Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

Fault code	Description
P126111	High Voltage Interlock 2 Short to Ground Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.

Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.

3.1.8 SERVICE AND REPAIR GUIDANCE

LXA12EV10_BUFFER FOAM 01

REMOVAL PROCEDURE

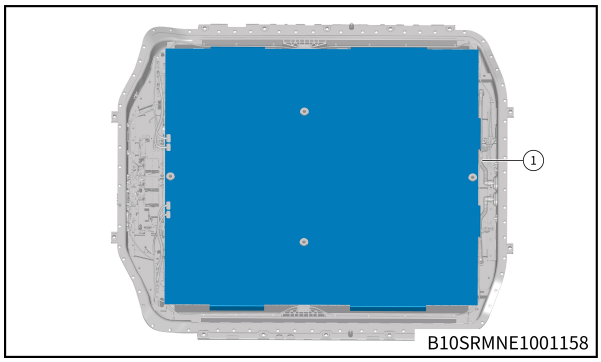
1. Remove the power battery pack assembly.
   See:Power Battery Pack Assembly (page 1809)
2. Disconnect the high voltage inside the battery pack.
   See:Fuse-ZR-RS309-MD-EVS630A-JP-Fast-acting-500VDC/630A (page)
3. Remove LXA12EV10_buffer foam 01.

a. Use appropriate tools to remove LXA12EV10_cushion foam 01 ①.

NOTE

- Do not remove the foam unless necessary, the foam has poor adhesion after removal, and it must be replaced if necessary.

SETUP



1. The installation procedure is performed in reverse order.

LXA12EV10A-FIRE BLANKET

REMOVAL PROCEDURE

1. Remove the power battery pack assembly.
   See:Power Battery Pack Assembly (page 1809)
2. Remove LXA12EV10_buffer foam 01.
   See:LXA12EV10_Buffer Foam 01 (page 1784)
3. Remove the LXA12EV10A fire blanket.

a. Slowly peel off the LXA12EV10A fire blanket ① along all four sides of the battery pack.

NOTE

- The LXA12EV10A fire blanket and the LXA12EV10 module upper cover are bonded with double-sided tape. Do not use excessive force during removal to avoid damaging the LXA12EV10 module upper cover.

SETUP

1. The installation procedure is performed in reverse order.

LX-M482F-SAND AND MUD PROOF BREATHER VALVE-0.7

NOTE

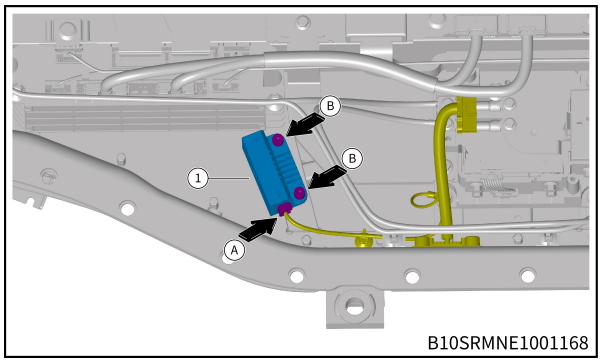
- This section describes the removal procedure for the rear LX-M482F sand and mud proof breather valve - 0.7. The removal procedure for the front LX-M482F sand and mud proof breather valve - 0.7 can generally refer to the procedure for the rear LX-M482F sand and mud proof breather valve - 0.7.

REMOVAL PROCEDURE

1. Remove the power battery pack assembly.
   See:Power Battery Pack Assembly (page 1809)
2. Disconnect the high voltage inside the battery pack.
   See:Fuse-ZR-RS309-MD-EVS630A-JP-Fast-acting-500VDC/630A (page)
3. Remove LX-M482F sand and mud proof breather valve - 0.7.

a. Unscrew the 4 fixing bolts -arrow- of the LX-M482F-sand and mud proof breather valve-0.7, and remove the LX-M482F-sand and mud proof breather valve-0.7 ①.
Recommended tool: 3mm hex wrench
Torque: 3±0.5N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After the bolt is installed, use a marker to draw a line mark.

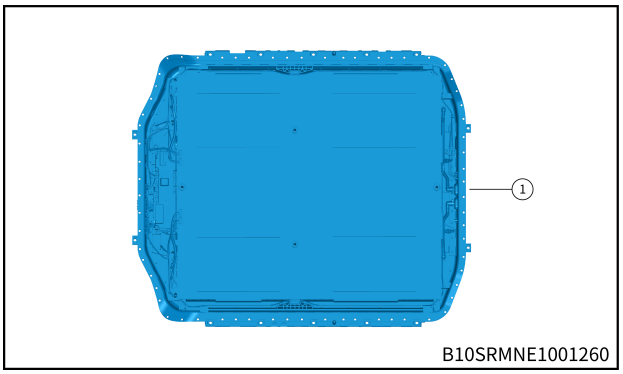
SENSY-AEROSOL SENSOR

REMOVAL PROCEDURE

1. Remove the power battery pack assembly.
   See:Power Battery Pack Assembly (page 1809)
2. Disconnect the high voltage inside the battery pack.
   See:Fuse-ZR-RS309-MD-EVS630A-JP-Fast-acting-500VDC/630A (page)
3. Remove the Senasic aerosol sensor.

a. Disconnect 1 connector plug - Arrow A - between the Senasic aerosol sensor and the A12HW67.1 communication integrated wiring harness.
b. Unscrew the 2 mounting bolts -Arrow B- of the Enjie aerosol sensor, and remove the Enjie aerosol sensor ①.
   Recommended tool: 4mm hex key
   Torque: 5.5±0.5N m



SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Follow the "insert, listen, pull back, and mark" procedure. When installing the connector, a "click" sound indicates that it is fully seated, so gently pull back on the connector to check for any loose connection. Then, use a marker pen to draw a line for marking.
   b. After the bolt is installed, use a marker to draw a line mark.

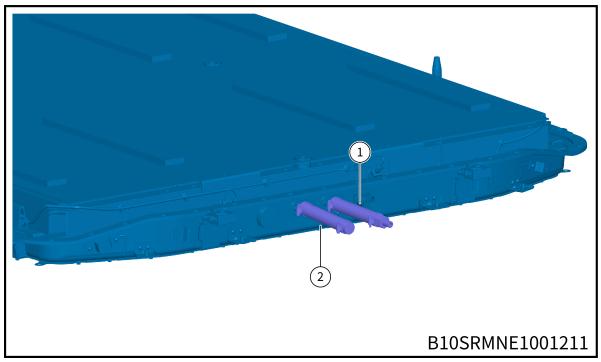
BATTERY PACK VISUAL INSPECTION

BATTERY PACK VISUAL INSPECTION

a. Check the exterior surface of the battery pack ① for dents, deformation, holes, PVC scratches, etc.
b. Check the battery pack nameplate, whole machine code, and warning card for damage or scratches.
c. Check the front of the battery pack for impact damage, deformation, or missing material on the mounting ears, breather valve, communication connector, high-voltage socket, etc.
d. Check the positioning holes around the battery pack and the surrounding area for any impact damage or deformation.
e. Check whether the sealing foam around the battery pack is missing or damaged.

ATTENTION



- When handling the battery pack, ensure smooth and coordinated movements, and lift and place it gently.

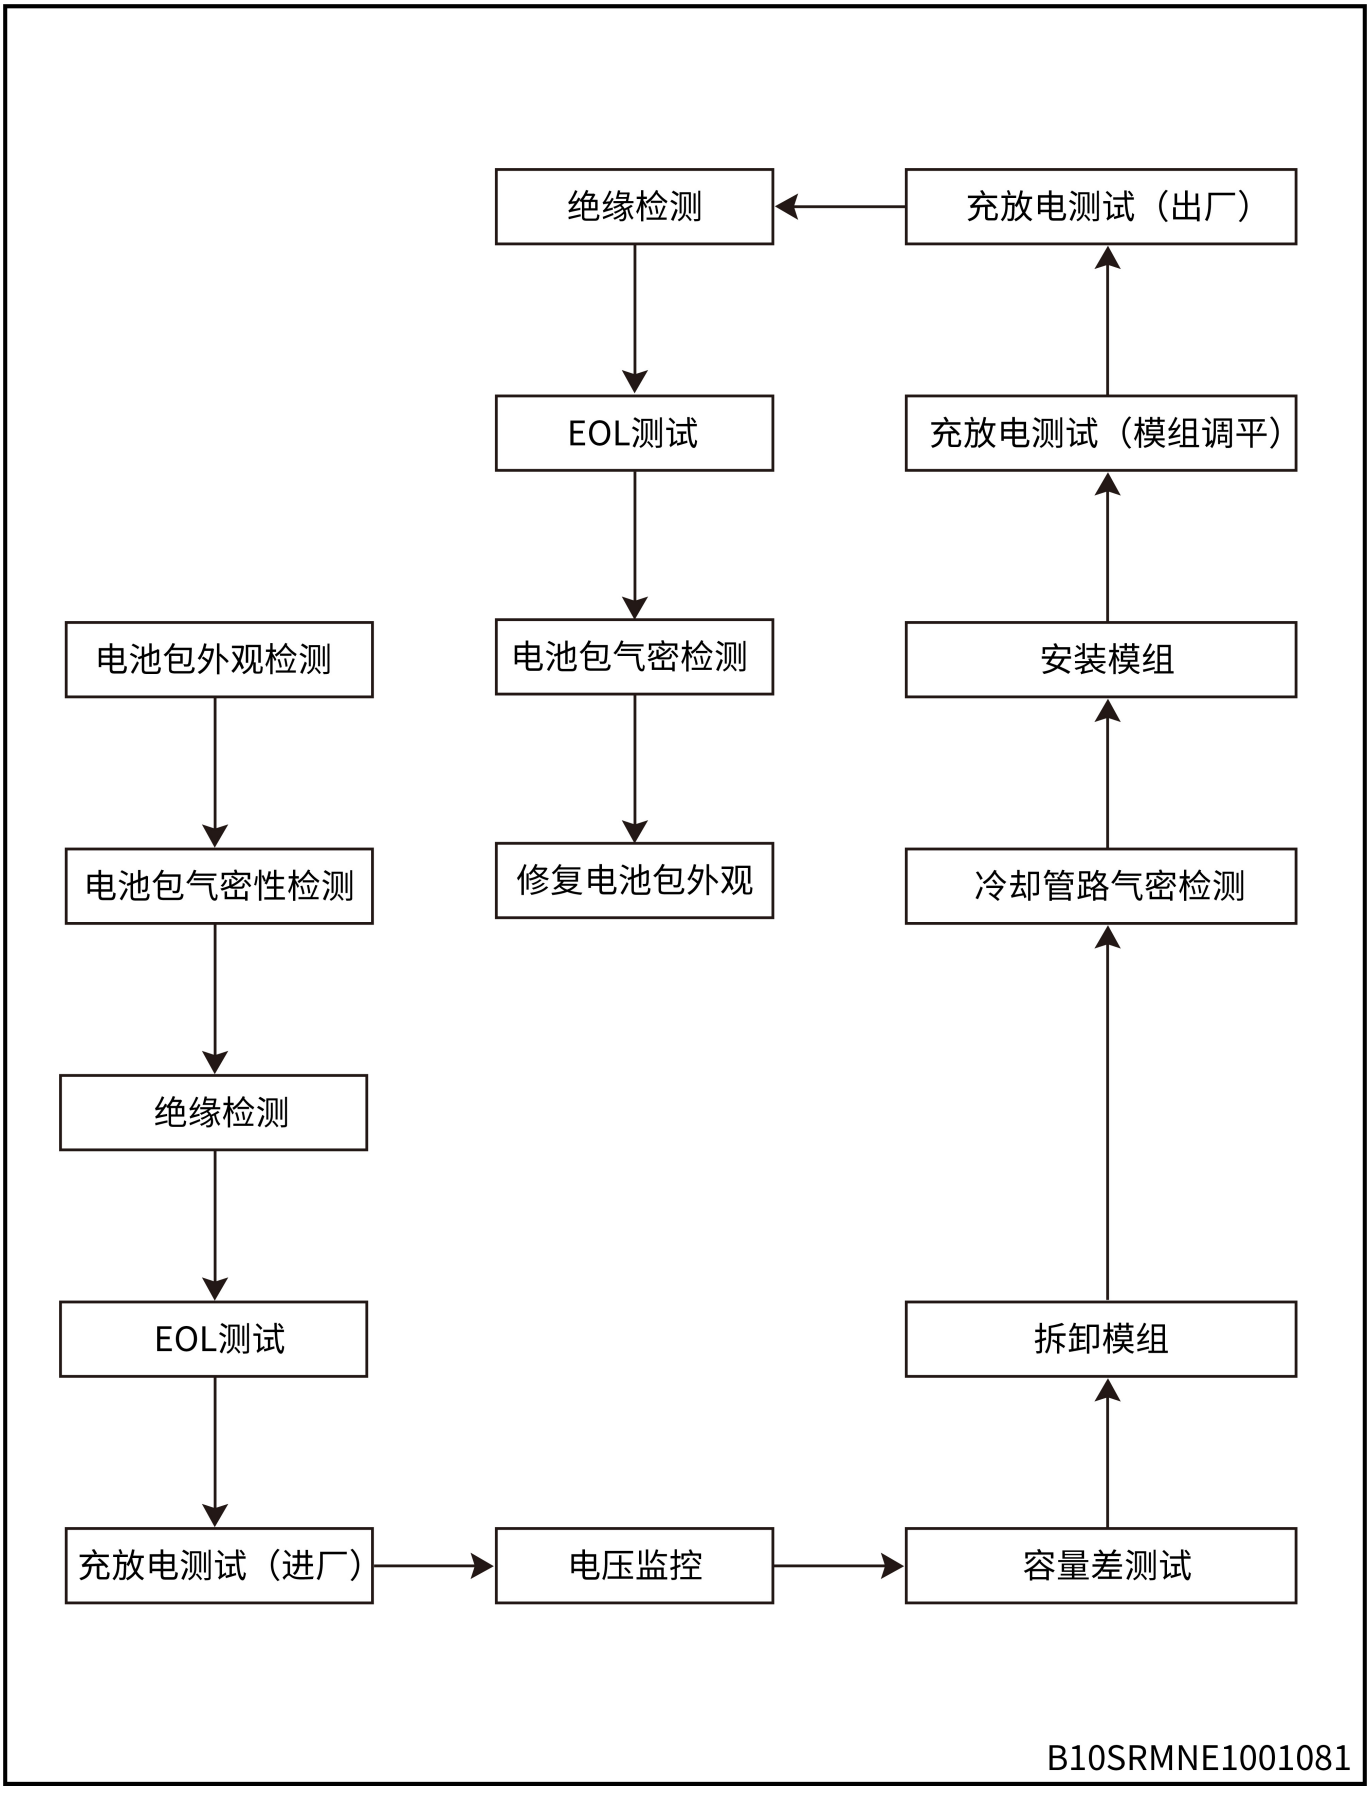
AIR TIGHTNESS TEST OF LIQUID COOLING PIPELINE ASSEMBLY

TEST PROCEDURE



1. Air tightness test of liquid cooling pipeline assembly.

a. Use the airtight plug ② for the coolant passage to plug the liquid cooling pipe.
Special tool: Airtight plug for water passage (7002581DHY1)
b. Use the water passage air inlet fixture ① to plug the liquid cooling pipe, and use a hose to connect the airtightness testing tool.
Special tool: Water passage air intake fixture (7002581DHY1)
c. Airtightness testing tool Status 1: Connect the power to the tool and turn it on. After entering the main interface, select "Micro-pressure Detection" - Settings - Set Parameters (Preset pressure: 200Kpa, regulated pressure: 205kpa (only for C11ST100101 airtightness testing tool), upper leakage limit: 50pa, inflation time: depending on equipment capacity, reference air source pressure: 0.4-0.8Mpa, stabilization time: 120s, testing time: 60s) - Confirm Parameters - Long press the start button”, the airtightness testing instrument starts working.
d. Airtightness testing tool status 2 (Only for C11ST100101 airtightness testing tool): Connect the tool to the power supply and turn it on. After entering the main interface, select "Enter Test", then sequentially select the vehicle model, model year, and test item to automatically load the corresponding test parameters, and perform the airtightness test according to the on-screen prompts.
Special tool: Airtightness testing tool (7002605DHY1)
e. Upon completion of the airtightness test, the display will prompt "Qualified", the qualified indicator light will flash accompanied by a buzzer sound. Tap "Reset" to release the pressure in the power battery pack and complete the test.

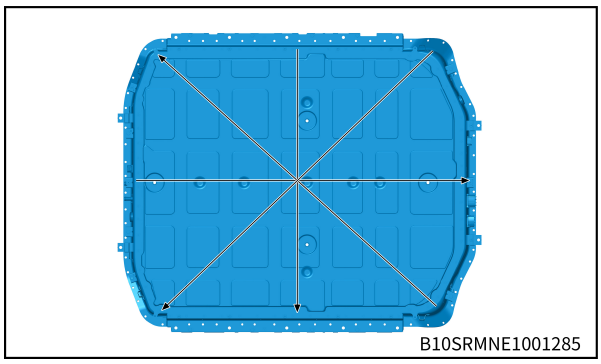
BATTERY PACK BUMP AND SCRAPE DAMAGE INSPECTION

Battery System Collision Damage Inspection

1. This method applies to fault types where obvious cracks, damage, or severe deformation on the housing surface can be identified by the naked eye.

> ⚠ WARNING
>
> - Since the battery pack contains a high-voltage battery, improper handling of the vehicle poses a risk of electric shock, electrical leakage, or similar incidents. Proper operating procedures must be followed when performing maintenance operations.
> - Before starting work on the high-voltage system, insulating protective equipment (including insulating gloves, electrical safety helmet, and insulating shoes) must be worn. During high-voltage operations, insulated tools must be used.
> - Personnel responsible for high-voltage operations shall be clearly identified to ensure that no other personnel touch the vehicle. When not in operation, high-voltage components shall be covered with insulating shields or similar items to prevent unauthorized contact.



