of the wire h arness connector CH024 of the Intelligent Integrated Brake System assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1 and 30 of the wiring harness connector CH024 of the Intelligent Integrated Brak e System assembly and the body ground to check if it is nor mal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: C252544-IBC

Fault code	Description
C252544	Software caused the system to restart twice

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Re-flash the software program.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to reflash the software program and perform calibration. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the controller assembly and the intelligent integrated braking system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the controller assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 23 of wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 22 of the wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C253242-IBC

Fault code	Description
C253242	Fault management buffer overflow

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power cycle and check.	
	A Clear the fault codes, power cycle the vehicle, and check whether the fault is cleared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Re-flash the software program.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to reflash the software program and perform calibration. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 System normal.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelligent integrated brake system assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

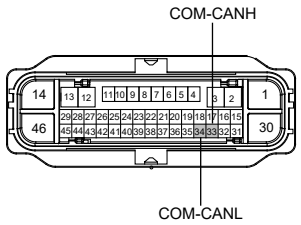
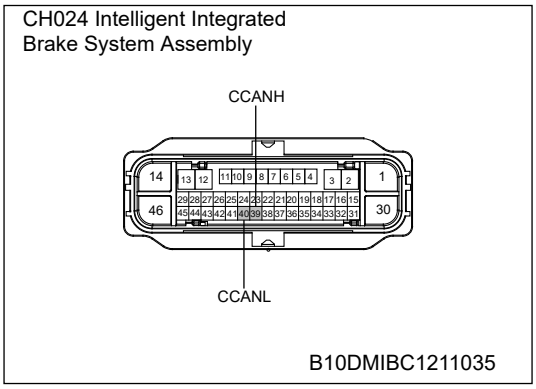
DTC: C260187-IBC

Fault code	Description
C260187	No communication on CANFD line



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the COM-CAN wiring harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211034	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 33 and body ground, and between terminal 34 and body ground, respectively, at the wiring harness connector CH024 of the Intelligent Integrate d Brake System assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Inspect the CCAN wiring harness of the smart integrated brake system assembly.	

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Using a multimeter, select the DC voltage range and mea sure the voltage values between terminal 39 and terminal 4 0 of the wire harness connector CH024 of the intelligent int egrated brake system assembly and the vehicle body groun d, respectively. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

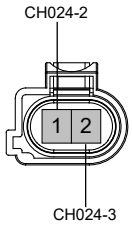
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

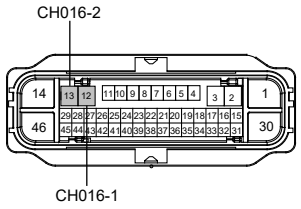
CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

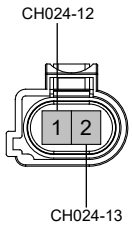
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of harness conn ector CH015 for the left drive brake motor and the vehicle b ody ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wire harness connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left drive brake motor or the right drive brake motor.

A Replace the left drive brake motor or the right drive brake motor.

© 2026, All rights reserved

	B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

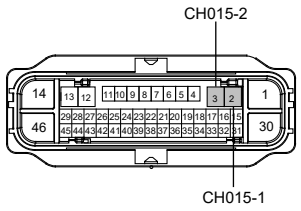
DTC: C260309-IBC

Fault code	Description
C260309	EPB Motor Circuit Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

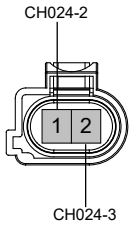
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness between the left drive brake motor and the intelligent integrated brake system assembly is normal.

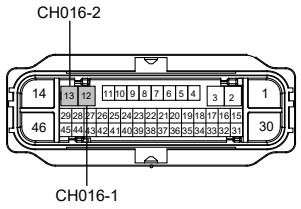
CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211022

CH015 Left Drive Brake Motor

B10DMIBC1211023

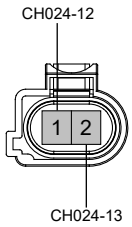
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH015 of the lef t drive brake motor.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wiring harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 1 of the wiring harness connector CH01 5 of the left drive brake motor to check whether the resista nce value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor CH024 of the Intelligent Integrated Brake System assem bly and terminal 2 of wire harness connector CH015 of the l eft drive brake motor to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 1 and 2 of harness conn ector CH015 for the left drive brake motor and the vehicle b ody ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 1 and 2 of the wire harness connector CH015 of the left drive brake motor and the vehi cle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left drive brake motor or the right drive brake motor.

A Replace the left drive brake motor or the right drive brake motor.

© 2026, All rights reserved

	B After replacing the left drive brake motor or the right drive brake motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: C260088-IBC

Fault code	Description
C260088	CANFD Bus-Off Fault

1. Simplified Circuit Diagram

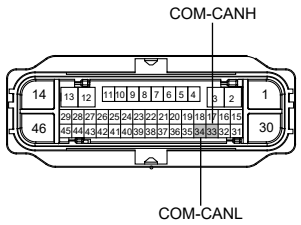
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



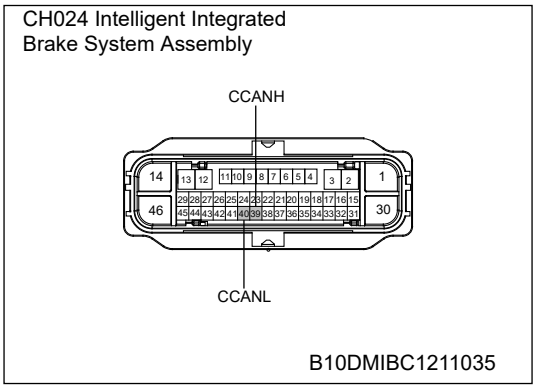
Step 2 Check the battery voltage.

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.

No》》》 Replace the battery, check the charging system;
Measure the sleep current to check whether the vehicle body leaks electricity.

Yes》》》
Go to step 3.

Step 3 Check the COM-CAN wiring harness of the intelligent integrated brake system assembly.



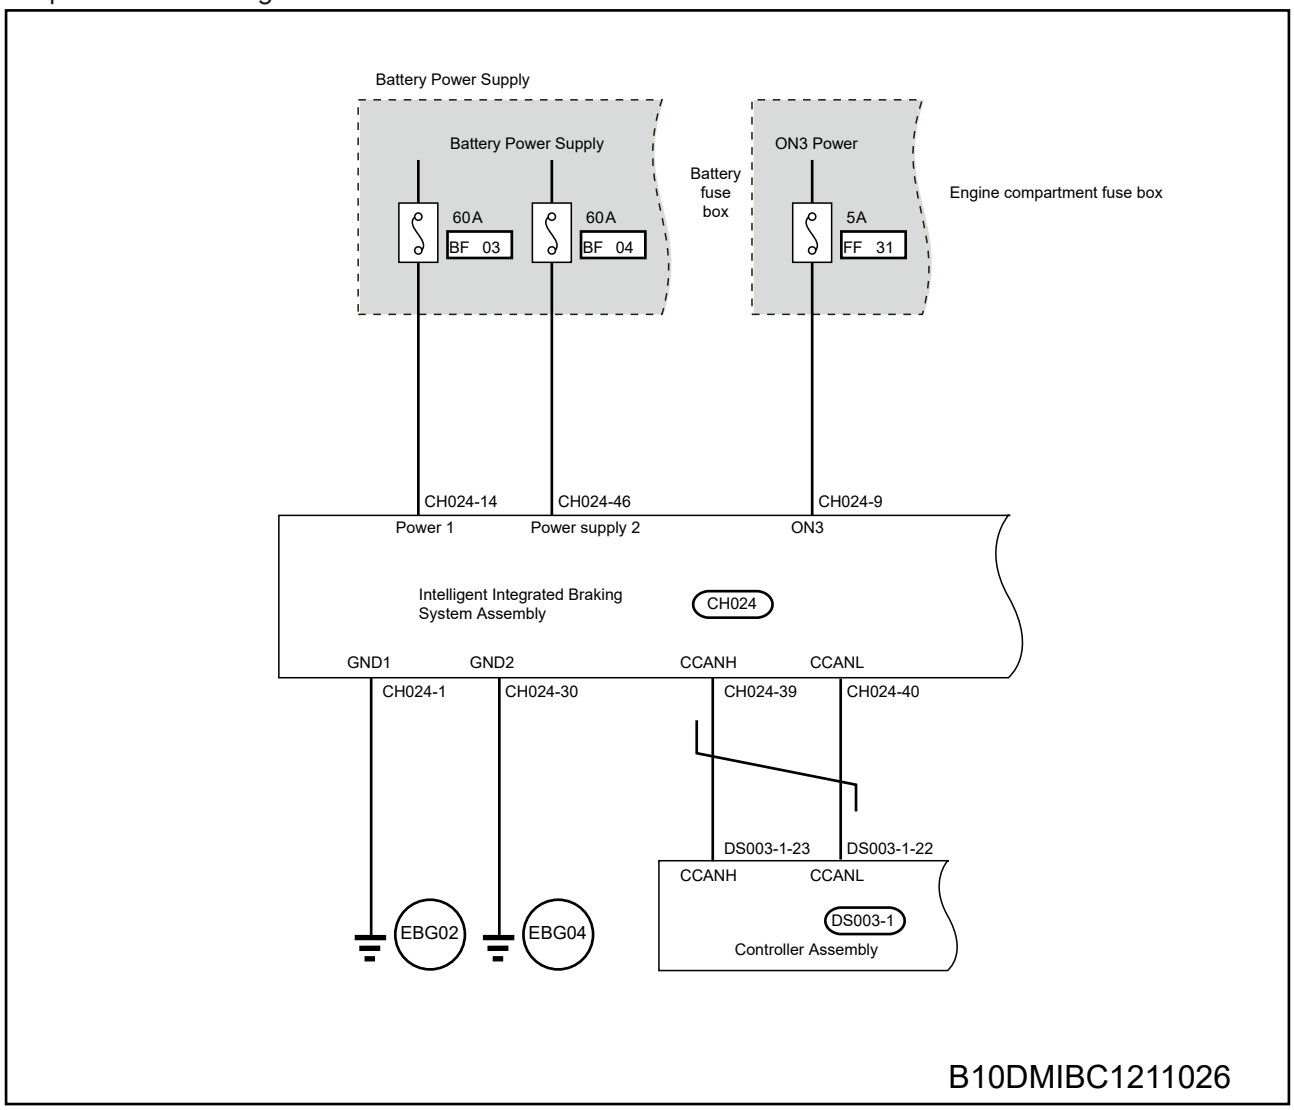
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211034	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 33 and body ground, and between terminal 34 and body ground, respectively, at the wiring harness connector CH024 of the Intelligent Integrate d Brake System assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Inspect the CCAN wiring harness of the smart integrated brake system assembly.

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Using a multimeter, select the DC voltage range and mea sure the voltage values between terminal 39 and terminal 4 0 of the wire harness connector CH024 of the intelligent int egrated brake system assembly and the vehicle body groun d, respectively. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

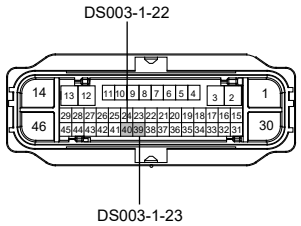
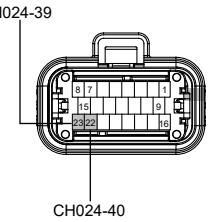
DTC: C260687-IBC

Fault code	Description
C260687	Communication fault: HPCVCUB7 message timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the controller assembly and the intelligent integrated braking system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the controller assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 23 of wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 22 of the wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C260585-IBC

Fault code	Description
C260585	Communication fault: Driver demand rear axle torque status abnormal

1. Simplified Circuit Diagram

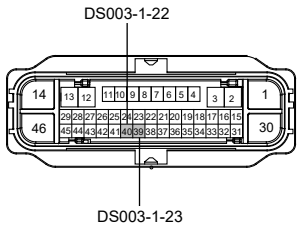
2. Diagnostic Steps

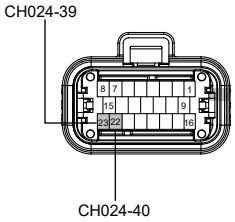
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003- 1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.

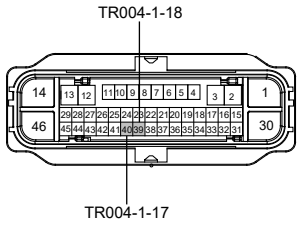
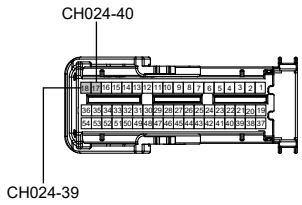
DTC: C260982-IBC

Fault code	Description
C260982	Communication fault: Abnormal sensor calibration status





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check for relevant fault codes.
Yes》》》 Prioritize the repair of faults related to the airbag control module assembly.	
	No》》》 Go to step 3.
Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the airbag control module assembly.	

© 2026, All rights reserved

	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: P090800-IBC

Fault code	Description
P090800	Production mode information error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Disable production mode.	
	A Clear the fault codes, use the diagnostic tool to disable th e production mode, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

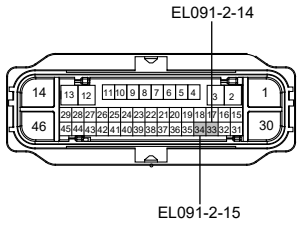
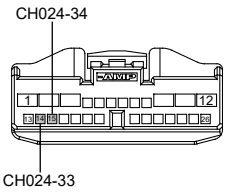
DTC: C261186-IBC

Fault code	Description
C261186	Communication fault: Abnormal gear position signal





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the combination switch fault code.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the combination switch fault c ode and record it. C Check for relevant fault codes.
	Yes 》 》 》 Prioritize the repair of combination switch related faults.
	No 》 》 》 Go to step 3.
Step 3 Check the CAN wiring harness between the combination switch and the Intelligent Integrated Brakin g System assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211040 EL091-2 Combination Switch  B10DMIBC1211041	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector EL091-2 of the combin ation switch. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 33 of wiring harne ss connector CH024 of the smart integrated brake system a ssembly and terminal 14 of wiring harness connector EL091 -2 of the combination switch is normal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 34 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 15 of wiring harness connector EL091-2 of the combination switch to check if the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the combination switch.	
	A Check whether the power ground circuit of the combinati on switch is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: C261581-IBC

Fault code	Description
C261581	Communication fault: Virtual accelerator pedal signal status invalid

1. Simplified Circuit Diagram

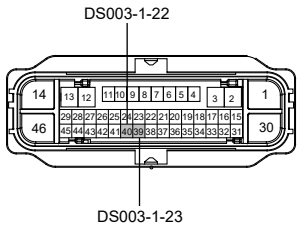
2. Diagnostic Steps

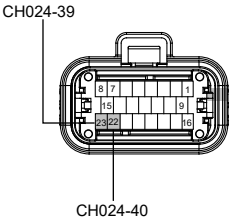
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003-1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U200A81-IBC

Fault code	Description
U200A81	Abnormal steering force transmission status

1. Simplified Circuit Diagram

2. Diagnostic Steps

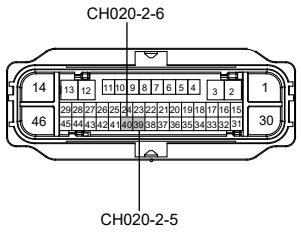
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

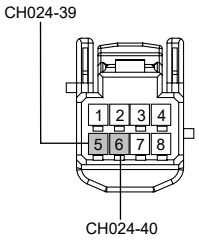
Step 2 Check the diagnostic trouble codes of the integrated motor controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the integrated motor controller, and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize repairing faults related to the integrated motor controller.

No》》》
Go to step 3.



Step 3 Check the CAN harness between the integrated motor controller and the smart integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211018

CH020-2 Integrated Motor Controller

B10DMIBC1211019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH020-2 of the integrated motor controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the smart integrated brake system assembly and terminal 5 of wiring harness connector CH020-2 of the integrated motor controller to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of wire harness connector CH020-2 of the Integrated Motor Controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the Integrated Motor Controller.

A Check whether the power ground circuit of the integrated motor controller is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of integrated motor controller.	
	Replacement of integrated motor controller. B After replacing the integrated motor controller and performing the calibration procedure, end soft limit learning, configuration word writing, and VIN writing, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the controller assembly and the intelligent integrated braking system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the controller assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 23 of wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 22 of the wiring harness connector DS003-1 of the controller assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: C261081-IBC

Fault code	Description
C261081	Communication fault: Invalid accelerator pedal status signal

1. Simplified Circuit Diagram

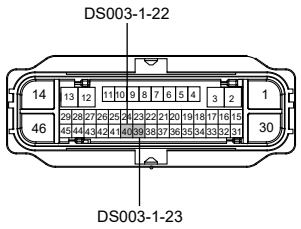
2. Diagnostic Steps

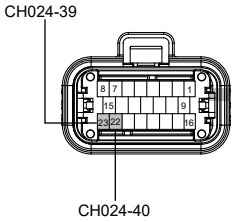
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003- 1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U200A86-IBC

Fault code	Description
U200A86	Communication fault: Front right seat belt status signal abnormal

1. Simplified Circuit Diagram

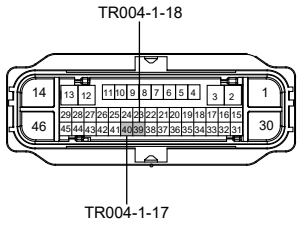
2. Diagnostic Steps

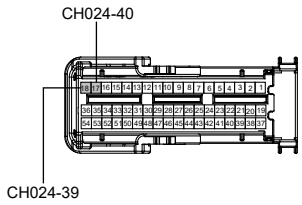
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the diagnostic trouble codes of the airbag control module assembly.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the airbag control module assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the airbag control module assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

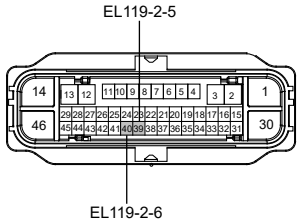
DTC: U200683-IBC

Fault code	Description
U200683	Communication fault: ICU24D message checksum error

1. Simplified Circuit Diagram

2. Diagnostic Steps

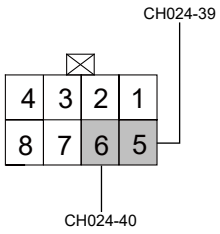
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the instrument display and the Smart Integrated Brake System assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211073

EL119-2 Instrument Display

B10DMIBC1211074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the instrument display harness connector EL119-2.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 5 of the wire harness connector EL119-2 of the instrument display to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of the wire harness connector EL119-2 of the instrument display to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the instrument cluster display.

A Check whether the power ground circuit of the instrument display is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the instrument cluster display.

A Replace the instrument cluster display.
B After replacing the instrument cluster display, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

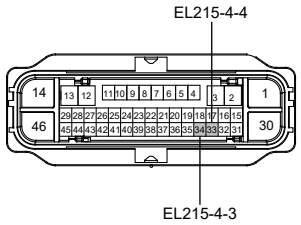
DTC: U200482-IBC

Fault code	Description
U200482	Communication fault: IVI331 message counter abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

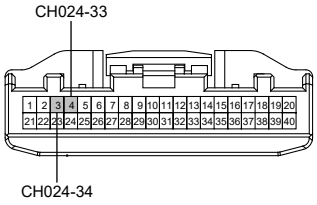
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



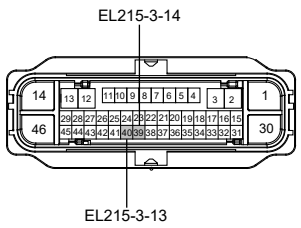
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

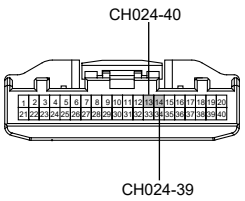


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

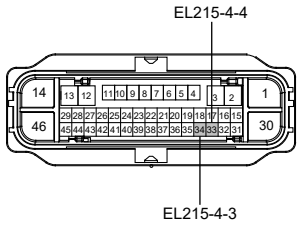
DTC: U200687-IBC

Fault code	Description
U200687	Communication fault: HPCBCM290 message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

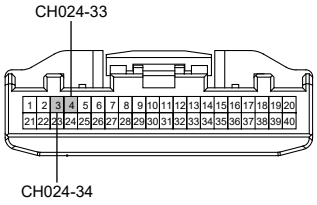
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



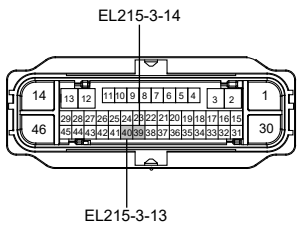
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

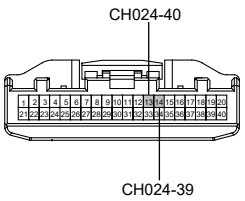


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

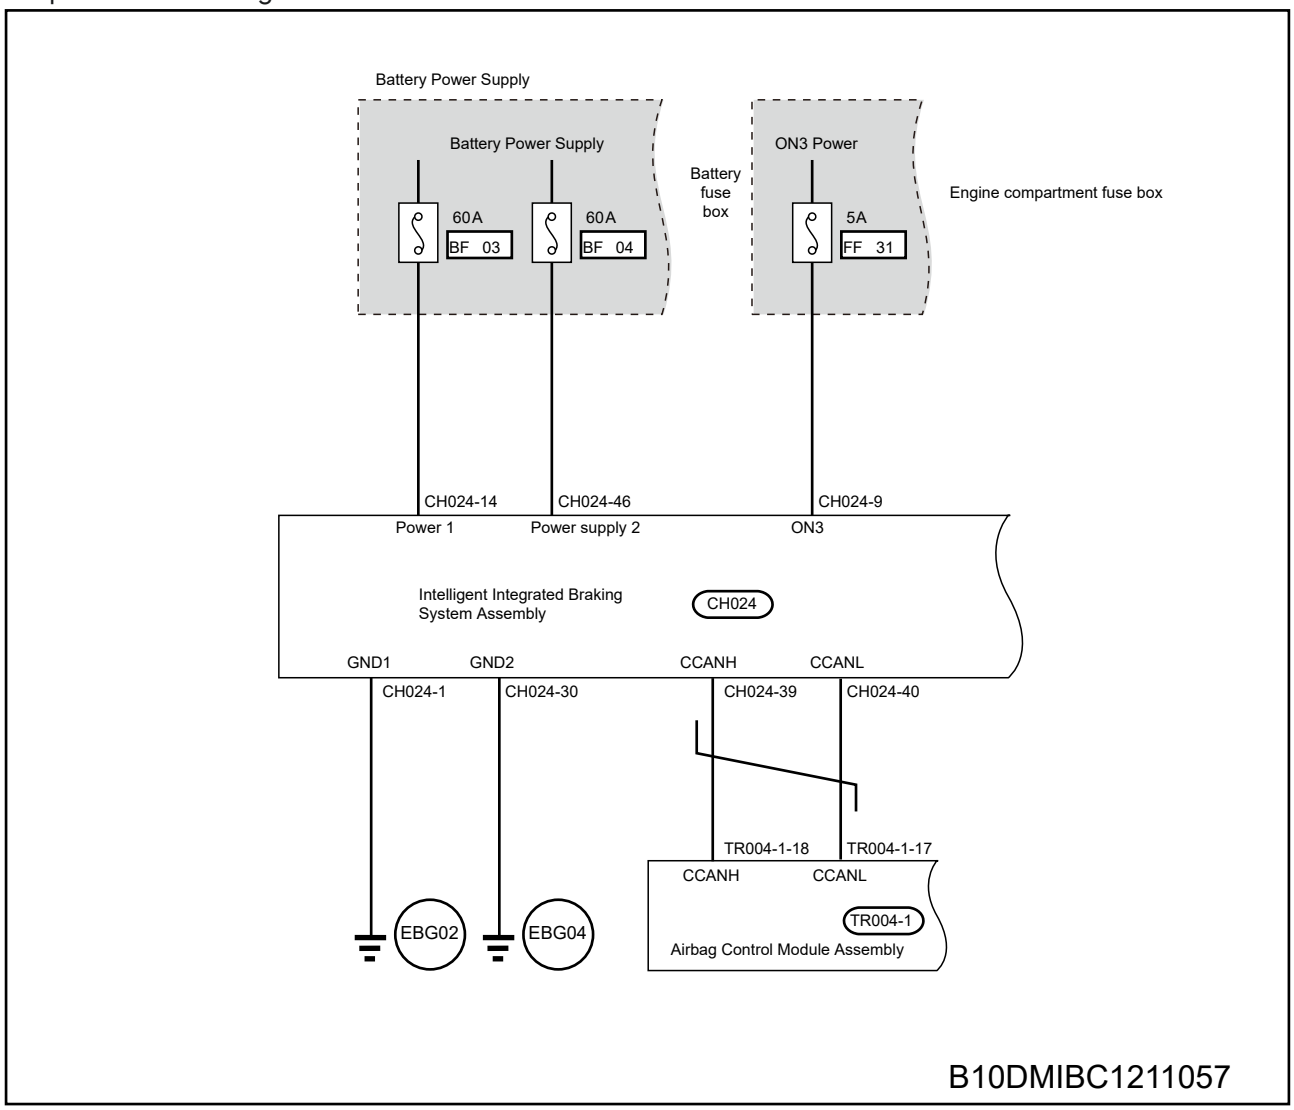


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

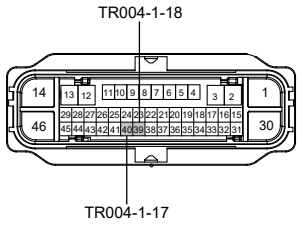
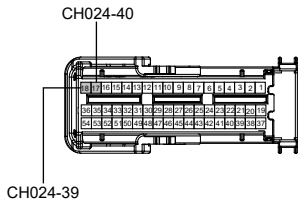
DTC: U200886-IBC

Fault code	Description
U200886	Communication fault: Abnormal collision output status signal





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.
A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check for relevant fault codes.
Yes 》 》 》 Prioritize the repair of faults related to the airbag control module assembly.
No 》 》 》 Go to step 3.
Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059 A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the airbag control module assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U200386-IBC

Fault code	Description
U200386	Communication fault: Abnormal brake pedal status signal

1. Simplified Circuit Diagram

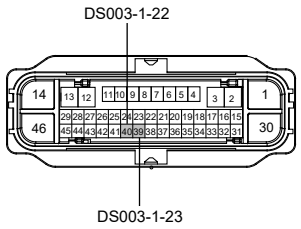
2. Diagnostic Steps

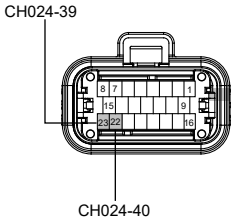
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003- 1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

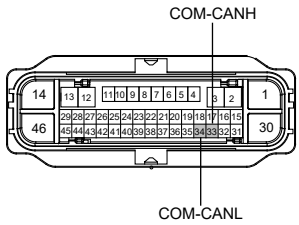
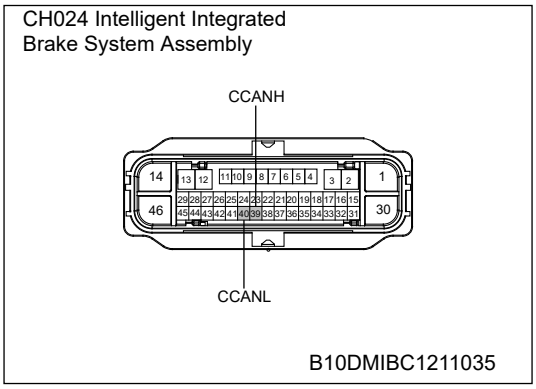
DTC: U070088-IBC

Fault code	Description
U070088	CANFD Bus-Off Fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the COM-CAN wiring harness of the intelligent integrated brake system assembly.
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211034
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 33 and body ground, and between terminal 34 and body ground, respectively, at the wiring harness connector CH024 of the Intelligent Integrate d Brake System assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Inspect the CCAN wiring harness of the smart integrated brake system assembly.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Using a multimeter, select the DC voltage range and mea sure the voltage values between terminal 39 and terminal 4 0 of the wire harness connector CH024 of the intelligent int egrated brake system assembly and the vehicle body groun d, respectively. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U200081-IBC

Fault code	Description
U200081	Communication fault: Invalid external ambient temperature signal

1. Simplified Circuit Diagram

2. Diagnostic Steps

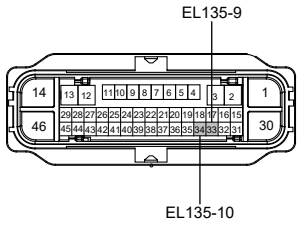
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

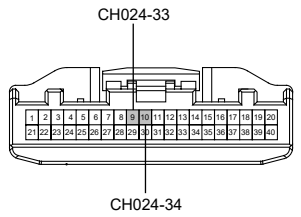
Step 2 Check the fault codes of the thermal management controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the thermal management controller, and record them.
C Check for any diagnostic trouble codes related to the ambient temperature sensor.

Yes》》》 Prioritize repairing faults related to the thermal management controller.

No》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the thermal management controller and the smart integrated brake system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211037

EL135 Thermal Management Controller

B10DMIBC1211038

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL135 of the thermal management controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of the wiring harness connector CH024 of the Intelligent Integrated Brake System Assembly and terminal 9 of the wiring harness connector EL135 of the Thermal Management Controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 10 of the wiring harness connector EL135 of the Thermal Management Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the thermal management controller.

© 2026, All rights reserved

	A Check if the power ground circuit of the thermal management controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

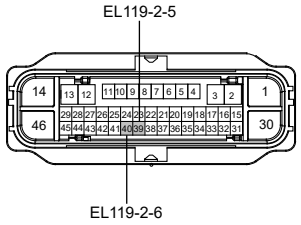
DTC: U200682-IBC

Fault code	Description
U200682	Communication fault: ICU24D message counter abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

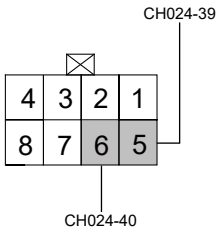
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the instrument display and the Smart Integrated Brake System assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211073

EL119-2 Instrument Display

B10DMIBC1211074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the instrument display harness connector EL119-2.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 5 of the wire harness connector EL119-2 of the instrument display to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of the wire harness connector EL119-2 of the instrument display to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the instrument cluster display.

A Check whether the power ground circuit of the instrument display is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the instrument cluster display.