2. Visual Inspection
   a. Check the PVC coating on the lower housing of the battery pack (if equipped) for peeling, and if the PVC coating is peeling, touch-up spraying is required.
   b. Check the joints of the battery pack housing for cracks or deformation. If minor cracks or deformation are found, perform an airtightness test on the battery pack. If the housing is severely deformed or damaged, measure the surface warpage of the battery pack housing. If the warpage does not meet the standard value, open the housing for inspection and determine whether to replace the battery assembly based on the severity of the fault.
3. Measuring the surface warpage of the battery pack enclosure

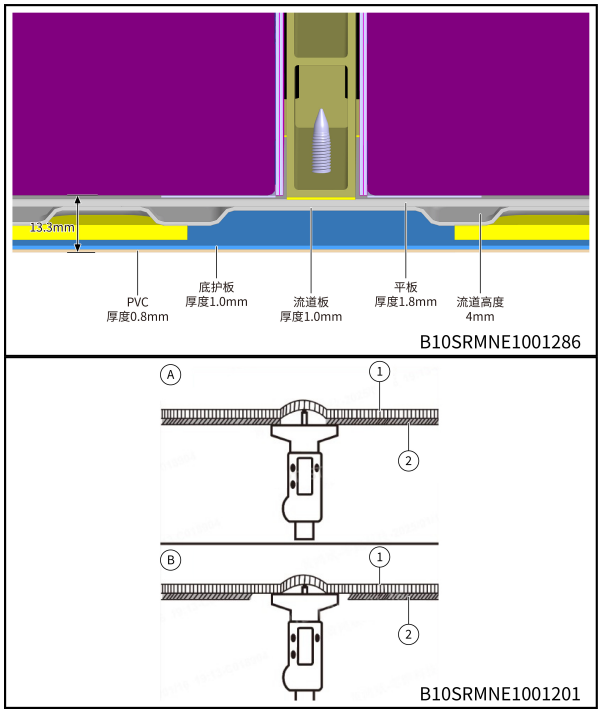
4. Warpage Inspection



a. Lift the vehicle.
b. Measure the flatness and warpage of the power battery in a total of six directions along the bottom edge and straight lines passing through the center.
   - Use a precision straightedge and feeler gauge to check the battery pack lower housing for deformation at various positions along each straight line.
   - Use a precision straightedge and feeler gauge to check for deformation on the

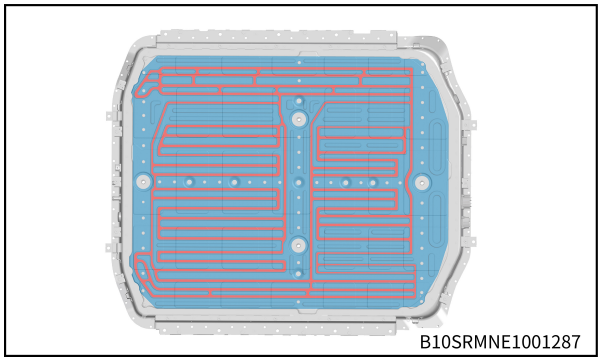
four sides of the battery pack at various positions along each straight line.

- If the power battery enclosure undergoes slight deformation after a collision or bump, software diagnostics must be performed first, followed by electrical measurements and an airtightness test. If no faults are detected, it can continue to be used; if any abnormalities are found, the cover or the enclosure must be opened for inspection.
- If the power battery enclosure is severely deformed after a collision or bottoming out, isolate and store the power battery assembly separately to prevent additional damage from battery fires or other incidents. Contact a battery repair technician to open the enclosure for inspection.

5. Dent Depth Inspection



a. Lift the vehicle.
b. Use a depth gauge to check the dent depth of the battery pack. As shown in Figure A, if the bottom shield coating ② is not peeled off and the dent depth of the bottom shield ① is > 2mm (electrical performance, overall pack airtightness, and water cooling plate are all OK), the battery pack needs to be removed for further inspection. As shown in Figure B, if the bottom shield coating ② is peeled off and the dent depth of the bottom shield ① is > 1.2mm (electrical performance, overall pack airtightness, and water cooling plate are all OK), the battery pack needs to be removed for further inspection.

Traction Battery Impact and Scrape Repair Procedure

1. Minor damage
   a. When the damage degree of the power battery is determined to be minor, handle it according to the following scheme:
      - In principle, it is not necessary to return the power battery assembly to the factory for repair.

© 2026, All rights reserved

- If the underbody shield has dents or deformation damage but no rupture, it is necessary to evaluate whether there are abnormal issues such as impacts or friction between the underbody shield and the cooling plate, or wind whistling noises during actual vehicle use, and if any of the aforementioned issues are present, replace the underbody shield and its cushioning foam.
- Except for minor damage to the guard plate, touch-up painting is required in all other cases to meet the company's salt spray test requirements.

2. Severe damage
   a. When the damage level of the power battery is determined to be severe, handle it according to the following scheme:
      - The damage is confined to the underbody shield. Replace the underbody shield and its cushioning foam, and inspect the lower surface of the cold plate for peeling of the epoxy coating caused by friction or impact. If any, touch up the epoxy coating on the cold plate by spraying to a thickness > 100 μm.
      - The damage extends to the cold plate; replace the power battery assembly.
      - If the damage involves the frame or fails the airtightness test, and does not involve damage to the cold plate, perform unpacking inspection and repair confirmation.
3. Water Immersion Damage Assessment Specification
   a. When the vehicle experiences conditions such as water immersion, wading, high-pressure car washing, or condensation, the inspection and maintenance items shall be determined based on the wading depth, immersion time, and whether an insulation fault is reported. For specific criteria, see the table below.

Classification	Scenario	Judgment Condition 1 Water Immersion Time	Judgment condition 2 Water immersion depth	Inspection and repair methods
Parking in Flooded Areas	Water immersion due to accidents, heavy rain, etc.	/	≤300mm	If an insulation fault is reported, perform Level 1 maintenance operations.
		≤0.5h	> 300mm	No insulation fault reported, normal use (once an insulation fault is reported, perform Level 1 maintenance operation).
		< 24h	> 300mm	No insulation fault reported, perform Level 1 inspection operation.
				Insulation fault reported, perform Level 2 maintenance operations.

Classification	Scenario	Judgment Condition 1 Water Immersion Time	Judgment condition 2 Water immersion depth	Inspection and repair methods
Driving through water	Water immersion due to accidents, heavy rain, etc.	≤0.5h	/	If an insulation fault is reported, perform Level 1 maintenance operations.
		> 0.5h	≤300m	No insulation fault reported, normal use (once an insulation fault is reported, perform Level 1 maintenance operation).
		> 0.5h	> 300mm	No insulation fault reported, perform Level 1 inspection operation.
				Insulation fault reported, perform Level 2 maintenance operations.
Car washing	High-pressure car washing	/		If an insulation fault is reported, perform Level 1 maintenance operations.
Condensation	/	/		No insulation fault reported, normal use.

Note: When executing maintenance procedures, both Judgment Condition 1 and Judgment Condition 2 must be considered simultaneously. When an insulation fault is reported, first troubleshoot insulation faults caused by non-battery factors. After confirming that the battery is the cause, proceed with battery maintenance.

b. Level 1 inspection operation content: visual inspection (focusing on the high- and low-voltage connector areas, water inlet and outlet areas, and the sealing areas of the upper and lower housings for any water leaks or water stains), software diagnostics, electrical measurements, and airtightness test.
c. Level 2 maintenance operation content: First, perform the Level 1 maintenance operation content, then conduct an unpacking inspection (focusing on the installation area of the high- and low-voltage connectors, the water inlet and outlet areas, and the sealing gasket area), and replace all relevant components that have experienced water leakage or reported insulation faults.

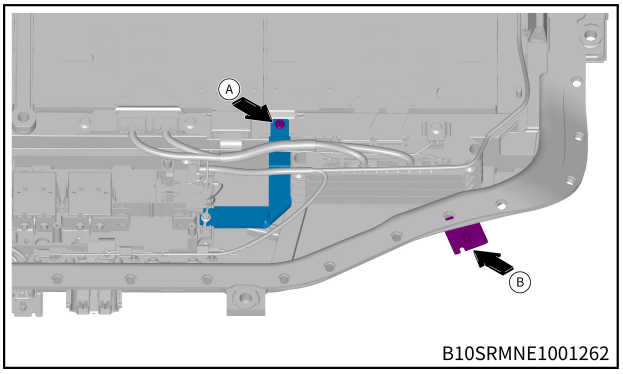
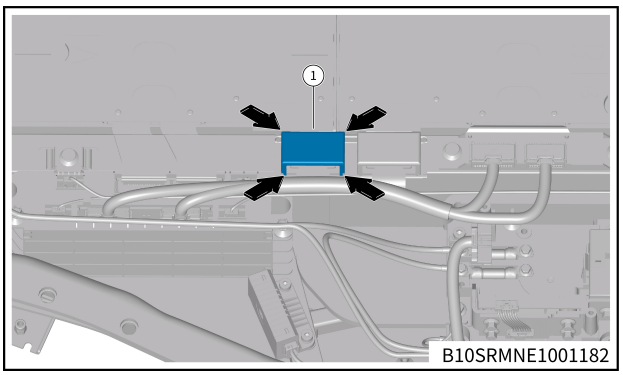
INSULATION DETECTION



ATTENTION

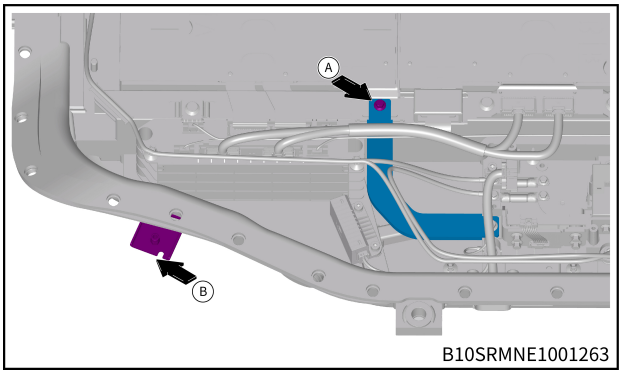
- Insulation testing operations must only be performed when proper personal insulation protection is in place.

INSULATION DETECTION



a. Prepare before testing: insulating protective gloves and an insulation tester.
b. Release the 4 retaining clips -arrow- of the LXB11_PBP_output stage cover 02, and remove the LXB11_PBP_output stage cover 02 ①.

c. Wear protective gloves, set the insulation tester to the 1000 range, connect the red test lead to the main positive copper busbar of the module - Arrow A -, and the black test lead to the enclosure - Arrow B -. After connecting, press the button on the red test lead to perform the measurement. The voltage rise time is ≤2S, and the test time is ≥10S.
Insulation resistance requirement ≥10MΩ



ATTENTION

- When performing insulation testing, ensure proper personal insulation to prevent electric shock.
- During testing, ensure the correct range is selected on the insulation tester.

d. Release the 4 retaining clips -arrow- of the LXB11_PBP_output stage cover 02, and remove the LXB11_PBP_output stage cover 02 ①.

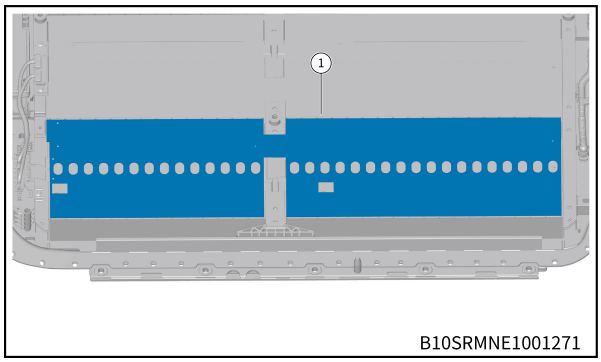
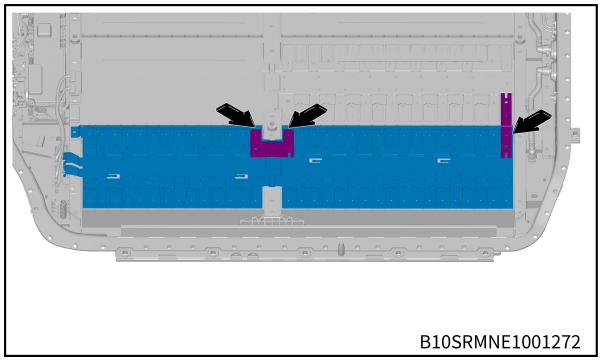
    See:Air Tightness Test of Liquid Cooling Pipeline Assembly (page 1789)
13. Remove the battery module.



B10SRMNE1001270

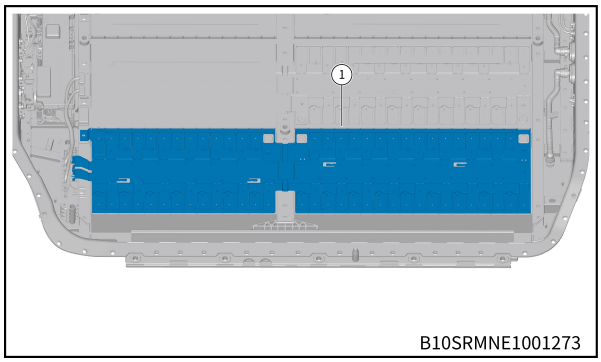
a. Use appropriate tools to remove LXA12EV10_support foam 01 ①.

NOTE



- Do not remove the foam unless necessary, the foam has poor adhesion after removal, and it must be replaced if necessary.

B10SRMNE1001271



b. Disconnect the LXA12EV10 module upper cover from the LXA12EV10A-CCS assembly-D2, and remove the LXA12EV10 module upper cover ①.
Recommended tools: Insulated gloves, clip remover

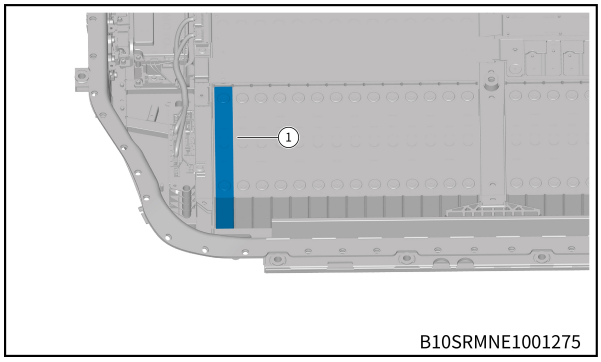
B10SRMNE1001272

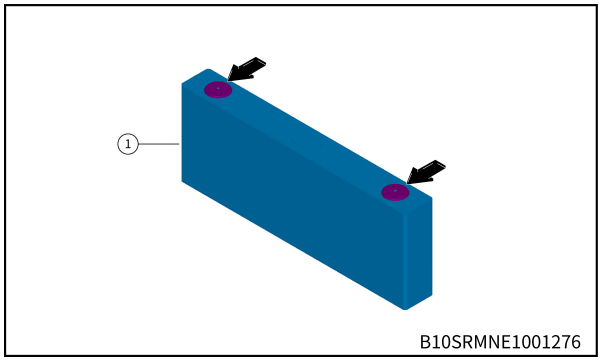
c. First, cover the unworked connection areas of the module with tape, then cover it with a simple fixture (the original ceramic silicone sheet) to insulate the module and prevent movement during operation, which could cause the positive and negative poles to come into contact and result in a short circuit.
d. Use needle-nose pliers to slightly pry up one corner of the connecting tab -arrow-, then use diagonal cutting pliers to slowly cut through the aluminum busbar at the pried-up portion of the connecting tab. Use needle-nose pliers to pry up the edges of the cut connecting tab, and use diagonal cutting pliers to cut away the pried-up edges of the connecting tab bit by bit. Place the cut aluminum busbar into a small parts box.



B10SRMNE1001273

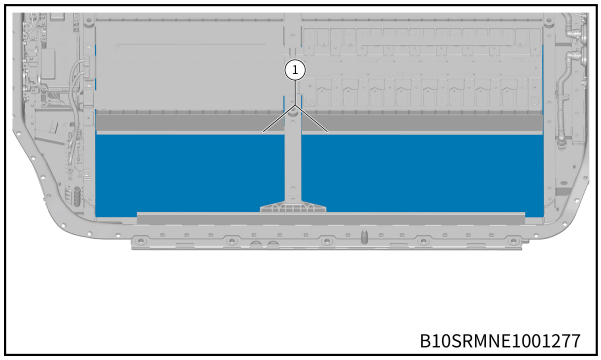
e. Peel off the FPC ①, use pliers to lift the aluminum busbar, repeatedly bend it back and forth and then remove it, use diagonal cutting pliers to cut off the protruding parts of the aluminum busbar while placing an epoxy board underneath (to prevent sparking), cut all of them in sequence, and then pry up the aluminum busbar on each individual cell (to allow the nylon board to be lowered when removing the cells).

B10SRMNE1001274



f. Remove the LXA12EV10A-side ceramic silicone sheet ①.

B10SRMNE1001275



g. Use appropriate tools to remove the individual cell ①, and then remove all the cells in sequence.

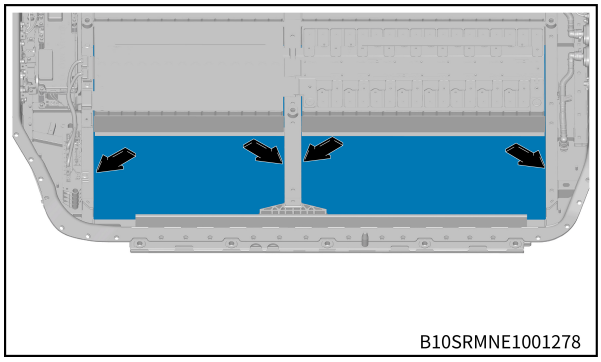
h. After all cells are removed, cut and hammer flat the upper aluminum busbar - arrow -, then wrap it with insulating tape for insulation protection, and mark the battery pack number, then install cell ① into the box of the corresponding model. Remove the faulty cell separately, label it with the battery pack number and serial number, and place it in the faulty cell box.



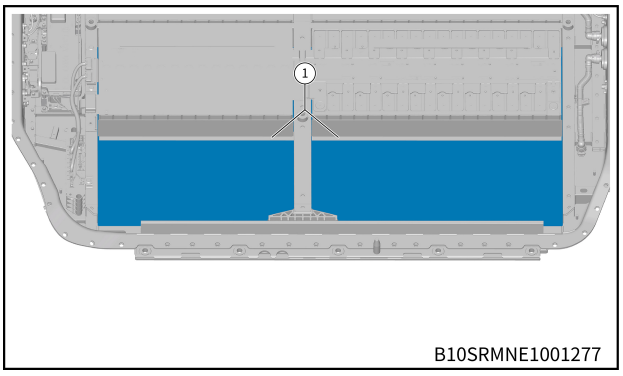
B10SRMNE1001277

i. Use appropriate tools to remove the adhesive from ① on the LXA12EV10A-aluminum hot-formed lower housing body.

ATTENTION

- The adhesive on the LXA12EV10A - hot-stamped aluminum lower housing body must be completely removed to prevent improper installation when installing the LXA12EV10A - hot-stamped aluminum lower housing body and the module.
- When cleaning residual adhesive from the LXA12EV10A-aluminum hot-formed lower housing body, exercise caution to avoid damaging the LXA12EV10A-aluminum hot-formed lower housing body.

B10SRMNE1001278



j. Use sandpaper to sand away some minor adhesive residues at the LXA12EV10A-crossmember-arrow-position to prevent improper installation of the module.

ATTENTION

- After sanding, the surface should feel smooth to the touch with no unevenness.

SETUP

a. Place the new module aside for future use.
b. Load the structural adhesive into the caulking gun, then evenly apply the structural adhesive onto the LXA12EV10A-aluminum hot-formed lower housing body ①.

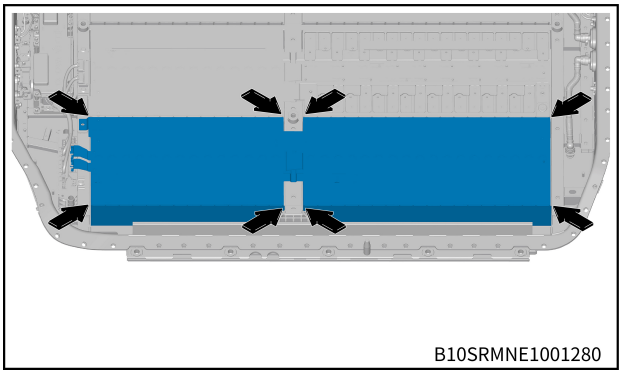
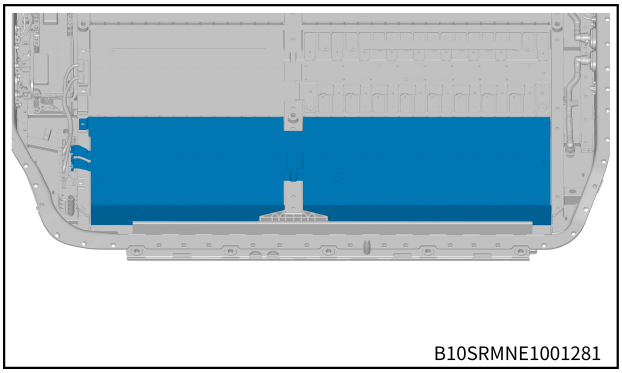
ATTENTION

- When applying structural adhesive, the LXA12EV10A-aluminum hot-stamped lower housing body must be cleaned.
- Apply the structural adhesive evenly to prevent the module from lifting during installation.



c. After applying the structural adhesive evenly, lift module ① and install module ①.



ATTENTION

- Before installing the module, ensure the correct positive and negative polarity of the battery module.
- After the module installation tool is installed, gently pull it to confirm that the tool is securely in place.
- When lifting the module, ensure someone supports the middle to prevent it from bending. Install the module immediately after applying the adhesive.

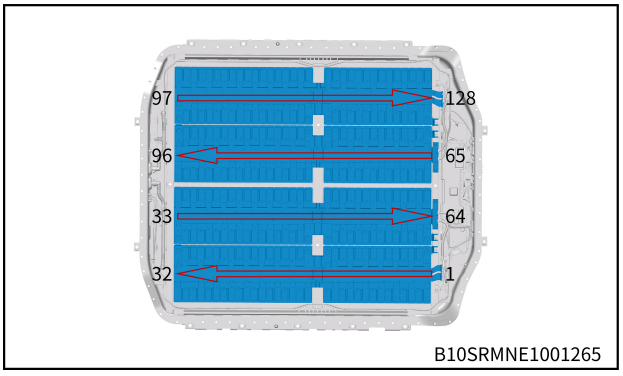
Special tool: Airtightness testing tool (7002605DHY1)



i. Upon completion of the airtightness test, the display will prompt "Qualified", the qualified indicator light will flash accompanied by a buzzer sound. Tap "Reset" to release the pressure in the power battery pack and complete the test.

ATTENTION

- Due to the large volume of the battery pack, the internal pressure may not reach the preset pressure value during the first airtightness test; simply perform the airtightness test again.
- If the airtightness tester indicates "Unqualified", check whether all plugs are installed in place and whether the stabilized pressure reaches 2700~3300 Pa.

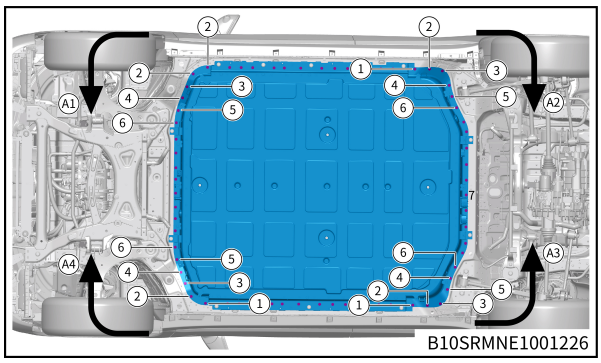
b. Clean the bolt mounting holes on the vehicle body for the power battery pack assembly.

> **ATTENTION**
>
> - After the battery pack mounting bolts and sealing surface bolts are removed, new bolts must be used for assembly.



c. Slowly raise the flatbed lift to bring the power battery pack close to the vehicle body, adjust the position of the battery pack to insert the locating pins into the locating holes in the vehicle body, then continue to slowly raise the battery pack until it fits flush against the vehicle body, and pre-tighten the 6 bolts (2, 4, 6/9, 11, and 13) (3 on each side, pre-tightening both sides simultaneously), then lower the flatbed lift.

d. Two technicians tighten the 14 fastening bolts of the battery pack in the sequence of 1-7, 8-14 to the specified torque.
Recommended tool: 16mm socket

Recommended tool: 10mm socket
Torque: 10±1N m

h. After all bolts are installed, an airtightness test must be performed on the assembly: connect the power supply of the tool and turn it on, and after entering the main interface, select "Enter Test", then sequentially select the vehicle model, model year, and test item to automatically load the corresponding test parameters, and follow the on-screen instructions to perform the airtightness test (Preset pressure: 3.0 kPa, regulated pressure: 25 kPa, leakage upper limit: -10~50 Pa (retest once if below -10 Pa), inflation time: depending on equipment capability, reference air source pressure: 0.4-0.8 MPa, time 300 s, stabilization time: 120 s, test time: 60 s).
Special tool: Airtightness testing tool (7002605DHY1)

i. When the power battery pack needs to be removed for repair, first remove the M6 bolts, then the M10 bolts. Inspect the appearance of the O-ring at the center mounting point at the bottom of the battery pack, and replace it if there is any deformation or wear. After removal, the M10 nuts on the body side must be retapped. Use new bolts for reassembly, and retest for air tightness after assembly is complete.

j. Follow the steps below when replacing the power battery pack to ensure software version compatibility:
   - Record the old version: Before removal, read and record the software version number of the old power battery pack.
   - Check for new version: After installing the new power battery pack, first read its software version number.

   Version Comparison and Processing:
   - If the new version ≥ the old version, the replacement process will be completed normally.

© 2026, All rights reserved

- If the new version < the old version, the software of the new power battery pack must first be updated to the old version or a higher version before being put into service.

k. After the new power battery pack is installed, the following operations must be performed on the battery pack assembly:
   - Write VIN-Diagnostic tool operation: Select the corresponding vehicle model-System Diagnostics-High-Voltage Battery Management System BMS-Data Write-Write VIN.
   - After all bolts are installed, an airtightness test must be performed on the assembly. Pressurize the battery pack to 2.7-3.5kPa, maintain the pressure for 120s with the holding pressure not less than 2.7kPa, and conduct the test for 60s, requiring a leakage value of less than 50Pa.
   - When the power battery pack needs to be removed for repair, first remove the M6 bolts, then the M10 bolts. Inspect the appearance of the O-ring at the center mounting point at the bottom of the battery pack, and replace it if there is any deformation or wear. After removal, the M10 nuts on the body side must be retapped. Use new bolts for reassembly, and retest for air tightness after assembly is complete.
   - Follow the steps below when replacing the power battery pack to ensure software version compatibility:
     - Record the old version: Before removal, read and record the software version number of the old power battery pack.
     - Check for new version: After installing the new power battery pack, first read its software version number.

     Version Comparison and Processing:
     - If the new version ≥ the old version, the replacement process will be completed normally.
     - If the new version < the old version, the software of the new power battery pack must first be updated to the old

version or a higher version before being put into service.

- After the new power battery pack is installed, the following operations must be performed on the battery pack assembly:
  - Write VIN-Diagnostic tool operation: Select the corresponding vehicle model-System Diagnostics-High-Voltage Battery Management System BMS-Data Write-Write VIN.

ATTENTION

After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

3.2 VEHICLE POWER SUPPLY SYSTEM

3.2.1 PRECAUTIONS

PRECAUTIONS

1. The orange wiring harnesses in the engine compartment are high-voltage wiring harnesses. Do not touch them if they have not been discharged and you are not wearing insulated work clothes.
2. In all maintenance operations involving vehicle electrical components and high-voltage wiring harness areas, disconnect the power supply and discharge the high-voltage cables and electrical components.
3. Maintenance personnel must keep an insulating tool (e.g., an insulating stick) within reach and be supervised by a safety supervisor to prevent accidental electric shock.
4. Disconnect the battery negative cable. Do not perform any other operations within 5 min.
5. Before servicing high-voltage components, first disconnect the negative battery cable, and then disconnect the connection cable of the power battery pack.
6. Wrap all removed and disconnected high-voltage electrical connector interfaces with insulating tape to prevent debris from entering.
7. The harness connector should be kept dry. If coolant or oil is accidentally splashed into the high-voltage harness or electrical components, it should be cleaned and dried with compressed air. And use a megohmmeter to measure the insulation resistance of the high-voltage electrical components or harness. Installation can only be performed if it meets the standard.
8. Do not wear loose clothing. Do not wear jewelry when working.
9. Do not perform maintenance operations near flammable vapors.

3.2.2 OVERVIEW AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Two-in-One Controller Assembly:

1. As the core of the vehicle's high-voltage control, the 2-in-1 controller assembly sequentially distributes the high-voltage power from the power battery to various components according to the vehicle control strategy, and mainly integrates the following control units internally:
   - OBC On-Board Charger.
   - DC-DC on-board power supply.
   - DC/AC Onboard Power Supply.
2. During slow charging, the OBC draws power from the AC grid to charge the high-voltage power battery, and the rear zone controller can monitor the entire charging process. During inversion, the DCAC converts high-voltage DC into AC to power external AC loads. The on-board DCDC converter converts high-voltage DC into the required low-voltage DC to provide low-voltage power supply for the entire vehicle and charge the battery, and this converter can receive control signals from the vehicle controller.
3. The OBC, DCDC, and DCAC control the output voltage and output current via the CAN bus, exchange information with the BMS and VCU through CAN communication, and report their operating status.

AC charging procedure:

- When the vehicle is switched to the ON2 ignition state or the charging connector is plugged in, the EVCC is awakened. The EVCC detects the duty cycle for AC charging, outputting the CP signal to the OBC via a hardwired connection. The EVCC determines the OBC S2 status by sampling the CPOUT voltage to control

the EVCC S2 switch. The BMS and OBC exchange messages to initiate slow charging. At the end of charging, the EVCC detects the OBC S2 disconnected status and requests to disconnect S2. Upon detection, the charging pile stops outputting the CP signal, the BMS enters sleep mode, and the EVCC waits for the next CP signal input.

3.2.4 FAULT DIAGNOSIS

DIAGNOSTIC DESCRIPTION-CDU

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic interface. By utilizing the CDU data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without disassembling any parts. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION-CDU

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the low-voltage electrical equipment.	
	A Check whether the vehicle is overloaded due to the installation of other electrical equipment? B Check whether the low-voltage electrical loads are short-circuited or damaged?
Yes》》》 Please remove any added accessories, then repair or replace the low-voltage electrical equipment.	
No》》》 Go to step 3.	
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage value: 11~14 V C Confirm whether the voltage is too low.
Yes》》》 Replace the battery, and retest.	
No》》》 Go to step 4.	
Step 4 Check the charging circuit wiring harness between the 2-in-1 power assembly and the rear compartment fuse box.

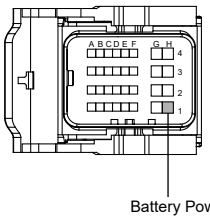
BA001-3 2-in-1 Power Assembly

B10DMCDU1211011



A Power on the vehicle.
B Wear insulating gloves, use a multimeter, select the DC vo ltage range, and measure the voltage between terminal 1 of the wire harness connector BA001-3 of the 2-in-1 power as sembly and the vehicle body ground to check if it is normal.
Standard voltage value: approx. 14V
C. Check whether the voltage meets the standard value.

Yes》》》 Go to Step 9.

No》》》
Go to step 6.

Step 6 Check the battery power supply of the 2-in-1 power supply assembly.

BA001-1 2-in-1 Power Supply Assembly

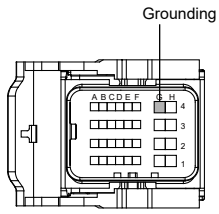
Step 7 Check the ON2A power supply of the 2-in-1 power assembly.

BA001-1 2-in-1 Power Supply Assembly

B10DMCDU1211006



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA001-1 of the 2-in-1 power supply assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal D3 of the harness connector BA001-1 of the 2-in-1 power supply assembly and the vehicle body ground to check whether the voltage is normal.
Standard voltage: 11~14V
E Confirm whether the voltage meets the standard value.

No 》 》 》 Troubleshoot the ON2A power supply.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA001-1 of the 2-in-1 power supply assembly.
C Use a multimeter, set it to the resistance range, and measure the resistance between terminal G4 of harness connector BA001-1 of the two-in-one power assembly and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D. Confirm whether the resistance meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to Step 9.

Step 9 Replace the 2-in-1 power supply assembly.

A Replace the 2-in-1 power supply assembly.
B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the ambient temperature is too high.
Yes》》》 Move the vehicle indoors to cool down, wait for a period of time for it to cool, and then re-inspect.	
No》》》 Go to step 3.	
Step 3 Check the coolant level.	
	A Check whether the coolant level in the expansion tank is normal.
No》》》 Troubleshoot coolant leakage; add or replace coolant and bleed the system.	
Yes》》》 Go to step 4.	
Step 4 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and check whether there are any related fault codes for the electronic fan, electric water pump, five-way valve, etc. in the thermal management controller.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 5.	
Step 5 Check the cooling system hoses.	
	A Check the cooling system hoses for blockages caused by foreign objects. B Check whether the radiator surface is excessively dirty.

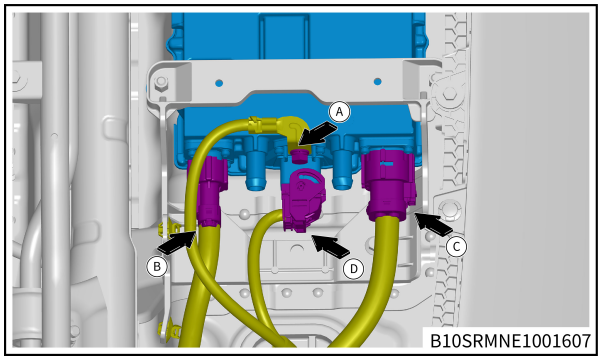
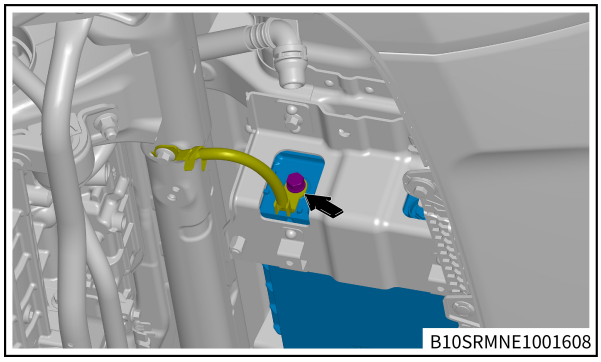
3.2.7 SERVICE AND REPAIR GUIDANCE



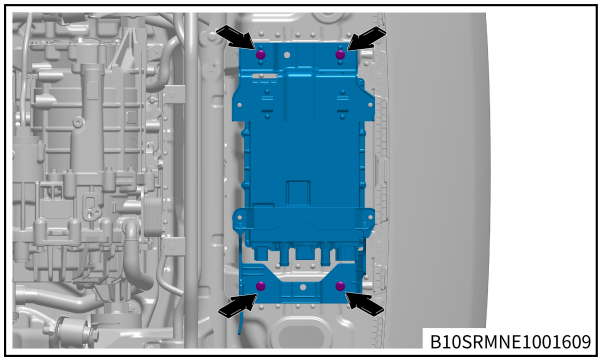
2-IN-1 POWER SUPPLY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Disconnect the high voltage.
   See:High-Voltage Power-Off Operation (page 254)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
6. Remove the 2-in-1 Power Assembly.



a. Disconnect the 1 fixing connector - arrow A - between the OBC+DCDC outlet water pipe and the 2-in-1 power assembly, and disconnect the hose.
   Recommended tool: Slip-joint pliers
b. Disconnect the OBC+DCDC water inlet pipe from the 1 fixing connector - arrow B - of the 2-in-1 power assembly, and disconnect the pipe.
   Recommended tool: Slip-joint pliers



c. Unscrew the 1 fixing bolt between the floor wiring harness assembly and the 2-in-1 power supply assembly - arrow A -.
   Recommended tool: 13mm socket
   Torque: 15±1.5N m
d. Disconnect the 1 connection plug between the OBC cable assembly and the 2-in-1 power supply assembly - arrow B -, and move the wiring harness aside.
e. Disconnect 1 connection plug -arrow C- between the fast and slow charging cable assembly and the 2-in-1 power supply assembly, and move the wiring harness aside.
f. Disconnect the 1 connecting plug - arrow D - between the floor wiring harness assembly and the 2-in-1 power supply assembly, and move the harness aside.

g. Unscrew the 1 fixing nut securing the DCDC negative ground cable assembly and the 2-in-1 power supply assembly - arrow -.
Recommended tool: 13mm socket
Torque: 15±1.5N m

h. Unscrew the 4 mounting bolts of the 2-in-1 power assembly -arrow-, and remove the 2-in-1 power assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Installation is complete, fill with coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

   ATTENTION

   Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Replacing the 2-in-1 power supply assembly requires the following steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old 2-in-1 power supply assembly.
      - Check for new version: After installing the new 2-in-1 power assembly, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new 2-in-1 power assembly software must first be updated to the old version or a higher version before being put into service.

   c. If a new 2-in-1 power supply assembly is installed, the following operations must be performed on the 2-in-1 power supply assembly after installation:
      - Write the VIN. Diagnostic instrument operation: Select the corresponding vehicle model - 2-in-1 power supply CDU - Data writing - VIN.