A Replace the instrument cluster display.
B After replacing the instrument cluster display, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

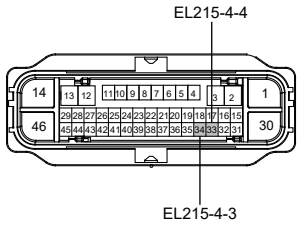
DTC: U200483-IBC

Fault code	Description
U200483	Communication Fault: IVI331 Message Checksum Abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

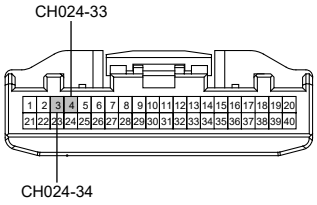
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



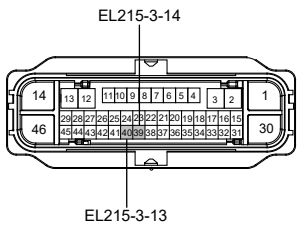
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

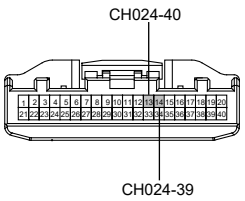


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

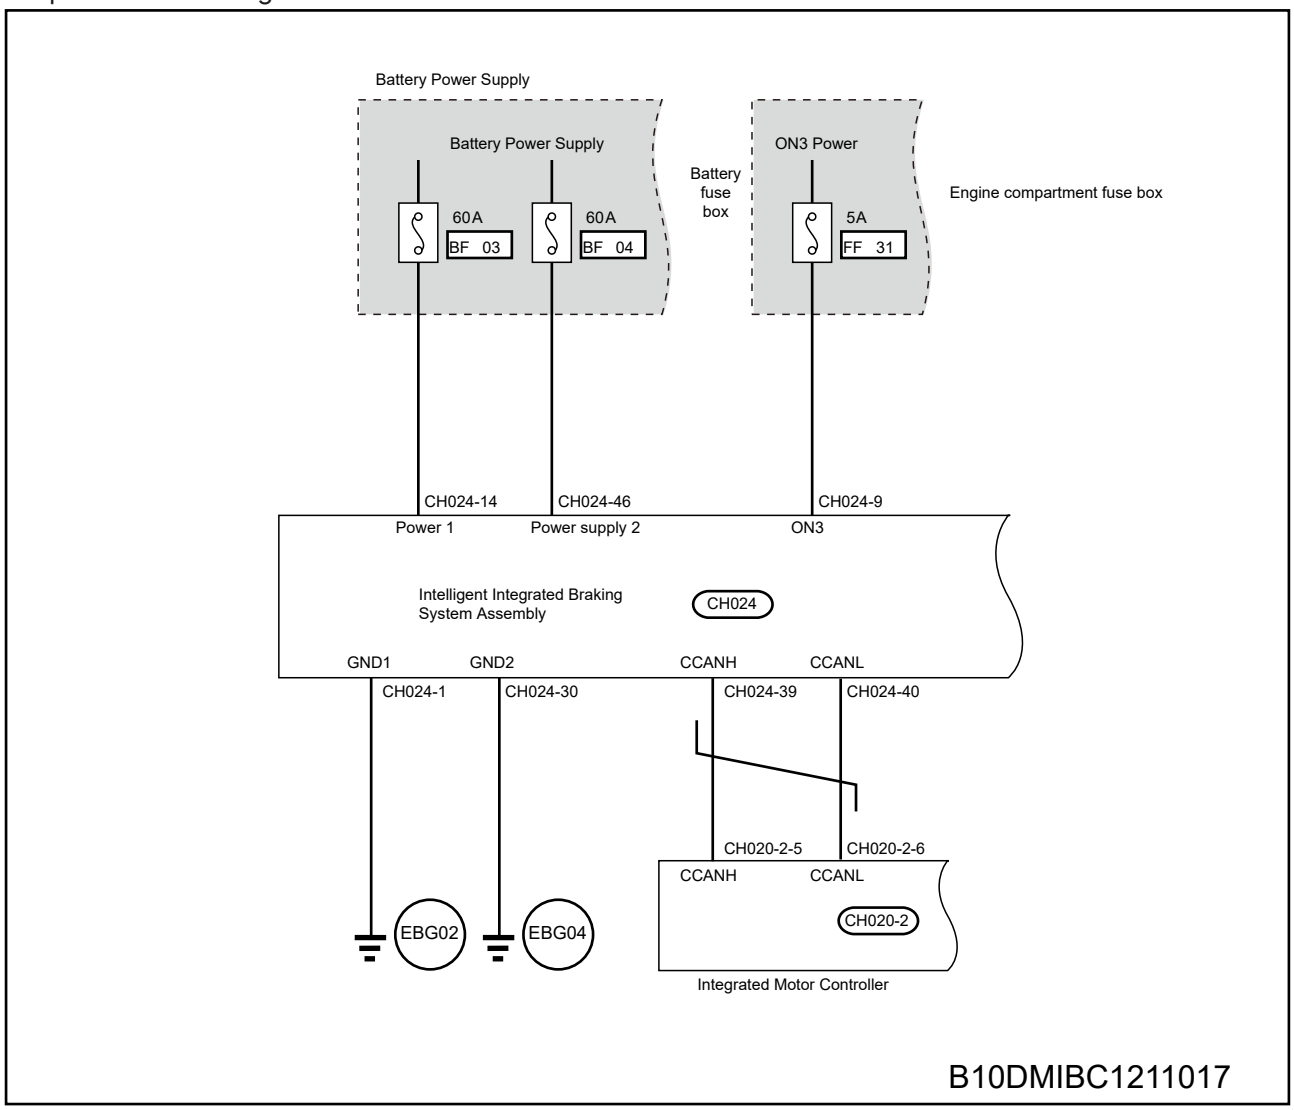


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

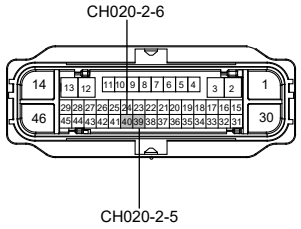
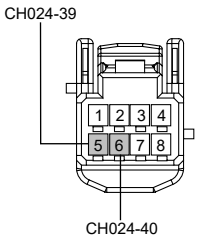
DTC: U200882-IBC

Fault code	Description
U200882	Communication fault: EPS18D message counter error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the integrated motor controller and the smart integrated braking system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211018 CH020-2 Integrated Motor Controller  B10DMIBC1211019	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector CH020-2 of the integrated motor controller. D. Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the smart integrated brake system assembly and terminal 5 of wiring harness connector CH020-2 of the integrated motor controller to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of wire harness connector CH020-2 of the Integrated Motor Controller to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the Integrated Motor Controller.	
	A Check whether the power ground circuit of the integrated motor controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of integrated motor controller.	
	Replacement of integrated motor controller. B After replacing the integrated motor controller and performing the calibration procedure, end soft limit learning, configuration word writing, and VIN writing, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

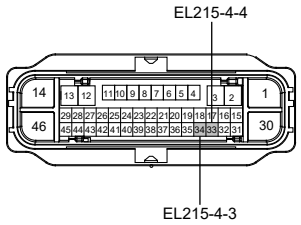
DTC: U200083-IBC

Fault code	Description
U200083	Communication fault: HPCGW0CB message checksum abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

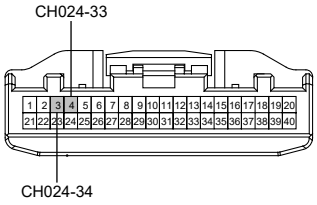
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



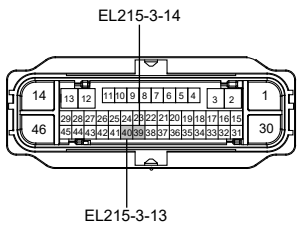
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

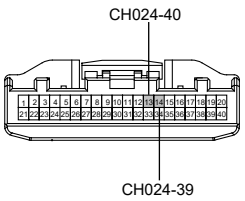


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

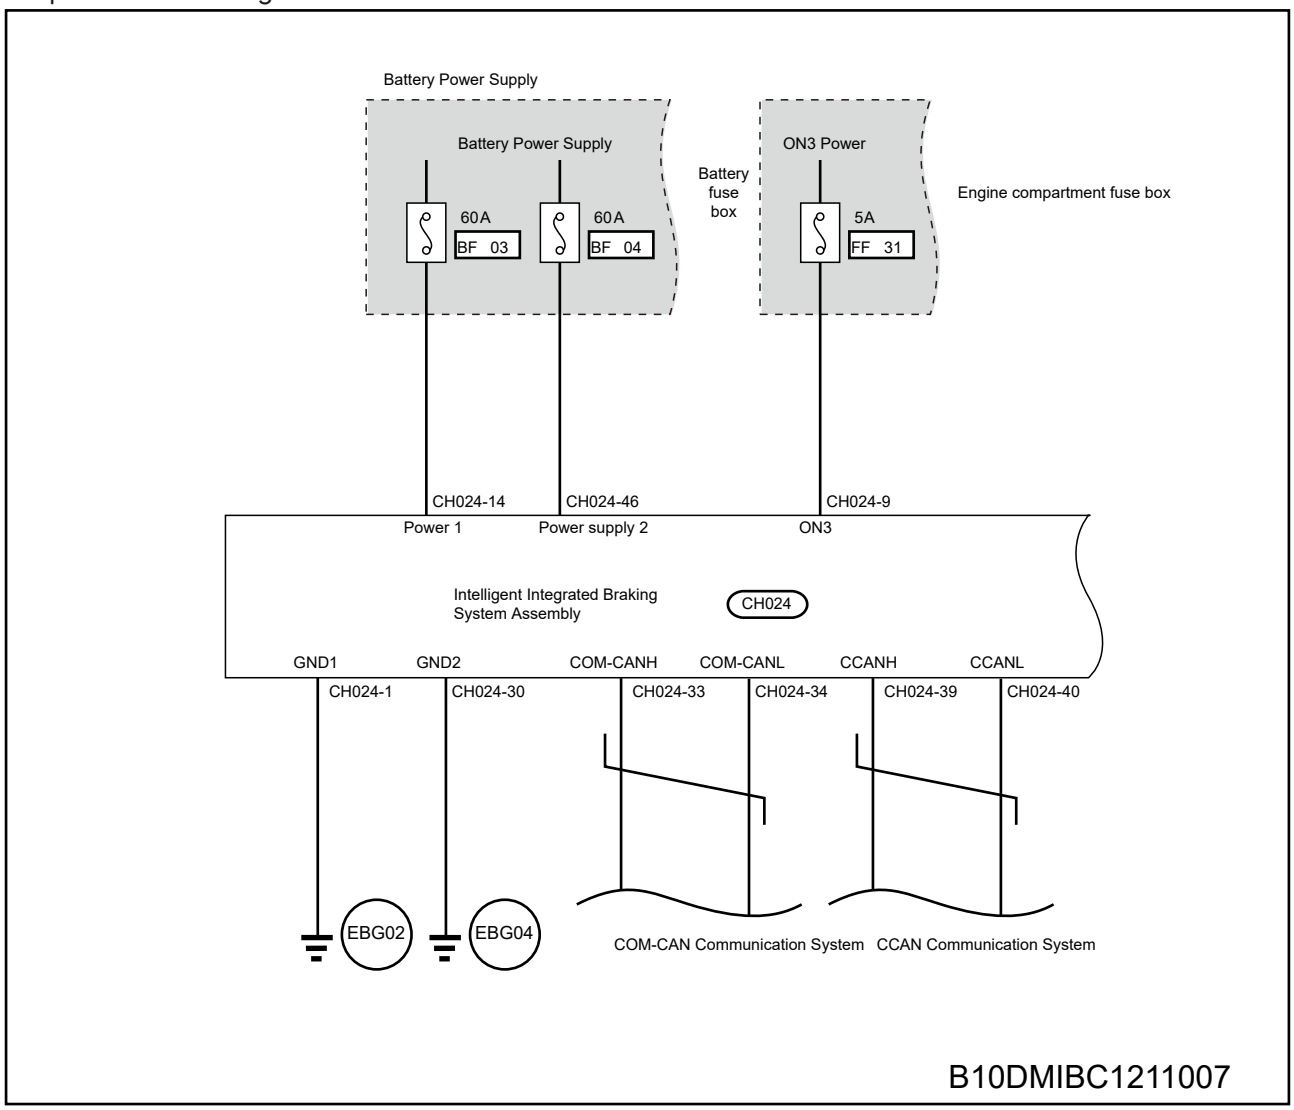


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U200186-IBC

Fault code	Description
U200186	Communication fault: Rear motor speed signal abnormal

1. Simplified Circuit Diagram

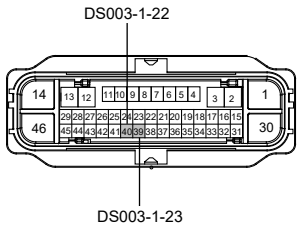
2. Diagnostic Steps

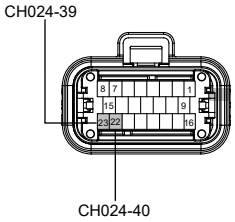
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check controller assembly fault codes.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controlle r assembly and record them. C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the controller assembly.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the controller assembly and the intelligent integrated braking syste m assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211027 DS003-1 Controller Assembly  B10DMIBC1211028	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 39 of wiring harness con nector CH024 of the Intelligent Integrated Brake System ass embly and terminal 23 of wiring harness connector DS003-1 of the controller assembly to check whether the resistanc e value is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 40 of the wiring harness co nnector CH024 of the Smart Integrated Brake System asse mbly and terminal 22 of the wiring harness connector DS00 3-1 of the controller assembly to check whether the resista nce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the controller assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

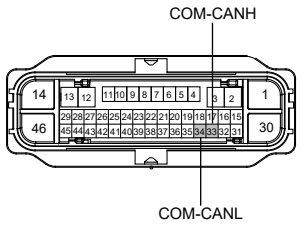
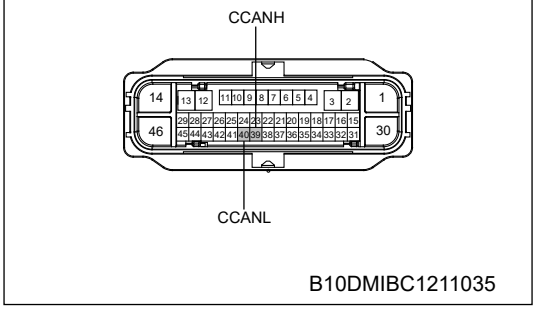
DTC: U070187-IBC

Fault code	Description
U070187	No communication on CANFD line



1. Simplified Circuit Diagram



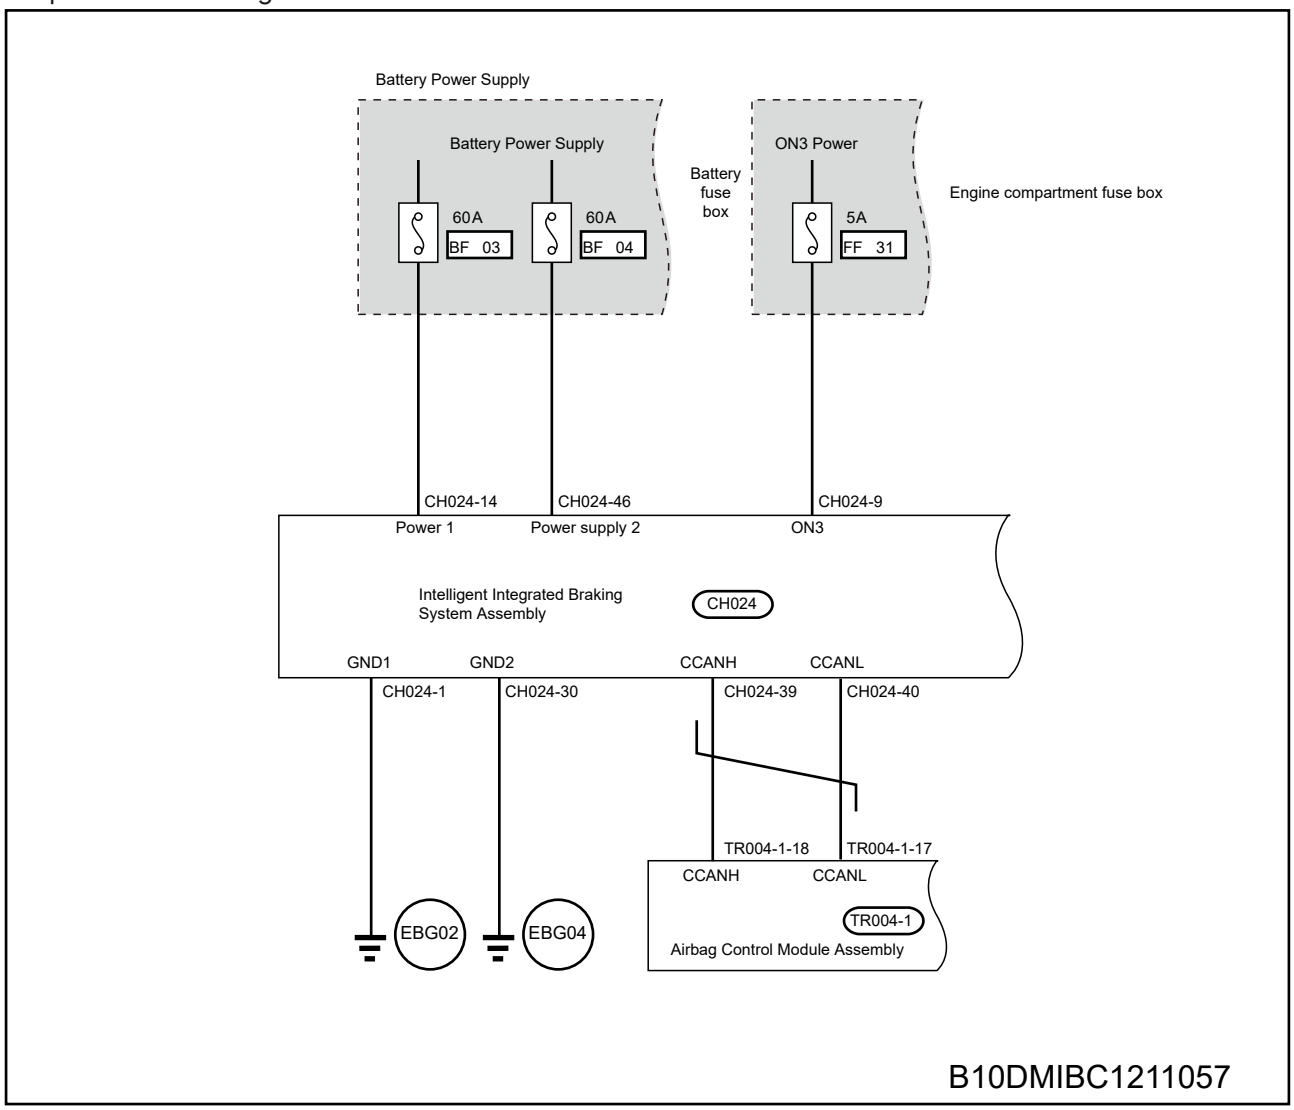
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the COM-CAN wiring harness of the intelligent integrated brake system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211034	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 33 and body ground, and between terminal 34 and body ground, respectively, at the wiring harness connector CH024 of the Intelligent Integrate d Brake System assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Inspect the CCAN wiring harness of the smart integrated brake system assembly.	

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Using a multimeter, select the DC voltage range and mea sure the voltage values between terminal 39 and terminal 4 0 of the wire harness connector CH024 of the intelligent int egrated brake system assembly and the vehicle body groun d, respectively. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211058 TR004-1 Airbag Control Module Assembly  B10DMIBC1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

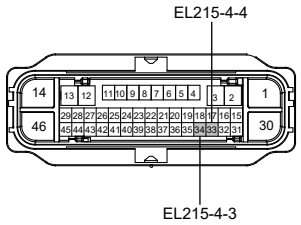
DTC: U200287-IBC

Fault code	Description
U200287	Communication fault: HPCGW3B0 message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

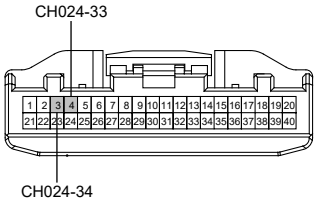
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



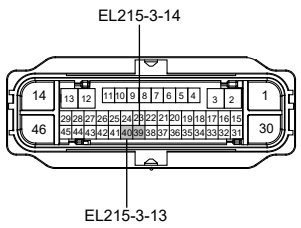
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

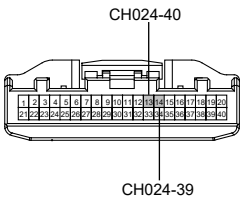


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

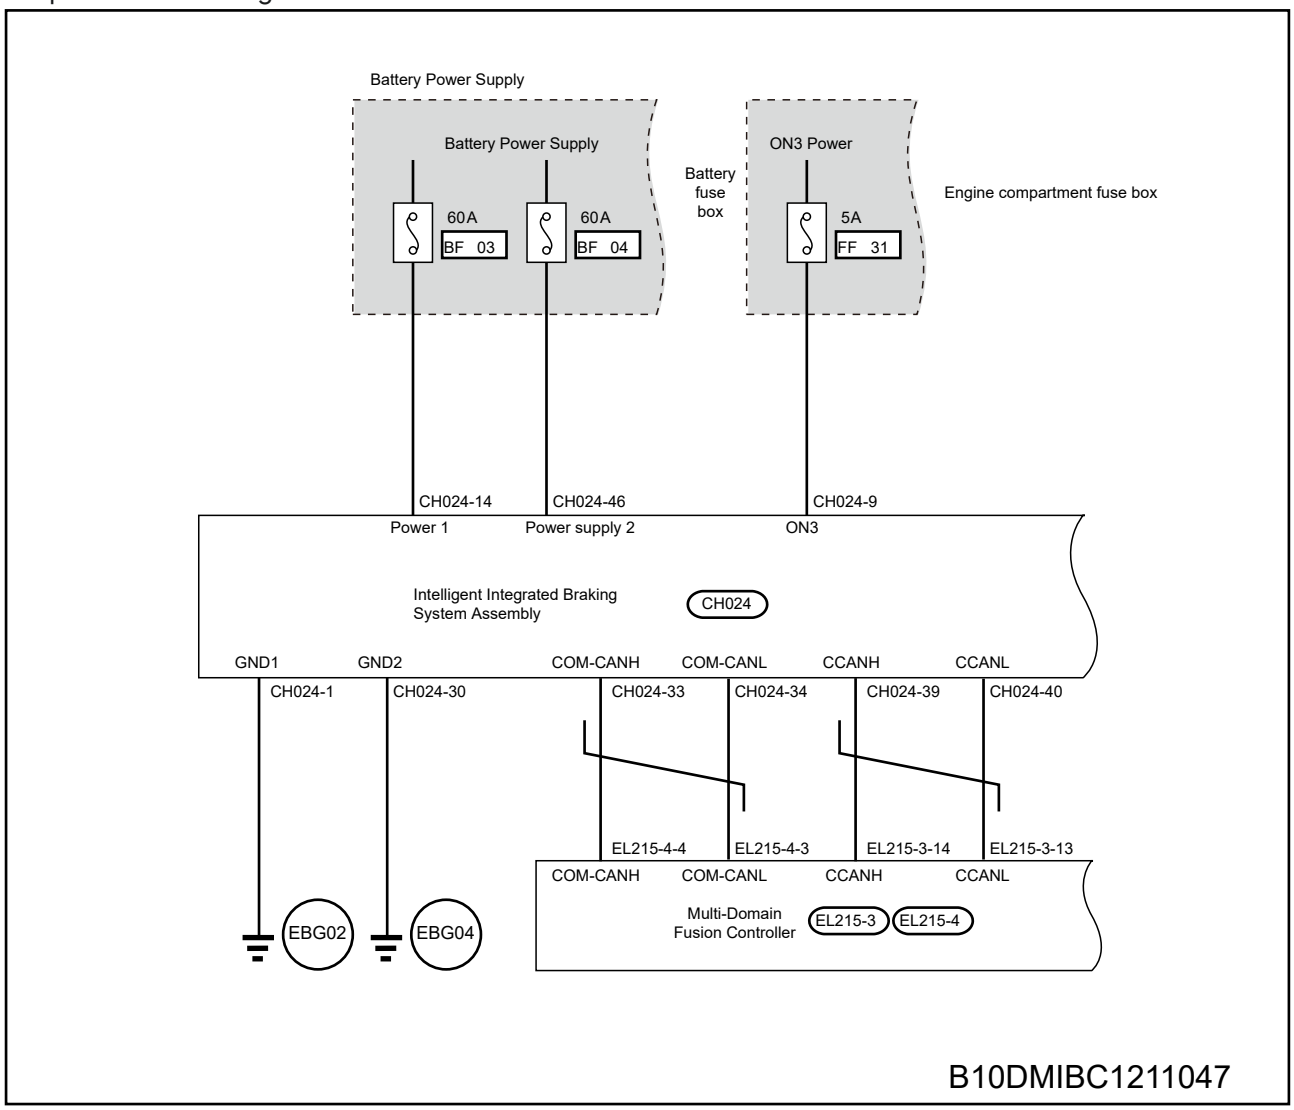


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

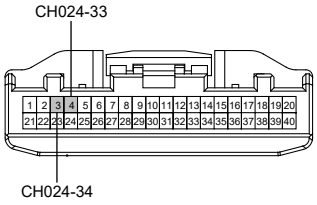
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



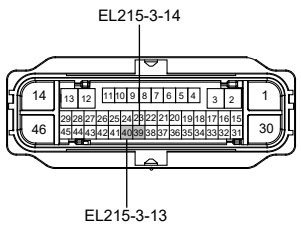
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

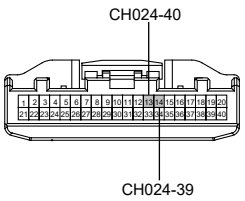


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

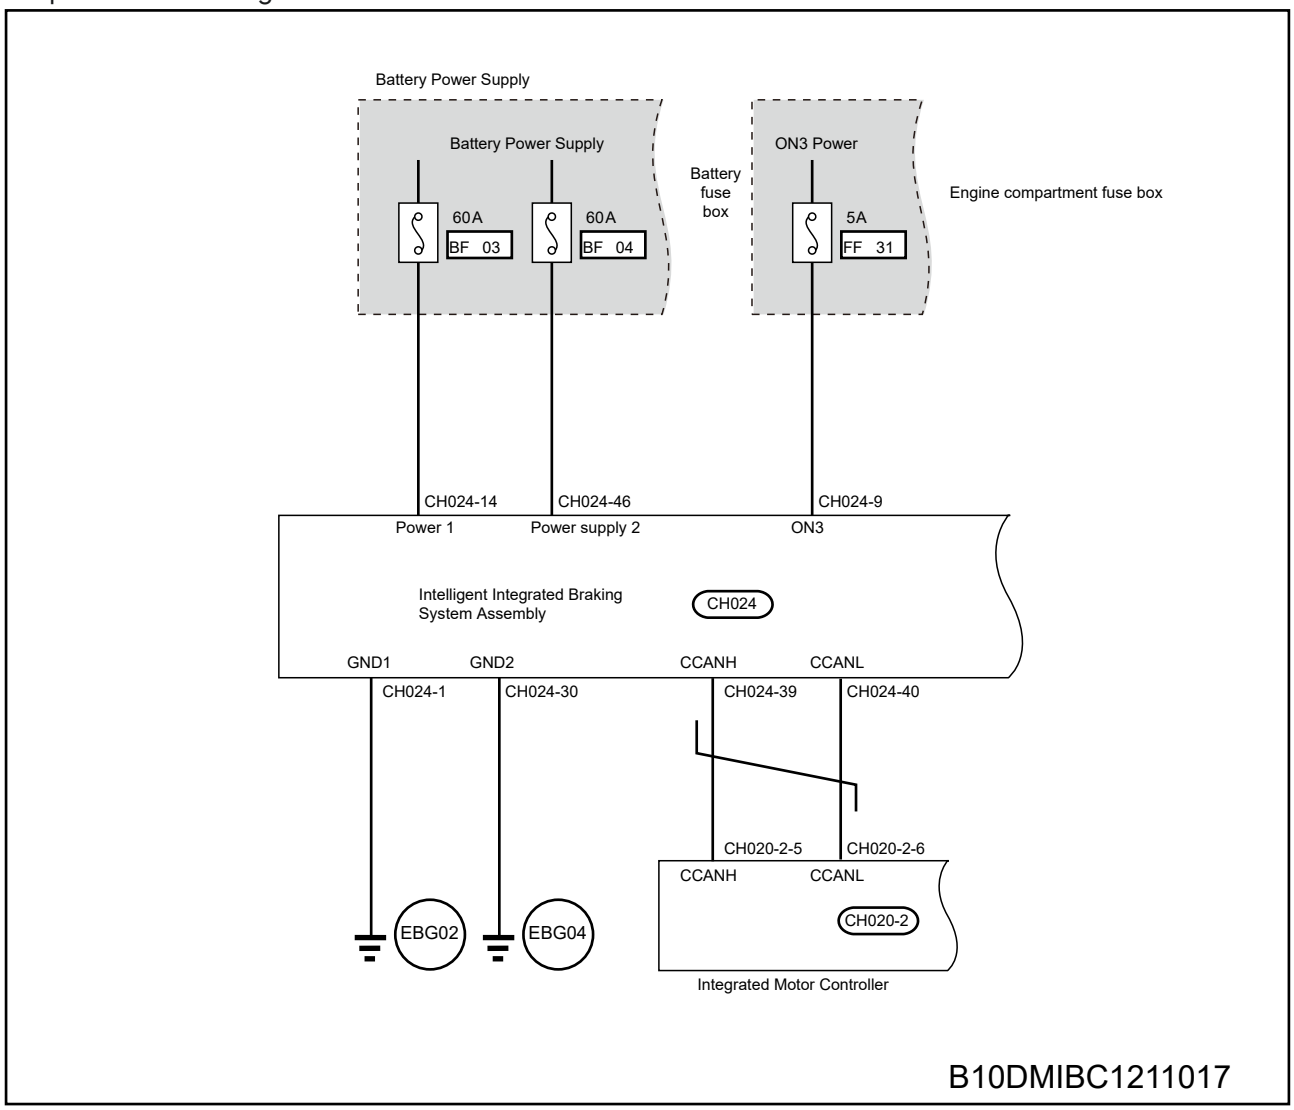


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?

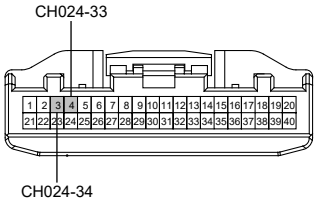
Yes 》 》 》
Go to step 2.



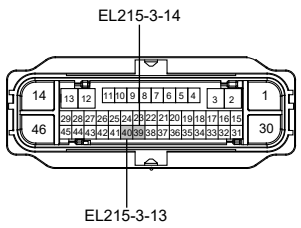
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

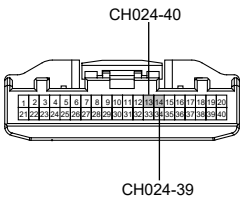


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

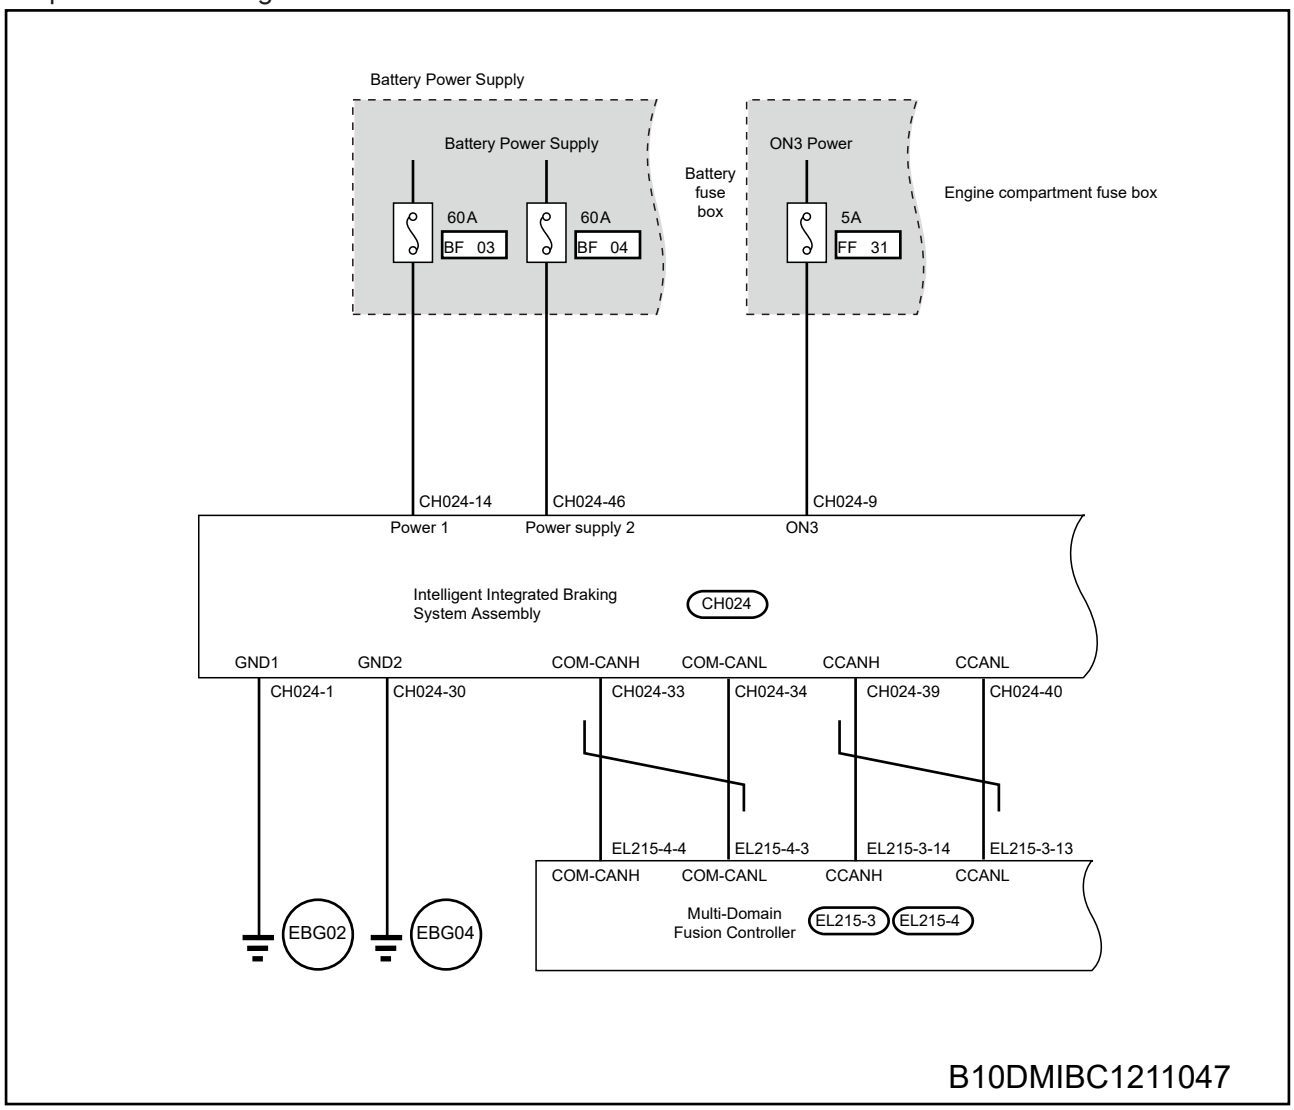


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

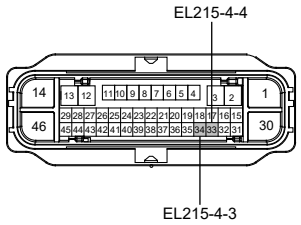
DTC: U200387-IBC

Fault code	Description
U200387	Communication fault: HPCGW0CB message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

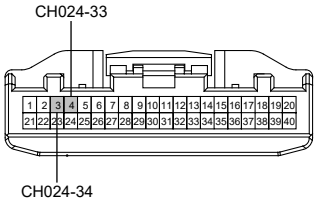
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



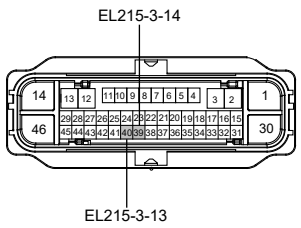
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

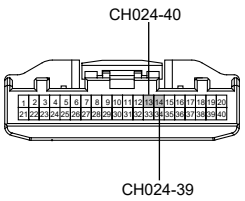


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

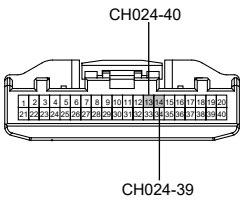
Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

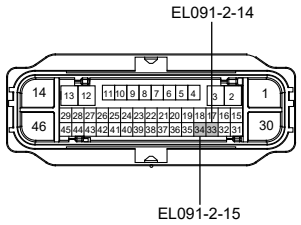
DTC: U200B82-IBC

Fault code	Description
U200B82	Communication fault: TCM30B message counter abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

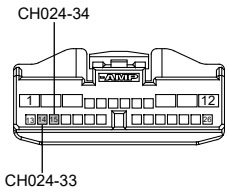
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the combination switch and the Intelligent Integrated Braking System assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211040

EL091-2 Combination Switch

B10DMIBC1211041

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL091-2 of the combination switch.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 33 of wiring harness connector CH024 of the smart integrated brake system assembly and terminal 14 of wiring harness connector EL091-2 of the combination switch is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 15 of wiring harness connector EL091-2 of the combination switch to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the combination switch.