   ATTENTION

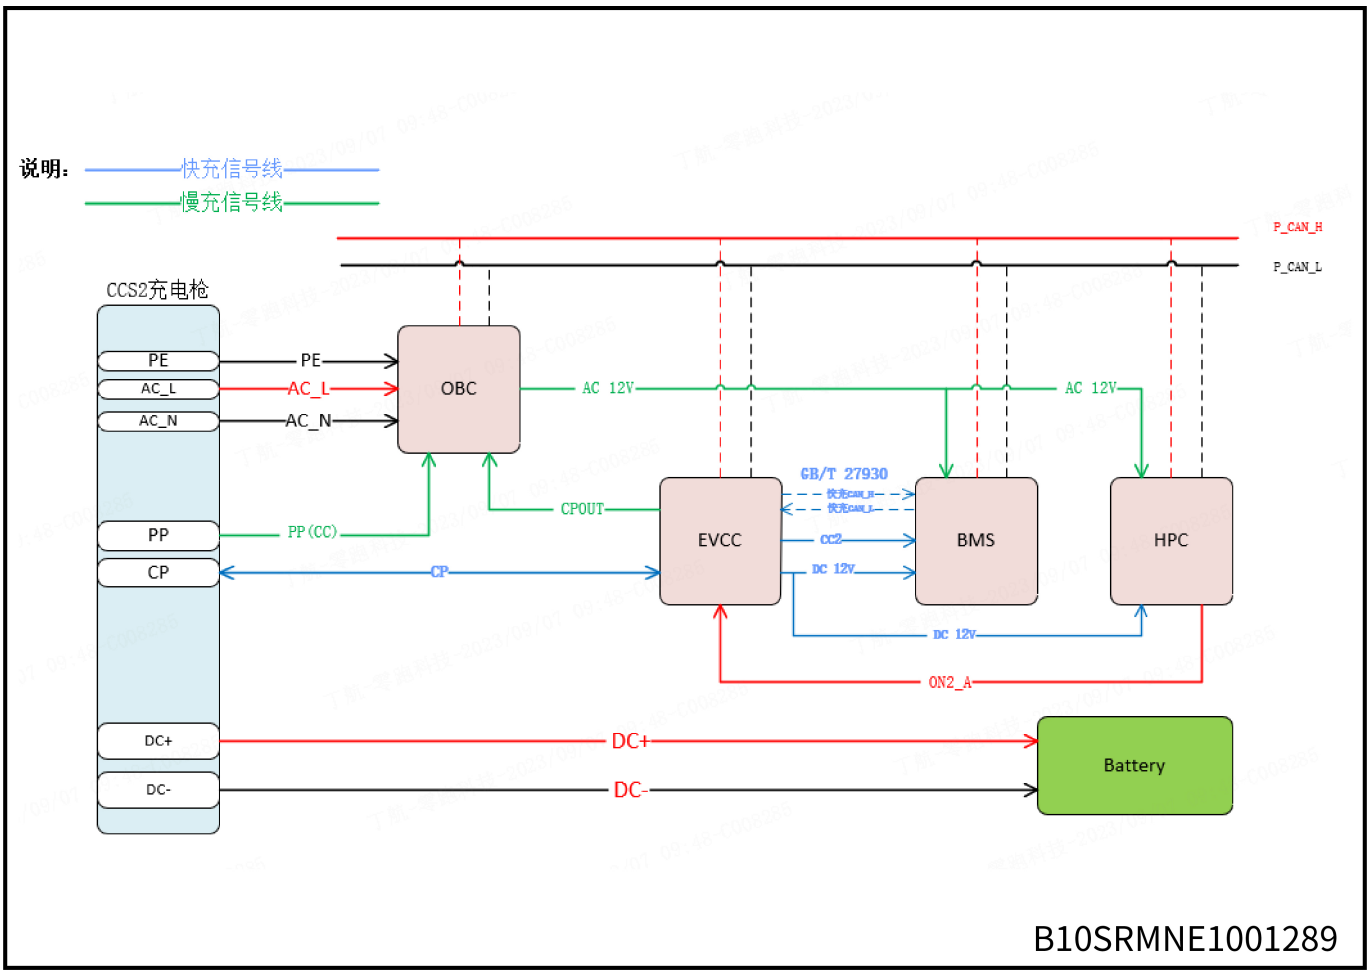
3.3 CHARGING PROTOCOL CONVERSION SYSTEM

3.3.1 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION



SYSTEM INTRODUCTION

The charging protocol conversion system primarily consists of the charging protocol converter (EVCC), which is a core component of the electric vehicle. Its main function is to convert the GB/T27930 CAN communication protocol into other PLC communication standards such as ISO/IEC15118, DIN70121, SAE2847-2, SAE J2931-4, and DIN7012. In addition, the EVCC not only supports bidirectional communication (V2G protocol) but also provides UDS diagnostic services, enabling bidirectional communication between the electric vehicle and the power grid.

EVCC CHARGING CONTROL LOGIC

- AC charging circuit: CC is directly connected to the 2-in-1 power assembly (OBC), CP is connected via the EVCC, if the duty cycle is 8%-90% the signal is sent to the 2-in-1 power assembly (OBC), the 2-in-1 power assembly (OBC) outputs an AC 12V signal to wake up the traction battery management system (BMS) & central controller (HPC), entering the AC charging process.
- Fast charging circuit: The CP passes through the EVCC. If the duty cycle is 3-7%, the EVCC initiates the European standard protocol conversion, sends the CC2 signal via hardwire to the Battery Management System (BMS), and outputs a DC 12V signal to wake up the Battery Management System (BMS) & Central Controller (HPC), entering the fast charging sequence.
- EVCC Wake-up: The ON2_A signal provided by the central controller (HPC) or the CP signal detected upon plug insertion serves as the wake-up source. EVCC S2: During AC charging, it follows the S2 status of the 2-in-1 power assembly (OBC); during DC charging, it automatically closes before the cable check at the charging pile side.

3.3.3 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-EVCC

Fault codes can be read via the vehicle's OBD diagnostic interface using a diagnostic tool. By utilizing the EVCC data table and reading the data table displayed on the diagnostic tool, you can read switch and sensor values without removing any components. Reading the data table is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION - EVCC

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the charging protocol converter.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the charging protocol converter fuse DF04. Fuse specification: DF04 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the charging protocol converter.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA003 of the charging protocol converter. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the harness connector BA003 of the charging protocol converter and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA003 of the charging protocol converter.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 5 of harness connector BA003 of the charging protocol converter and the body ground to verify if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No》》》 Troubleshoot the ON2A power supply.

Yes》》》
Go to step 6.

Step 6 Check the ground wire harness of the charging protocol converter.

BA003 Charging Protocol Converter

B10DMEVCC1211005

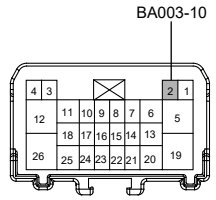
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA003 of the charging protocol converter.
C. Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 11 of the wire harness connector BA003 of the charging protocol converter and the vehicle body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 7.

Step 7 Disconnect and reconnect the charger to test.

A Reconnect and disconnect the charger for testing, with an interval greater than 5s between each operation, and check whether the fault is cleared.



Yes》》》 System normal.

B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the charging protocol converter.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the charging protocol converter fuse DF04. Fuse specification: DF04 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the charging protocol converter.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA003 of the charging protocol converter. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the harness connector BA003 of the charging protocol converter and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

a. Disconnect 1 connector of the charging protocol converter - arrow A -.
b. Unscrew the 4 fixing nuts of the charging protocol converter - arrow B -.
   Recommended tool: 10mm socket
   Torque: 9±1N m
c. Remove the charging protocol converter ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the charging protocol converter requires the following steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old charging protocol converter.
      - Check for new version: After installing the new charging protocol converter, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new charging protocol converter software must first be updated to the old version or a higher version before it can be put into service.

   b. After replacing the charging protocol converter, perform the following operations:
      - Write the VIN code. Diagnostic tool operation: Select the corresponding vehicle model - System diagnostics - Charging protocol conversion device (EVCC) - Data write - Write VIN code.

> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

4 ELECTRIC DRIVE SYSTEM

4.1 ELECTRIC DRIVE POWERTRAIN SYSTEM

4.1.1 PRECAUTIONS

PRECAUTIONS

1. Before operation, please ensure that the vehicle has been moved to the dedicated maintenance bay for new energy vehicles, the vehicle is powered off, and high-voltage warning signs and isolation belts are placed.
2. When removing the electric drive powertrain, electrical safety must be observed, live working is strictly prohibited, and operations must be performed only after the high-voltage and low-voltage power supplies have been disconnected for 10 minutes.
3. Maintenance personnel must wear anti-static clothing and insulated gloves to prevent short-circuit faults in the motor controller caused by static electricity.
4. Flammable and explosive items must not be stored at the maintenance site, otherwise there is a risk of fire and explosion.
5. To prevent damage to the motor, use a hoist to support the motor during removal.
6. Do not touch the motor directly during or immediately after operation, otherwise there is a risk of burns.
7. The motor shall be maintained regularly as specified. During maintenance, the motor must be stopped and the power supply disconnected; otherwise, personal injury may occur.
8. When measuring insulation resistance, do not touch exposed conductive parts; otherwise, there is a risk of electric shock.
9. When the motor is rotated by other equipment or by hand, do not touch exposed conductive parts to avoid the risk of electric shock.
10. When repairing and securing the control wire, it is prohibited to secure the control wire to the high-voltage cable.
11. Do not disassemble or modify the motor without authorization; otherwise, the motor will fail to operate properly and may lead to dangerous accidents.
12. After disconnecting the cable, take care to protect the cable connector to prevent breakage or damage.
13. Do not replace the motor in a damp environment to prevent moisture ingress that could lead to motor insulation failure.
14. The bolts/nuts of all components in the electric drive system must be tightened to the specified torque.

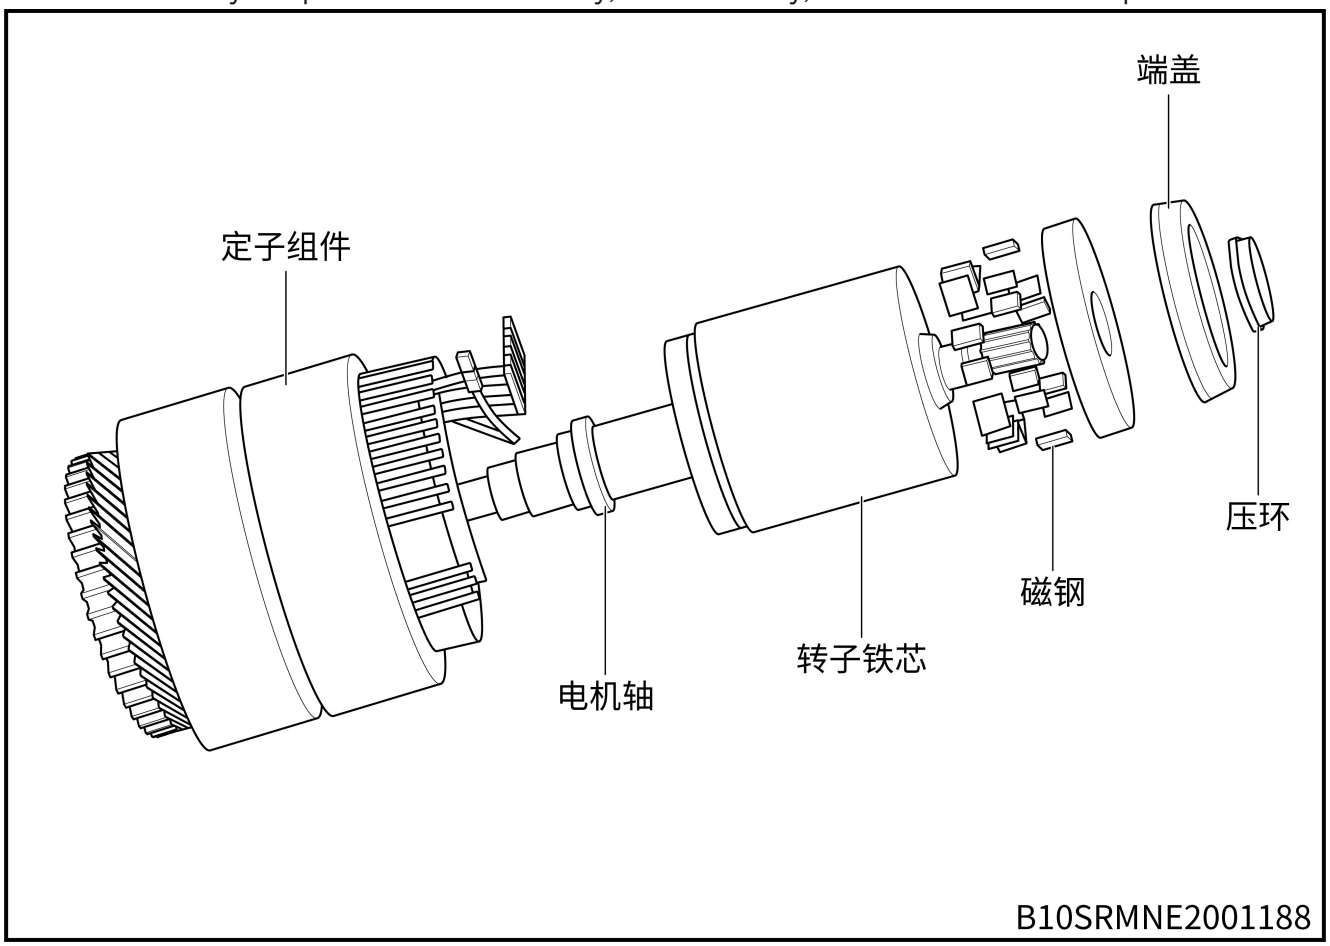
4.1.2 OVERVIEW AND INTRODUCTION TO PRINCIPLES

STRUCTURE AND PRINCIPLE INTRODUCTION

Electric Drive Powertrain System Overview:



The electric drive powertrain adopts a 3-in-1 integrated design, an oil-cooled motor design with optimized topology, and a high-torque-density reducer. It meets the requirements for the vehicle's dynamic performance, energy economy, and high efficiency.