A Check whether the power ground circuit of the combination switch is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the combination switch.

Replace the combination switch.
B After replacing the combination switch, is the fault eliminated?

Yes》》》 System normal.

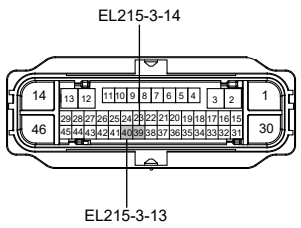
CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

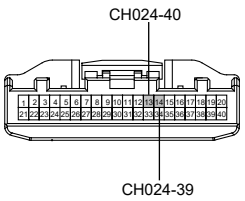
No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

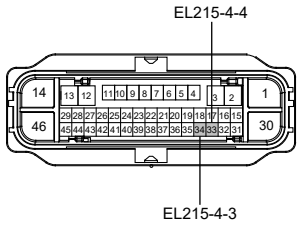
DTC: U201687-IBC

Fault code	Description
U201687	Communication fault: HPCADAS0x084 message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

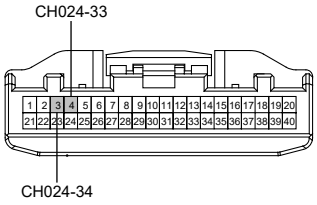
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



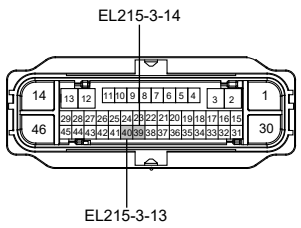
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

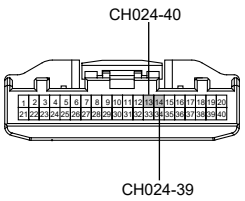


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

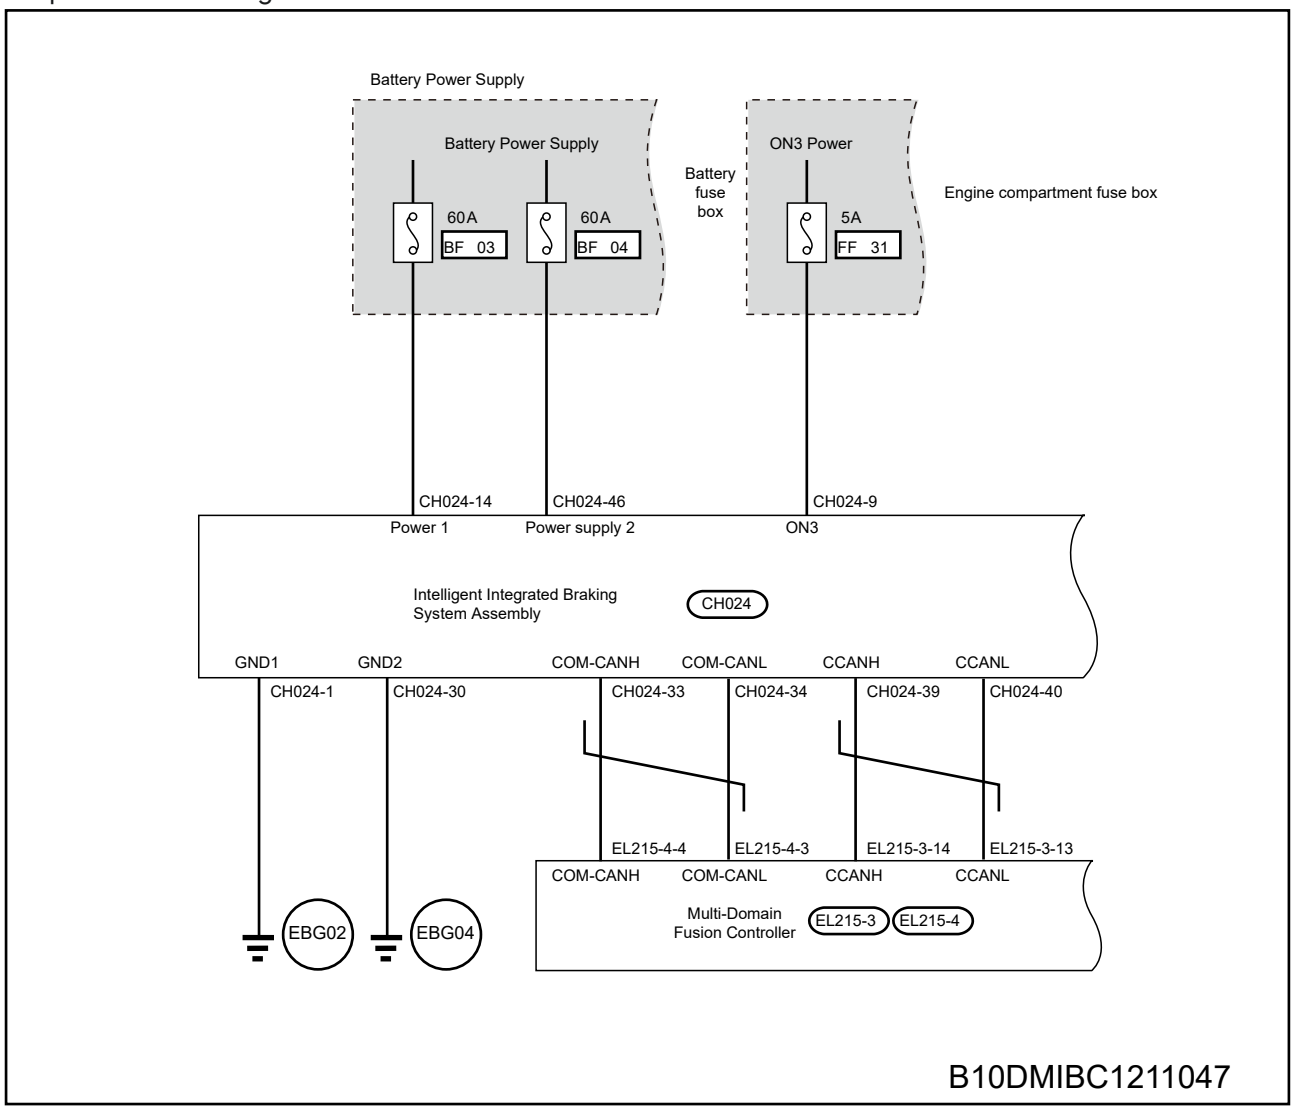


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

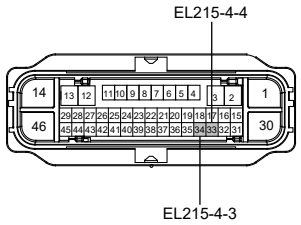
DTC: U201283-IBC

Fault code	Description
U201283	Communication fault: HPCBCM241 message checksum abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

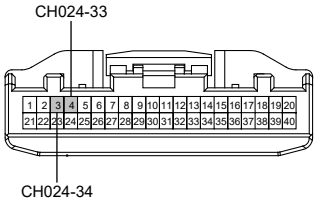
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



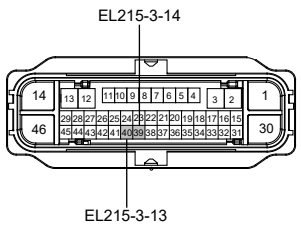
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

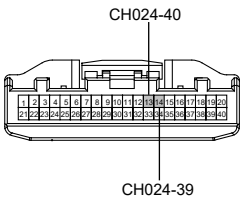


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

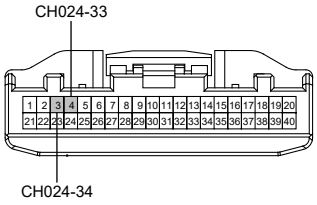
Go to step 2.



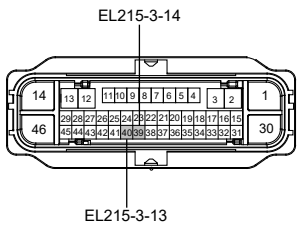
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

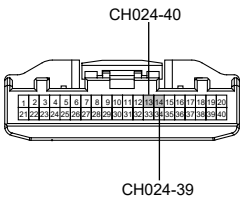
No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

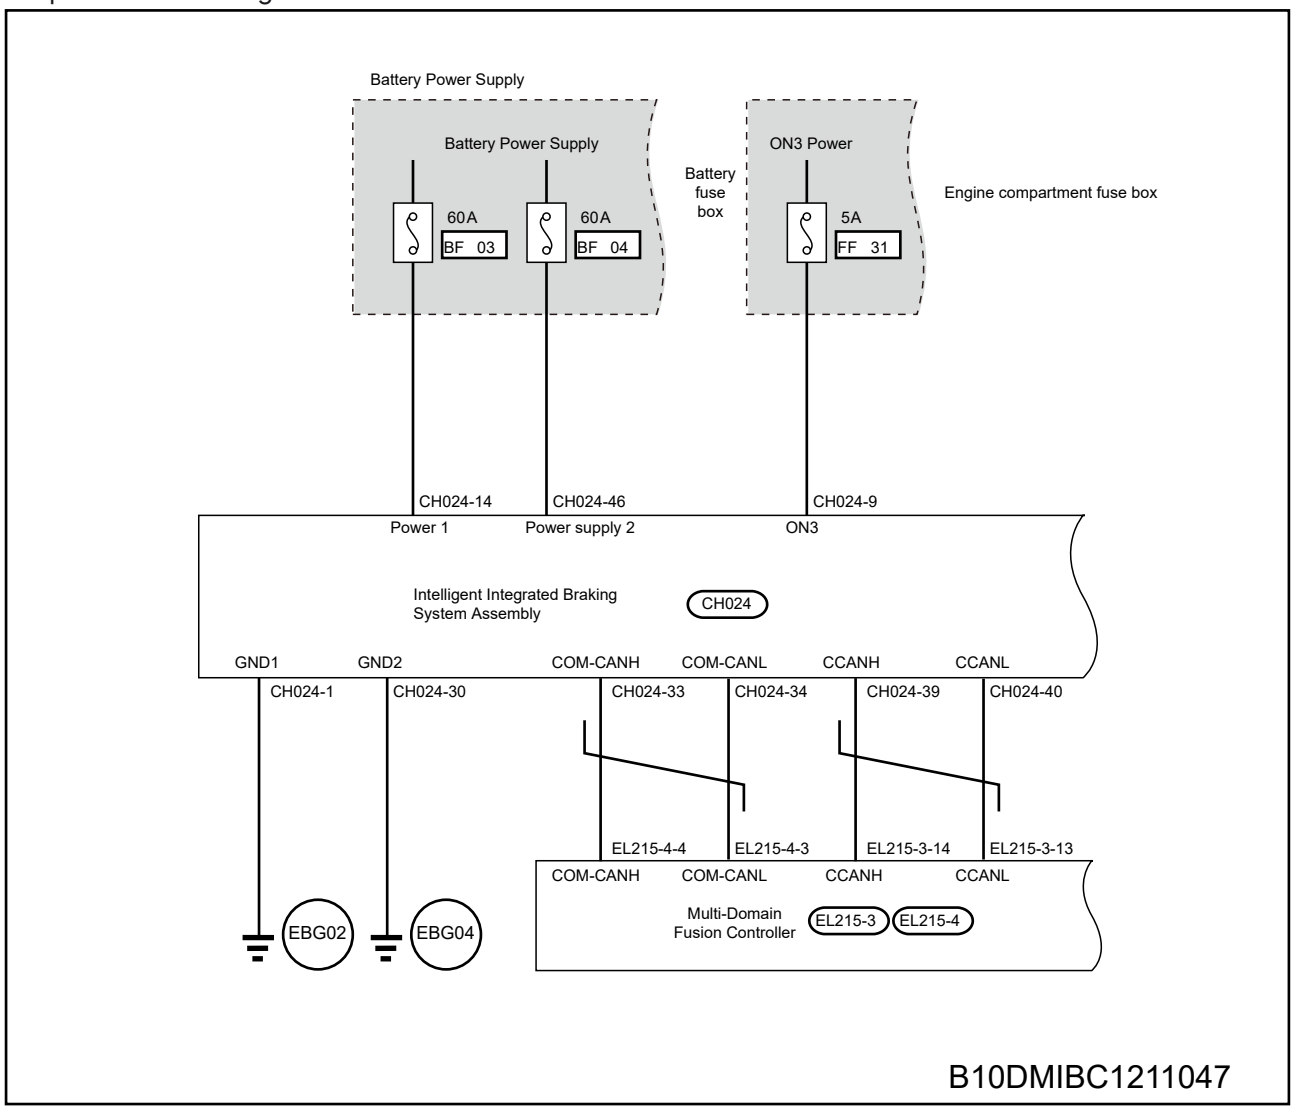


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U201686-IBC

Fault code	Description
U201686	EPS steering angle sensor not calibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

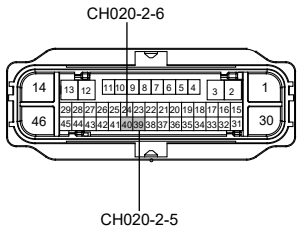
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

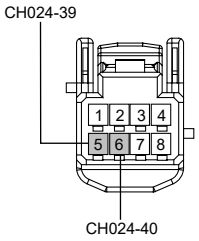
Step 2 Check the diagnostic trouble codes of the integrated motor controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the integrated motor controller, and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize repairing faults related to the integrated motor controller.

No》》》
Go to step 3.



Step 3 Check the CAN harness between the integrated motor controller and the smart integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211018

CH020-2 Integrated Motor Controller

B10DMIBC1211019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH020-2 of the integrated motor controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 of the smart integrated brake system assembly and terminal 5 of wiring harness connector CH020-2 of the integrated motor controller to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of wire harness connector CH020-2 of the Integrated Motor Controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the Integrated Motor Controller.

A Check whether the power ground circuit of the integrated motor controller is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of integrated motor controller.	
	Replacement of integrated motor controller. B After replacing the integrated motor controller and performing the calibration procedure, end soft limit learning, configuration word writing, and VIN writing, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U201886-IBC

Fault code	Description
U201886	Communication fault: Left front seat belt status signal abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

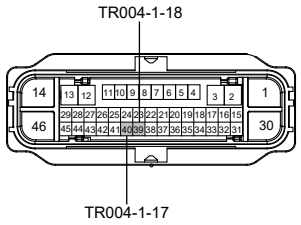
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

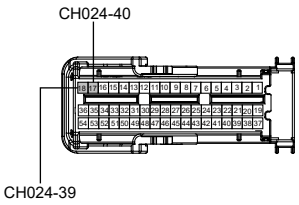
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the airbag control module assembly.

No》》》
Go to step 3.



Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211058

TR004-1 Airbag Control Module Assembly

B10DMIBC1211059

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector TR004-1 of the airbag control module assembly.
D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 39 of th e wire harness connector CH024 of the intelligent integrate d brake system assembly and terminal 18 of the wire harnes s connector TR004-1 of the airbag control module assembly is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 40 of the wire harness connector CH024 of the Smart Integrated Brake System ass embly and terminal 17 of the wire harness connector TR004 -1 of the Airbag Control Module assembly to check if the re sistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the airbag control module assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U201B86-IBC

Fault code	Description
U201B86	Communication fault: Invalid external ambient temperature signal

1. Simplified Circuit Diagram

2. Diagnostic Steps

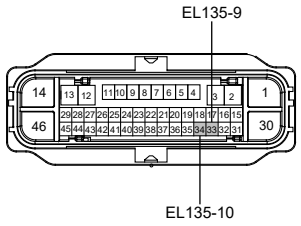
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

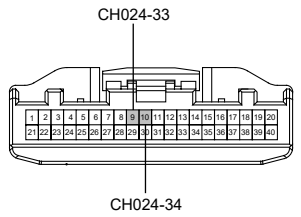
Step 2 Check the fault codes of the thermal management controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the thermal management controller, and record them.
C Check for any diagnostic trouble codes related to the am bient temperature sensor.

Yes》》》 Prioritize repairing faults related to the thermal management controller.

No》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the thermal management controller and the smart integrate d brake system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211037

EL135 Thermal Management Controller

B10DMIBC1211038

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Int elligent Integrated Brake System assembly.
C Disconnect the harness connector EL135 of the thermal m anagement controller.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 33 of the wiring harness connector CH024 of the Intelligent Integrated Brake System Assembly and terminal 9 of the wiring harness connector E L135 of the Thermal Management Controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 10 of the wiring harness connector E L135 of the Thermal Management Controller to check whet her the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the thermal management controller.

© 2026, All rights reserved

	A Check if the power ground circuit of the thermal management controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

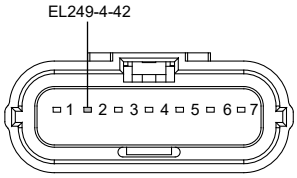
Yes》》》
Go to step 2.



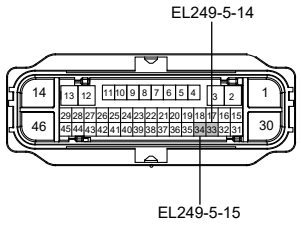
Step 2 Check the wiring harness between the main zone controller and the left front door lock body.

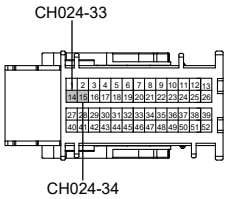
EL249-4 Main Zone Controller

B10DMIBC1211043

BY013 Left Front Door Lock Body

B10DMIBC1211044





A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BY013 of the front left door lock body.
C. Disconnect the wiring harness connector EL249-4 of the main zone controller.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 2 of the wire harness connector BY013 of the left front door lock body and terminal 42 of the wire harness connector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector BY013 of the front left door lock body and the vehicle body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 of the wire harness connector BY013 for the front left door lock body and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the main zone controller and the intelligent integrated braking system assembly.

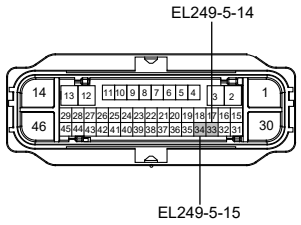
Step 2 Check the wiring harness between the main zone controller and the left front door lock body.

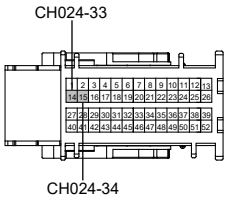
EL249-4 Main Zone Controller

B10DMIBC1211043

BY013 Left Front Door Lock Body

B10DMIBC1211044





A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BY013 of the front left door lock body.
C. Disconnect the wiring harness connector EL249-4 of the main zone controller.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 2 of the wire harness connector BY013 of the left front door lock body and terminal 42 of the wire harness connector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector BY013 of the front left door lock body and the vehicle body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 of the wire harness connector BY013 for the front left door lock body and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the main zone controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211045 EL249-5 Main Zone Controller  B10DMIBC1211046	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of harness connector EL249-5 of the Main Zone Controller to check if it is normal. E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 15 of harness connector EL249-5 of the Main Zone Controller to check if the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the front left door lock body.	
	A Replace the front left door lock body. B After replacing the left front door lock body, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller.

© 2026, All rights reserved

	B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

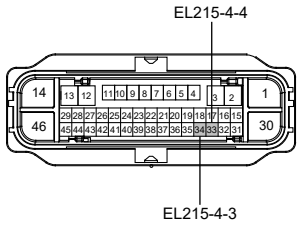
DTC: U201282-IBC

Fault code	Description
U201282	Communication fault: HPCBCM241 message counter abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

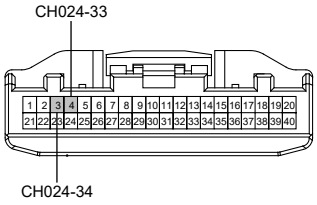
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



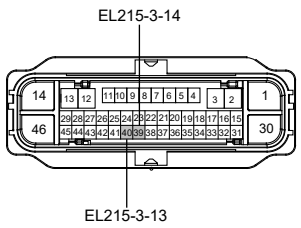
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

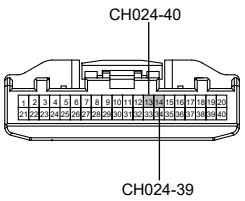


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

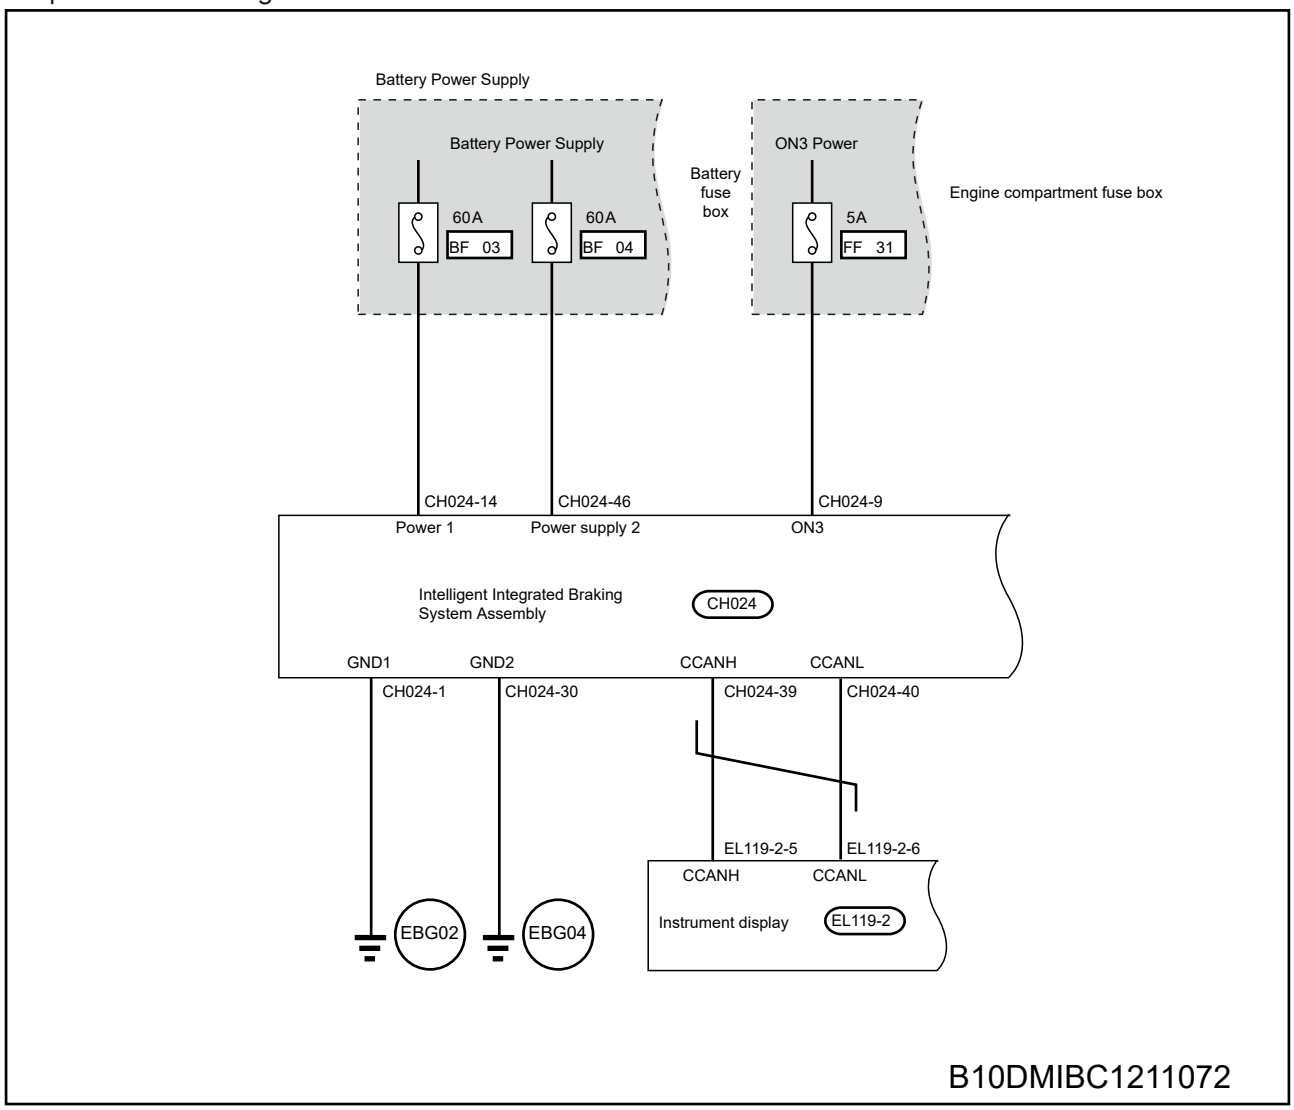


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

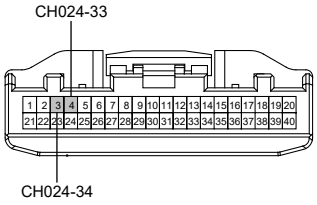
Yes 》 》 》
Go to step 2.



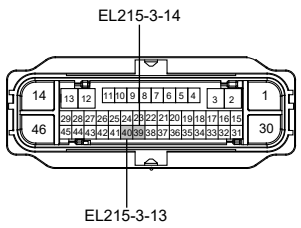
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

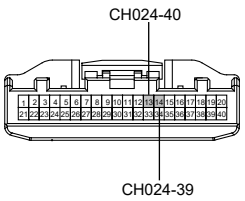


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

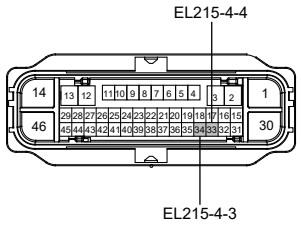
DTC: U202683-IBC

Fault code	Description
U202683	Communication fault: HPCGW0CB message checksum abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

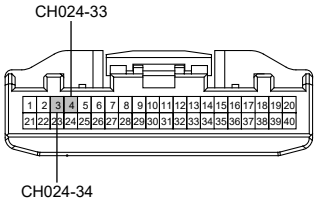
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



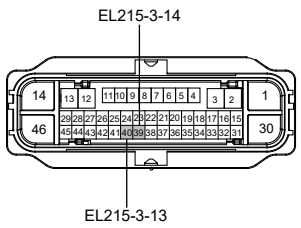
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

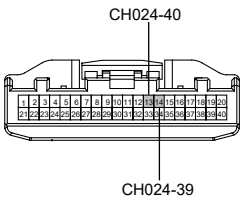


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the instrument display and the Smart Integrated Brake System assembly.	
CH024 Intelligent Integrated Brake System Assembly  B10DMIBC1211073 EL119-2 Instrument Display  B10DMIBC1211074	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly. C Disconnect the instrument display harness connector EL119-2. D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 5 of the wire harness connector EL119-2 of the instrument display to check if it is normal. E. Use a multimeter, select the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 6 of the wire harness connector EL119-2 of the instrument display to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the instrument cluster display.	
	A Check whether the power ground circuit of the instrument display is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the instrument cluster display.	
	A Replace the instrument cluster display. B After replacing the instrument cluster display, is the fault cleared?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

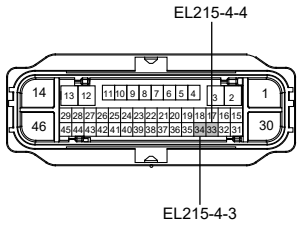
DTC: U202187-IBC

Fault code	Description
U202187	Communication fault: IVI5CE message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

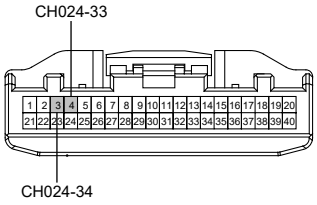
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



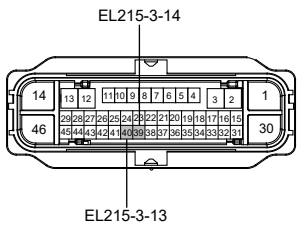
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

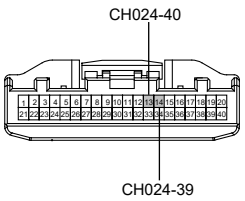


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

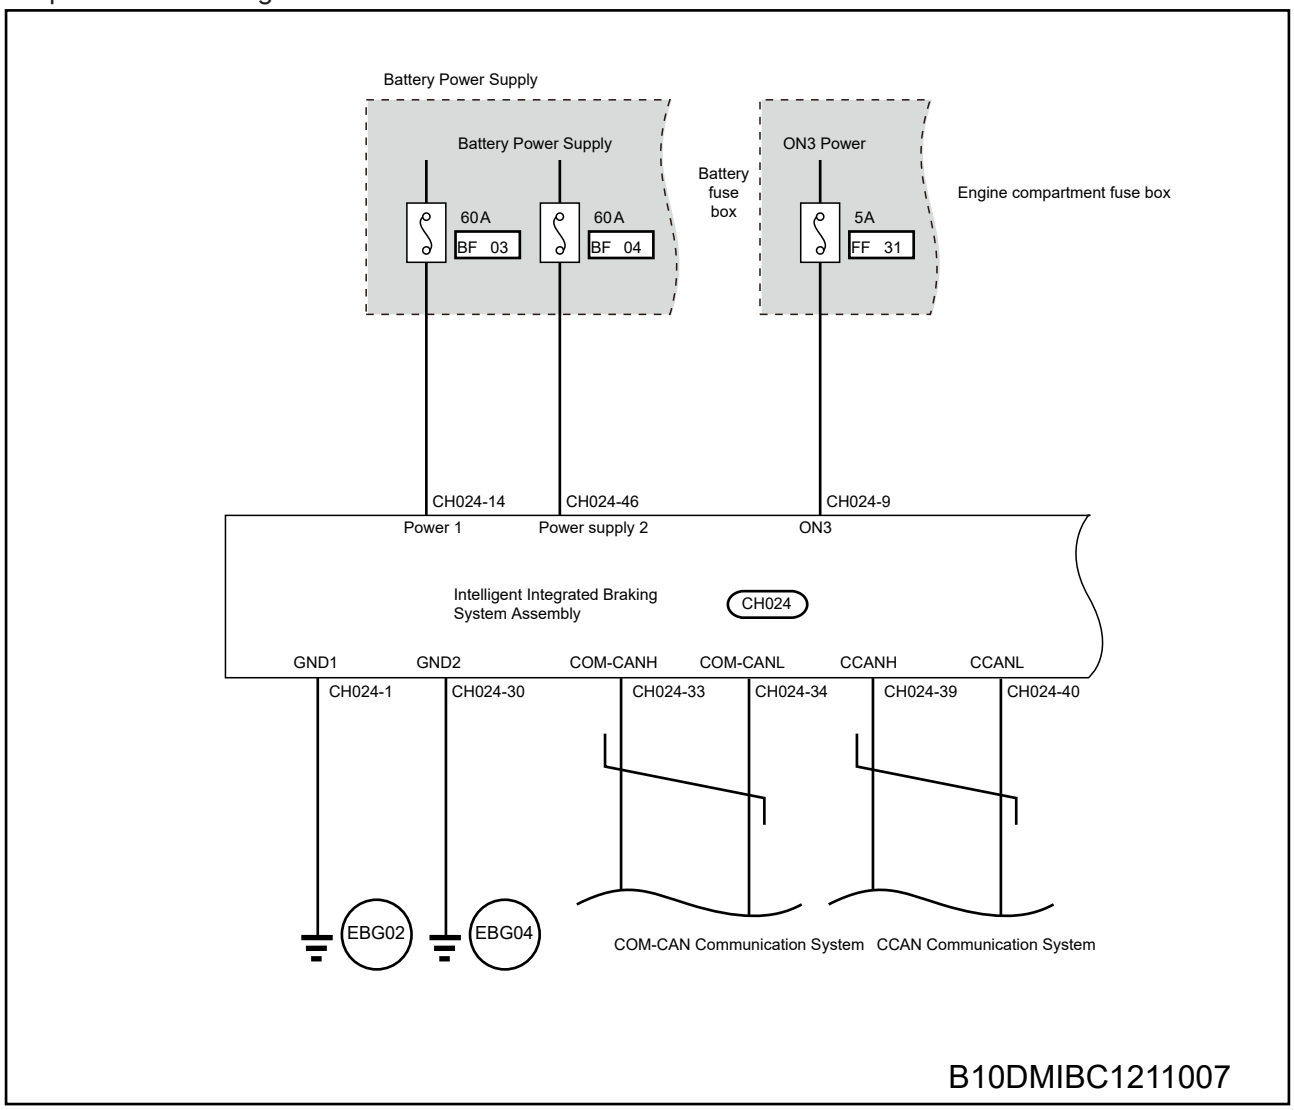


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

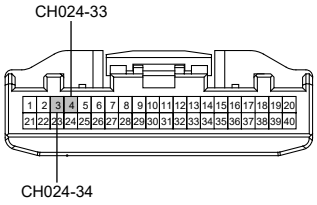
Yes》》》
Go to step 2.



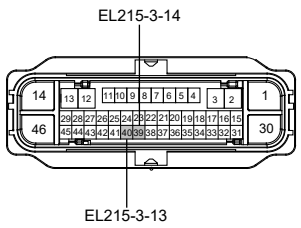
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211048

EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

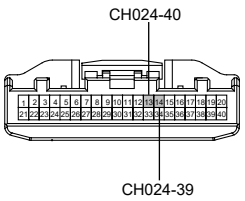


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

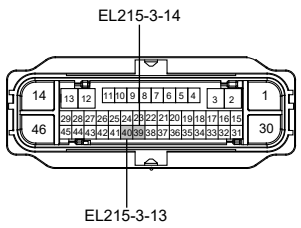
EL215-4 Multi-Domain Fusion Controller

B10DMIBC1211049

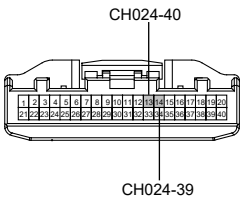


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 4 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check if the resistance is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 34 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of the wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to verify if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

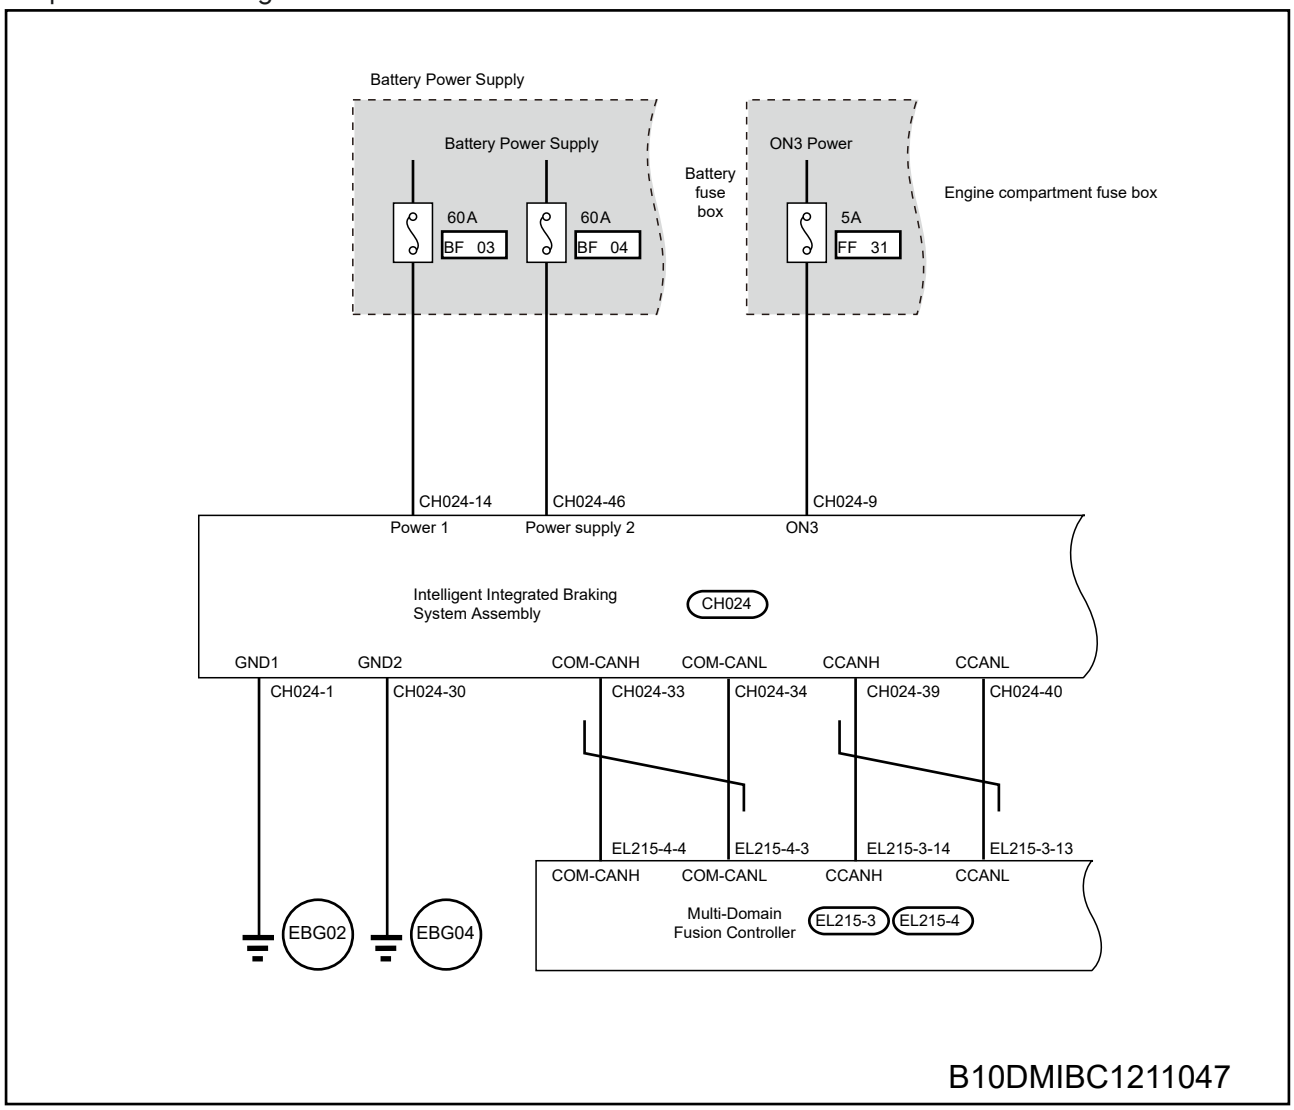


CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 39 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 14 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMIBC1211051	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U202887-IBC

Fault code	Description
U202887	Communication fault: EPBr message timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Clear the fault codes, cycle the power, and check if the fa ult is resolved.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply and ground of the Intelligent Integrated Brake System assembly.	
	A Check whether the power supply and ground of the intelli gent integrated brake system assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

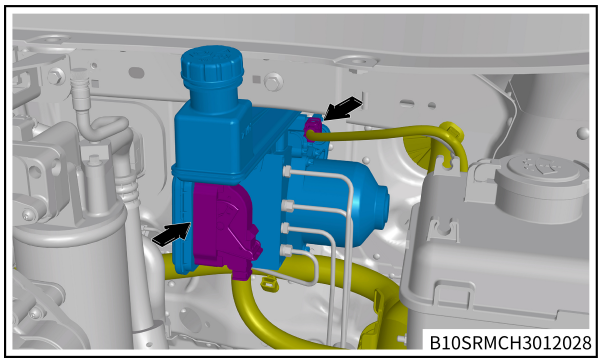
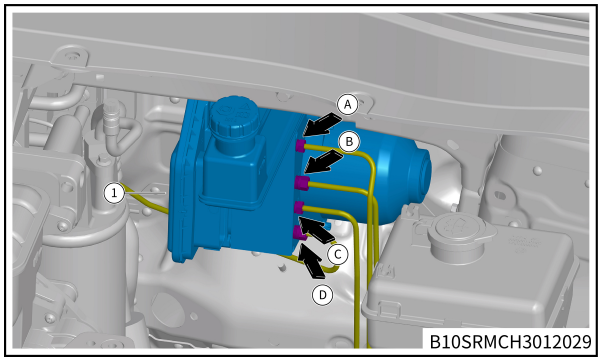
5.11.8 SERVICE AND REPAIR GUIDANCE



INTELLIGENT INTEGRATED BRAKING SYSTEM ASSEMBLY

ATTENTION



When removing any brake line, first drain the brake fluid from the brake fluid reservoir and purge the remaining brake fluid from the system lines. After installation, refill with new brake fluid and bleed the system.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
4. Remove the brake pedal assembly.
   See:Brake Pedal Assembly (page 3201)
5. Remove the Intelligent Integrated Braking System assembly.

a. Disconnect the 2 connecting plugs -arrow- between the smart integrated brake system assembly and the engine compartment wiring harness assembly.

b. Unscrew the 1 oil pipe nut connecting the Intelligent Integrated Brake System Assembly to the left front brake hard pipe assembly -Arrow A-, and disconnect the connection.
   Recommended tool: 11mm fuel line wrench
   Torque: 17±3N m
c. Unscrew the 1 pipe nut -Arrow B- connecting the Intelligent Integrated Brake System Assembly to the Right Rear No. 1 Brake Hard Pipe Assembly, and disconnect the connection.
   Recommended tool: 11mm fuel line wrench
   Torque: 17±3N m
d. Unscrew the 1 brake pipe nut connecting the Intelligent Integrated Braking System assembly to the left rear No. 1 brake hard pipe assembly -Arrow C-, and disconnect.

© 2026, All rights reserved

Recommended tool: 11mm fuel line wrench
Torque: 17±3N m

e. Unscrew the 1 oil pipe nut - Arrow D - connecting the Intelligent Integrated Brake System Assembly to the right front brake hard pipe assembly, and disconnect the connection.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m

> **ATTENTION**
>
> Spilled brake fluid must be cleaned up promptly to prevent corrosion of hoses and other components.

f. Remove the Intelligent Integrated Braking System assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After removing the brake hard pipe, the brake fluid must be replaced with new brake fluid.
   See:Replace Brake Fluid (page 212)

   > **ATTENTION**
   >
   > Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   b. After filling the brake fluid, bleed the brake system.
   See:Brake System Bleeding (page 214)
   c. After installation, check whether all lines are properly installed and check for any fluid leaks.
   d. The Intelligent Integrated Braking System assembly can only be replaced as a complete unit and must not be disassembled for inspection or partially replaced/interchanged.
   e. Replacing the Intelligent Integrated Brake System Assembly requires following these steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old smart integrated braking system assembly.
      - Check for new version: After installing the new intelligent integrated brake system assembly, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the software of the new Intelligent Integrated Brake System Assembly must first be updated to the old version or a higher version before it can be put into service.
   f. After installation, the following calibration steps must be performed on the intelligent integrated brake system assembly:

© 2026, All rights reserved

> **ATTENTION**
>
> All the following operations must be performed when the vehicle is in the READY state.

- Precautions for Calibration after Replacing the Intelligent Integrated Braking System Assembly:
  - When using the diagnostic tool, the vehicle must be powered on to ON3 (Ready), and the high voltage must not be disconnected.
  - During the entire bleeding process, the diagnostic tool must not be disconnected, first perform manual pedal bleeding, then proceed with the service bleeding.
  - During the bleeding process, monitor the brake fluid level and top it up promptly.
  - Upon completion, disconnect the diagnostic tool to exit diagnostics.
- Diagnostic Tool Connection:
  - The PC performs diagnostics via a CAN tool such as the ZLG 200U, using Channel 0 and connecting to the OBD port (6, 14). If vehicle identification fails, click "Start Diagnostics" to enter the submenu, and a diagnostic request will be initiated only when a controller is clicked.
- Write the VIN. Diagnostic scanner operation: Select the corresponding vehicle model - System Diagnostics - Intelligent Integrated Braking System (IBC) Assembly - Data Write - Write VIN, and write the actual VIN.
- Write the end-of-line configuration. The diagnostic tool operation is as follows: Select the corresponding vehicle model - System Diagnostics - Intelligent Integrated Brake System Assembly (IBC) - Data Write - Write End-of-Line Configuration, and write according to the actual vehicle configuration.
- EPB Assembly Inspection:
  - EPB Assembly Check - Confirm that the final result is RoutineCompleted, indicating that the test is complete.

    > **ATTENTION**
    >
    > Assembly check completed, the EPB is in the released state, please note that the vehicle must be operated on level ground to prevent rolling!

- Master cylinder test.
  - 1. Scan tool operation: Select the corresponding vehicle model - System Diagnostics - Intelligent Integrated Brake Control (IBC) Assembly - Routine Control - Master Cylinder Test.
  - 2. Depress the brake pedal as prompted. During this test, the brake pedal requires greater effort, so the operator must firmly depress it all the way to the floor.
  - Result verification: The master cylinder stroke value must be ≤4.
  - If the requirements are not met, repeat the bleeding procedure until the requirements are met, or perform troubleshooting to check for leaks in the master cylinder.
- Clear/Read Diagnostic Trouble Codes.
  - After completing the above operations, clear the diagnostic trouble codes, then read the DTCs to ensure the system is operating normally and no DTCs are present.
  - If a fault code is present, troubleshoot the issue according to the specific fault code definition.

g. After installation is completed, a road test must be conducted to check the braking performance of the vehicle while driving.

5.12 ELECTRONIC STABILITY SYSTEM

5.12.1 PRECAUTIONS

PRECAUTIONS

1. The sensor wiring harness must be securely fastened according to the original routing standard during vehicle installation.
2. The sensor wiring harness must not be twisted, and the wiring harness connector and the mating connector must be fully seated.

© 2026, All rights reserved

5.12.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

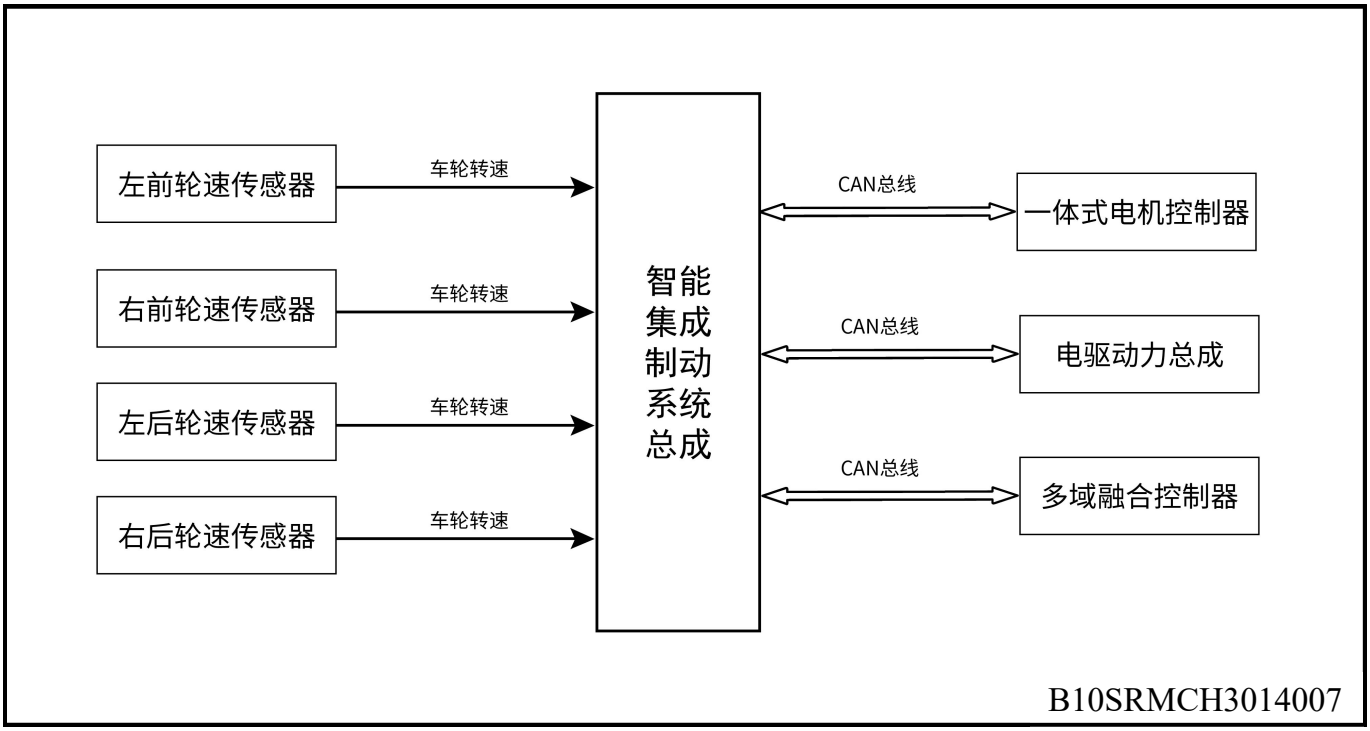
System Overview

The Electronic Stability Control system consists of three main parts: sensors, an Electronic Control Unit (ECU), and actuators. It monitors the vehicle's operating status through the ECU and intervenes to control the vehicle's motor and braking system. The sensors include four wheel speed sensors, a yaw rate sensor, and a brake master cylinder pressure sensor. The other systems include the conventional braking system (brake booster, brake lines, and brakes) and hydraulic control valves. The ECU works in conjunction with the integrated vehicle control system to intervene in and adjust the motor power output.

Feature Introduction

The Electronic Control Unit (ECU) of the Electronic Stability Control system is integrated into the Smart Integrated Brake System assembly and operates in conjunction with the EHB brake boost function.

TCS: Traction Control System, ESC: Electronic Stability Control:



- It features a function to assist the driver in controlling the driving direction. After the motor is started, the system automatically enters standby mode. When the system detects a deviation between the actual vehicle state and the driver's driving intention (steering angle sensor, vehicle speed, and accelerator pedal position signal) via the yaw-G sensor on the vehicle body, it takes measures such as selectively applying the brakes and intervening through the torque management system to prevent drive wheel slip, avoid vehicle skidding, correct understeer and oversteer, and help stabilize the direction. The anti-skid switch is integrated into the vehicle display screen interface!

Anti-lock Braking System (ABS):

- During vehicle braking, the wheel speed sensors promptly transmit the wheel speed signals of each wheel to the ABS. The ABS control unit processes the input signals from the four wheel speed sensors according to the set control logic and calculates the slip ratio of the wheels. By controlling the operation of the solenoid valves, the slip ratio of each wheel is maintained within the ideal range (around 20%) to prevent the wheels from locking.

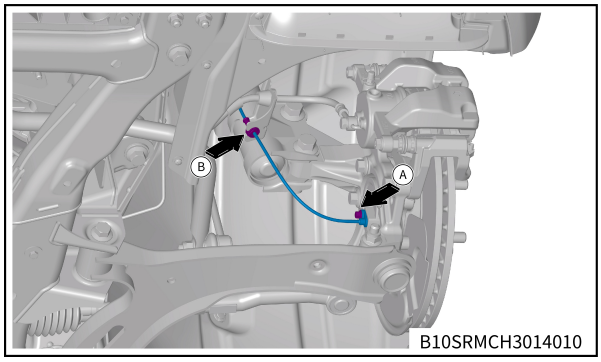
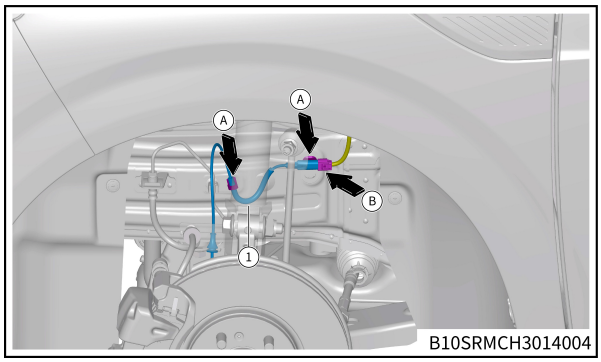
5.12.7 SERVICE AND REPAIR GUIDANCE



FRONT INTELLIGENT WHEEL SPEED SENSOR

NOTE



This section describes the removal and installation of the front left intelligent wheel speed sensor, and the removal and installation of the front right intelligent wheel speed sensor can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front intelligent wheel speed sensor.

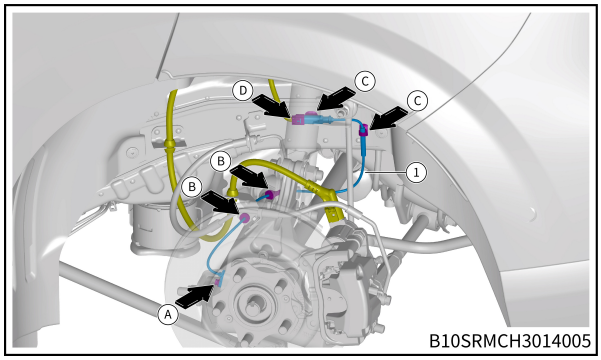
a. Unscrew the 1 fixing bolt -arrow A- connecting the front intelligent wheel speed sensor to the front hub unit assembly, and disconnect the connection.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the 1 fixing rubber bushing connecting the front intelligent wheel speed sensor to the left front strut assembly - arrow B -.

c. Release the 2 retaining clips securing the front intelligent wheel speed sensor to the vehicle body - Arrow A -.
   Recommended tool: Clip remover
d. Disconnect 1 connector between the front intelligent wheel speed sensor and the engine compartment wiring harness assembly -Arrow B-.
e. Remove the front intelligent wheel speed sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The sensor wiring harness must be securely fastened according to the standard routing of the original vehicle installation to prevent potential interference during vehicle operation.
   b. The sensor wiring harness must be routed naturally and must not be twisted.

© 2026, All rights reserved



LEFT REAR SMART WHEEL SPEED SENSOR

NOTE

This section describes the removal and installation of the rear left intelligent wheel speed sensor, and the removal and installation of the rear right intelligent wheel speed sensor can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the rear left intelligent wheel speed sensor.

a. Unscrew the 1 fixing bolt connecting the rear left intelligent wheel speed sensor to the rear left steering knuckle assembly -Arrow A-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the 2 fixing rubber grommets connecting the left rear intelligent wheel speed sensor to the left rear strut assembly -arrow B-.
c. Disconnect the 2 retaining clips connecting the left rear intelligent wheel speed sensor to the vehicle body - arrow C -.
   Recommended tool: Clip remover
d. Disconnect the 1 connector between the left rear intelligent wheel speed sensor and the floor harness assembly -Arrow D-, and remove the left rear intelligent wheel speed sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The wiring harness of the rear intelligent wheel speed sensor must be securely fastened along the standard routing as per the original vehicle installation to prevent potential interference issues during vehicle operation.
   b. The sensor wiring harness must be routed naturally and must not be twisted.

6 ENERGY MANAGEMENT SYSTEM

6.1 HEAT PUMP AIR CONDITIONING SYSTEM

6.1.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

⚠ WARNING

- Refrigerant charging or discharging operations should be performed in a well-ventilated environment, and do not inhale refrigerant vapor. Avoid inhaling air conditioning refrigerant and lubricating oil vapor or mist. Exposure to them may irritate the eyes, nose, and throat. Operations should be performed in a well-ventilated area. When removing air conditioning refrigerant from the A/C system, certified service equipment that meets the requirements (A/C refrigerant recycling equipment) should be used. If an accidental leak occurs in the system, the work area must be ventilated before continuing the repair. Other health and safety information can be obtained from the refrigerant and lubricating oil manufacturers.
- Before servicing the electrical system, the negative terminal of the battery must be disconnected, or the high-voltage system must be powered down for maintenance. It is prohibited to perform welding or steam cleaning operations on or near a vehicle equipped with A/C lines or components.

Precautions for A/C Refrigerant

1. Skin contact may cause frostbite.
2. Follow the instructions provided by the manufacturer. When performing the operation, wear appropriate safety goggles and protective gloves.

Operations to Avoid for Air Conditioning Refrigerant

1. Do not store refrigerant in direct sunlight or near heat sources.
2. During charging, do not keep the refrigerant cylinder upright, keep the valves facing downward.
3. Do not expose the refrigerant cylinder to frost and snow.
4. Do not drop the refrigerant cylinder.
5. Under no circumstances should refrigerant be released directly into the atmosphere.
6. Do not mix refrigerants, such as R134a (tetrafluoroethane) and R12 (dichlorodifluoromethane).

Precautions for Refrigerant Oil

1. Only use the type and grade of lubricating oil specified by the compressor manufacturer; do not mix lubricating oils of different types and grades, otherwise the compressor will be damaged. Lubricating oil is highly hygroscopic, so minimize the time it is exposed to air.
2. It is forbidden to use water, corrosive solvents, or flammable and explosive solvents to clean the air conditioning system.

Precautions for the Electric Compressor

1. The power must be turned on only after confirming that the high- and low-voltage circuits are correctly connected; otherwise, it may cause damage to the drive.

© 2026, All rights reserved

2. The positive and negative terminals of the main power input cable must not be connected in reverse, otherwise it will instantly cause permanent damage to the controller.
3. The high voltage must not exceed 450VDC, otherwise the internal components of the controller will be damaged.
4. Keep in mind that the electric compressor is a high-voltage device. When coming into contact with the electric compressor while it is connected to the power source, operators must take necessary safety precautions. Safety precautions include wearing workwear and safety goggles, and using insulated tools.
5. Before starting the compressor, please ensure the blower is running, since a failure to start the blower will cause excessive pressure in the air conditioning system, potentially leading to compressor shutdown due to overcurrent.
6. It is recommended to wait 2min after a normal shutdown before restarting the compressor, to prevent the compressor from shutting down due to overcurrent caused by an excessive pressure differential in the air conditioning system. Continuous overcurrent will affect the service life of the controller.

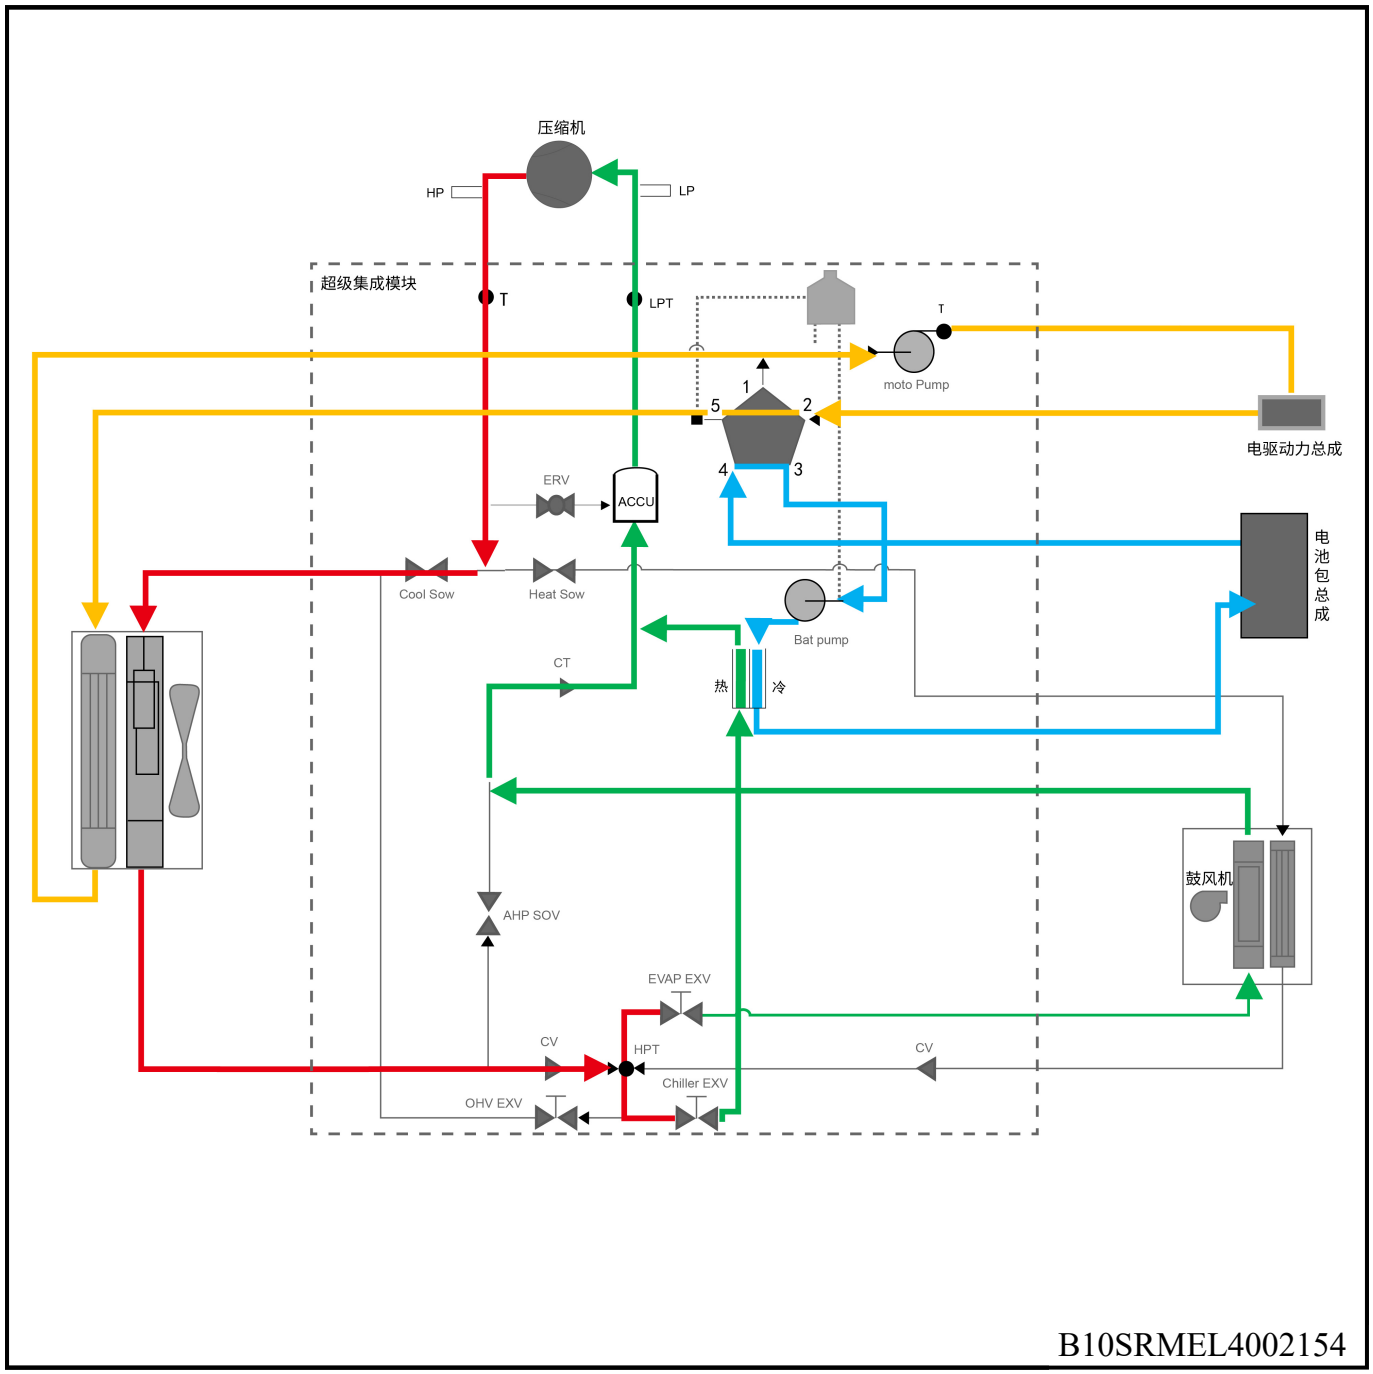
6.1.2 STRUCTURE AND PRINCIPLE INTRODUCTION

INTRODUCTION TO AIR CONDITIONING STRUCTURE AND PRINCIPLES

Air conditioning control system:

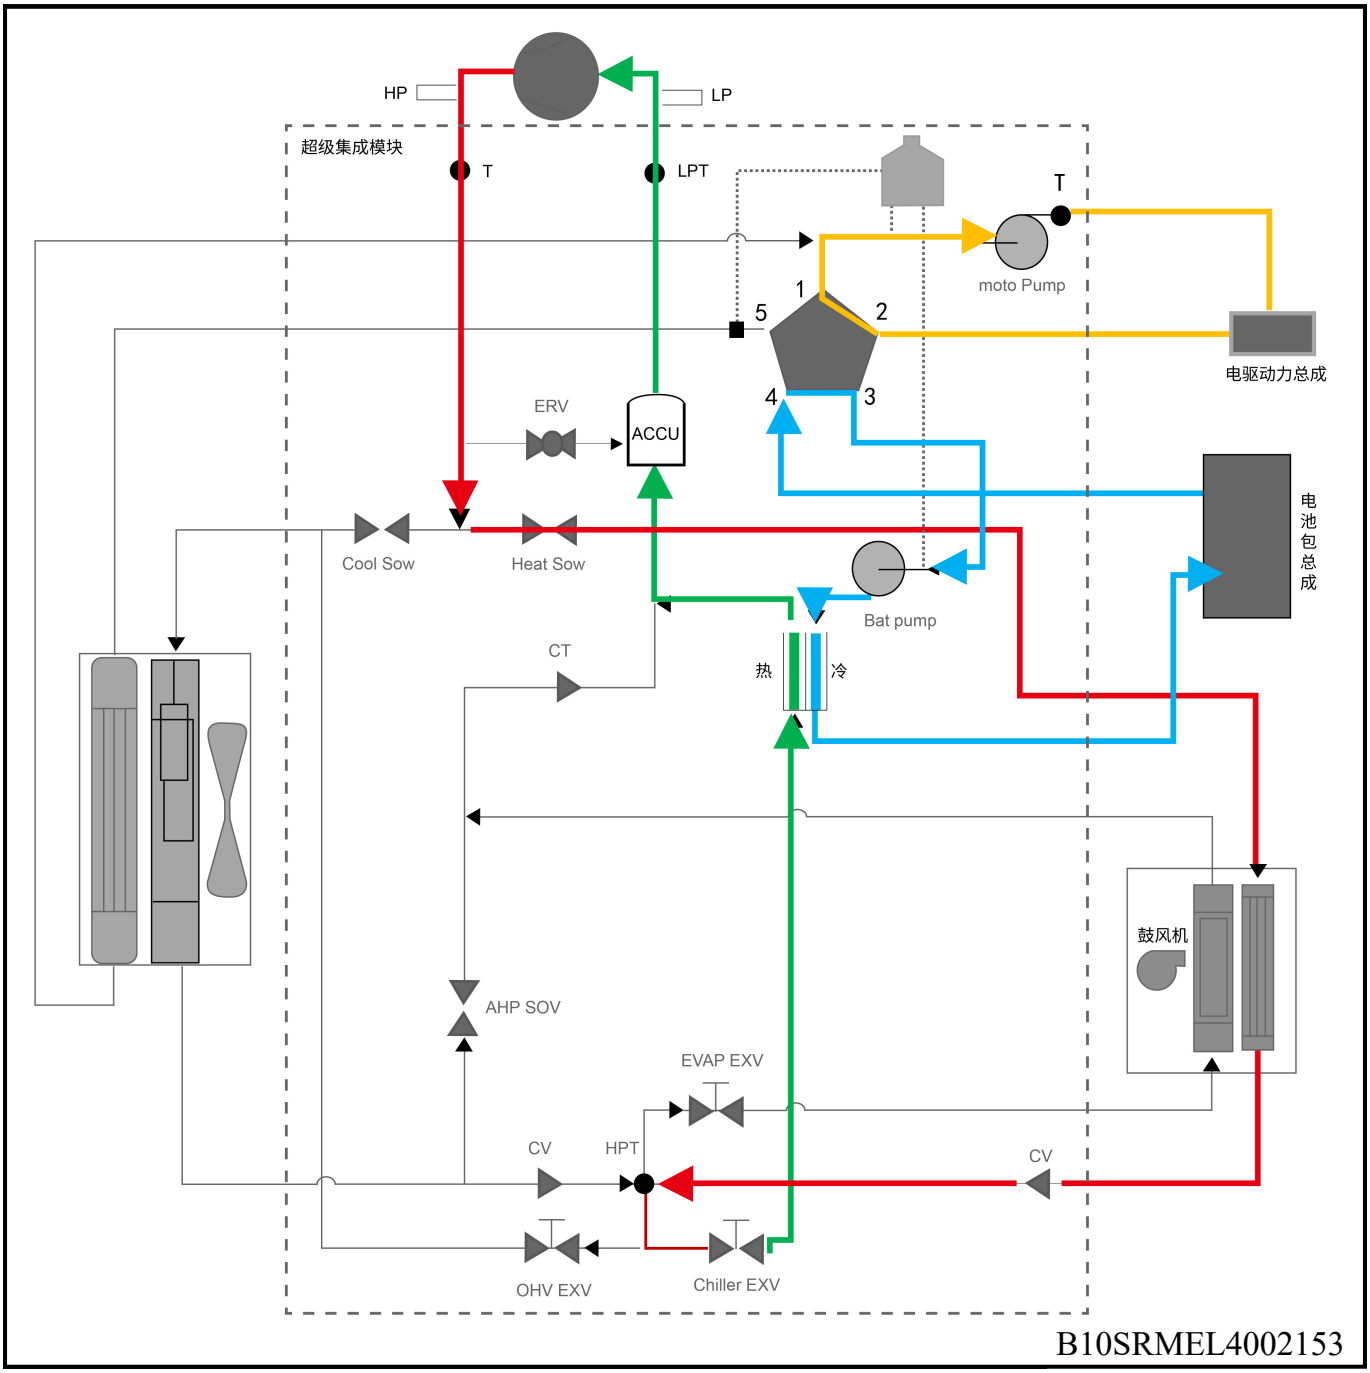
1. The air conditioning system consists of components such as the automatic HVAC assembly, left and right front footwell air ducts, thermal management controller, air conditioning pipelines, air duct temperature sensor, and electric compressor.