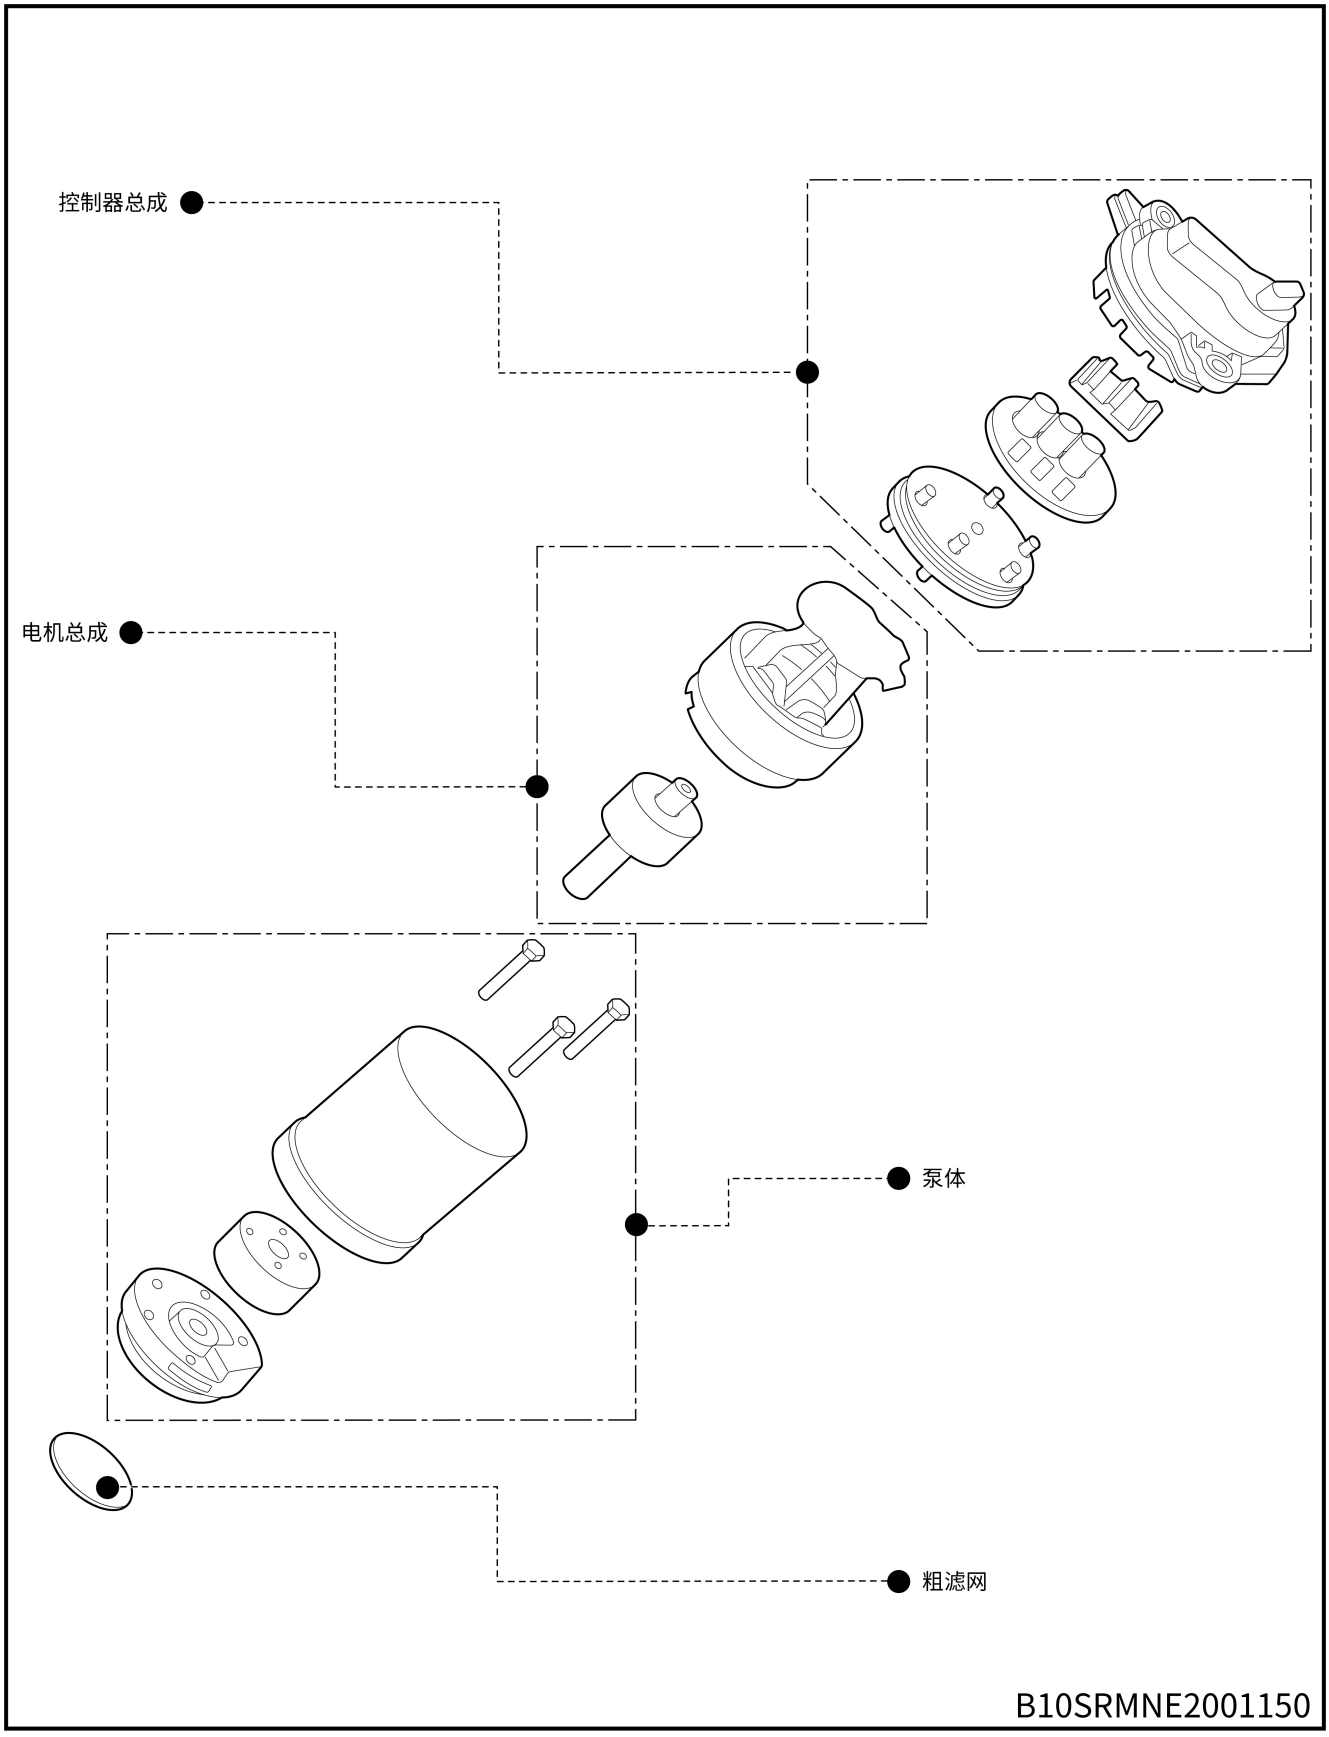
The electric drive powertrain is mainly composed of the following components:

- Drive motor;
- Reducer;
- Electric oil pump
- Controller assembly;

Drive motor structure and composition:

- The motor is mainly composed of stator assembly, rotor assembly, end cover and other components.

Reduction gear structure composition:

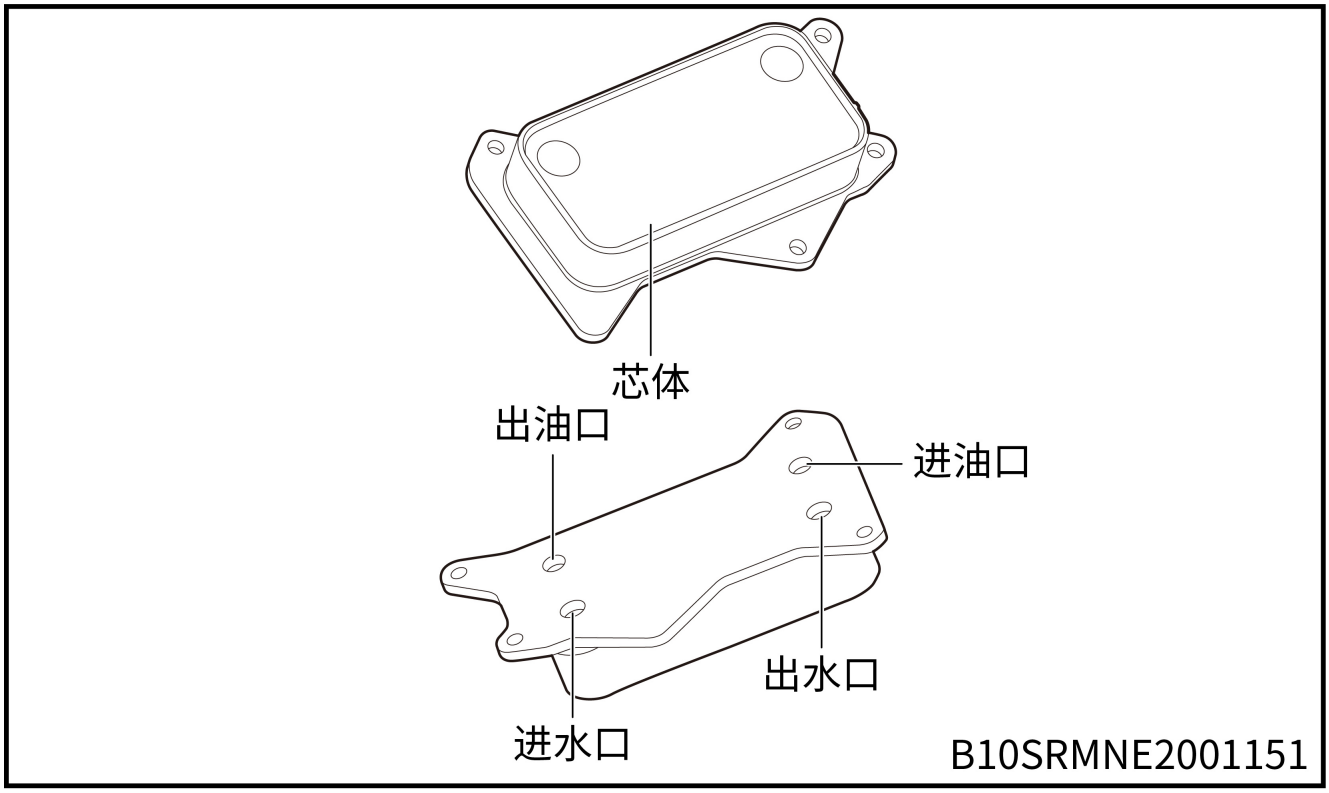


- The reducer section mainly consists of the input shaft, intermediate shaft, output shaft, housing, and accessories.
- The input shaft is connected to the drive motor, the intermediate shaft acts as a speed reducer, and the output shaft is connected to the differential.

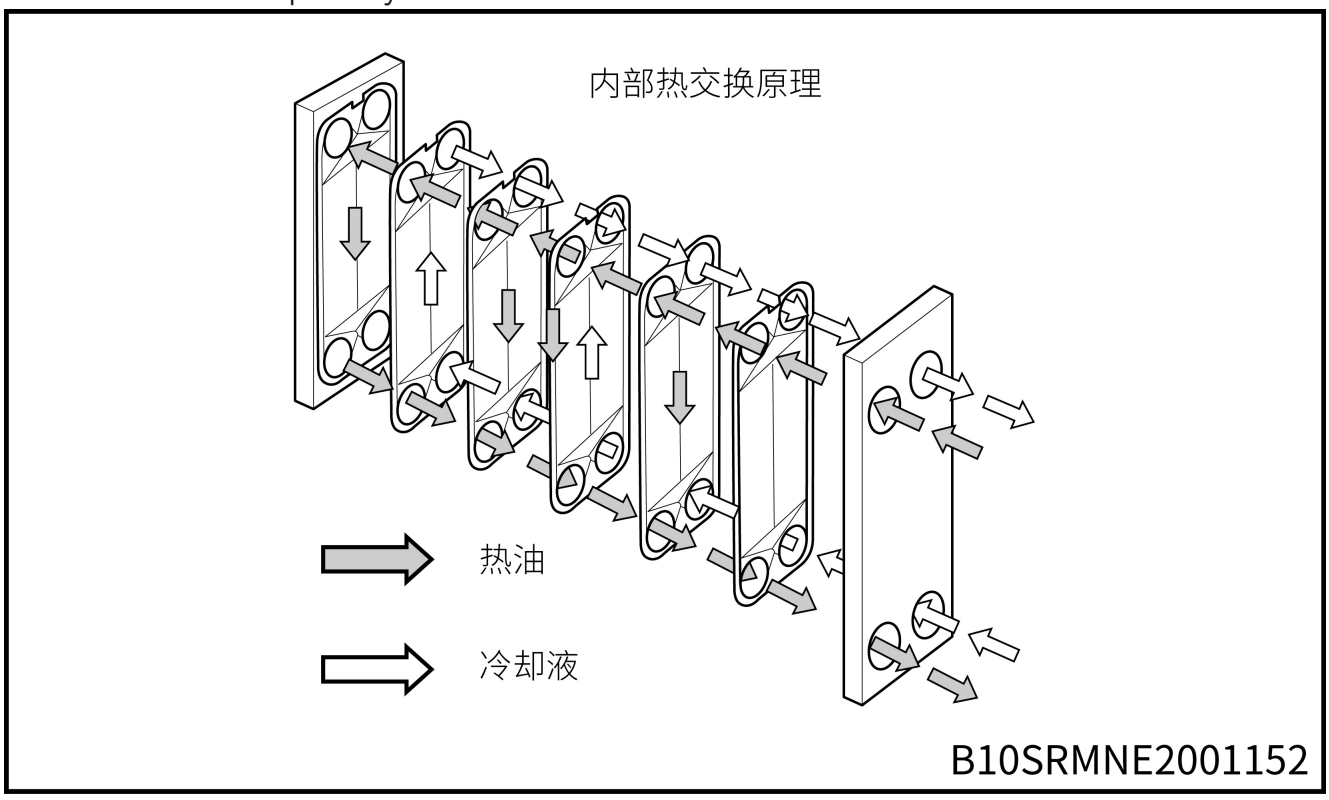
© 2026, All rights reserved

Introduction to the function and structure of the electronic oil pump:

- The electronic oil pump is installed on the front housing of the reducer. In the installed vehicle posture, the oil pump inlet must be immersed in the oil sump. After the oil pump operates, the gear oil will form a circulating oil circuit in the electric drive assembly, thereby achieving the functions of cooling the motor and lubricating the bearings and gears;
- The electronic oil pump consists of three parts: the controller assembly, the motor assembly, and the pump body. The controller assembly is responsible for communication control, the motor provides power, and the pump body is responsible for performing work.



© 2026, All rights reserved

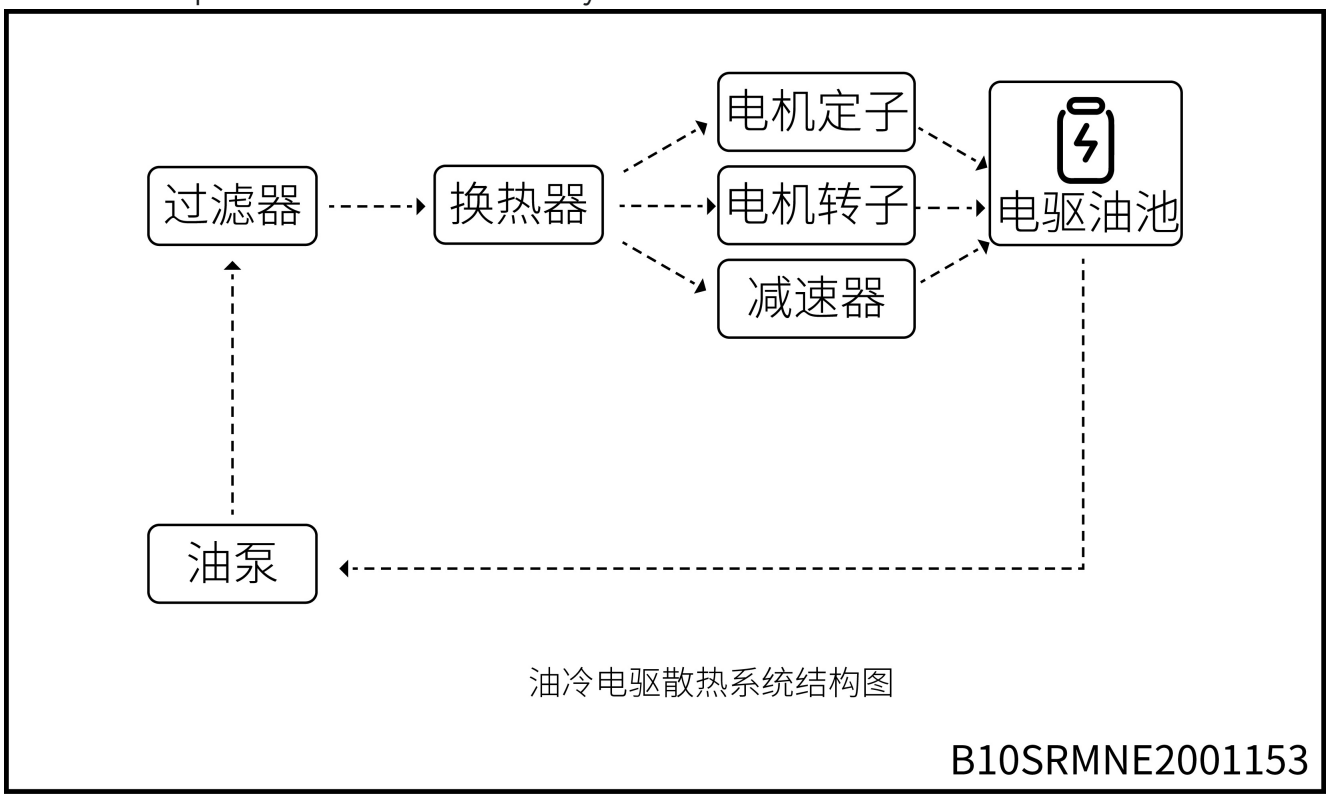


Lubrication and Cooling System - Oil Cooler

- The motor is mainly composed of three parts: oil inlet and outlet, water inlet and outlet, and core.

© 2026, All rights reserved

- Cooling water and hot oil enter the core through the water inlet and oil inlet respectively, flow in opposite directions, achieve maximum heat exchange efficiency within the core, and then exit through the water outlet and oil outlet respectively.

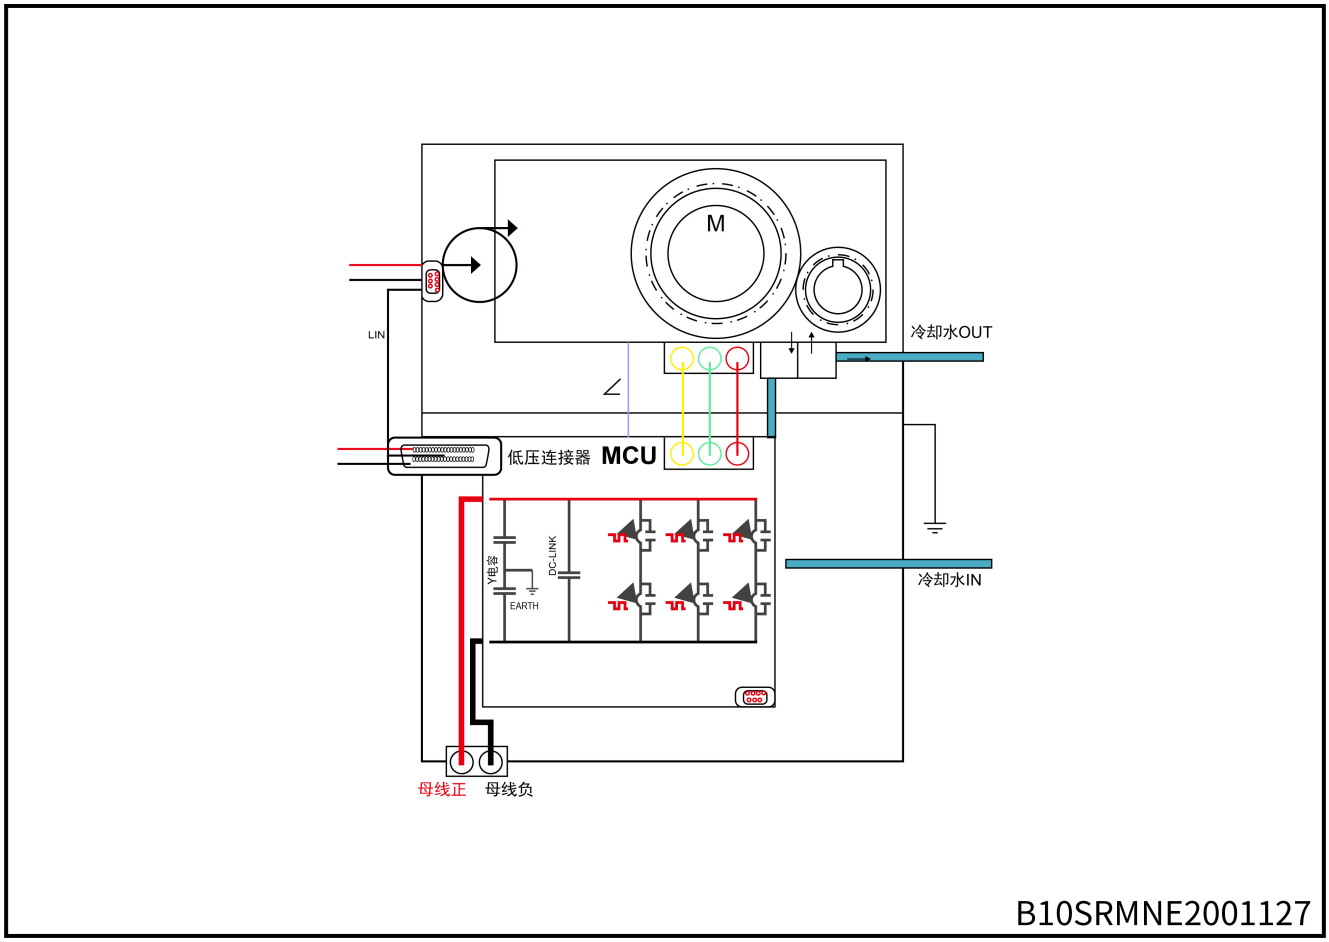


Lubrication and cooling system - Electric drive powertrain cooling:

- Addressing the electric drive bearings and motor cooling, cooling and lubrication structures for the internal bearings of the motor and reducer are innovatively introduced to achieve high-speed and high-efficiency operation;
- High speed: The maximum speed reaches 17000RPM after the bearing is cooled;

© 2026, All rights reserved

- Gear oil has the following advantages: excellent insulation, low kinematic viscosity, anti-foaming property, anti-emulsification property, high gear anti-scuffing grade, low corrosiveness, etc. Therefore, oil cooling can be used to dissipate heat for the electric drive system.