Air Conditioning Component Function Description:

1. Electric compressor:
   - The compressor is the "heart" of the A/C system. It provides the power for the refrigerant to circulate in the A/C system, compressing the refrigerant to a high-temperature and high-pressure state.
2. Condenser:
   - The high-temperature and high-pressure gaseous refrigerant from the compressor is cooled by the condenser (through heat exchange with the outside air via the fan) and becomes a normal-temperature, high-pressure liquid refrigerant.
   - Operating principle: The high-temperature and high-pressure gaseous refrigerant enters the condenser inlet from the compressor. After being cooled by the external air, it turns into saturated vapor. Upon further cooling, it completely condenses into a liquid and flows from the outlet to the receiver-drier. In a parallel flow condenser, the refrigerant flows into multiple tubes simultaneously. Due to the low flow resistance of this device, higher cooling performance can be achieved.
3. Outdoor heat exchanger:
   - The main function of the outdoor heat exchanger is to exchange heat between the refrigerant and the air side. During summer cooling, it transfers heat from the refrigerant side to the air side, and in winter, it transfers heat from the air side to the refrigerant side.
4. Indoor heat exchanger:
   - The main function of the indoor heat exchanger is to exchange heat between the refrigerant and the air side, transferring heat from the refrigerant side to the air side.
5. Gas-liquid separator:
   - The gas-liquid separator primarily functions during heat pump heating. Its main function is to trap liquid refrigerant. It also integrates a refrigerant valve, enabling on/off control of the refrigerant.
6. Refrigeration system:
   The refrigeration unit is located inside the vehicle and consists of an expansion valve, an evaporator, and a temperature sensor.
   a. Expansion valve
      - It primarily functions for throttling and pressure reduction. The high-pressure, normal-temperature liquid refrigerant from the condenser becomes a low-temperature, low-pressure gas-liquid mixture after passing through the expansion valve. By adjusting the opening of the expansion valve, the refrigerant flow rate entering the evaporator can be regulated, thereby adjusting the cooling capacity of the passenger compartment.
   b. Evaporator
      - The low-temperature and low-pressure refrigerant gas-liquid mixture from the expansion valve absorbs heat in the evaporator and completely evaporates into a gas. The air in the passenger compartment is drawn in and blown out by the blower to exchange heat with the refrigerant in the evaporator, thereby lowering the temperature inside the passenger compartment.

© 2026, All rights reserved



c. Temperature sensor:
   - To regulate the cabin temperature and prevent the evaporator from frosting, a temperature sensor is installed on the evaporator. When the evaporator temperature approaches the set value, the controller reduces the compressor speed. When the evaporator temperature reaches the set value, the compressor stops operating. When the temperature rises above the set value, the compressor restarts.

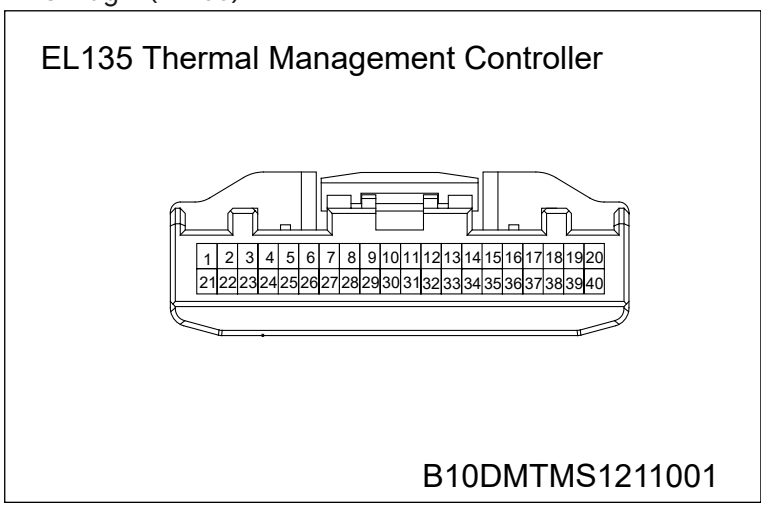
6.1.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-TMS

Using a diagnostic tool, fault codes can be read via the vehicle's OBD diagnostic connector. By utilizing the TMS data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-TMS

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B101577	Internal/external circulation door motor internal fault	Servo motor wiring harness open circuit or short circuit	Check the continuity of the wiring harness, if the wiring harness is normal, check the driver chip, if the driver chip is normal, replace the servo motor.
U14D087	Low-Temperature Boost Electronic Expansion Valve Communication Fault	LIN bus connection abnormality	Check the continuity of the LIN bus wiring harness. If the wiring harness is normal, replace the component.
B101612	Low-Temperature Boost Electronic Expansion Valve Motor Coil Short Circuit	Low-temperature boost EXV motor coil short circuit	Component replacement
B101613	Low-temperature supercharging electronic expansion valve motor coil open circuit	Low temperature boost EXV motor coil open circuit	Component replacement
B101698	Low-Temperature Boost Electronic Expansion Valve Driver Chip Over-Temperature Fault	Low-temperature boost EXV motor or valve body over-temperature	Component replacement
B10161C	Low temperature boost EXV power supply out of range	Power supply abnormality; Low-temperature boost EXV power supply out of range	Check the power supply. If the power supply is normal, replace the component.
U14D787	Heat pump electronic expansion valve motor coil communication fault	LIN bus connection abnormality	Check the continuity of the LIN bus wiring harness. If the wiring harness is normal, replace the component.
B101712	Heat pump electronic expansion valve motor coil short circuit	Heat pump EXV motor coil short circuit	Component replacement
B101713	Heat pump electronic expansion valve motor coil open circuit	Heat pump EXV motor coil open circuit	Component replacement
B101798	Heat pump electronic expansion valve motor coil over-temperature	Heat pump EXV motor or valve body over-temperature	Component replacement

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B10171C	Heat pump electronic expansion valve motor coil power supply out of range	Heat pump EXV power supply out of range	Check the power supply. If the power supply is normal, replace the component.
U14D887	Evaporator electronic expansion valve communication failure	LIN bus connection abnormality	Check the continuity of the LIN bus wiring harness. If the wiring harness is normal, replace the component.
B101812	Evaporator electronic expansion valve motor coil short circuit	LIN bus connection abnormality	Component replacement
B101813	Evaporator electronic expansion valve motor coil open circuit	LIN bus connection abnormality	Component replacement
B101898	Evaporator electronic expansion valve over-temperature	LIN bus connection abnormality	Component replacement
B10181C	Evaporator electronic expansion valve power supply out of range	LIN bus connection abnormality	Check the power supply. If the power supply is normal, replace the component.
U14D387	Battery cooler side electronic expansion valve communication fault	LIN bus connection abnormality	Check the continuity of the LIN bus wiring harness. If the wiring harness is normal, replace the component.
B101912	Short circuit in the motor coil of the electronic expansion valve on the battery cooler side	LIN bus connection abnormality	Component replacement
B101913	Open circuit in the motor coil of the electronic expansion valve on the battery cooler side	LIN bus connection abnormality	Component replacement
B101998	Battery chiller side electronic expansion valve over-temperature	LIN bus connection abnormality	Component replacement
B10191C	Power supply of the electronic expansion valve on t	LIN bus connection abnormality	Check the power supply. If the power supply is normal, replace the component.

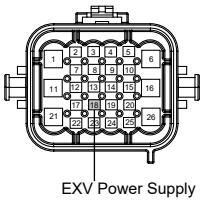
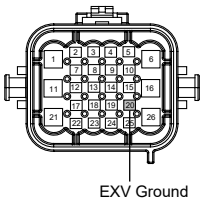
DTC: B10161C-TMS

Fault code	Description
B10161C	Low temperature boost EXV power supply out of range



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the low-temperature boost EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the low-temperature boost EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the low-temperature supercharging EXV (super integrate d module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the low-temperature boost EXV (Super Integrated Module connec tor).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the low-temperature boost EXV connector and the Super Integra ted Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the low-temp erature boost EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the low-temperature supercharging EXV and the wire harness connector terminal of the super integrated module connector (device end) to check whether the resistance val ue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: B101477-TMS

Fault code	Description
B101477	Mode door motor internal fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the thermal management controller and the mode door motor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. Disconnect the wiring harness connector of the mode door motor. D. Use a multimeter, set it to the resistance range, and measure the resistance between the terminals of the wiring harness connector of the thermal management controller and the terminals of the wiring harness connector of the mode door motor to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the mode door actuator.	
	A Replace the mode door actuator assembly. B After replacing the mode door actuator assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B100114-TMS

Fault code	Description
B100114	Interior temperature sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the thermal management controller and the interior temperature sensor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. C Disconnect the wiring harness connector of the interior te mperature sensor. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between the terminals of the wiring harn ess connector of the thermal management controller and th e terminals of the wiring harness connector of the indoor te mperature sensor to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the interior temperature sensor.	
	A Replace the interior temperature sensor. B After replacing the interior temperature sensor, is the faul t cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

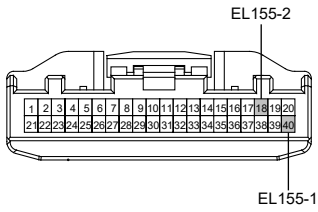
DTC: B100714-TMS

Fault code	Description
B100714	Compressor outlet temperature sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

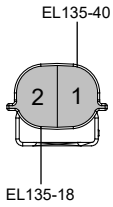
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller and the compressor discharge temperature sensor (heat pump).

EL135 Thermal Management Controller

B10DMTMS1211016

EL155 Compressor Discharge Temperature Sensor (Heat Pump)

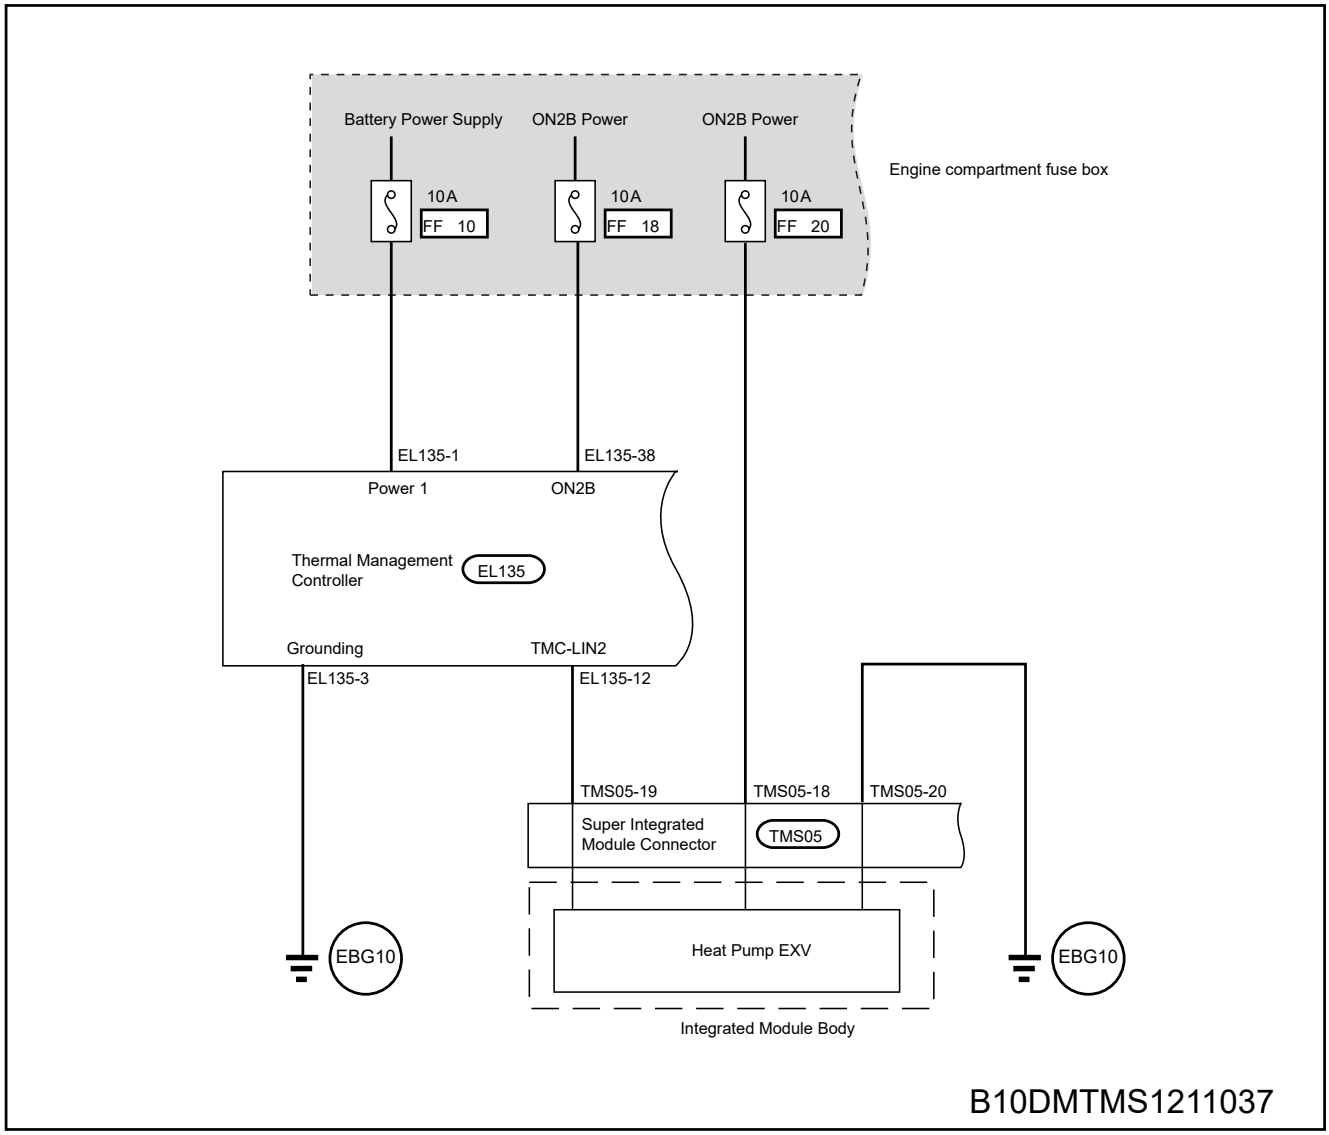
B10DMTMS1211017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL155 of the compressor discharge temperature sensor (heat pump).
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of wiring harness connector EL135 of the thermal management controller and terminal 2 of wiring harness connector EL155 of the compressor discharge temperature sensor (heat pump) to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 40 of the thermal management controller wiring harness connector EL135 and terminal 1 of the compressor discharge temperature sensor (heat pump) wiring harness connector EL155 to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and check whether the resistance value between terminals 18 and 40 of the harness connector EL135 of the thermal management controller and the body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 18 and 40 of the wiring harness connector EL135 of the thermal management controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved

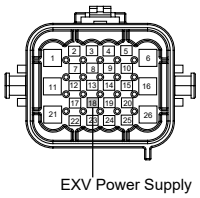


Step 3 Replace the compressor discharge temperature sensor (heat pump).	
	A Replace the compressor discharge temperature sensor (heat pump). B After replacing the compressor discharge temperature sensor (heat pump), is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.	

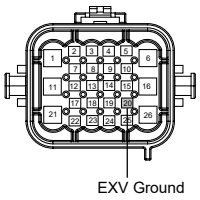
© 2026, All rights reserved

DTC: B10171C-TMS

Fault code	Description
B10171C	Heat pump electronic expansion valve motor coil power supply out of range



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the heat pump EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the heat pump EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the heat pump EXV connector and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the heat pump EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connect or terminals of the heat pump EXV and the wiring harness c onnector terminals of the super integrated module connect or (device side) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the integrated module body.	

© 2026, All rights reserved

	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

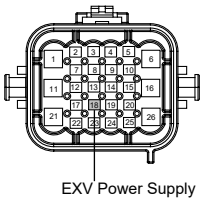
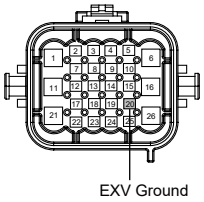
DTC: B101704-TMS

Fault code	Description
B101704	Heat Pump EXV Initialization Failure



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the heat pump EXV.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the heat pump EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the heat pump EXV (Super Integrated Module connector).
TMS05 Super Integrated Module Connector  B10DMTMS1211035
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 18 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Check the wiring harness between the heat pump EXV connector and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the heat pump EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connect or terminals of the heat pump EXV and the wiring harness c onnector terminals of the super integrated module connect or (device side) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

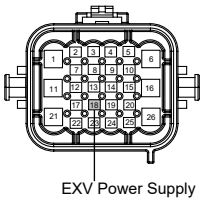
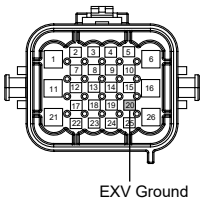
DTC: B101604-TMS

Fault code	Description
B101604	Low-Temperature Boost EXV Initialization Failure Fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the low-temperature boost EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the low-temperature boost EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the low-temperature supercharging EXV (super integrate d module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

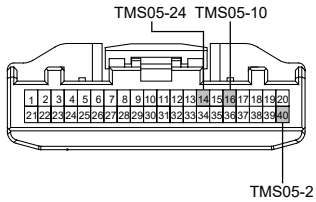
DTC: B100F14-TMS

Fault code	Description
B100F14	High pressure/temperature sensor pressure fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

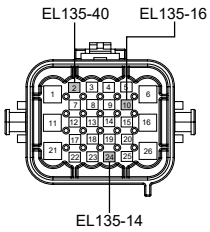
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller connector and the super integrated module connector.

EL135 Thermal Management Controller

B10DMTMS1211026

TMS05 Super Integrated Module Connector

B10DMTMS1211027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL135 of the thermal management controller and terminal 24 of harness connector TMS05 of the super integrated module to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of wire harness connector EL135 of the thermal management controller and terminal 10 of wire harness connector TMS05 of the super integrated module connector to check whether the resistance value is normal.
F. Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the thermal management controller harness connector EL135 and terminal 2 of the super integrated module harness connector TMS05 to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 14, 16, and 40 of the harness connector EL135 for the thermal management controller and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 14, 16, and 40 of the thermal management controller wire harness connector EL135 and the vehicle body ground is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 3.
Step 3 Check the wiring harness between the high-voltage PT sensor and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector for the high-voltage PT sensor. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance value between the wire harness connector terminals of the high-voltage PT sensor and the wire harness connector terminals of the Super Integrated Module connector (device end) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B101277-TMS

Fault code	Description
B101277	Left temperature blend door motor internal fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the thermal management controller and the left temperature blend door motor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. C Disconnect the wiring harness connector of the left temperature blend door motor. D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the thermal management controller and the terminals of the wiring harness connector of the left temperature blend door motor to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the right temperature blend door actuator and linkage assembly.	
	A Replace the right temperature blend door motor and moving components. B After replacing the right temperature blend door actuator and moving components, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.

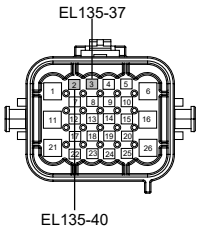
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller connector and the super integrated module connector.

EL135 Thermal Management Controller

B10DMTMS1211010

TMS05 Super Integrated Module Connector

B10DMTMS1211011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the thermal management controller wiring harness connector EL135 and terminal 3 of the super integrated module wiring harness connector TMS05 to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance value between terminal 40 of wiring harness connector EL135 of the thermal management controller and terminal 2 of wiring harness connector TMS05 of the super integrated module to check whether it is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter, set it to the resistance range, and measure the resistance between terminals 37 and 40 of the harness connector EL135 of the thermal management controller and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 37 and 40 of the wire harness connector EL135 of the thermal management controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the liquid-side temperature sensor and the super integrated module connector.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the liquid-side temperature sensor. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D. Use a multimeter, set it to the resistance range, and measure the resistance between the harness connector terminal of the liquid-side temperature sensor and the harness connector terminal of the super integrated module connector (device end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

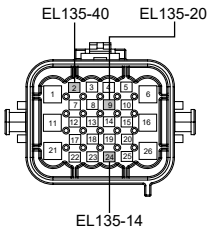
Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller connector and the super integrated module connector.

EL135 Thermal Management Controller

B10DMTMS1211024

TMS05 Super Integrated Module Connector

B10DMTMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL135 of the thermal management controller and terminal 24 of harness connector TMS05 of the super integrated module to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 20 of the Thermal Management Controller wiring harness connector EL135 and terminal 9 of the Super Integrated Module wiring harness connector TMS05 to check whether the resistance value is normal.
F. Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the thermal management controller harness connector EL135 and terminal 2 of the super integrated module harness connector TMS05 to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
G. Use a multimeter, set it to the resistance range, and measure the resistance between terminals 14, 20, and 40 of the harness connector EL135 of the thermal management controller and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 14, 20, and 40 of the wiring harness connector EL135 of the thermal management controller and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	K Confirm whether the voltage value meets the standard va lue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the wiring harness between the high-voltage PT sensor and the Super Integrated Module con nector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector for the high-volt age PT sensor. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance value between the wire harness connector terminals of the high-voltage PT sensor and the wire harnes s connector terminals of the Super Integrated Module conn ector (device end) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》 》 》 System normal.

Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the heat pump EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the heat pump EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  EXV Power Supply B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 20 of the wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Check the wiring harness between the heat pump EXV connector and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the heat pump EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connector terminals of the heat pump EXV and the wiring harness connector terminals of the super integrated module connector (device side) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

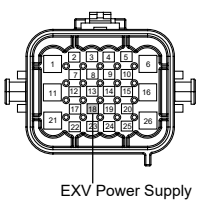
© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.	

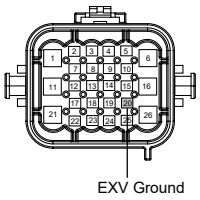
© 2026, All rights reserved

DTC: B101613-TMS

Fault code	Description
B101613	Low-temperature supercharging electronic expansion valve motor coi l open circuit



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the low-temperature boost EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the low-temperature boost EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the low-temperature supercharging EXV (super integrate d module connector).	
TMS05 Super Integrated Module Connector  EXV Power Supply B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the low-temperature boost EXV (Super Integrated Module connec tor).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the low-temperature boost EXV connector and the Super Integra ted Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the low-temp erature boost EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the low-temperature supercharging EXV and the wire harness connector terminal of the super integrated module connector (device end) to check whether the resistance val ue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

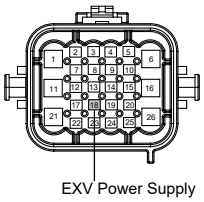
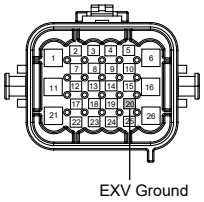
DTC: B101804-TMS

Fault code	Description
B101804	Evaporator EXV initialization failure fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the evaporator EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the evaporator EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the evaporat or EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and meas ure the resistance between the wire harness connector ter minals of the evaporator EXV and the wire harness connect or terminals of the super integrated module connector (devi ce end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

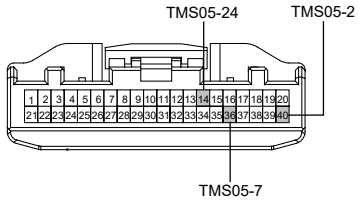
DTC: B100814-TMS

Fault code	Description
B100814	Low pressure/temperature sensor temperature fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

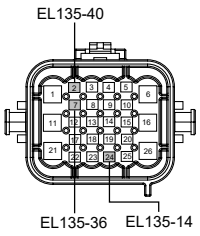
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller connector and the super integrated module connector.

EL135 Thermal Management Controller

B10DMTMS1211019

TMS05 Super Integrated Module Connector

B10DMTMS1211020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL135 of the thermal management controller and terminal 24 of harness connector TMS05 of the super integrated module to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 36 of wiring harness connector EL135 of the thermal management controller and terminal 7 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
F. Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the thermal management controller harness connector EL135 and terminal 2 of the super integrated module harness connector TMS05 to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
G. Use a multimeter, set it to the resistance range, and measure the resistance between terminals 14, 36, and 40 of the wire harness connector EL135 of the thermal management controller and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J. Use a multimeter, select the DC voltage range, and measure the voltage between terminals 14, 36, and 40 of the thermal management controller harness connector EL135 and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the low-voltage PT sensor and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the low-voltage PT sensor. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, set it to the resistance range, and measure the resistance between the wiring harness connector terminal of the low-voltage PT sensor and the wiring harness connector terminal of the Super Integrated Module connector (device side) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

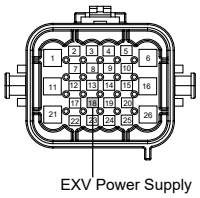
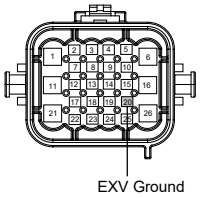
DTC: B101712-TMS

Fault code	Description
B101712	Heat pump electronic expansion valve motor coil short circuit



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the heat pump EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the heat pump EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 18 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wiring harness of the heat pump EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 20 of the wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Check the wiring harness between the heat pump EXV connector and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the heat pump EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connector terminals of the heat pump EXV and the wiring harness connector terminals of the super integrated module connector (device side) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

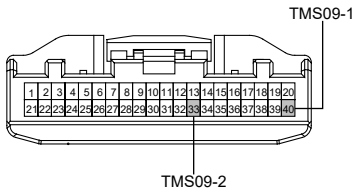
DTC: B100314-TMS

Fault code	Description
B100314	Driver face level temperature sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

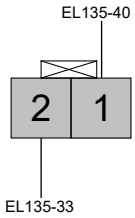
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller and the driver's air duct temperature sensor.

EL135 Thermal Management Controller

B10DMTMS1211006

TMS09 Driver Air Duct Temperature Sensor

B10DMTMS1211007

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS09 of the driver air duct temperature sensor.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 33 of the thermal management controller harness connector EL135 and terminal 2 of the driver air duct temperature sensor harness connector TMS09 is normal.
E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 40 of the wire harness connector EL135 of the thermal management controller and terminal 1 of the wire harness connector TMS09 of the driver air duct temperature sensor is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and check whether the resistance value between terminals 33 and 40 of the wire harness connector EL135 of the thermal management controller and the body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 33 and 40 of the wiring harness connector EL135 of the thermal management controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the driver's side air duct temperature sensor.

A Replace the driver's air duct temperature sensor.

© 2026, All rights reserved

	B After replacing the driver's air duct temperature sensor, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

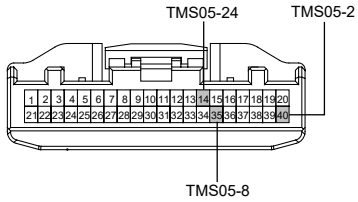
DTC: B101014-TMS

Fault code	Description
B101014	Low pressure/temperature sensor pressure fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

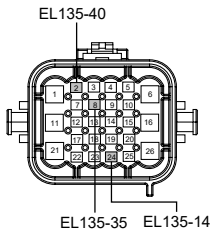
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller connector and the super integrated module connector.

EL135 Thermal Management Controller

B10DMTMS1211021

TMS05 Super Integrated Module Connector

B10DMTMS1211022

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL135 of the thermal management controller and terminal 24 of harness connector TMS05 of the super integrated module to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 35 of the wiring harness connector EL135 of the thermal management controller and terminal 8 of the wiring harness connector TMS05 of the super integrated module connector to check if the resistance value is normal.
F. Use a multimeter set to the resistance range to measure the resistance between terminal 40 of the thermal management controller harness connector EL135 and terminal 2 of the super integrated module harness connector TMS05 to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
G. Use a multimeter, set it to the resistance range, and measure the resistance between terminals 14, 35, and 40 of the thermal management controller harness connector EL135 and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 14, 35, and 40 of harness connector EL135 for the thermal management controller and the body ground to check whether the voltage is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the low-voltage PT sensor and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the low-voltage PT sensor. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, set it to the resistance range, and measure the resistance between the wiring harness connector terminal of the low-voltage PT sensor and the wiring harness connector terminal of the Super Integrated Module connector (device side) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B101577-TMS

Fault code	Description
B101577	Internal/external circulation door motor internal fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the thermal management controller and the internal/external circulation flap motor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. C Disconnect the wiring harness connector of the internal/external air circulation door motor. D. Use a multimeter, select the resistance range, and measure the resistance between the terminal of the wiring harness connector of the thermal management controller and the terminal of the wiring harness connector of the inside/outside recirculation door motor to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the recirculation door actuator.	
	A Replace the recirculation door actuator. B After replacing the recirculation door actuator, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

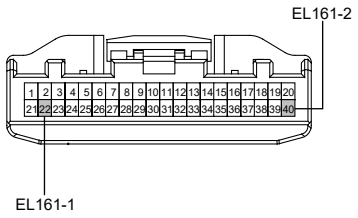
DTC: B100014-TMS

Fault code	Description
B100014	Ambient (outside) temperature sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

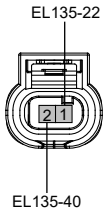
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the thermal management controller and the outdoor temperature sensor assembly.

EL135 Thermal Management Controller

B10DMTMS1211003

EL161 Outside Temperature Sensor Assembly

B10DMTMS1211004

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL161 of the ambient temperature sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 22 of wiring harness connector EL135 of the thermal management controller and terminal 1 of wiring harness connector EL161 of the outdoor temperature sensor assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 40 of wiring harness connector EL135 of the thermal management controller and terminal 2 of wiring harness connector EL161 of the ambient temperature sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 22 and 40 of the wire harness connector EL135 of the thermal management controller and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 22 and 40 of the wire harness connector EL135 of the thermal management controller and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the outdoor temperature sensor assembly.

© 2026, All rights reserved

	A Replace the outside air temperature sensor assembly. B After replacing the ambient temperature sensor assembly , is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

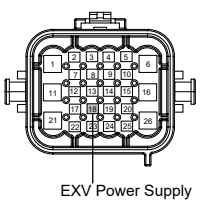
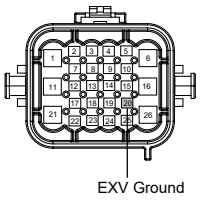
DTC: B101698-TMS

Fault code	Description
B101698	Low-Temperature Boost Electronic Expansion Valve Driver Chip Over -Temperature Fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the low-temperature boost EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the low-temperature boost EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the low-temperature supercharging EXV (super integrate d module connector).	
TMS05 Super Integrated Module Connector  EXV Power Supply B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the low-temperature boost EXV (Super Integrated Module connec tor).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the low-temperature boost EXV connector and the Super Integra ted Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the low-temp erature boost EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the low-temperature supercharging EXV and the wire harness connector terminal of the super integrated module connector (device end) to check whether the resistance val ue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

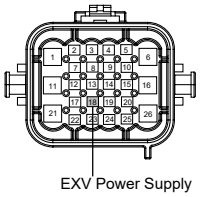
© 2026, All rights reserved

	Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.	

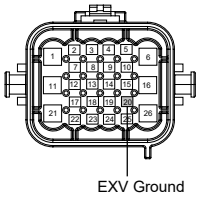
© 2026, All rights reserved

DTC: B101898-TMS

Fault code	Description
B101898	Evaporator electronic expansion valve over-temperature



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the evaporator EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the evaporator EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the evaporat or EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and meas ure the resistance between the wire harness connector ter minals of the evaporator EXV and the wire harness connect or terminals of the super integrated module connector (devi ce end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

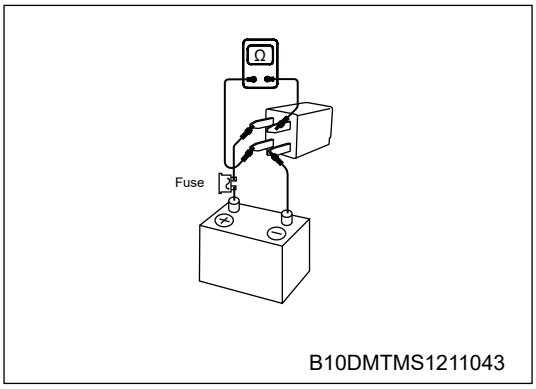
	B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: B101B98-TMS

Fault code	Description
B101B98	EWP (Battery Water Pump) Over-temperature Fault

1. Simplified Circuit Diagram



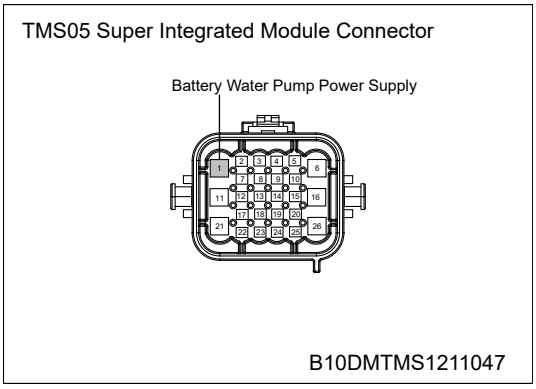
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling system lines. B Check the battery cooling system lines for foreign objects.
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to the normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

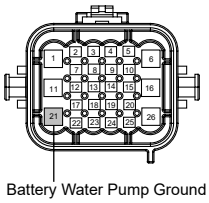


A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.

No 》 》 》 Replace the water pump relay.

Yes 》 》 》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connector).



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

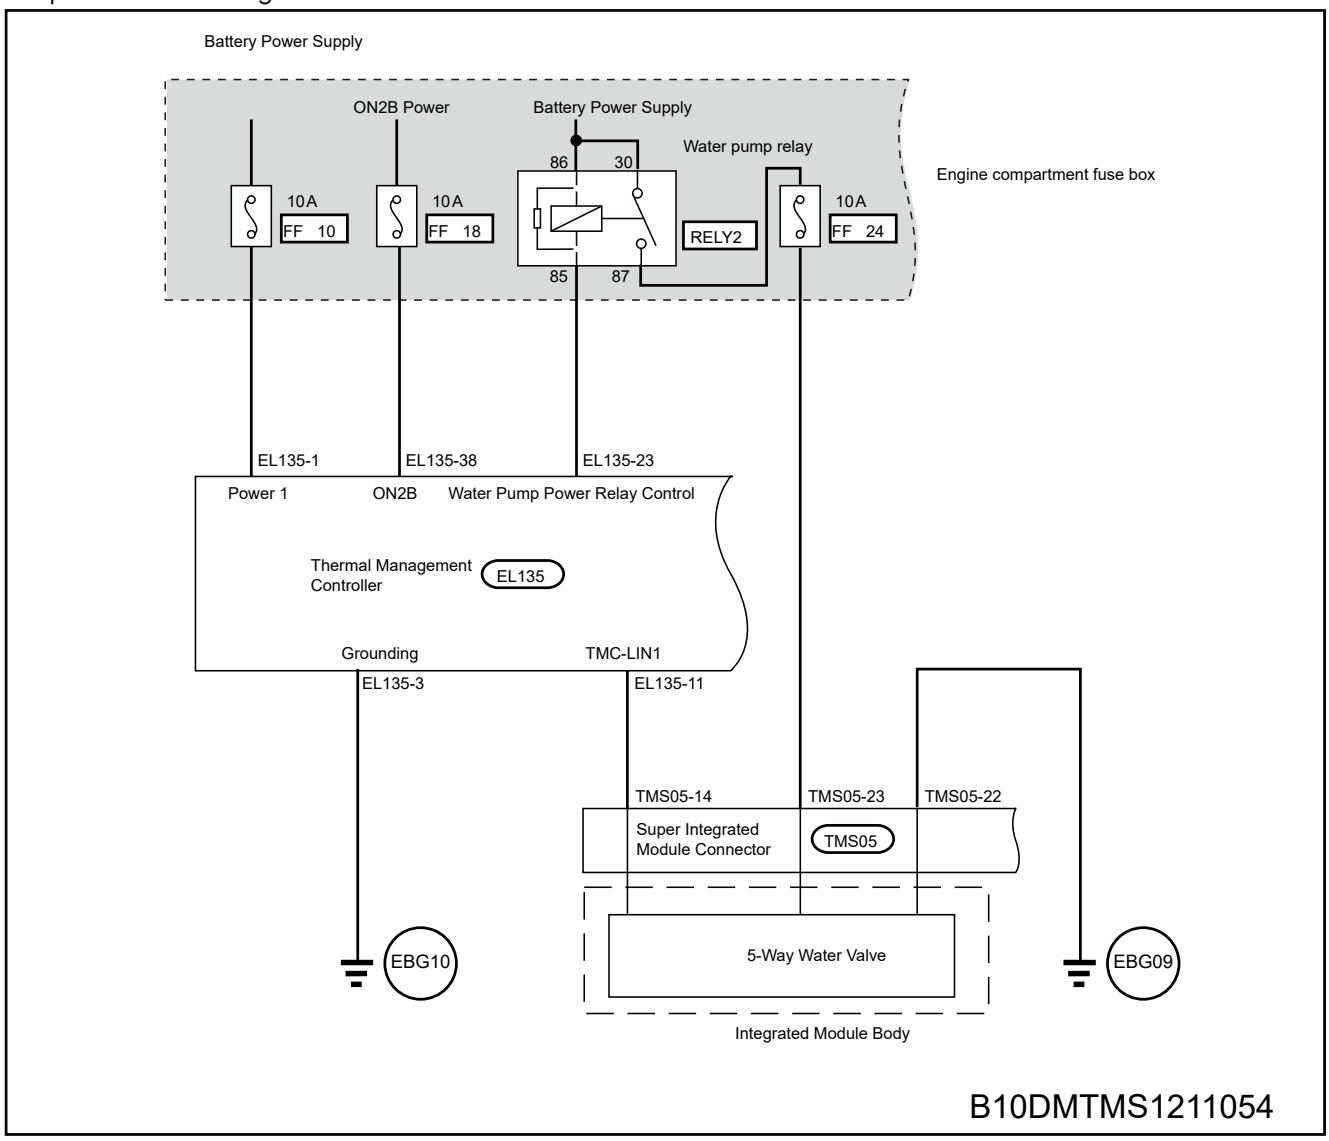
Yes 》 》 》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211048	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of the wiring harness connector TMS05 of the Super Integrated Module connector and the body ground to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Check the wiring harness between the battery water pump connector and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the battery water pump. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the battery water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	

© 2026, All rights reserved



Next 》 》 》 Go to step 10.
Step 10 Diagnosis complete.

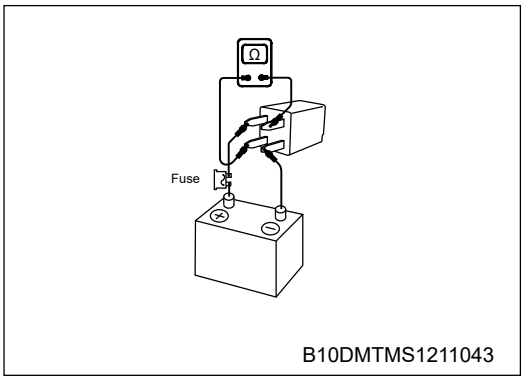
DTC: B101E12-TMS

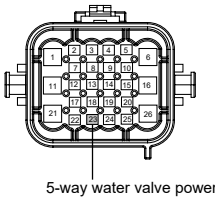
Fault code	Description
B101E12	Five-way water valve 1 coil short circuit fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

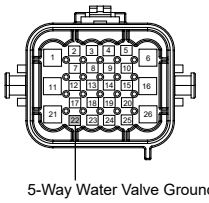
May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the 5-way water valve.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the water pump relay.
 A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.
Yes》》》 Go to step 5.

© 2026, All rights reserved

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

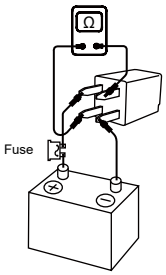
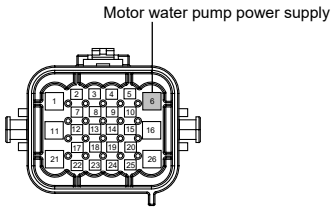
DTC: B101A72-TMS

Fault code	Description
B101A72	EWP (Electric Water Pump) Dry Running Fault

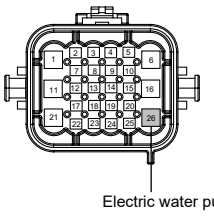
1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the motor cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there are any leaks in the motor cooling syste m hoses. B Check the motor cooling system hoses for foreign objects . .
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to th e normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the electric water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electric water pump fuse FF22. Fuse specification: FF22 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

 B10DMTMS1211043	A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.
No》》》 Replace the water pump relay.	
Yes》》》 Go to step 6.	
Step 6 Check the power supply wiring harness of the electric water pump (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 6 of the harness connector TMS05 of the super integrated module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Check the ground wire harness of the electric water pump (Super Integrated Module connector).	

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211045	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 26 of the wiring h arness connector TMS05 of the Super Integrated Module an d the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Check the wiring harness between the electric water pump connector and the Super Integrated Mod ule connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the electric w ater pump. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the terminals of the wiring harnes s connector of the motor water pump and the terminals of t he wiring harness connector of the Super Integrated Modul e connector (device side) to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》 》 》 System normal.

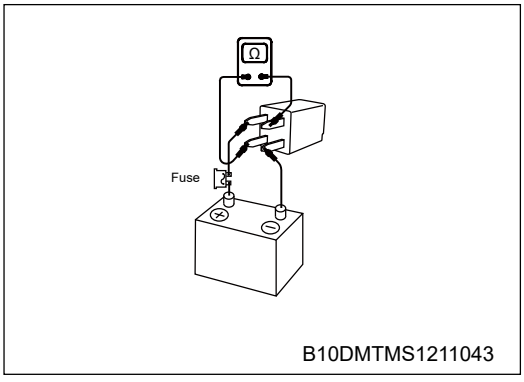
DTC: B101E13-TMS

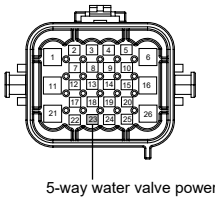
Fault code	Description
B101E13	5-way water valve 1 open circuit fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the 5-way water valve.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the water pump relay.
 A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.
Yes》》》 Go to step 5.

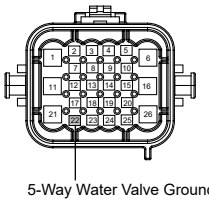
Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to Step 9.	
Step 9 Diagnosis complete.

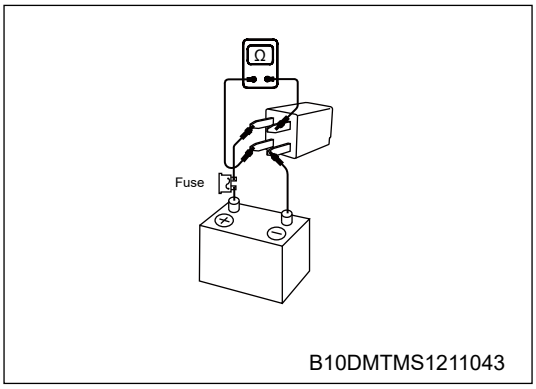
DTC: B101B19-TMS

Fault code	Description
B101B19	EWP (Battery Water Pump) Overcurrent Fault

1. Simplified Circuit Diagram



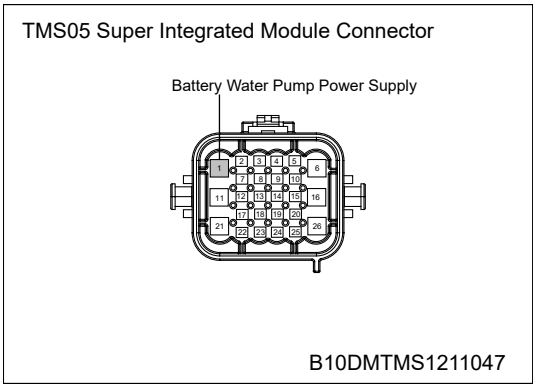
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling system lines. B Check the battery cooling system lines for foreign objects.
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to the normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

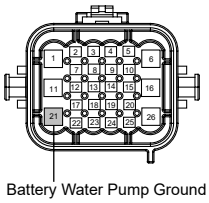


A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.

No 》 》 》 Replace the water pump relay.

Yes 》 》 》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connector).



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211048	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of the wiring harness connector TMS05 of the Super Integrated Module connector and the body ground to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Check the wiring harness between the battery water pump connector and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the battery water pump. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the battery water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.

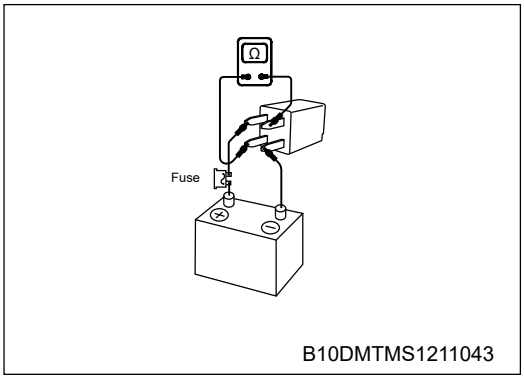
DTC: B101E17-TMS

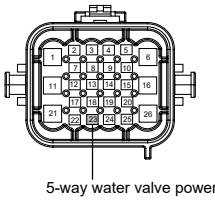
Fault code	Description
B101E17	5-way water valve 1 overvoltage or undervoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

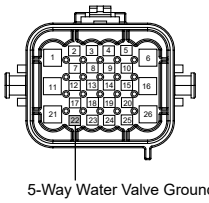
May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the 5-way water valve.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the water pump relay.
 A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.
Yes》》》 Go to step 5.

© 2026, All rights reserved

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the motor cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there are any leaks in the motor cooling syste m hoses. B Check the motor cooling system hoses for foreign objects . .
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to th e normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the electric water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electric water pump fuse FF22. Fuse specification: FF22 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

 B10DMTMS1211043	A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.
No》》》 Replace the water pump relay.	
Yes》》》 Go to step 6.	
Step 6 Check the power supply wiring harness of the electric water pump (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 6 of the harness connector TMS05 of the super integrated module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Check the ground wire harness of the electric water pump (Super Integrated Module connector).	

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211045	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 26 of the wiring h arness connector TMS05 of the Super Integrated Module an d the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Check the wiring harness between the electric water pump connector and the Super Integrated Mod ule connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the electric w ater pump. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the terminals of the wiring harnes s connector of the motor water pump and the terminals of t he wiring harness connector of the Super Integrated Modul e connector (device side) to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》 》 》 System normal.	
Next 》 》 》

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
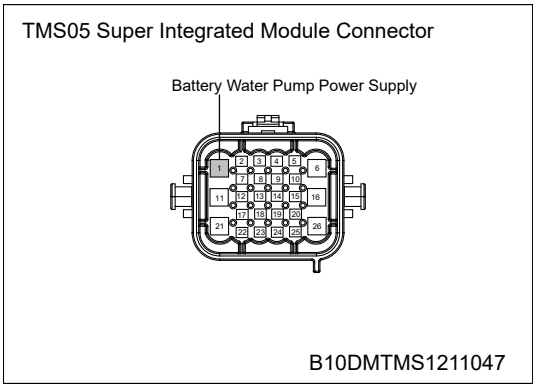
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling system lines. B Check the battery cooling system lines for foreign objects.
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to the normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

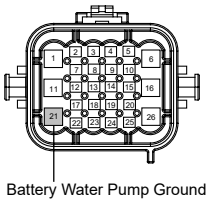


A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.

No 》 》 》 Replace the water pump relay.

Yes 》 》 》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connector).



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

TMS05 Super Integrated Module Connector  B10DMTMS1211045	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 26 of the wiring h arness connector TMS05 of the Super Integrated Module an d the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Check the wiring harness between the electric water pump connector and the Super Integrated Mod ule connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the electric w ater pump. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the terminals of the wiring harnes s connector of the motor water pump and the terminals of t he wiring harness connector of the Super Integrated Modul e connector (device side) to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》 》 》 System normal.	
Next 》 》 》

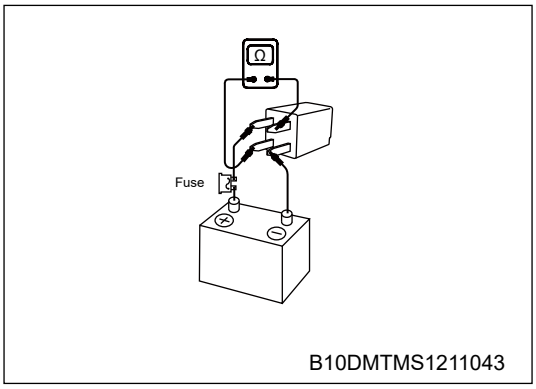
DTC: B101B1C-TMS

Fault code	Description
B101B1C	EWP (Battery Water Pump) Power Supply Failure

1. Simplified Circuit Diagram



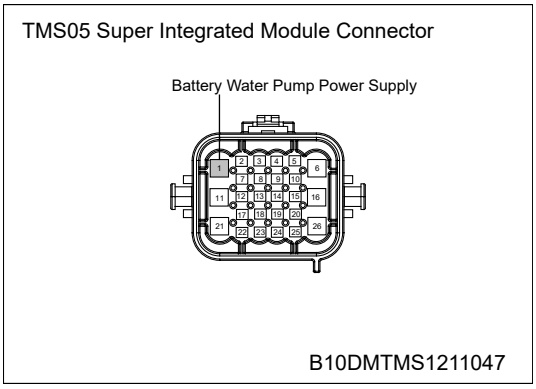
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling system lines. B Check the battery cooling system lines for foreign objects.
Yes》》》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to the normal level.	
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
	No》》》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

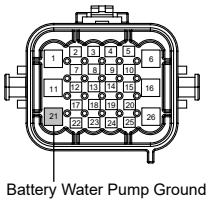


A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.

No 》 》 》 Replace the water pump relay.

Yes 》 》 》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connector).



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211048	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of the wiring harness connector TMS05 of the Super Integrated Module connector and the body ground to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Check the wiring harness between the battery water pump connector and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the battery water pump. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the battery water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.

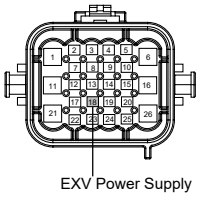
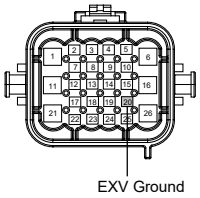
DTC: B101812-TMS

Fault code	Description
B101812	Evaporator electronic expansion valve motor coil short circuit



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the evaporator EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the evaporator EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the evaporat or EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and meas ure the resistance between the wire harness connector ter minals of the evaporator EXV and the wire harness connect or terminals of the super integrated module connector (devi ce end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

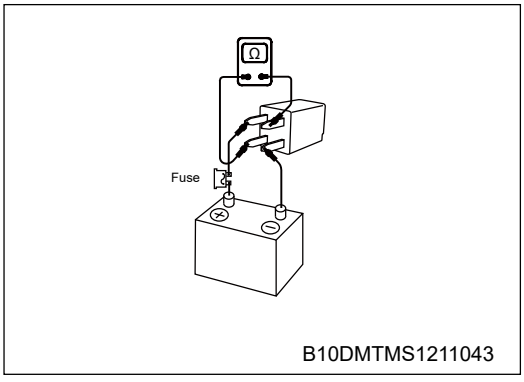
DTC: B101E71-TMS

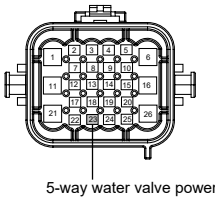
Fault code	Description
B101E71	5-way water valve 1 stall fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

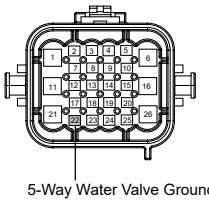
May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the 5-way water valve.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the water pump relay.
 A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.
Yes》》》 Go to step 5.

© 2026, All rights reserved

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to Step 9.	
Step 9 Diagnosis complete.

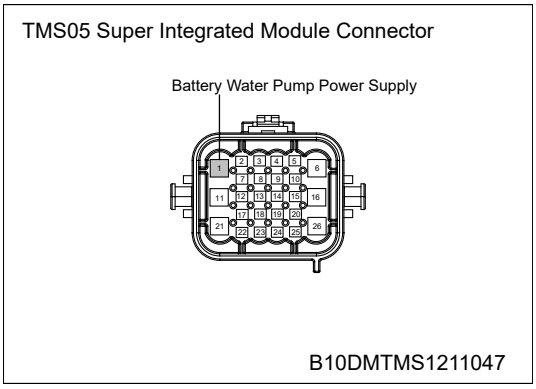
	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the battery cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there is any leakage in the battery cooling syst em lines. B Check the battery cooling system lines for foreign objects . .
Yes 》 》 》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to th e normal level.	
	No 》 》 》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply fuse of the battery water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the battery water pump fuse FF23. Fuse specification: FF23 15A C. Confirm whether the fuse is blown.
Yes 》 》 》 Replace the fuse with one of the same rating.	
	No 》 》 》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

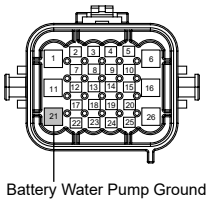


A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.

No 》 》 》 Replace the water pump relay.

Yes 》 》 》
Go to step 6.

Step 6 Check the power supply wiring harness of the battery water pump (Super Integrated Module connector).



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 7.

Step 7 Check the ground wire harness of the battery water pump (Super Integrated Module connector).

	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the chiller EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the chiller EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  EXV Power Supply B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the chiller EXV and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the chiller EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the chiller EXV and the wire harness connector termina l of the Super Integrated Module connector (device side) to verify if the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
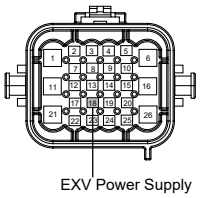
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.	

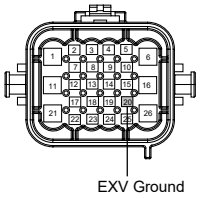
© 2026, All rights reserved

DTC: B101813-TMS

Fault code	Description
B101813	Evaporator electronic expansion valve motor coil open circuit



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the evaporator EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the evaporator EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 18 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the evaporat or EXV. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, set it to the resistance range, and meas ure the resistance between the wire harness connector ter minals of the evaporator EXV and the wire harness connect or terminals of the super integrated module connector (devi ce end) to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body.

© 2026, All rights reserved

	B After replacing the integrated module body, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 8.
Step 8 Diagnosis complete.

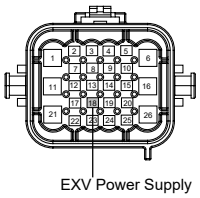
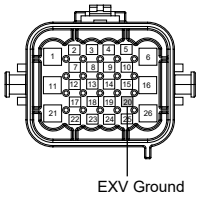
DTC: B10181C-TMS

Fault code	Description
B10181C	Evaporator electronic expansion valve power supply out of range



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the evaporator EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the evaporator EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the evaporator EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the wiring harness co nnector TMS05 of the Super Integrated Module connector a nd the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

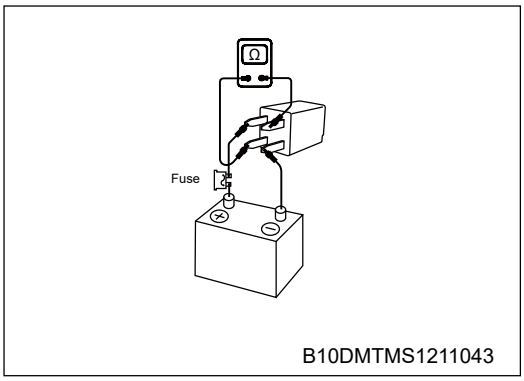
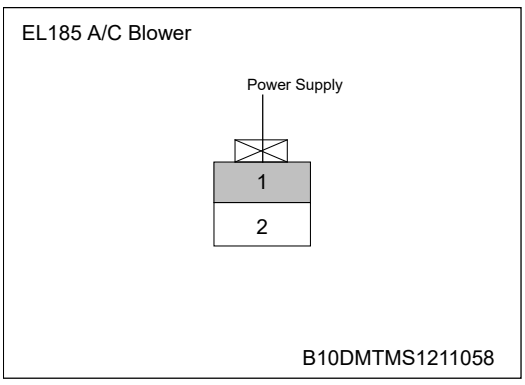
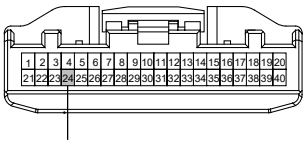
DTC: B102177-TMS

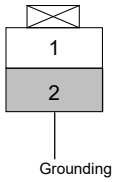
Fault code	Description
B102177	Front blower fault





1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply fuse for the A/C blower.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the A/C blower fuse SF07. Fuse specification: SF07 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the blower relay.	
	A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the blower relay RELY3, connect the positive battery power to one side of the blower relay coil terminal and the other side to ground, and check for continuity across both ends of the relay switch contacts.
	No》》》 Replace the blower relay.
	Yes》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the A/C blower.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the A/C blower wire harness connector EL185. C Connect the negative terminal of the battery, use a wire harness to short-circuit pins 30# and 87# of the blower relay RELY3, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure whether the voltage between terminal 1 of the A/C blower wire harness connector EL185 and the body ground is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the A/C blower motor relay control circuit.	
EL135 Thermal Management Controller  [错误] 翻译失败(已重试 3 次): HTTP 429: {"error":{"message":"Request rate increased too quickly. To ensure system stability, please adjust your client logic to scale requests more smoothly over time.","type":"limit_burst_rate","param":"","code":"limit_burst_rate"}} B10DMTMS1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the thermal management controller wiring harness connector EL135. C Remove the blower relay RELY3. D. Set the multimeter to the resistance range and measure the resistance between terminal 24 of harness connector EL135 of the thermal management controller and socket 85# of blower relay RELY3 to check whether it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the A/C blower.	
EL185 A/C Blower  B10DMTMS1211060	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the A/C blower wire harness connector EL185. C Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of wire harness connector EL185 for the A/C blower and the vehicle body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Check the wiring harness between the A/C blower and the speed control module.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the A/C blower.

© 2026, All rights reserved

	C Disconnect the wiring harness connector of the speed control module. D. Use a multimeter, select the resistance range, and measure whether the resistance between the terminals of the A/C blower wiring harness connector and the terminals of the speed control module wiring harness connector is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 8.	
Step 8 Check the wiring harness between the thermal management controller and the speed control module.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. C Disconnect the wiring harness connector of the speed control module. D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connector terminals of the thermal management controller and the wiring harness connector terminals of the speed control module is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to Step 9.	
Step 9 Replace the speed control module.	
	A Replace the speed control module. B After replacing the speed control module, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 10.	
Step 10 Replace the A/C blower motor.	

© 2026, All rights reserved

	A Replace the A/C blower motor. B After replacing the A/C blower motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 11.
Step 11 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to Step 12.
Step 12 Diagnosis complete.

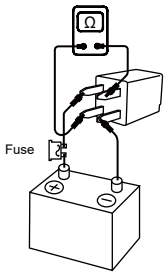
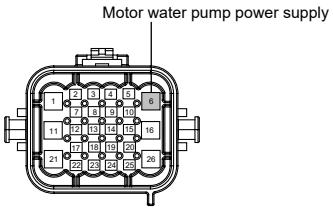
DTC: B101A71-TMS

Fault code	Description
B101A71	EWP (Electric Water Pump) Stall Fault

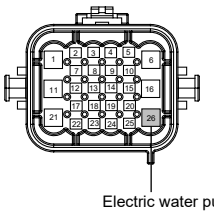
1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the motor cooling system hoses and coolant.	
	A Check whether the coolant level in the reservoir is too low and whether there are any leaks in the motor cooling syste m hoses. B Check the motor cooling system hoses for foreign objects . .
Yes 》 》 》 Inspect and repair the leakage point; remove foreign objects from the pipeline; add coolant to th e normal level.	
	No 》 》 》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply fuse of the electric water pump.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electric water pump fuse FF22. Fuse specification: FF22 15A C. Confirm whether the fuse is blown.
Yes 》 》 》 Replace the fuse with one of the same rating.	
	No 》 》 》 Go to step 5.
Step 5 Check the water pump relay.	

© 2026, All rights reserved

 B10DMTMS1211043	A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power supply of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch contacts.
No》》》 Replace the water pump relay.	
Yes》》》 Go to step 6.	
Step 6 Check the power supply wiring harness of the electric water pump (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 6 of the harness connector TMS05 of the super integrated module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Check the ground wire harness of the electric water pump (Super Integrated Module connector).	

© 2026, All rights reserved

TMS05 Super Integrated Module Connector  B10DMTMS1211045	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 26 of the wiring h arness connector TMS05 of the Super Integrated Module an d the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 8.	
Step 8 Check the wiring harness between the electric water pump connector and the Super Integrated Mod ule connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the electric w ater pump. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the terminals of the wiring harnes s connector of the motor water pump and the terminals of t he wiring harness connector of the Super Integrated Modul e connector (device side) to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to Step 9.	
Step 9 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》 》 》 System normal.	
Next 》 》 》

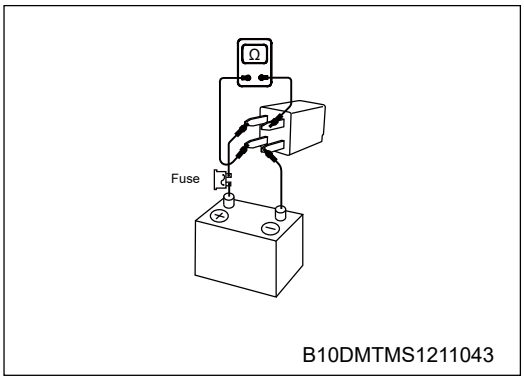
DTC: B101E98-TMS

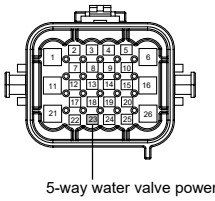
Fault code	Description
B101E98	5-way water valve 1 over-temperature pause fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the battery voltage.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the 5-way water valve.
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the 5-way water valve fuse FF24. Fuse specification: FF24 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.
No》》》 Go to step 4.
Step 4 Check the water pump relay.

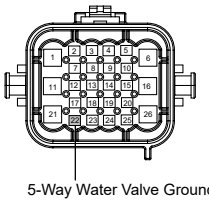
A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the water pump relay RELY2. Connect the positive power suppl y of the battery to one side of the coil terminal of the water pump relay, and connect the other side to ground. Check w hether there is continuity across the two ends of the relay s witch contacts.
No》》》 Replace the water pump relay.
Yes》》》 Go to step 5.

© 2026, All rights reserved

Step 5 Check the power supply wiring harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C Connect the negative terminal of the battery, use a jumper wire to short-circuit pins 30# and 87# of the water pump relay RELY2, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 6.

Step 6 Check the ground wire harness of the five-way water valve (Super Integrated Module connector).

TMS05 Super Integrated Module Connector

B10DMTMS1211056

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector.
C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 22 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 7.

Step 7 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.