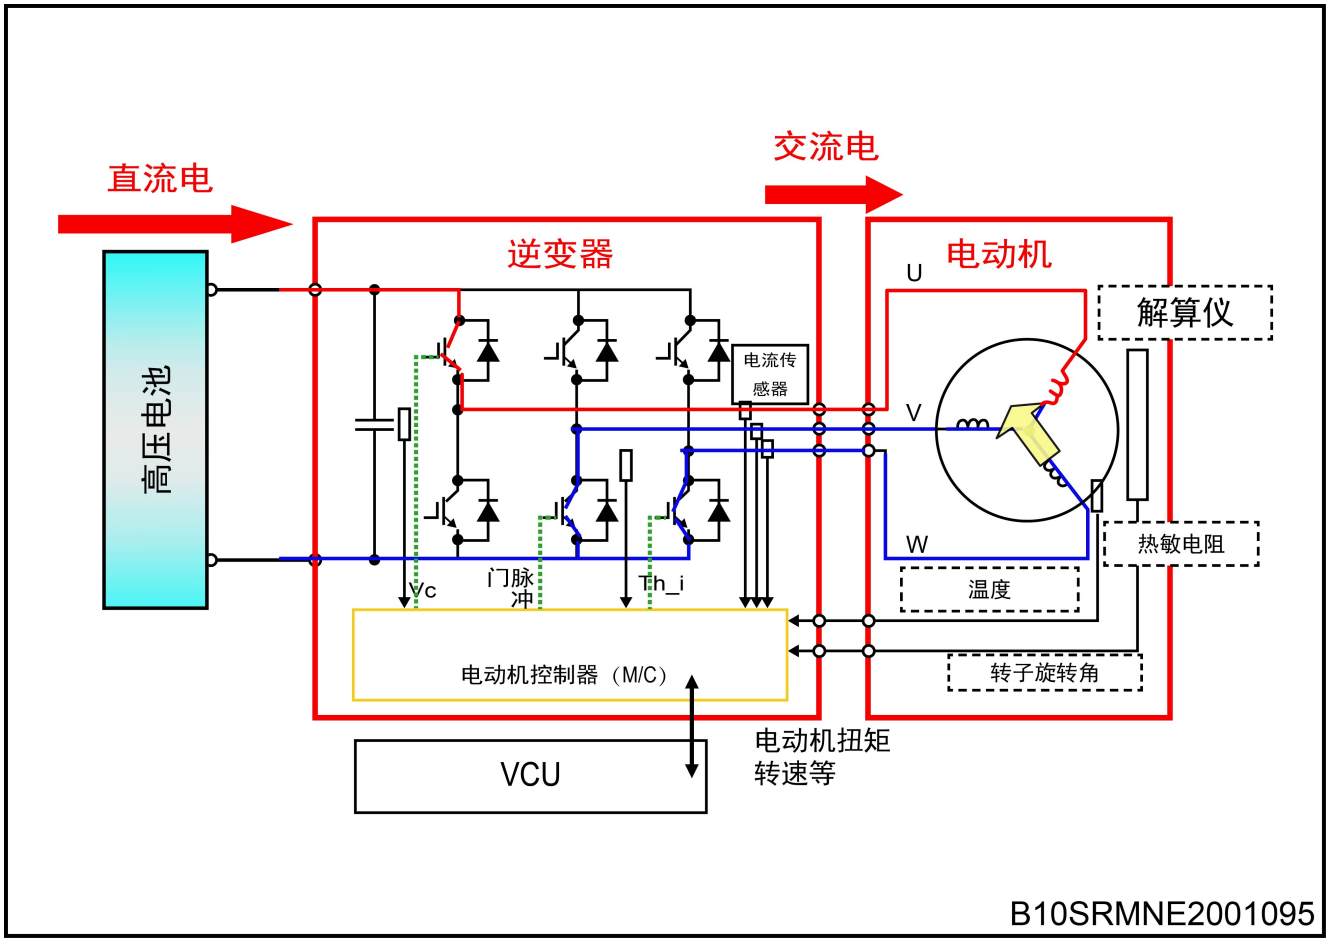


Controller composition:

- Control assembly mainly consists of control board-drive integrated board assembly, capacitor assembly, busbar assembly, housing and other components.

Controller Working Principle:

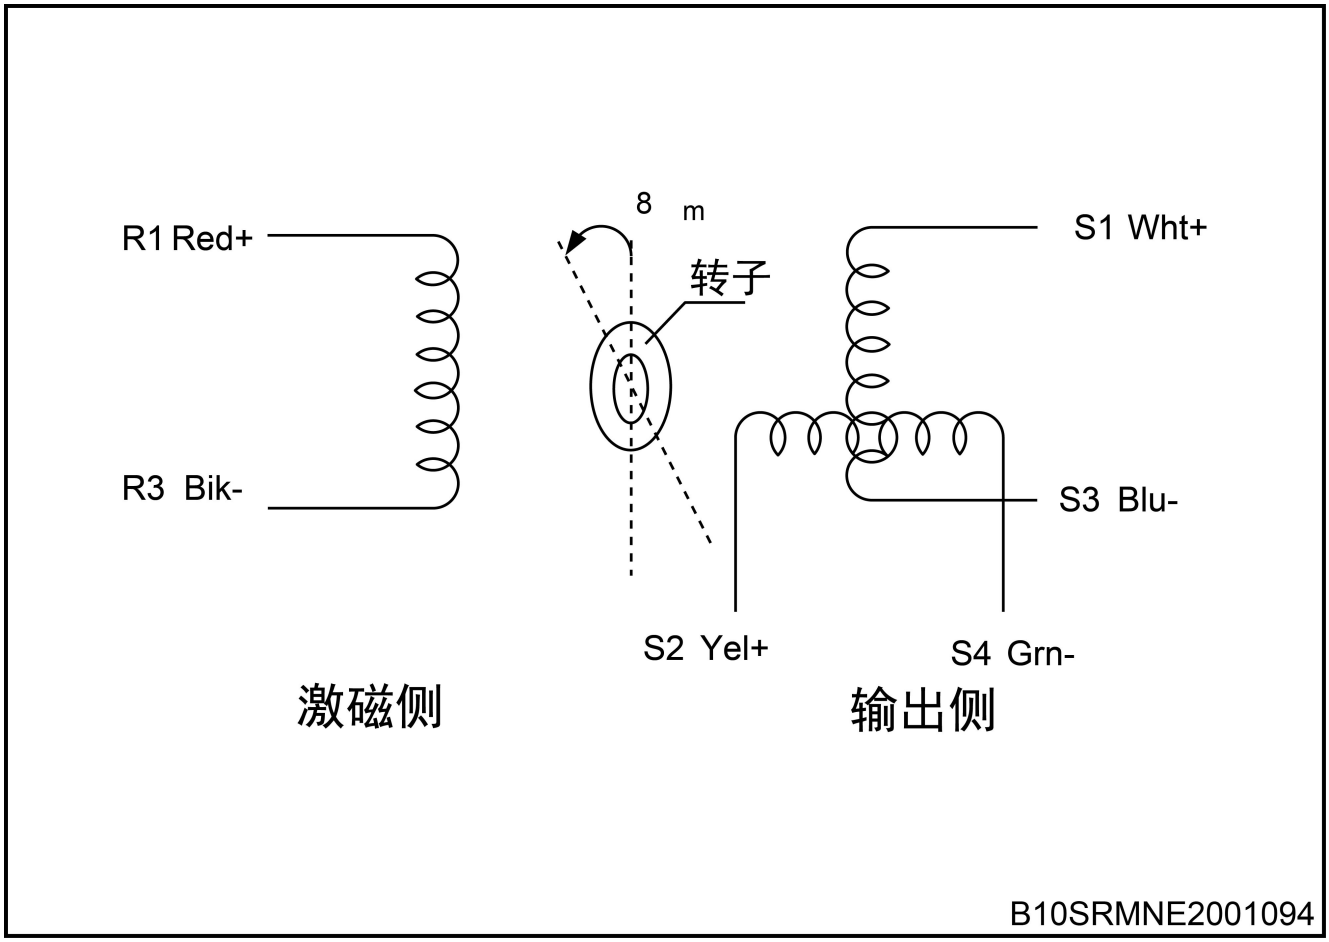
- Motor controller main functions: Active and passive discharge, motor torque and speed control, motor temperature, voltage, and current monitoring and protection, etc.
- The controller MCU controls the IGBT power module to generate alternating current of different frequencies and magnitudes on the excitation winding of the motor stator side, thereby controlling the motor operation.
- The MCU monitors the motor rotor position via a resolver to calculate the rotor direction and rotational speed, thereby achieving precise control of the motor.



© 2026, All rights reserved

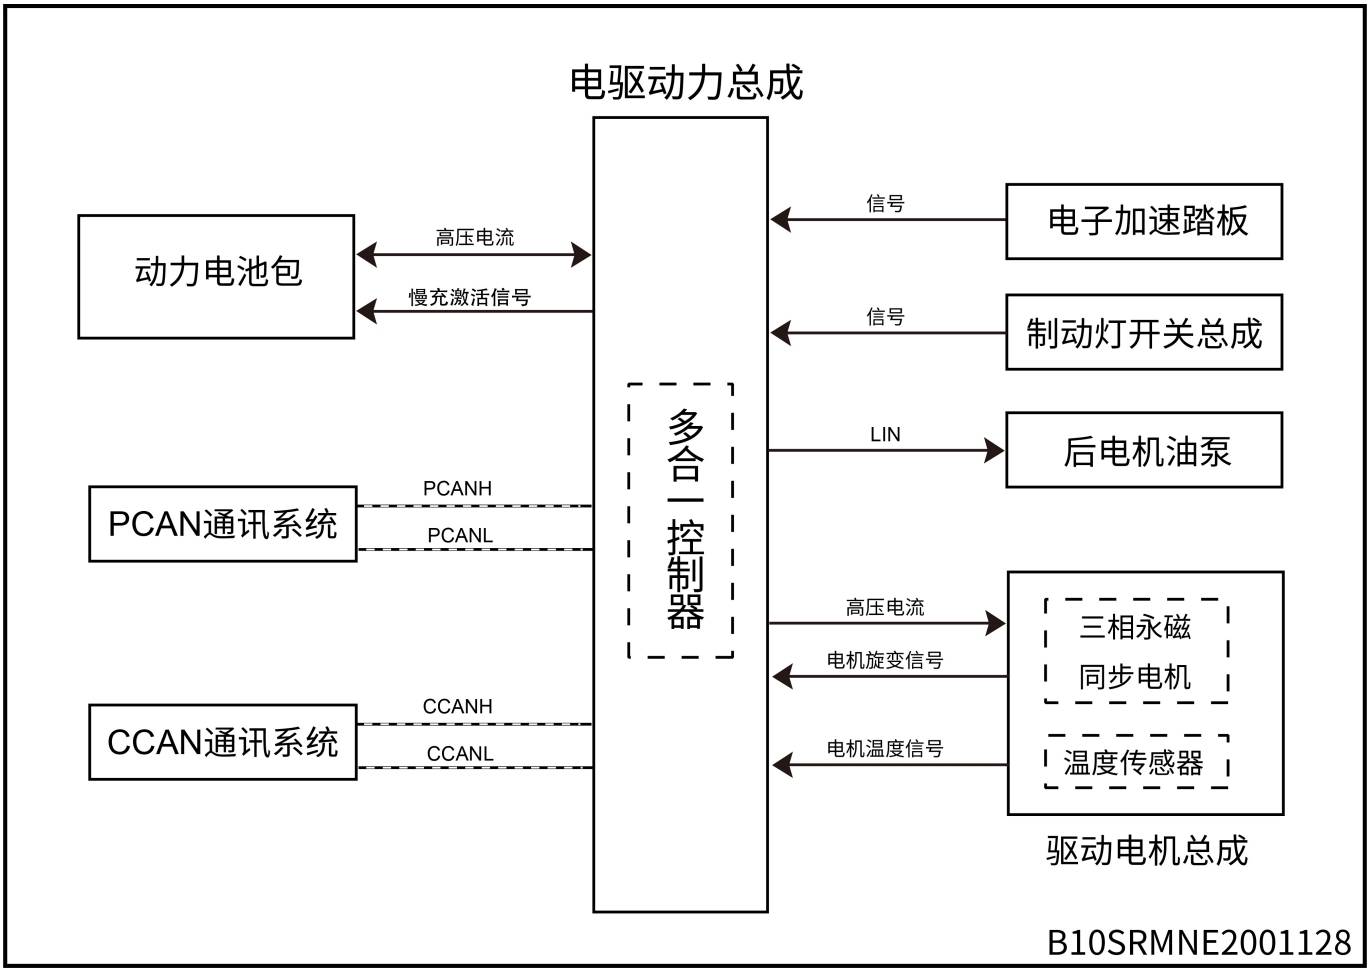
Controller Working Principle - Drive Control

- After the vehicle enters the "READY" state, shift the gear to "D" or "R" and release the parking brake. When the gear is in D and the accelerator pedal is pressed, the vehicle input torque is positive; when the gear is in R, the torque is negative. The vehicle controller sends gear position information and target torque to the MCU motor controller via the CAN bus. Within one interrupt cycle (50us), the MCU motor controller looks up a table to determine the d- and q-axis currents to be supplied to the motor based on the vehicle controller's request and the current sampled voltage. Meanwhile, the resolver collects current position information, and the software decodes the current rotor position and speed, converting the given d- and q-axis currents into three-phase currents. The MCU sends PWM signals with different duty cycles to control the conduction of the IGBTs in the corresponding phases, outputting three-phase currents of the corresponding frequency to the drive motor. To ensure the accuracy of the given current output, the three-phase currents are sampled within the 50us cycle and then converted into d- and q-axis currents according to the rotor position. PI control is applied to the given idq and feedback idq to adjust the output PWM duty cycle, ensuring that the sampled feedback current remains basically consistent with the given current, thereby controlling the vehicle torque output.



© 2026, All rights reserved

Working principle of resolver:



- A resolver is a signal element whose output voltage varies with the rotor angle. When an AC voltage of a certain frequency is input to the excitation winding, the voltage amplitude of the output winding maintains a sine and cosine function relationship with the rotor angle, and the rotor angle and speed can be obtained through the trigonometric function relationship.