© 2026, All rights reserved

	C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 8.	
Step 8 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

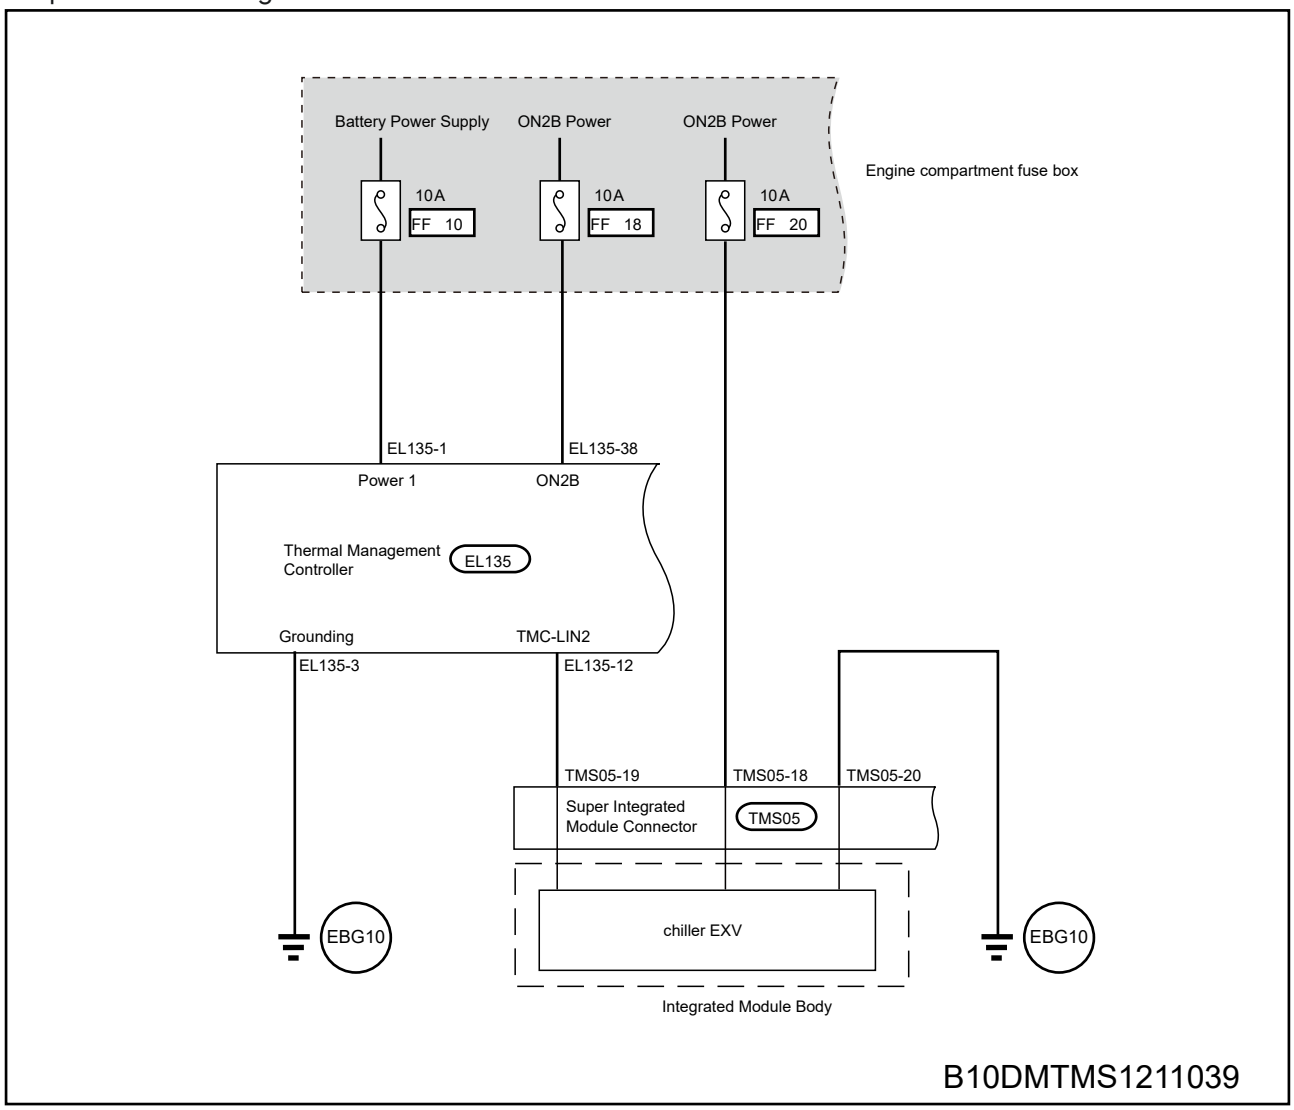
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 20 of th e wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the chiller EXV and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the chiller EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the chiller EXV and the wire harness connector termina l of the Super Integrated Module connector (device side) to verify if the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

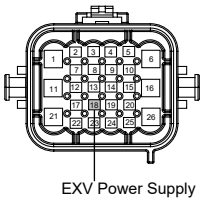
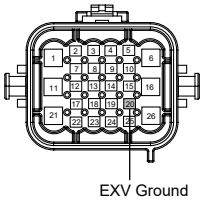
DTC: B101904-TMS

Fault code	Description
B101904	Chiller EXV initialization failure fault



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

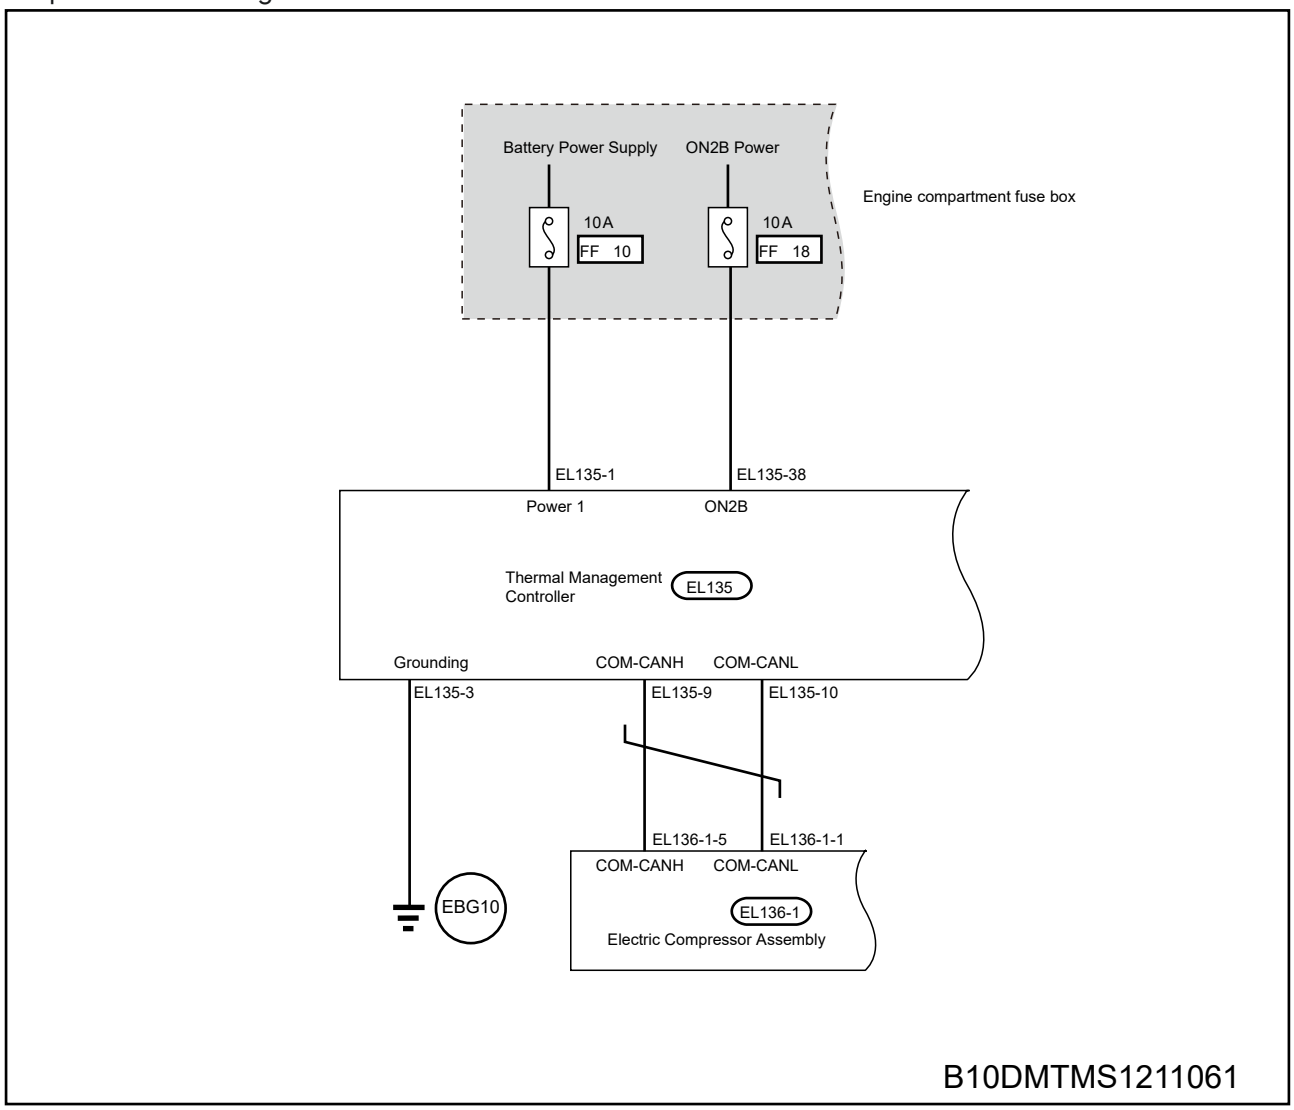
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the chiller EXV.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the chiller EXV fuse FF20. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 18 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the chiller EXV (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  B10DMTMS1211036	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 20 of the wiring harness connector TMS05 of the super integrated module connector and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Check the wiring harness between the chiller EXV and the super integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the chiller EXV wiring harness connector. C Disconnect the wiring harness connector TMS05 of the super integrated module connector. D Use a multimeter, select the resistance range, and measure the resistance between the wire harness connector terminal of the chiller EXV and the wire harness connector terminal of the Super Integrated Module connector (device side) to verify if the resistance value is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?

© 2026, All rights reserved

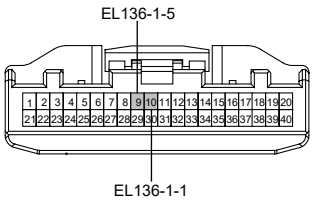


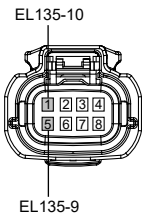
Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

DTC: B110117-TMS

Fault code	Description
B110117	Compressor overpressure alarm





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the diagnostic trouble codes for the electric compressor assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the electric compressor assembly, and record them. C Check for relevant diagnostic trouble codes.
Yes 》 》 》 Prioritize the repair of faults related to the electric compressor assembly.	
	No 》 》 》 Go to step 3.
Step 3 Check the CAN communication wiring harness between the thermal management controller and the electric compressor assembly.	
EL135 Thermal Management Controller  B10DMTMS1211062 EL136-1 Electric Compressor Assembly  B10DMTMS1211063	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the thermal management controller wiring harness connector EL135. C Disconnect the wiring harness connector EL136-1 of the electric compressor assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the wire harness connector EL135 of the thermal management controller and terminal 5 of the wire harness connector EL136-1 of the electric compressor assembly to check whether it is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 10 of harness connector EL135 of the thermal management controller and terminal 1 of harness connector EL136-1 of the electric compressor assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the electric compressor assembly.	
	A Check whether the power supply ground circuit of the electric compressor assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

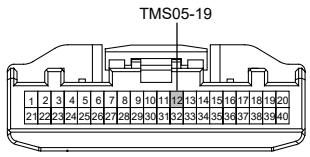
DTC: U14D387-TMS

Fault code	Description
U14D387	Battery cooler side electronic expansion valve communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

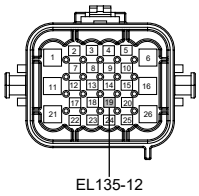
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wiring harness connector EL135 of the thermal management controller and terminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the chiller EXV and the super integrated module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the chiller EXV wiring harness connector.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure the resistance between the wire harness connector terminal of the chiller EXV and the wire harness connector terminal of the Super Integrated Module connector (device side) to verify if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the chiller EXV.	
	A Check whether the power ground circuit of the chiller EXV is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

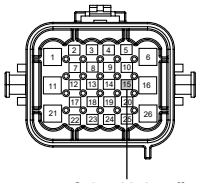
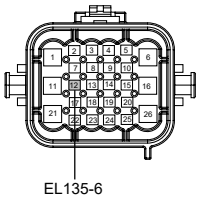
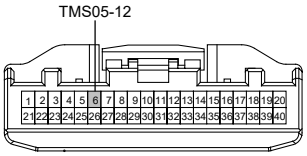
DTC: B103B12-TMS

Fault code	Description
B103B12	Electromagnetic shut-off valve 1 (normally closed) fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the electromagnetic shut-off valve 1 - normally closed.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuse FF20 for electromagnetic shut-off valve 1-normally closed. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of electromagnetic shut-off valve 1 - normally closed (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  Solenoid shutoff valve power supply B10DMTMS1211069	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 15 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if the voltage is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the wiring harness between the Super Integrated Module connector and the Thermal Manage ment Controller.	
TMS05 Super Integrated Module Connector  B10DMTMS1211070 EL135 Thermal Management Controller  B10DMTMS1211071	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C Disconnect the harness connector EL135 of the thermal m anagement controller. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 12 of th e wiring harness connector TMS05 of the super integrated module connector and terminal 6 of the wiring harness con nector EL135 of the thermal management controller is norm al. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the wiring harness between the electromagnetic shut-off valve 1 - normally closed and the su per integrated module connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the normally closed solenoid shut-off valve 1. C Disconnect the wiring harness connector TMS05 of the su per integrated module connector. D. Use a multimeter, set it to the resistance range, and meas ure whether the resistance between the wiring harness con nector terminal of the electromagnetic shut-off valve 1 - no rmally closed and the wiring harness connector terminal of t he Super Integrated Module connector (device end) is norm al.

May be caused by an intermittent fault. Check for intermittent faults.

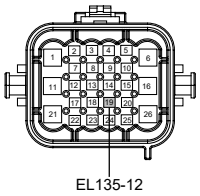
Yes 》》》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management c ontroller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Disconnect the wiring harness connector TMS05 of the su per integrated module connector.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 12 of wiring harness co nnector EL135 of the thermal management controller and t erminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the wiring harness between the low-temperature boost EXV connector and the Super Integra ted Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the low-temp erature boost EXV.
C Disconnect the wiring harness connector TMS05 of the su per integrated module connector.
D Use a multimeter, select the resistance range, and measur e the resistance between the wire harness connector termin al of the low-temperature supercharging EXV and the wire harness connector terminal of the super integrated module connector (device end) to check whether the resistance val ue is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	E Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the low-temperature boost EXV.	
	A Check whether the power ground circuit of the low-temp erature boost EXV is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

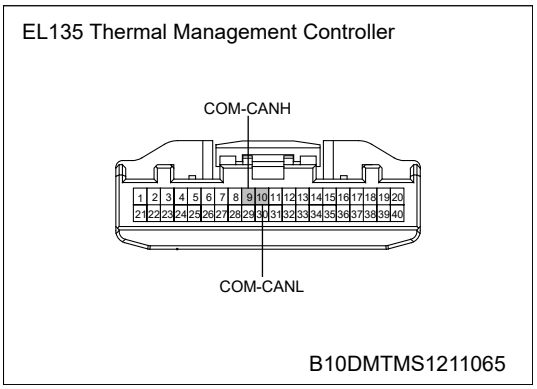
DTC: U007388-TMS

Fault code	Description
U007388	Bus communication fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the CAN wiring harness of the thermal management controller is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the thermal management controller wiring har ness connector EL135. C. Connect the negative terminal of the battery to power on the vehicle. D. Using a multimeter, select the DC voltage range, and mea sure the voltage between terminal 9 and body ground, and between terminal 10 and body ground, of the harness conn ector EL135 of the thermal management controller. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the thermal management controller.	
	A Check whether the power supply and ground of the ther mal management controller are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

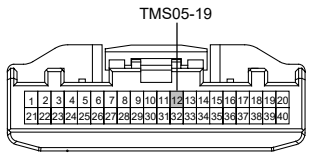
DTC: U14D887-TMS

Fault code	Description
U14D887	Evaporator electronic expansion valve communication failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

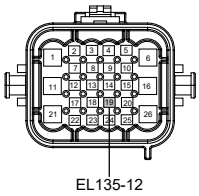
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wiring harness connector EL135 of the thermal management controller and terminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the evaporator EXV and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the evaporator EXV.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between the wire harness connector terminals of the evaporator EXV and the wire harness connector terminals of the super integrated module connector (device end) to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

Fault code	Description
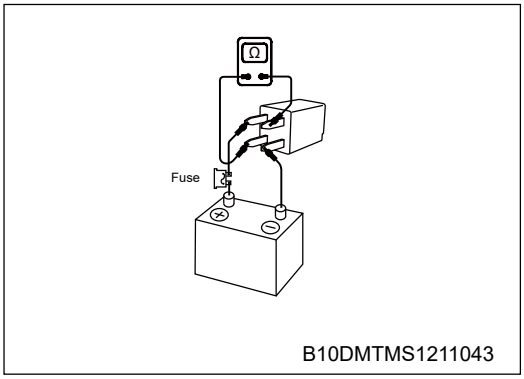
U14F087	Rear defogger relay drive communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps



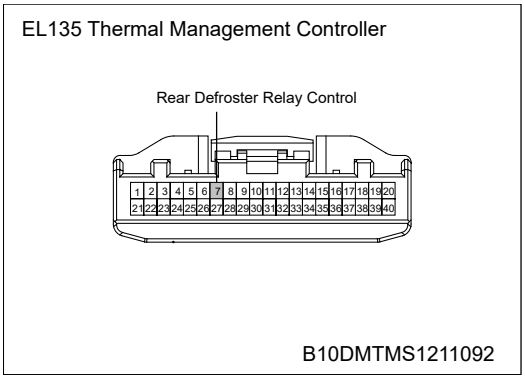
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the rear defroster relay.



A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the rear defrost relay RELY4. Connect the battery positive powe r supply to one side of the coil terminal of the rear defrost r elay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch c ontacts.

No 》 》 》 Replace the rear defroster relay.

Yes 》 》 》
Go to step 3.

Step 3 Check the rear defroster relay control circuit.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring har ness connector EL135.
C Remove the rear defrost relay RELY4.
D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 7 of the wire harness connector EL135 of the thermal management controller and slot 85# of the rear defrost relay RELY4 is nor mal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Replace the thermal management controller.

A Replace the thermal management controller.
B After replacing the thermal management controller, is the fault cleared?

Yes 》 》 》 System normal.

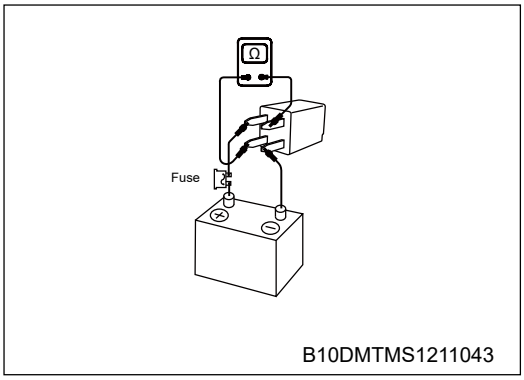
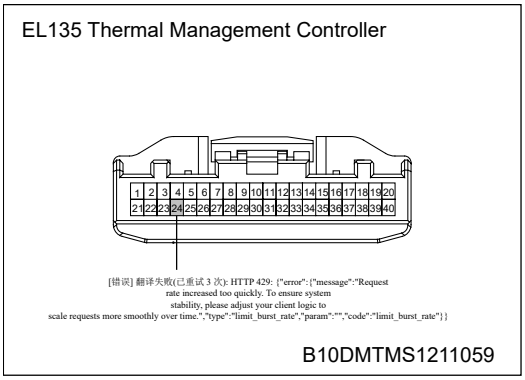
DTC: B18B277-TMS

Fault code	Description
B18B277	Front blower relay drive internal fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply fuse for the control terminal of the blower relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuse FF18 at the control terminal of the blower relay. Fuse specification: FF18 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the blower relay.	
 B10DMTMS1211043	A. Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the blower relay RELY3, connect the positive battery power to one side of the blower relay coil terminal and the other side to ground, and check for continuity across both ends of the relay switch contacts.
	No》》》 Replace the blower relay.
	Yes》》》 Go to step 4.
Step 4 Check the blower relay control circuit.	
 B10DMTMS1211059	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the thermal management controller wiring harness connector EL135. C Remove the blower relay RELY3. D. Set the multimeter to the resistance range and measure the resistance between terminal 24 of harness connector EL135 of the thermal management controller and socket 85# of blower relay RELY3 to check whether it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

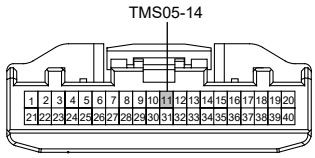
DTC: U14D487-TMS

Fault code	Description
U14D487	EWP (Electric Water Pump) Communication Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

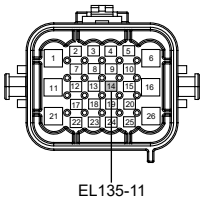
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211041

TMS05 Super Integrated Module Connector

B10DMTMS1211042

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of the thermal management controller harness connector EL135 and terminal 14 of the Super Integrated Module harness connector TMS05 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the electric water pump connector and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector of the electric water pump.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure the resistance between the terminals of the wiring harness connector of the motor water pump and the terminals of the wiring harness connector of the Super Integrated Module connector (device side) to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	E Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power supply ground circuit of the electric water pump.	
	A Check whether the power ground circuit of the electric w ater pump is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the integrated module body.	
	A Replace the integrated module body. B After replacing the integrated module body, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

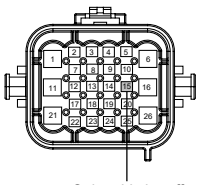
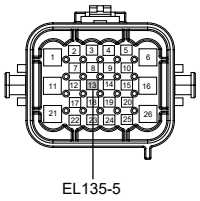
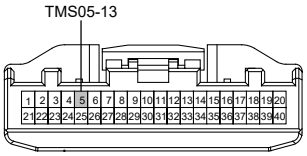
DTC: B102212-TMS

Fault code	Description
B102212	Electromagnetic shutoff valve 2 (Normally Closed) fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for electromagnetic shut-off valve 2 - normally closed.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuse FF20 for the electromagnetic shut-off valve 2-normally closed. Fuse specification: FF20 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the electromagnetic shut-off valve 2 - normally closed (Super Integrated Module connector).	
TMS05 Super Integrated Module Connector  Solenoid shutoff valve power supply B10DMTMS1211069	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TMS05 from the Super Integrated Module connector. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 15 of the wiring harness connector TMS05 of the Super Integrated Module connector and the vehicle body ground to check if the voltage is normal. Standard voltage: 11~14V

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the rear defroster relay.	
	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove the rear defrost relay RELY4. Connect the battery positive powe r supply to one side of the coil terminal of the rear defrost r elay, and connect the other side to ground. Check whether there is continuity across the two ends of the relay switch c ontacts.
	No》》》 Replace the rear defroster relay.
	Yes》》》 Go to step 3.
Step 3 Check the rear defroster relay control circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the thermal management controller wiring har ness connector EL135. C Remove the rear defrost relay RELY4. D. Using a multimeter, select the resistance range, and meas ure whether the resistance value between terminal 7 of the wire harness connector EL135 of the thermal management controller and slot 85# of the rear defrost relay RELY4 is nor mal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

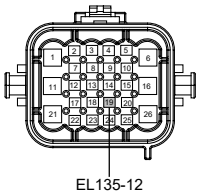
Yes》》》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211033

TMS05 Super Integrated Module Connector

B10DMTMS1211034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wiring harness connector EL135 of the thermal management controller and terminal 19 of wiring harness connector TMS05 of the super integrated module to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the heat pump EXV connector and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the heat pump EXV wiring harness connector.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, set it to the resistance range, and check whether the resistance between the wiring harness connector terminals of the heat pump EXV and the wiring harness connector terminals of the super integrated module connector (device side) is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

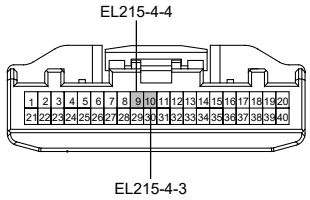
DTC: U14FF83-TMS

Fault code	Description
U14FF83	HPCGW_0x313 Message CRC Check Error Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

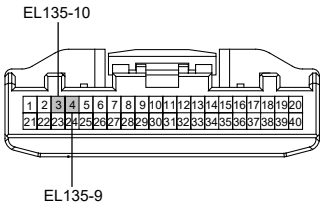
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN communication wiring harness between the thermal management controller and the multi-domain fusion controller.

EL135 Thermal Management Controller

B10DMTMS1211079

EL215-4 Multi-Domain Fusion Controller

B10DMTMS1211080

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and terminal 3 of wiring harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

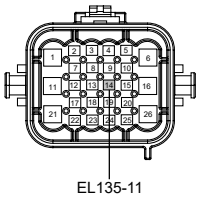
Yes》》》
Go to step 2.



Step 2 Check the LIN communication wiring harness between the connectors of the thermal management controller and the super integrated module.

EL135 Thermal Management Controller

B10DMTMS1211041

TMS05 Super Integrated Module Connector

B10DMTMS1211042

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of the thermal management controller harness connector EL135 and terminal 14 of the Super Integrated Module harness connector TMS05 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the five-way water valve and the Super Integrated Module connector.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the wiring harness connector of the five-way water valve.
C Disconnect the wiring harness connector TMS05 of the super integrated module connector.
D Use a multimeter, select the resistance range, and measure whether the resistance between the wiring harness connector terminals of the 5-way water valve and the wiring harness connector terminals of the Super Integrated Module connector (device end) is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and terminal 3 of wiring harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

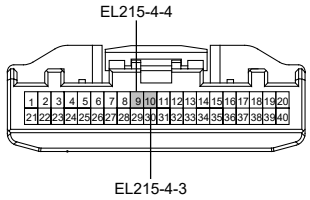
DTC: U14E587-TMS

Fault code	Description
U14E587	HPCGW node lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

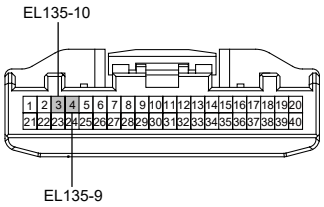
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN communication wiring harness between the thermal management controller and the multi-domain fusion controller.

EL135 Thermal Management Controller

B10DMTMS1211079

EL215-4 Multi-Domain Fusion Controller

B10DMTMS1211080

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the thermal management controller wiring harness connector EL135.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 9 of wiring harness connector EL135 of the thermal management controller and terminal 4 of wiring harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of wiring harness connector EL135 of the thermal management controller and terminal 3 of wiring harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

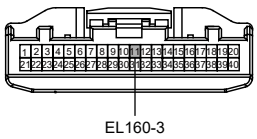
No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.

Step 5 Check the ground wire harness of the electric fan assembly.

EL160 Electric Fan Assembly

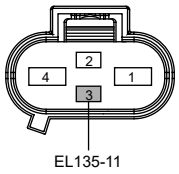
B10DMTMS1211103



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of harness conn ector EL160 of the electronic fan assembly and the body gr ound is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.



Step 6 Check whether the LIN harness between the electronic fan assembly and the thermal management c ontroller is working properly.

EL135 Thermal Management Controller

B10DMTMS1211104

EL160 Electric Fan Assembly

B10DMTMS1211105

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Disconnect the harness connector EL135 of the thermal m anagement controller.
D. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 3 of harness con nector EL160 of the electronic fan assembly and terminal 11 of harness connector EL135 of the thermal management co ntroller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the electric fan assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the electronic fan assembly fuse SF01. Fuse specification: SF01 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the electronic fan assembly.	
EL160 Electric Fan Assembly  B10DMTMS1211102	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL160 of the electronic fan assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 of wire harness connect or EL160 of the electric fan assembly and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

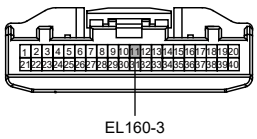
Yes 》 》 》
Go to step 5.

Step 5 Check the ground wire harness of the electric fan assembly.

EL160 Electric Fan Assembly

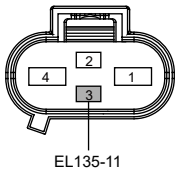
B10DMTMS1211103



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of harness conn ector EL160 of the electronic fan assembly and the body gr ound is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.



Step 6 Check whether the LIN harness between the electronic fan assembly and the thermal management c ontroller is working properly.

EL135 Thermal Management Controller

B10DMTMS1211104

EL160 Electric Fan Assembly

B10DMTMS1211105

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL160 of the electronic fan assembly.
C Disconnect the harness connector EL135 of the thermal m anagement controller.
D. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 3 of harness con nector EL160 of the electronic fan assembly and terminal 11 of harness connector EL135 of the thermal management co ntroller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 7.
Step 7 Replace the electric fan assembly.	
	A Replace the electric fan assembly. B After replacing the electric fan assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 8.
Step 8 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to Step 9.
Step 9 Diagnosis complete.

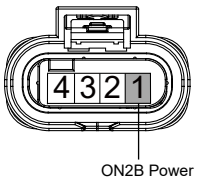
DTC: B18BE07-TMS

Fault code	Description
B18BE07	AGS mechanical damage



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the active grille shutter assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the active grille shutter assembly fuse FF18. Fuse specification: FF18 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the active grille assembly.	
EL036 Active Grille Assy  B10DMTMS1211096	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL036 of the active grille shutter assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of wiring harness connector EL036 of the active grille shutter assembly and the body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

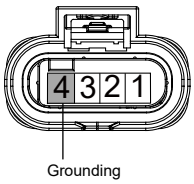
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the active grille shutter assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the active grille shutter assembly fuse FF18. Fuse specification: FF18 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the active grille assembly.	
EL036 Active Grille Assy  B10DMTMS1211096	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL036 of the active grille shutter assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of wiring harness connector EL036 of the active grille shutter assembly and the body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.



© 2026, All rights reserved

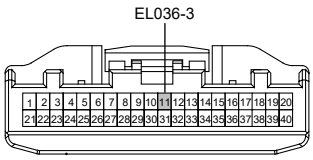
No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.

Step 5 Check the ground wire harness of the active grille shutter assembly.

EL036 Active Grille Assy

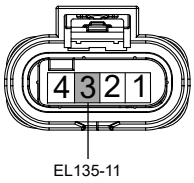
B10DMTMS1211097



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL036 of the act ive grille shutter assembly.
C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 4 of wire harness connector EL036 of the active grille shutter assembly and t he body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.



Step 6 Check whether the LIN harness between the Active Grille Shutter Assembly and the Thermal Manag ement Controller is working properly.

EL135 Thermal Management Controller

B10DMTMS1211094

EL036 Active Grille Assy

B10DMTMS1211095

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL036 of the act ive grille shutter assembly.
C Disconnect the harness connector EL135 of the thermal m anagement controller.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 3 of harness connector EL0 36 of the active grille shutter assembly and terminal 11 of h arness connector EL135 of the thermal management contro ller, and check whether the resistance is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 7.
Step 7 Replace the active grille shutter assembly.	
	A Replace the Active Grille Assembly. B After replacing the active grille shutter assembly, is the fa ult cleared?
	Yes》》》 System normal.
	No》》》 Go to step 8.
Step 8 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: U150287-TMS

Fault code	Description
U150287	Defrost door motor communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the thermal management controller and the defrost motor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector of the thermal management controller. C Disconnect the defrost motor wire harness connector. D. Use a multimeter, select the resistance range, and check whether the resistance between the terminals of the therma l management controller harness connector and the termin als of the defrost motor harness connector is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the defroster motor.	
	A Replace the defrost motor. B Is the fault cleared after replacing the defrost motor?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

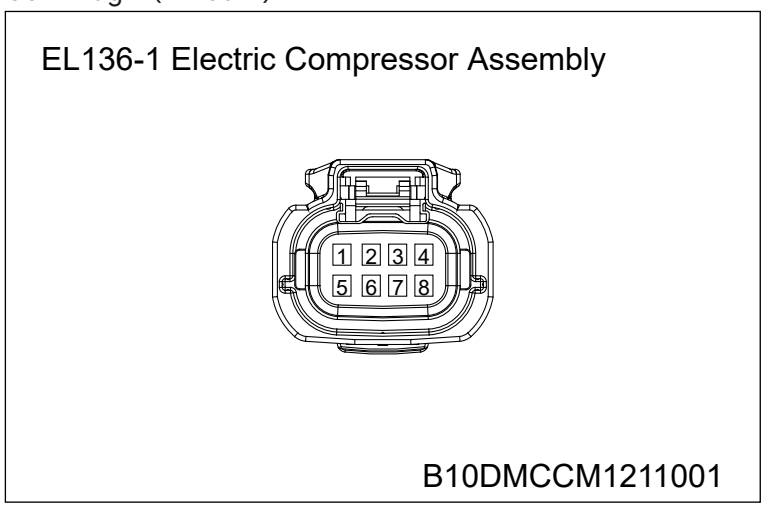
DIAGNOSTIC DESCRIPTION-CCM

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the CCM data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-CCM

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST-CCM

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
U131587	CCM_CANLostComWithGW	GW frame loss or CAN bus malfunction	Check the CAN bus or replace the controller
U137587	CCM_CANLostComWithTMC	TMC frame drop or CAN bus abnormality	Check the CAN bus or replace the controller
U007388	CCM_CANbusoff	CAN bus short circuit or open circuit	Check the CAN bus or replace the controller
B1A0017	CCM_HighVoltFault	High voltage power supply circuit abnormality	Check the high voltage input circuit
B1A0019	CCM_CurrentOverFault (Hardware overcurrent)	A/C system malfunction or condenser fan fails to start	Check the fan and air conditioning system
B1A0016	CCM_LowVoltFault	Blown fuse or abnormal connector contact	Check the high-voltage input circuit and fuses
B1A0119	CCM_Reserved (Software overcurrent)	High system load or condenser fan not turned on	Check the fan and air conditioning system
B1A0200	CCM_StartFault	Compressor failure or structural seizure	Try to power off and power on the low-voltage system, or replace the compressor, and check the A/C system.
B1A004B	CCM_OverTempFault	Insufficient system refrigerant or heavy load operation at low speed	Check the fan and air conditioning system
B1A0300	Reserved (Jitter Protection)	Condenser fan is not rotating or system is blocked	Check the fan and air conditioning system
U007487	CAN node lost	1.TMC malfunction 2. CCM malfunction 3.Wiring damage	1. Check whether the TMC node communication transmission is working properly. 2. Check whether the CCM node communication reception is normal.

DTC: B1A004B-CCM

Fault code	Description
B1A004B	CCM_OverTempFault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the refrigerant.	
	A Check whether the refrigerant in the air conditioning system is insufficient?
	Yes》》》 Inspect the A/C pipelines for leakage; add refrigerant.
	No》》》 Go to step 3.
Step 3 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check whether the thermal management controller has any faults.
	Yes》》》 Prioritize repairing faults related to the thermal management controller.
	No》》》 Go to step 4.
Step 4 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electric compressor assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1A0017-CCM

Fault code	Description
B1A0017	CCM_HighVoltFault

1. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the power battery pack assembly voltage.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and read the voltage value of the po wer battery pack assembly. C Check whether the voltage value of the power battery pa ck assembly is too high.
Yes 》》》 Discharge the power battery and retest.	
No 》》》 Go to step 3.	
Step 3 Check the high-voltage wiring harness connector between the power battery pack and the electric c ompressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the high-voltage wiring harness connector from th e power battery pack to the electric compressor assembly f or looseness, pushed-out pins, or signs of arcing.
Yes 》》》 Replace the compressor cable assembly.	
No 》》》 Go to step 4.	

© 2026, All rights reserved

Step 4 Check the insulation value of the high-voltage wiring harness between the power battery pack and t he electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wi ring harness of the electric compressor assembly is damage d, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector be tween the electric compressor assembly and the power batt ery pack. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between the positive and negative terminals of the high-voltage harness connect or from the electric compressor assembly to the power batt ery pack. Insulation resistance standard value: Greater than 100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the positive ter minal of the high-voltage harness connector from the electr ic compressor assembly to the power battery pack and the i nternal shielding contact of the plug. Insulation resistance standard value: Greater than 100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the negative ter minal of the high-voltage wiring harness connector from th e electric compressor assembly to the power battery pack a nd the contact piece of the internal shielding layer inside th e plug. Insulation resistance standard value: Greater than 100MΩ G Confirm whether the insulation resistance meets the stan dard value.
	No》》》 Replace the compressor cable assembly.
	Yes》》》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check whether the thermal management controller has a ny faults.
	Yes 》 》 》 Prioritize repairing faults related to the thermal management controller.
	No 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electr ic compressor assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1A1049-CCM

Fault code	Description
B1A1049	CCM sampling circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electric compressor assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: B1A0300-CCM

Fault code	Description
B1A0300	Reserved (Jitter Protection)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check whether relevant diagnostic trouble codes are disp layed.
Yes 》 》 》 Prioritize repairing faults related to the thermal management controller.	
	No 》 》 》 Go to step 3.
Step 3 Check the cooling fan.	
	A Check whether the cooling fan is not working properly. B Check whether the condenser is excessively dirty or block ed.
Yes 》 》 》 Repair the cooling fan fault; clean the condenser and replace it if necessary.	
	No 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electr ic compressor assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1A1516-CCM

Fault code	Description
B1A1516	CCM load voltage undervoltage

1. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power battery pack assembly voltage.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and read the voltage value of the po wer battery pack assembly. C Check whether the voltage of the power battery pack ass embly is too low.
Yes》》》 Recheck after charging the power battery.	
No》》》 Go to step 3.	
Step 3 Check the high-voltage wiring harness connector between the power battery pack and the electric c ompressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the high-voltage wiring harness connector from th e power battery pack to the electric compressor assembly f or looseness, pushed-out pins, or signs of arcing.
Yes》》》 Replace the compressor cable assembly.	
No》》》 Go to step 4.	

© 2026, All rights reserved

Step 4 Check the insulation value of the high-voltage wiring harness between the power battery pack and t he electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wi ring harness of the electric compressor assembly is damage d, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector be tween the electric compressor assembly and the power batt ery pack. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between the positive and negative terminals of the high-voltage harness connect or from the electric compressor assembly to the power batt ery pack. Insulation resistance standard value: Greater than 100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the positive ter minal of the high-voltage harness connector from the electr ic compressor assembly to the power battery pack and the i nternal shielding contact of the plug. Insulation resistance standard value: Greater than 100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the negative ter minal of the high-voltage wiring harness connector from th e electric compressor assembly to the power battery pack a nd the contact piece of the internal shielding layer inside th e plug. Insulation resistance standard value: Greater than 100MΩ G Confirm whether the insulation resistance meets the stan dard value.
	No》》》 Replace the compressor cable assembly.
	Yes》》》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.

© 2026, All rights reserved

Step 6 Diagnosis complete.

© 2026, All rights reserved

DTC: B1A1517-CCM

Fault code	Description
B1A1517	CCM load voltage overvoltage

1. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power battery pack assembly voltage.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and read the voltage value of the po wer battery pack assembly. C Check whether the voltage value of the power battery pa ck assembly is too high.
Yes》》》 Discharge the power battery and retest.	
No》》》 Go to step 3.	
Step 3 Check the high-voltage wiring harness connector between the power battery pack and the electric c ompressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the high-voltage wiring harness connector from th e power battery pack to the electric compressor assembly f or looseness, pushed-out pins, or signs of arcing.
Yes》》》 Replace the compressor cable assembly.	
No》》》 Go to step 4.	

© 2026, All rights reserved

Step 4 Check the insulation value of the high-voltage wiring harness between the power battery pack and t he electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wi ring harness of the electric compressor assembly is damage d, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector be tween the electric compressor assembly and the power batt ery pack. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between the positive and negative terminals of the high-voltage harness connect or from the electric compressor assembly to the power batt ery pack. Insulation resistance standard value: Greater than 100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the positive ter minal of the high-voltage harness connector from the electr ic compressor assembly to the power battery pack and the i nternal shielding contact of the plug. Insulation resistance standard value: Greater than 100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance between the negative ter minal of the high-voltage wiring harness connector from th e electric compressor assembly to the power battery pack a nd the contact piece of the internal shielding layer inside th e plug. Insulation resistance standard value: Greater than 100MΩ G Confirm whether the insulation resistance meets the stan dard value.
	No》》》 Replace the compressor cable assembly.
	Yes》》》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.

DTC: B1A154B-CCM

Fault code	Description
B1A154B	CCM over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check whether fault codes related to the cooling fan and expansion valve are displayed.
Yes 》 》 》 Prioritize repairing faults related to the thermal management controller.	
	No 》 》 》 Go to step 3.
Step 3 Check the cooling fan.	
	A Check whether the cooling fan is not working properly. B Check whether the condenser is excessively dirty or block ed.
Yes 》 》 》 Repair the cooling fan fault; clean the condenser and replace it if necessary.	
	No 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electr ic compressor assembly are normal.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1A141D-CCM

Fault code	Description
B1A141D	Overload causes overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the cooling fan.	
	A Check whether the cooling fan is not working properly. B Check whether the condenser is excessively dirty or blocked.
Yes》》》 Repair the cooling fan fault; clean the condenser and replace it if necessary.	
	No》》》 Go to step 3.
Step 3 Check the air conditioning system pressure.	
	A Check whether the air conditioning system pressure is too high. A/C system pressure range: low pressure side 1.5-2.5kg/cm², high pressure side 14.0-16.0kg/cm²
Yes》》》 Recover the refrigerant and recharge it to the standard refrigerant charge.	
	No》》》 Go to step 4.
Step 4 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check whether the expansion valve related fault codes are displayed.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
	No》》》 Go to step 5.
Step 5 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electric compressor assembly are normal.
No》》》 Repair or replace the wiring harness.	
	Yes》》》 Go to step 6.
Step 6 Replace the electric compressor assembly.	

© 2026, All rights reserved

	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

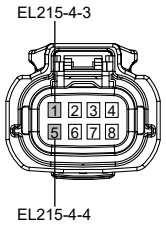
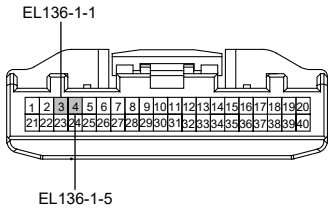
DTC: U131587-CCM

Fault code	Description
U131587	CCM_CANLostComWithGW





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the electric compressor assembly and the multi-domain fusion controller.	
EL136-1 Electric Compressor Assembly  B10DMCCM1211007 EL215-4 Multi-Domain Fusion Controller  B10DMCCM1211008	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL136-1 of the electric compressor assembly. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the electric compressor assembly wire harness connector EL136-1 and terminal 4 of the Multi-Domain Fusion Controller wire harness connector EL215-4 to check whether it is normal. E. Use a multimeter set to the resistance range to measure the resistance between terminal 1 of harness connector EL136-1 of the electric compressor assembly and terminal 3 of harness connector EL215-4 of the multi-domain fusion controller, and check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the f ault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

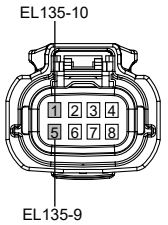
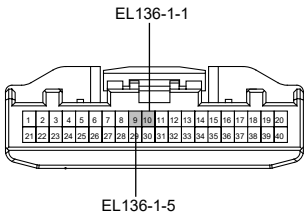
DTC: U137587-CCM

Fault code	Description
U137587	CCM_CANLostComWithTMC





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the electric compressor assembly and the thermal management co ntroller.	
EL136-1 Electric Compressor Assembly  B10DMCCM1211013 EL135 Thermal Management Controller  B10DMCCM1211014	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL136-1 of the el ectric compressor assembly. C Disconnect the harness connector EL135 of the thermal management controller. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector EL136-1 of the electric compressor assembly and te rminal 9 of the wire harness connector EL135 of the therma l management controller to check whether it is normal. E. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 1 of the wire har ness connector EL136-1 of the electric compressor assembl y and terminal 10 of the wire harness connector EL135 of t he thermal management controller is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the thermal management controller.	
	A Check whether the power ground circuit of the thermal m anagement controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the thermal management controller.	
	A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
	Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the f ault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

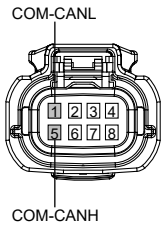
DTC: U007388-CCM (ZHONGCHENG)

Fault code	Description
U007388	CCM CAN bus off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the CAN harness of the electric compressor assembly is normal.	
EL136-1 Electric Compressor Assembly  B10DMCCM1211003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL136-1 of the electric compressor assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminals 5 and 1 of the wire harness connector EL136-1 for the electric compressor assembly and the vehicle body ground, respectively. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the electric compressor assembly.	
	A Check whether the power supply and ground of the electric compressor assembly are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

6.1.8 SERVICE AND REPAIR GUIDANCE

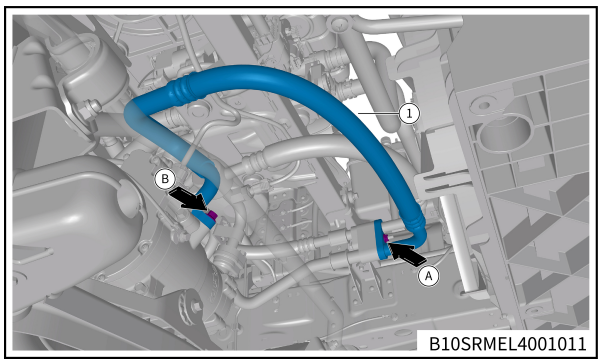
PRESSURE PLATE SEALING FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the pressure plate sealing sponge.

a. Remove the pressure plate sealing sponge ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

COMPRESSOR LOW-PRESSURE LINE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the compressor low-pressure pipe.

a. Unscrew 1 fixing nut of the compressor low-pressure line and the high- and low-pressure inlet and outlet line assembly - arrow A -.
Recommended tool: 10mm socket
Torque: 9±1N m

b. Unscrew the 1 fixing bolt between the compressor low-pressure pipe and the electric compressor assembly -arrow B-, and remove the compressor low-pressure pipe ①.
Recommended tool: 10mm socket
Torque: 23±2N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

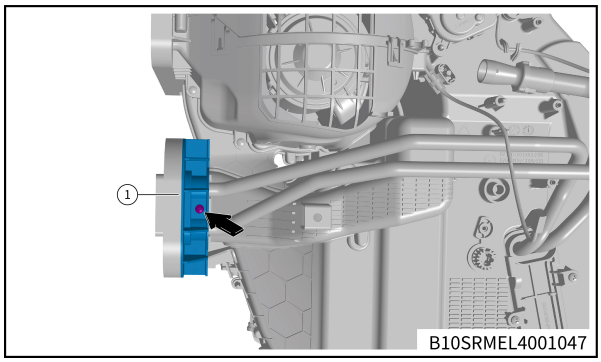
RIGHT FOOTWELL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the right footwell air duct assembly.

a. Unscrew 1 retaining nut of the right footwell air duct assembly -Arrow A-, and unscrew 1 retaining screw of the right footwell air duct assembly -Arrow B-.
   Recommended tools: 10mm socket, Phillips screwdriver
   -Arrow A-Torque: 6±1N m
   -Arrow B-Torque: 1.5±0.4N m
b. Release the 3 retaining clips - arrow C - connecting the right footwell air duct assembly to the HVAC, and remove the right footwell air duct assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

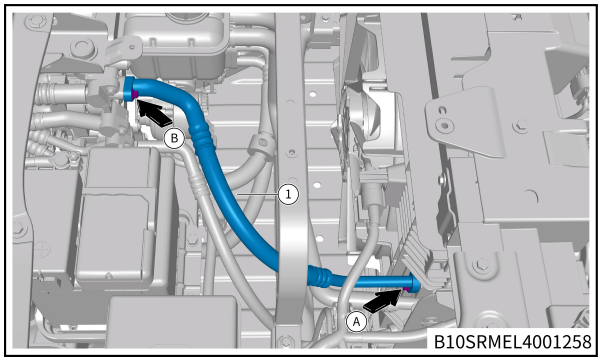
CLAMP PLATE MOUNTING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the pressure plate mounting bracket.

a. Unscrew the 1 fixing screw -arrow- of the pressure plate fixing bracket, and remove the pressure plate fixing bracket ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

CONDENSER LIQUID OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
5. Remove the condenser liquid outlet pipe.

a. Remove the 1 fixing bolt - arrow A - between the condenser liquid outlet pipe and the outdoor heat exchanger assembly.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew the 1 fixing bolt -Arrow B- between the condenser liquid outlet pipe and the Super Integrated Module, and remove the condenser liquid outlet pipe ①.
Recommended tool: 8mm socket
Torque: 9±1N m

> NOTE
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> ATTENTION
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

COMPRESSOR HIGH-PRESSURE LINE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the compressor high-pressure line.

a. Disconnect the 1 connector plug between the engine compartment wiring harness and the compressor high-voltage pipe - arrow A -, and release the 1 fixing clip of the compressor cable - arrow B -.
Recommended tool: Clip remover
b. Unscrew 1 fixing nut -Arrow C- securing the compressor high-pressure line and the high- and low-pressure inlet and outlet line assembly, and move away the compressor low-pressure line.
Recommended tool: 10mm socket
Torque: 9±1N m
c. Unscrew the 1 fixing bolt -arrow D- between the compressor high-pressure line and the electric compressor assembly, and remove the compressor high-pressure line ①.
Recommended tool: 10mm socket
Torque: 23±2N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

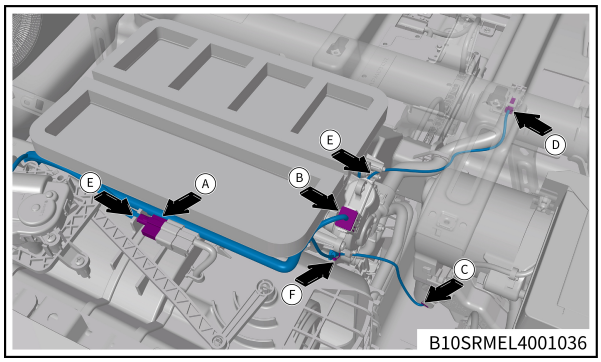
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

ATTENTION

© 2026, All rights reserved

> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.



b. After installation, check that the air conditioning system operates normally.

HVAC WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the HVAC wiring harness assembly.

a. Disconnect the 1 connector - arrow A - between the HVAC harness assembly and the blower motor fan assembly, and disconnect the 1 connector - arrow B - between the HVAC harness assembly and the defrost flap motor.
b. Disconnect 1 connector between the HVAC harness assembly and the air duct temperature sensor -Arrow C-, and disconnect 1 connector between the HVAC harness assembly and the interior temperature sensor -Arrow D-.
c. Detach the 3 retaining clips of the HVAC wiring harness assembly -arrow E-, -arrow F-.
   Recommended tool: Clip remover

d. Disconnect 1 connector between the HVAC harness assembly and the recirculation door motor - arrow A -, and disconnect 1 connector between the HVAC harness assembly and the mode door motor - arrow B -.
e. Disconnect 1 connector - Arrow C - between the HVAC harness assembly and the speed control module, and disconnect 1 connector - Arrow D - between the HVAC harness assembly and the thermal management controller.
f. Disconnect 1 connector between the HVAC harness assembly and the engine compartment harness - arrow E -, and disconnect 1 connector between the HVAC harness assembly and the evaporator temperature sensor - arrow F -.
g. Disconnect the 1 connector between the HVAC wiring harness assembly and the right

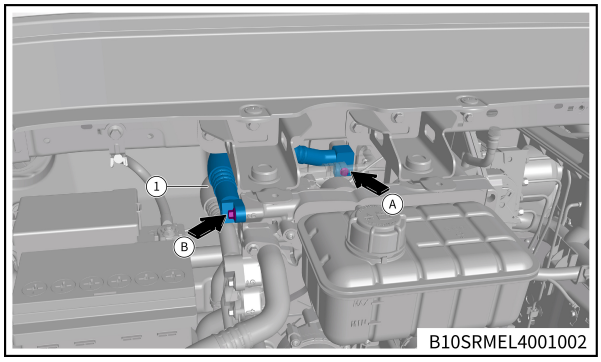
© 2026, All rights reserved

temperature blend motor - arrow G -, and release the 1 retaining clip of the HVAC wiring harness assembly - arrow H -.

Recommended tool: Clip remover

h. Remove the HVAC wiring harness assembly ①.

SETUP



1. Perform the installation procedure in reverse order, and note the following:
   a. After installation, check that the relevant electrical equipment is working properly.

© 2026, All rights reserved

FRONT EVAPORATOR OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
5. Remove the front evaporator outlet pipe.

a. Unscrew 1 mounting bolt securing the front evaporator outlet pipe to the evaporator housing -arrow A-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- securing the front evaporator outlet pipe to the super integrated module, and remove the front evaporator outlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 223)

ATTENTION

Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

CONDENSER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
5. Remove the condenser inlet pipe.

a. Unscrew 1 fixing bolt between the condenser inlet pipe and the outdoor heat exchanger assembly - arrow A -.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt - arrow B - between the condenser inlet pipe and the Super Integrated Module, and remove the condenser inlet pipe ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

> NOTE
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 223)

      > ATTENTION
      >
      > Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

FRONT EVAPORATOR LIQUID INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the battery assembly.
   See:Battery Assembly (page 9594)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the front evaporator liquid inlet pipe.

a. Unscrew the 1 retaining bolt between the front evaporator liquid inlet pipe and the evaporator housing -arrow A-, and move aside the front evaporator gas outlet pipe.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew 1 fixing bolt -arrow B- between the front evaporator liquid inlet pipe and the super integrated module, and remove the front evaporator liquid inlet pipe ①.
Recommended tool: 8mm socket
Torque: 9±1N m

> **NOTE**
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

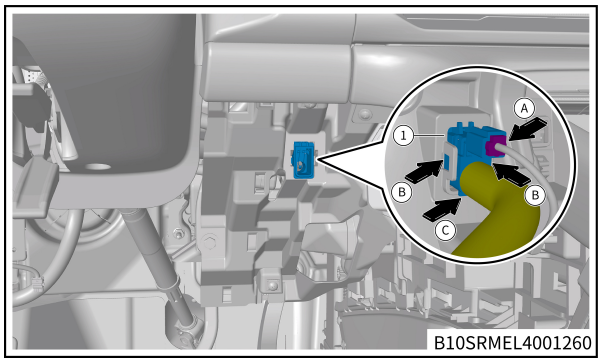
RIGHT TEMPERATURE BLEND MOTOR AND LINKAGE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the right footwell air duct assembly.
   See:Right footwell air duct assembly (page 5147)
5. Remove the right heating and cooling motor and moving components.

a. Disconnect the 1 connector -arrow A- between the HVAC wiring harness assembly and the right temperature blend motor and actuator assembly, and unscrew the 2 mounting screws -arrow B- of the right temperature blend motor and actuator assembly.
   Recommended tool: Phillips screwdriver
b. Remove the right blend door motor and linkage ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the right temperature blend door motor and moving components are working properly.

© 2026, All rights reserved

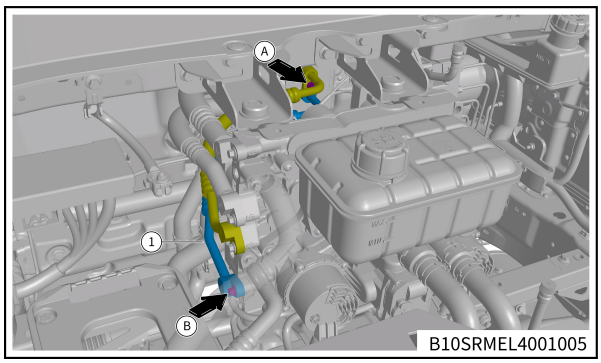
INTERIOR TEMPERATURE SENSOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the interior temperature sensor.

a. Disconnect the 1 connector between the HVAC harness assembly and the interior temperature sensor - arrow A -, and release the 2 retaining clips of the interior temperature sensor - arrow B -.
b. Disconnect the interior temperature sensor from the air duct - arrow C -, and remove the interior temperature sensor ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the interior temperature sensor is working properly.

© 2026, All rights reserved

INTERIOR CONDENSER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the battery assembly.
   See:Battery Assembly (page 9594)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the interior condenser inlet pipe.

a. Unscrew the 1 fixing bolt -Arrow A- between the indoor condenser inlet pipe and the evaporator case, and move aside the indoor condenser liquid outlet pipe.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew the 1 fixing bolt -Arrow B- between the indoor condenser inlet pipe and the Super Integrated Module, and remove the indoor condenser inlet pipe ①.
Recommended tool: 8mm socket
Torque: 9±1N m

> NOTE
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> ATTENTION
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

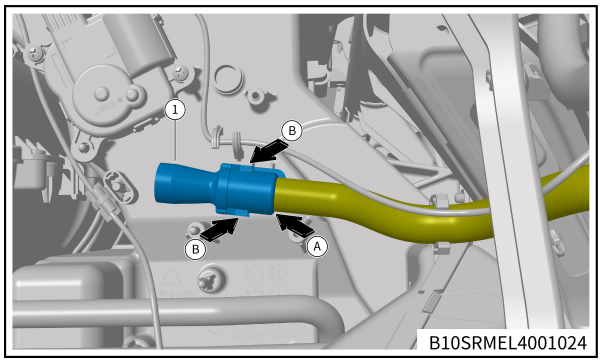
LEFT FOOTWELL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the air duct temperature sensor (left footwell air duct).
   See:Duct temperature sensor (Left footwell air duct) (page 5187)
5. Remove the left footwell air duct assembly.

a. Detach the 1 retaining clip connecting the air duct to the left footwell air duct assembly - arrow A -, and unscrew the 1 retaining screw of the left footwell air duct assembly - arrow B -.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Release the 1 retaining clip - arrow C - connecting the left footwell air duct assembly to the HVAC, and remove the left footwell air duct assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

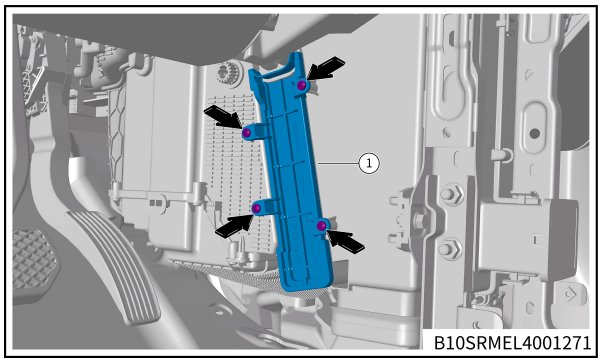
AIR INTAKE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the air intake.

a. Disconnect the breather from the air duct -arrow A-, release the 2 fixing clips of the breather -arrow B-, and remove the breather ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

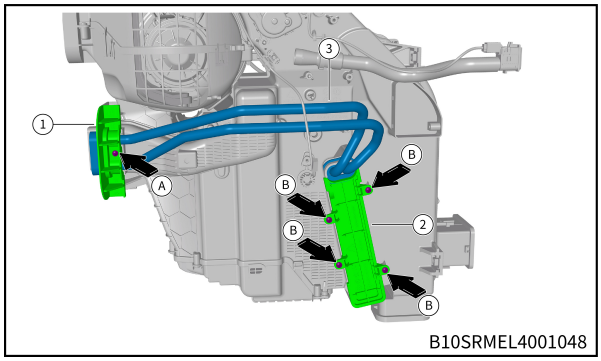
INTERIOR CONDENSER COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the interior condenser cover.

a. Unscrew the 4 fixing screws of the interior condenser cover -arrow-, and remove the interior condenser cover ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INDOOR CONDENSER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the pressure plate sealing sponge.
   See:Pressure plate sealing foam (page 5145)
5. Remove the interior condenser.

a. Unscrew 1 fixing screw -arrow A- of the pressure plate mounting bracket, and remove the pressure plate mounting bracket ①.
   Recommended tool: Phillips screwdriver
b. Unscrew the 4 fixing screws of the indoor condenser cover -arrow B-, and remove the indoor condenser cover ②.
   Recommended tool: Phillips screwdriver
c. Remove the interior condenser ③.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Recharge the refrigerant.
      See:Recharging refrigerant (page 223)

      ATTENTION

      Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. Before inspection, the automatic HVAC assembly should work properly.

© 2026, All rights reserved

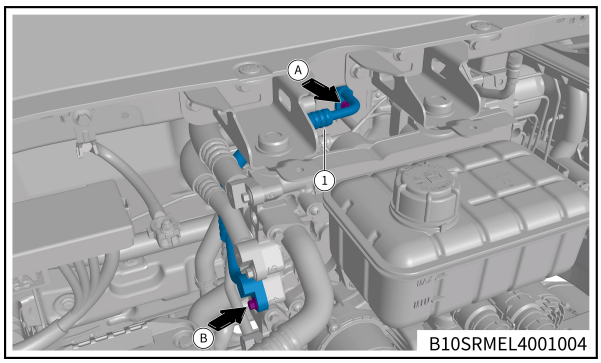
AIR DUCT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the interior temperature sensor.
   See:Interior temperature sensor (page 5158)
5. Remove the air duct.

a. Release 1 retaining clip of the air duct - arrow A -, disconnect the air duct from the suction device - arrow B -, and remove the air duct ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTERIOR CONDENSER LIQUID OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the battery assembly.
   See:Battery Assembly (page 9594)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the interior condenser liquid outlet pipe.

a. Unscrew the 1 fixing bolt -arrow A- between the indoor condenser liquid outlet pipe and the evaporator housing.
Recommended tool: 8mm socket
Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- between the indoor condenser liquid outlet pipe and the super integrated module, and remove the indoor condenser liquid outlet pipe ①.
Recommended tool: 8mm socket
Torque: 9±1N m

> NOTE
>
> Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> ATTENTION
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

OUTDOOR TEMPERATURE SENSOR ASSEMBLY

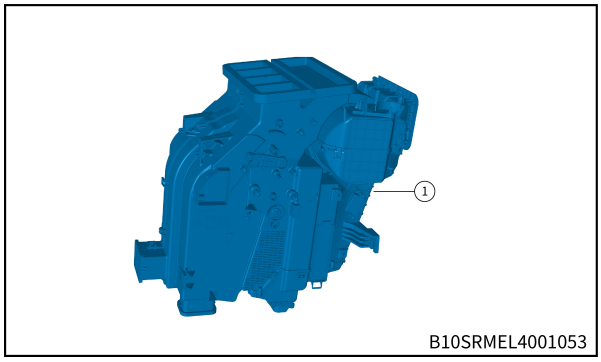
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the ambient temperature sensor assembly.

a. Disconnect the 1 connector between the engine compartment wiring harness and the outdoor temperature sensor assembly -arrow-, and remove the outdoor temperature sensor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the ambient temperature sensor assembly is working properly.



© 2026, All rights reserved

HOUSING AND EVAPORATOR ASSEMBLY

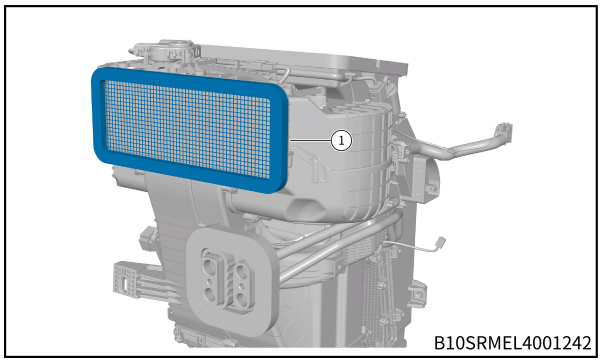
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the HVAC wiring harness assembly.
   See:HVAC wiring harness assembly (page 5152)
5. Remove the recirculation door actuator.
   See:Recirculation door motion assembly (page 5177)
6. Remove the defrost door actuator.
   See:Defrost door motion assembly (page 5183)
7. Remove the mode door actuator assembly.
   See:Mode Door Actuator Assembly (page 5175)
8. Remove the right heating and cooling motor and moving components.
   See:Right temperature blend motor and linkage (page 5157)
9. Remove the left footwell air duct assembly.
   See:Left footwell air duct assembly (page 5160)
10. Remove the right footwell air duct assembly.
    See:Right footwell air duct assembly (page 5147)
11. Remove the left air intake vent.
    See:Left air intake vent (page 5174)
12. Remove the blower motor fan assembly.
    See:Blower motor fan blade assembly (page 5192)
13. Remove the air filter.
    See:Air filter (page 5176)
14. Remove the evaporator temperature sensor.
    See:Evaporator temperature sensor (page 5182)
15. Remove the speed control module.
    See:Speed control module (page 5186)
16. Remove the air intake.
    See:Air intake (page 5161)
17. Remove the interior condenser.
    See:Indoor condenser (page 5163)
18. Remove the outside air seal sponge.
    See:Outside air sealing sponge (page 5169)
19. Remove the pressure plate sealing sponge.
    See:Pressure plate sealing foam (page 5145)
20. Remove the housing and evaporator assembly.

© 2026, All rights reserved

a. Remove the case and evaporator assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

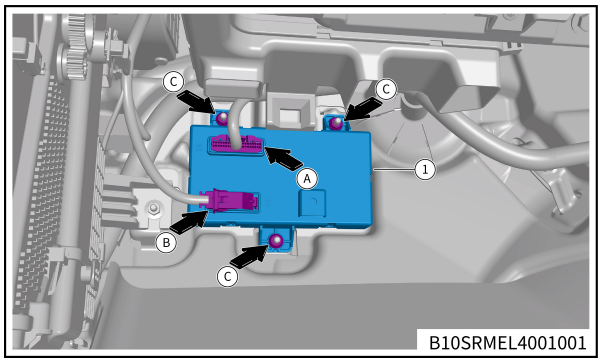
OUTSIDE AIR SEALING SPONGE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the outside air seal sponge.

a. Remove the outside air seal sponge ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

THERMAL MANAGEMENT CONTROLLER

REMOVAL PROCEDURE

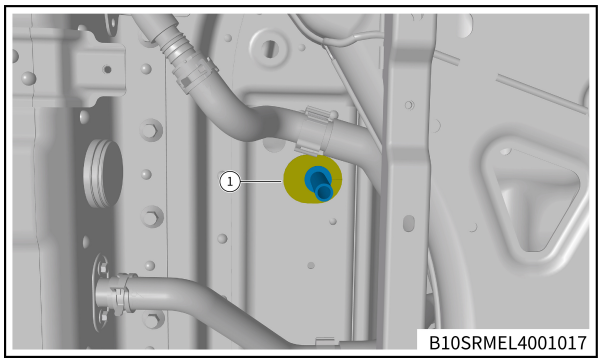
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
4. Remove the thermal management controller.

a. Disconnect the 1 connector between the engine compartment harness and the thermal management controller - Arrow A -, and disconnect the 1 connector between the HVAC harness and the thermal management controller - Arrow B -.
b. Unscrew the 3 mounting nuts - Arrow C - of the thermal management controller, and remove the thermal management controller ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the thermal management controller is working properly.
   b. Replacing the controller requires following these steps to ensure software version compatibility:
      - Record the old version: Before disassembly, read and record the software version number of the old controller.
      - Check for new version: After installing the new controller, first read its software version number.

      Version Comparison and Processing:
      - If the new version is greater than or equal to the old version, the replacement process will be completed normally.
      - If the new version is lower than the old version, the new controller software must first be updated to the old version or a higher version before it can be put into use.
   c. After replacing the controller, use the diagnostic tool to perform the following operations:
      - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnosis - Thermal Management Controller (TMS) - Data Write - Write VIN.
      - Write the EOL configuration. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Thermal Management Controller (TMS) - EOL Configuration - Configuration Selection - Write.



> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.