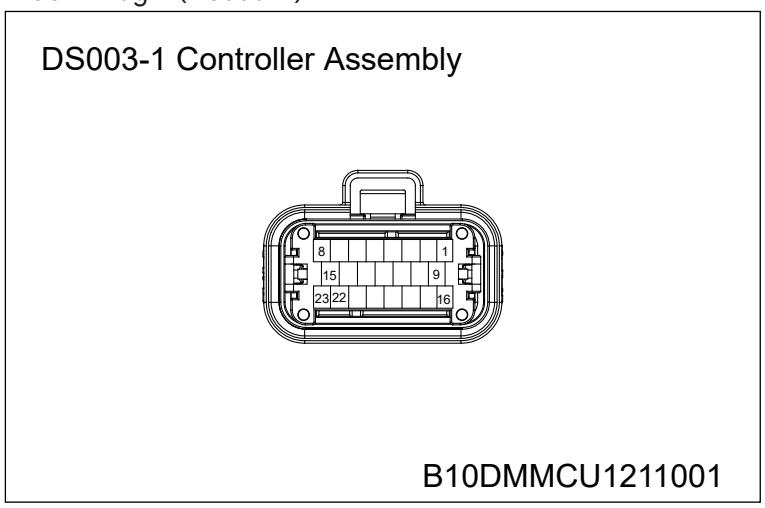
4.1.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS - MCUM

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the MCUM data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION - MCUM

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

FAULT DIAGNOSIS CODE LIST - MCUM

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
P101396	U-phase current sensor failure	1. U-phase current sensor damaged 2. U-phase current sensor power supply failure	1.Power off and restart 2. If multiple power-offs and restarts are ineffective, replace the controller.
P101496	W-phase current sensor fault	1. W-phase current sensor damaged 2. W-phase current sensor power supply fault	1.Power off and restart 2. If multiple power-offs and restarts are ineffective, replace the controller.
P131296	V-phase current sensor fault	1. V-phase current sensor failure 2. V-phase current sensor power supply fault	1.Power off and restart 2. If multiple power-offs and restarts are ineffective, replace the controller.
P131396	Fault of two-phase or above current sensor	1. Damage to current sensors of two or more phases 2. Power supply failure of two-phase or above current sensor	1.Power off and restart 2. If multiple power-offs and restarts are ineffective, replace the controller.
P101F00	Collision fault	1. The vehicle is involved in a collision 2. Vehicle Collision Signal False Detection	1. Check the collision signal 2. Power off and restart the vehicle; if multiple power-off and restart attempts are ineffective, replace the controller.
P100C96	Motor rotor position sensor fault	Resolver damage. 2. Motor resolver and control board connection harness abnormality	1.Power off and restart 2. Check the controller motor ground 3. If multiple restarts are ineffective, replace the electric drive assembly.
P102D16	Bus voltage severely below threshold	1. Power battery voltage is too low.	1. Check whether the power battery voltage is normal

		2. Bus voltage detection circuit fault	2.Power off and restart. If multiple restarts are ineffective, replace the controller.
P130B00	IGBT drive high-side failure	1. IGBT overcurrent 2. Control Hardware Circuit Fault	Power off and restart; if multiple power cycles fail, replace the controller.
P130616	IGBT Drive Undervoltage Fault	Control hardware circuit failure	Power off and restart; if multiple power cycles fail, replace the controller.
P130717	Hardware bus overvoltage fault	1. Power battery voltage too high. 2. Abnormal shutdown overshoot causes excessively high bus voltage 3. Bus voltage detection circuit abnormal	1. Check whether the power battery voltage is normal 2.Power off and restart. If multiple restarts are ineffective, replace the controller.
P130800	System crash	1. MCU 5K square wave abnormality 2. Hardware crash detection anomaly	Power off and restart; if multiple power cycles fail, replace the controller.
P130919	Hardware phase overcurrent fault	1. MCU current control abnormality 2. Hardware phase overcurrent detection abnormality	Power off and restart; if multiple power cycles fail, replace the controller.
P130A00	Hardware test general failure	1. Any hardware failure occurs 2. Hardware detection: General fault pin abnormal	Power off and restart; if multiple power cycles fail, replace the controller.
P102F00	Motor speed critically exceeds threshold	Motor overspeed	Power-off Restart
P102E4B	IGBT temperature severely exceeds the threshold	1. IGBT over-temperature 2. Cooling water circuit failure	1.Automatic recovery 2. Check the motor cooling water circuit 3. Power off and restart; if multiple power-off restarts

		3. IGBT Temperature Sensor Failure	are ineffective, replace the controller.
P102D17	Bus voltage severely exceeds the threshold.	1. Power battery voltage too high. 2. Abnormal shutdown overshoot causes excessively high bus voltage 3. Bus voltage detection circuit abnormal	1.Automatic recovery 2. Check whether the power battery voltage is normal 3. Power off and restart, if multiple restarts fail, replace the controller.
P130C00	IGBT drive low-side fault	1. IGBT overcurrent 2. Control Hardware Circuit Fault	1.Automatic recovery 2. Check whether the power battery voltage is normal 3. Power off and restart, if multiple restarts fail, replace the controller.
P100700	Motor speed exceeds threshold	Motor overspeed	Power-off Restart
P100971	Motor stall fault	Motor mechanical seizure	1.Power off and restart 2. Check whether the electric drive assembly is mechanically seized.
P130E4B	IGBT junction temperature exceeds threshold	1. IGBT over-temperature 2. Cooling water circuit failure 3. IGBT Temperature Sensor Failure	1.Automatic recovery 2. Check the motor cooling water circuit 3. Power off and restart; if multiple power-off restarts are ineffective, replace the controller.
P100E4B	IGBT temperature exceeds threshold.	1. IGBT over-temperature 2. Cooling water circuit failure 3. IGBT Temperature Sensor Failure	1.Automatic recovery 2. Check the motor cooling water circuit 3. Power off and restart; if multiple power-off restarts are ineffective, replace the controller.

After replacing the controller assembly, the "rotor zero position (angle)" needs to be written to the m otor controller via the diagnostic tool. After successful learning, test drive the vehicle to check wheth er the vehicle's power performance is normal and whether the vehicle has abnormal vibration.

Step 1 Check the fault code status.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

No》》》 Trigger cause of the fault code
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN harness between the forward collision radar and the front-view monocular camera a ssembly.

B Disconnect the harness connector EL008 of the forward c ollision radar. C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector EL008 of the forward collision avoidance radar and t erminal 10 of the wire harness connector EL231 of the fron t monocular camera assembly to check whether the resista nce value is normal. E Use a multimeter, select the resistance range, and check whether the resistance between terminal 6 of harness conn ector EL008 for the forward collision avoidance radar and t erminal 11 of harness connector EL231 for the front monoc ular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

c. Disconnect the 1 fixing clamp - Arrow A - between the rear motor water inlet pipe and the controller assembly.
Recommended tool: Slip-joint pliers

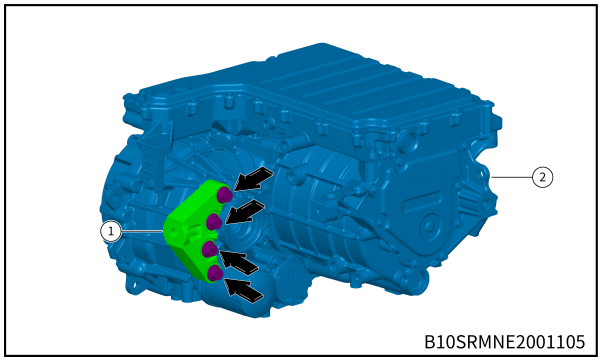
d. Disconnect the 1 connector -arrow B- between the rear subframe wiring harness assembly and the electronic oil pump, and release the 1 retaining clip -arrow C- of the rear subframe wiring harness assembly.
Recommended tool: Clip remover

B10SRMNE2001103

e. Lifting Requirements: Use a dedicated lifting device, and all three lifting holes - arrows - must be engaged simultaneously.

B10SRMNE2001104

f. Use a hoist to securely support the electric drive unit ①.



g. Unscrew the 1 fixing bolt connecting the rear motor front mount cushion assembly to the rear subframe assembly - Arrow A -.
Recommended tool: 18mm socket
Torque + Angle: 140N m + (135±5)°

> **ATTENTION**
>
> - The mounting bolt is a single-use part, and must be replaced with a new bolt after removal.

h. Unscrew the 2 fixing bolts - Arrow B - connecting the rear motor rear mount cushion assembly to the rear subframe assembly.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (55±5)°

i. Lift the electric drive powertrain, along with the rear motor front mounting bracket assembly ①, out of the rear suspension.
Recommended tool: Hanger

j. Unscrew the 4 fixing bolts -arrow- of the rear motor front mounting bracket assembly, and remove the rear motor front mounting bracket assembly ① and the electric drive powertrain ②.
Recommended tool: 15mm socket
Torque + angle: 80N m + (50±5)°

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. Lifting Requirements: Use a dedicated lifting device, and all three lifting holes - arrows - must be engaged simultaneously.
b. Do not remove the oil seal cover before assembling the half shaft:
   - When inserting the half shaft into the power output interface, the oil seal protective sleeve tool must be used, and the insertion part of the half shaft must be clean, free of burrs and foreign objects.
   - Strictly prohibited improper assembly that damages the oil seal, such as impact and scratching of the lip.
c. During installation, do not forget to install the drive motor inlet and outlet pipes. Before assembling the pipes, strictly forbidden to remove the rubber protective sleeve of the pipe connector. When installing the pipes, always loosen the clamp first, then insert and remove the pipe along the direction of the pipe outlet. Do not use pliers to clamp or pry the pipe connector.
d. Before assembling the high-voltage and low-voltage wiring harnesses of the controller, it is strictly prohibited to remove the high-voltage and low-voltage socket covers.
e. During assembly, the electric drive powertrain must not be subjected to impact or bumping.
f. After installation, fill the rear speed reducer gear oil.

© 2026, All rights reserved

See:Replace Rear Reducer Gear Oil (page)

ATTENTION

- The reducer gear oil cannot be reused or mixed.

g. After installation, fill coolant.
See:Replace the coolant for the air conditioning, drive motor, and power battery (page)

ATTENTION

- The coolant must not be reused, mixed, or replaced with coolant of a different color.

h. After installation, a four-wheel alignment and road test must be performed to confirm that there are no abnormal noises from the chassis components and no faults such as pulling to one side while driving.

i. Replacing the electric drive powertrain requires following these steps to ensure software version compatibility:
   - Record the old version: Before removal, read and record the software version number of the old electric drive powertrain.
   - Check for new version: After installing the new electric drive powertrain, first read its software version number.

   Version Comparison and Processing:
   - If the new version ≥ the old version, the replacement process will be completed normally.
   - If the new version < the old version, the new electric drive powertrain software must first be updated to the old version or a higher version before it can be put into use.

j. Replacing the electric drive powertrain requires the following operations:
   - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Motor Controller

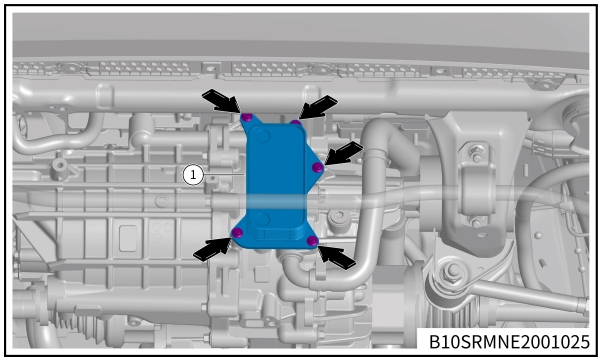
(MCUM) - MCUM-2LP - Data Writing - VIN.

- Write the end-of-line configuration. Diagnostic tool operation: Select the corresponding vehicle model - System diagnostics - Motor Controller (MCUM) - MCUM-2LP - End-of-line configuration - Vehicle model configuration - Configuration selection - Write.
- Write the key. Diagnostic tool operation: Corresponding vehicle model - IMMO key injection.

ATTENTION



After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

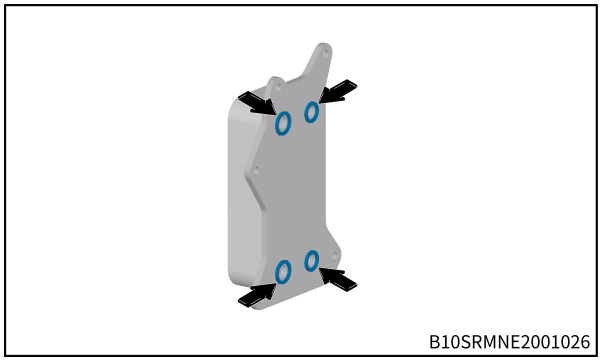
OIL COOLER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Drain the drive motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
6. Remove the oil cooler.



a. Unscrew the 5 mounting bolts connecting the oil cooler to the electric drive powertrain -arrow-, and remove the oil cooler ①.
Recommended tool: 8mm socket
Torque: 10±0.5 N·m

ATTENTION

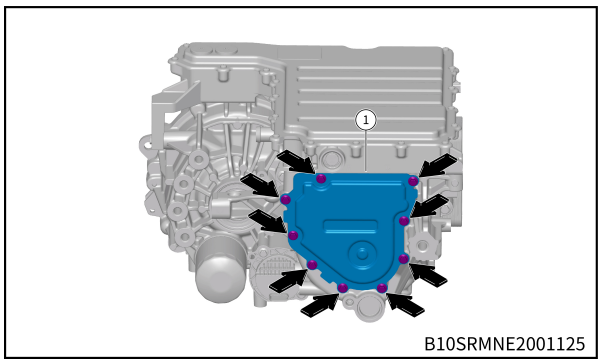
- During the disassembly process, if there is any residual oil leakage, please clean it up promptly.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. Before installing the rear drive oil cooler, ensure that the 4 sealing rings of the rear electric drive oil cooler are intact - arrow -.
b. After installation, fill the drive motor with coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

ATTENTION



- Do not reuse or mix coolant, and do not use coolants of different colors.

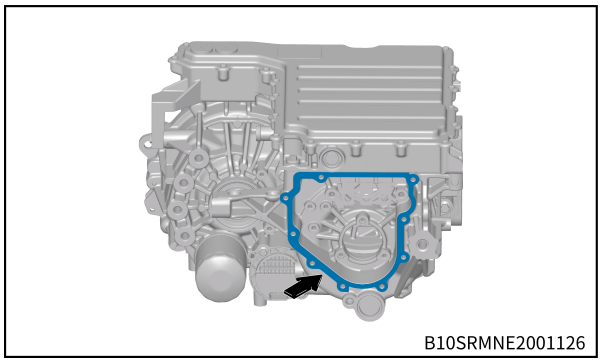
STAMPED RESOLVER COVER

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Drain the rear reducer gear oil.
   See:Replace Rear Reducer Gear Oil (page 219)
5. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
6. Remove the stamping resolver cover.

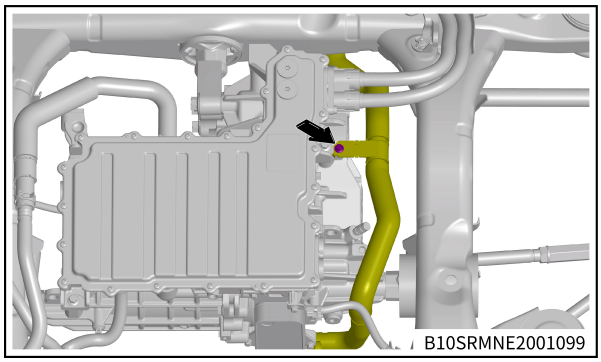
a. Unscrew the 9 fixing bolts -arrow- of the stamped resolver cover, and remove the stamped resolver cover ①.
Recommended tool: 8mm socket
Torque: 10±0.5 N·m

SETUP

1. Installation is performed in reverse order, while paying attention to the following items:

a. Before installing the stamped resolver cover, clean off the residual sealant at the mating surface -arrow- and apply new sealant.
Sealant model: 5569
b. After installation, fill the rear speed reducer gear oil.
See:Replace Rear Reducer Gear Oil (page 219)

ATTENTION



The reducer gear oil cannot be reused or mixed.

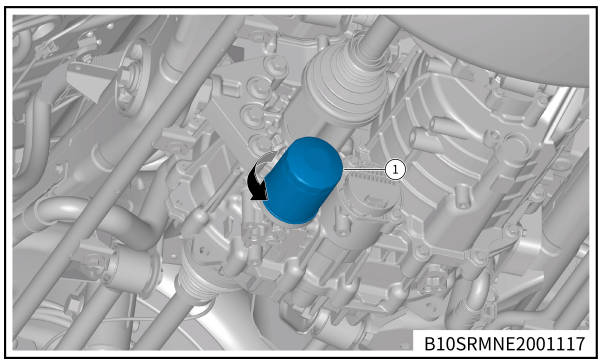
4. Remove the normally closed breather.

a. Unscrew the 1 fixing bolt - arrow - connecting the rear EDU outlet water pipe to the electric drive assembly, and move the rear EDU outlet water pipe aside.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew the normally closed breather plug ① in the direction of the arrow.
Recommended tool: 11mm open-end wrench
Torque: 10±1N m

SETUP



1. The installation procedure is performed in reverse order.

5. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
6. Remove the filter.

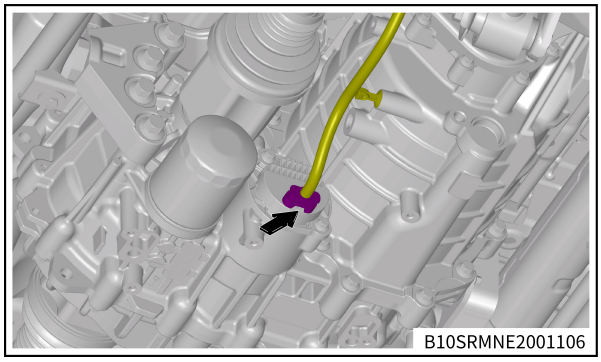
a. Use an oil filter wrench to unscrew filter ① in the direction of the arrow.
   Special tool: Oil filter wrench (7002600DHY1)
   Torque: 20±1.5 N·m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. Clean the contact surface of the filter.
b. Before installing the new filter, apply a small amount of reducer gear oil to the surface of the sealing ring - arrow -.
c. After installation, fill the rear speed reducer gear oil.
   See:Replace Rear Reducer Gear Oil (page 219)

ATTENTION



- The reducer gear oil cannot be reused or mixed.

b. Unscrew the 2 fixing bolts -arrow- of the electric oil pump, and remove the electric oil pump ①.
   Recommended tool: 8mm socket
   Torque: 10±0.5 N·m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

B10SRMNE2001013

a. Ensure that the mounting hole of the electronic oil pump is free of foreign matter.
b. Before installing the electronic oil pump, ensure that the sealing rings ①, ②, ③, and ④ are intact, and apply a small amount of reducer gear oil to the sealing rings.
c. After installation, fill the rear speed reducer gear oil.

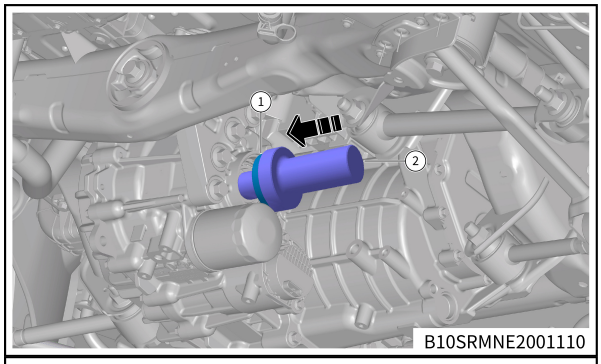
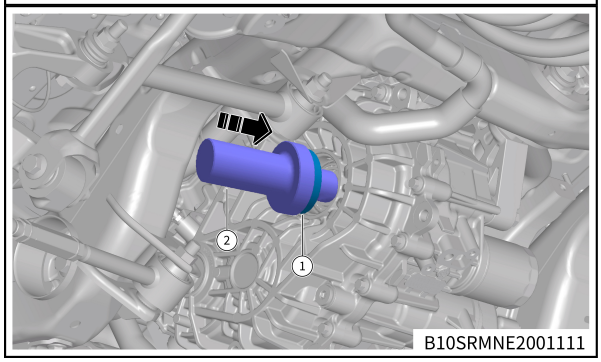
b. Use the output shaft oil seal removal tool to remove the right output shaft oil seal ①.
Special tool: Output shaft oil seal removal tool (7002598DHY1)



SETUP

1. The installation procedure is carried out in reverse order, while noting the following:



ATTENTION

- The output shaft oil seal must be installed using the electric drive shaft seal installation tool. When inserting the half shaft into the power output interface, the oil seal protective sleeve tool must be used. The insertion part of the half shaft must be clean, free of burrs and foreign objects; improper assembly practices that may damage the oil seal, such as impact or scratching the seal lip, are strictly prohibited. Once removed, the oil seal cannot be reused and must be replaced.

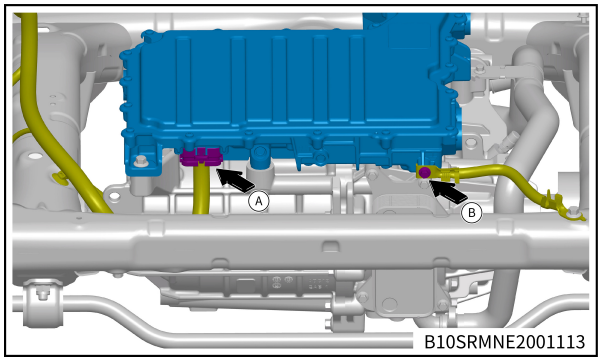
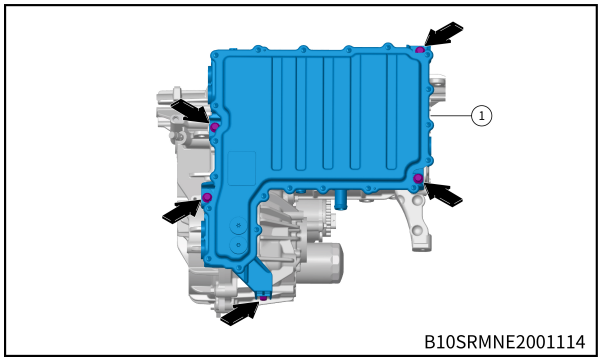
10. Remove the controller assembly.



a. Disconnect the 1 fixing clamp connecting the controller assembly to the rear EDU water inlet pipe - arrow -.
Recommended tool: Slip-joint pliers



b. Unscrew the 3 fixing bolts of the UVW transformer wiring harness -arrow A-, and disconnect the 1 connector of the low-voltage wiring harness inside the controller assembly -arrow B-.
Recommended tool: T45 Torx key
Torque: 20±1.5 N·m

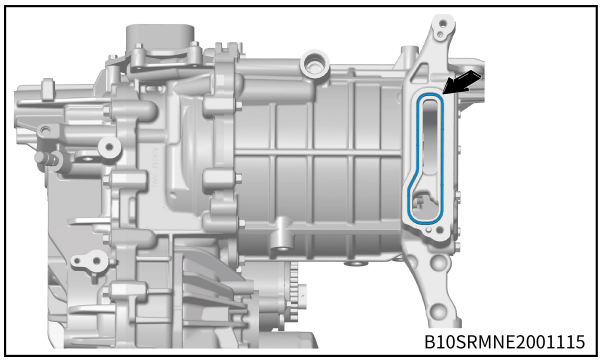
c. Disconnect 1 connector between the controller assembly and the rear subframe wiring harness - arrow A -.

d. Unscrew the 1 fixing bolt -Arrow B- of the controller assembly and IPU ground wire assembly.
Recommended tool: 8mm socket
Torque: 9±1N m

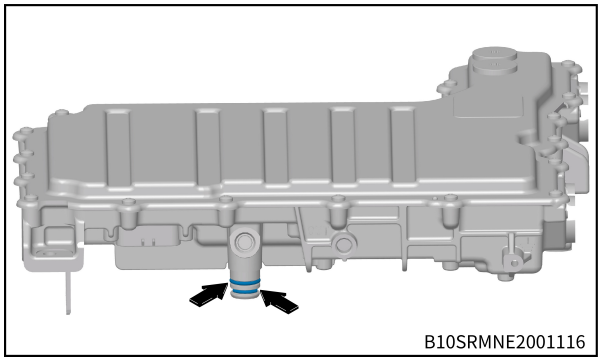
e. Unscrew the 5 mounting bolts of the controller -arrow-, and remove the controller assembly ①.
Recommended tool: 10mm socket
Torque: 25±1.5N m



ATTENTION

After the controller is removed, storage requirements:

- In a constant temperature and humidity assembly environment, the components must not be exposed to the air for more than 8 hours. If the exposure time exceeds 8 hours, they must be sealed in an anti-static and moisture-proof bag.
- Outside the constant temperature and humidity assembly environment, exposure to air for more than 30 minutes is not allowed, and if it exceeds 30 minutes, it must be sealed in an anti-static and moisture-proof bag.



SETUP

1. Installation is performed in reverse order, while paying attention to the following items:

a. Release the 1 fixing clamp - arrow - between the drive motor controller assembly and the controller water pipe, disconnect the connection, and remove the drive motor controller assembly ① and the controller water pipe ②.

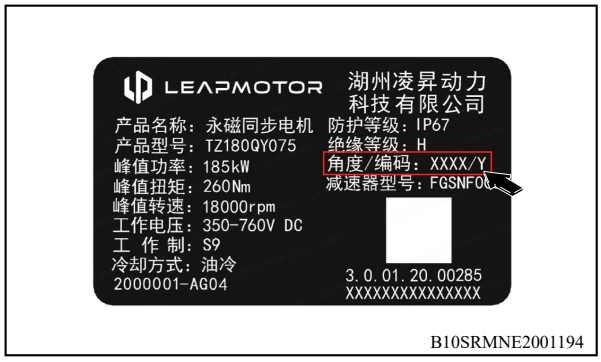
B10SRMNE2001116

b. Release the 1 fixing clamp - arrow - between the drive motor controller assembly and the controller water pipe, disconnect the connection, and remove the drive motor controller assembly ① and the controller water pipe ②.

c. After installation, the electric drive needs to undergo an air tightness test.
See:Electric Drive Air Tightness Test (page 2833)

d. After installation, fill the rear speed reducer gear oil.
See:Replace Rear Reducer Gear Oil (page 219)

ATTENTION



- The reducer gear oil cannot be reused or mixed.

e. After installation, fill coolant.
See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

ATTENTION

- The coolant must not be reused, mixed, or replaced with coolant of a different color.

f. Check the cooling system for leakage.

B10SRMNE2001194

g. Replacing the controller assembly requires following these steps to ensure software version compatibility:
- Record the old version: Before removal, read and record the software version number of the old controller assembly.
- Check for new version: After installing the new controller assembly, first read its software version number.

Version Comparison and Processing:
- If the new version ≥ the old version, the replacement process will be completed normally.
- If the new version < the old version, the new controller assembly software must first be updated to the old version or a

higher version before it can be put into use.

h. The following operations are required to replace a new controller assembly:
   - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Motor Controller (MCUM) - MCUM-2LP - Data Writing - VIN.
   - Rotor zero position writing.
     - Step1. Confirm the position sensor type value and rotor zero position value.
       - 1. Obtain the rotor zero point value to be entered (nameplate XXXX, with one decimal place); and the position sensor type value (nameplate Y) via the MCUM nameplate - arrow.

> **ATTENTION**
>
> The data format on the nameplate is (Angle/Model: XXXX/Y).

     - Step2. Write the position sensor type value
       - 1.Enter the interface: System Diagnostics→MCUM→MCUM-2LP→Data Writing→Position Sensor Type Writing.
       - 2. In the pop-up window, enter the nameplate Y value from Step 1.
     - Step3. Confirm the position sensor type value
       - 1. After completing the aforementioned write operation, a pop-up window displays the confirmed written value;
       - 2.Via path: System Diagnosis-MCUM-MCUM-2LP-Read Data Stream;
       - 3. Read the position sensor type value and confirm that the read value matches the written value.
     - Step4. Write rotor zero position value

© 2026, All rights reserved

- 1. Through the path: System Diagnostics - Motor Controller (MCUM) - MCUM-2LP - Data Writing - Rotor Zero Position Writing, write the rotor zero position (for example, if the XXXX value on the nameplate is 0214, representing a rotor zero position of 21.4°, you need to enter 214 when using the self-developed diagnostic tool).

- Step5. Confirm rotor zero point writing
  - 1. Path: System Diagnostics → MCUM → MCUM-2LP → Read Data Stream;
  - 2.Read the motor position offset (rotor zero point) to determine whether the rotor zero point parameter is written correctly;
  - 3.If the read rotor zero-point angle multiplied by 10 matches the nameplate, it indicates that the rotor zero point has been written correctly.

> **ATTENTION**
>
> For example, if the read value is 21.4; 21.4 × 10=214, which matches 0214 on the nameplate.

- Step6. Write parameters to take effect
  - 1. After completing the preceding Steps 1 to 5, you must lock the vehicle and power it off, and ensure the vehicle is powered on again before proceeding with subsequent operations.

- Vortex Parameter Learning.

Prerequisites

- 1. Complete position sensor type/rotor zero position write.
- 2.After the vehicle is unlocked and the driver confirms that it can be driven normally, connect the diagnostic tool.

Interface Entry

© 2026, All rights reserved

- 1. Access the position sensor self-learning and identification operation interface via the following path: System Diagnostics-MCUM-MCUM-2LP-Routine Control-Eddy Current Parameter Learning.

Position sensor parameter self-learning

- Step1. Enter the position sensor parameter calibration mode via the diagnostic tool, and the diagnostic tool interface displays the successful routine activation status.
- Step2. After the routine is successfully activated, the driver should drive the vehicle and maintain a vehicle speed of approximately 20km/h (15km/h~25km/h) for at least 4s to complete the parameter self-learning.
- Step3a. After driving continuously at 20km/h for 4s, exit the current interface and re-enter the vortex parameter learning interface. If the learning is successful, the interface will display (Vortex self-learning status: Parameter integrated; Vortex self-learning result: Parameter successful).
- Upon successful self-learning, you can return to the path: System Diagnostics-MCUM-MCUM-2LP-Read Data Stream.
- Perform data confirmation parameters (Position sensor Sin Gain; Position sensor Sin offset; Position sensor Cos Gain; Position sensor Cos offset; Position sensor sin_pha; Position sensor cos_pha).
- Step3b. If learning fails, the interface will display (Eddy current self-learning status: Identification failed; Eddy current self-learning result: Parameter failed; Eddy current identification failure Code: Parameter identification not converged; Parameter identification out of limit; Parameter writing failed).
- Upon self-learning failure, the position sensor parameters automatically match the default values of the EFI-

type sensor, where sin_pha and cos_pha are integers 0 and 1. This can be confirmed by navigating back to the following path: System Diagnostics-MCUM-MCUM-2LP-Read Data Stream.

- There are three possible states for the eddy current self-learning results: ① Eddy current identification not completed; ② Parameter successful; ③ Parameter failed.
  - 1. For ①, it indicates that the vehicle speed is maintained within the valid range for less than 4s, and the aforementioned Step 2 to Step 3 can be repeated;
  - 2. For ②, it indicates that this parameter self-learning is successful, and this process can be terminated after locking the vehicle with the key and ensuring the vehicle is powered off;
  - 3. For ③, it indicates that the current parameter self-learning has failed. You must lock the vehicle with the key to ensure the vehicle is powered off and the current process is terminated, then repeat Step 1-Step 3 to perform self-learning again.

ATTENTION

- If any abnormality occurs during the sensor calibration process, apply the brakes to stop the vehicle safely, lock the vehicle with the key, ensure the vehicle is powered off, and then restart it to forcibly exit the calibration mode.

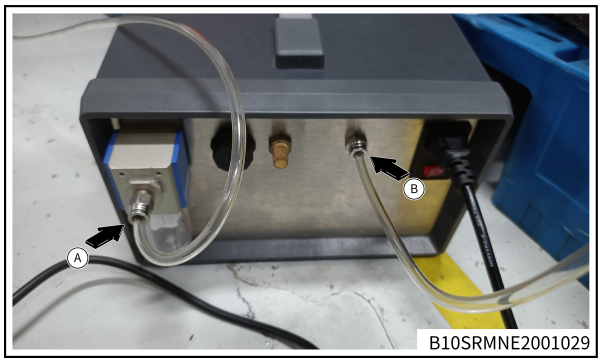
ELECTRIC DRIVE AIR TIGHTNESS TEST

TEST PROCEDURE



1. Electric Drive Water Channel Airtightness Test.

a. Use the airtight plug ① for the water passage to plug the water outlet of the oil cooler.
Special tool: Airtight plug for water passage (7002581DHY1)

b. Use the water passage air inlet tooling ① to connect the electric drive controller connector.
Special tool: Water passage air inlet fixture (7002580DHY1)

c. Connect the external air pump hose to the airtightness testing tool -Arrow A-, and connect one end of another hose to the airtightness testing tool -Arrow B- and the other end to the water passage air inlet tooling connector.
d. Connect the tool to the power supply and turn it on, after entering the main interface, select "Enter Test", then sequentially select the vehicle model, model year, and test items, to automatically load the corresponding test parameters, and perform the airtightness test according to the on-screen instructions (preset pressure: 250±2kpa, regulating pressure: 255kpa, leakage upper limit: 150pa, inflation time: 10s, stabilization time: 30s, test time: 10s).
Special tool: Airtightness testing tool (7002605DHY1)

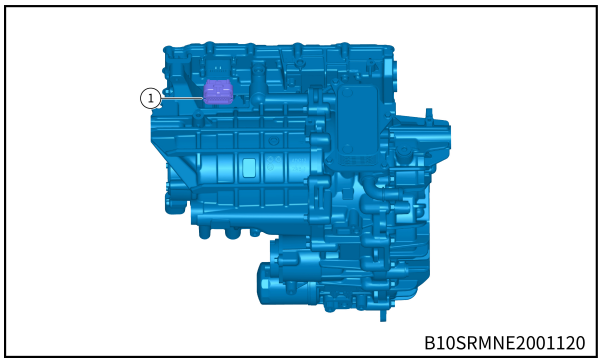
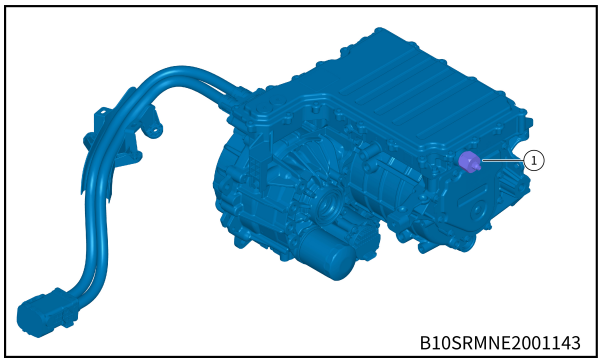
sound. Click "Reset" to release the water channel pressure and complete the inspection.



ATTENTION

- If the airtightness tester indicates "Unqualified", check whether all plugs are properly installed and whether the stabilized pressure reaches 250±2 kPa.



2. Controller cavity airtightness test.

a. Use the electric drive plug ① to plug the MCU high-voltage harness connector.
Special tool: MCU wiring harness blind plug (7002591DHY1)

b. Use the electric drive connector dummy plug ① to plug the electric drive controller connector.
Special tool: Electric drive connector plug (7002583DHY1)

c. Use the controller breather valve plug ① to connect the electric drive controller, and use a hose to connect the airtightness testing tool.
Special tool: Controller breather valve inflation plug (7002590DHY1)

d. Connect the tool to the power supply and turn it on. After entering the main interface, select "Enter Test", then sequentially select the vehicle model, model year, and test items to automatically load the corresponding test parameters. Perform the airtightness test according to the on-screen instructions (Preset pressure: 15±1 kPa, regulated pressure: 20 kPa, leakage upper limit: -10 Pa

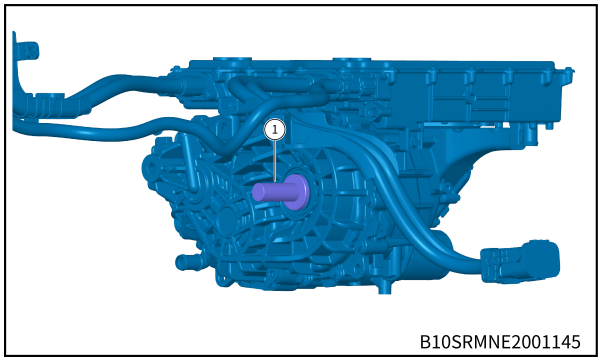
~ 30 Pa, inflation time: not less than 70s (the inflation time is for reference; ensure that the electronic control unit is fully filled with air), stabilization time: ≥15s, test time: 30s).

e. Upon completion of the airtightness tester inspection, the display will prompt "Qualified", the qualified indicator light will flash accompanied by a buzzer sound. Click "Reset" to release the pressure in the electric drive controller to complete the inspection.



ATTENTION

- If the airtightness tester indicates "Unqualified", check whether all plugs are installed in place and whether the stabilized pressure reaches 15±1 kPa.

3. Electric drive powertrain airtightness test.

d. Connect the airtight plug ① of the electric drive assembly to the breather valve port of the electric drive assembly, and use a hose to connect the airtightness testing tool.
Special tool: Electric drive assembly airtight plug (7002585DHY1)

e. Connect the tool to the power supply and turn it on. After entering the main interface, select "Enter Test", then sequentially select the vehicle model, model year, and test items, and the corresponding test parameters will be automatically loaded. Perform the airtightness test according to the on-screen instructions (preset pressure: 25±2kPa, regulated pressure: 30kPa, leakage upper limit: 16Pa, inflation time: 25s, stabilization time: 15s, test time: 10s).

f. After the air tightness tester completes the inspection, the display will prompt "Passed", the pass light will flash with a buzzer sound. Click "Reset" to release the pressure of the electric drive assembly and complete the inspection.

ATTENTION

- If the airtightness tester indicates "Unqualified", check whether all plugs are properly installed and whether the stabilized pressure reaches 25±2 kPa.

5 CHASSIS SYSTEM

5.1 SUSPENSION SYSTEM

5.1.1 PRECAUTIONS

PRECAUTIONS

1. During each vehicle maintenance, the rear drive motor mounting assembly must be checked.
2. There is 1 rear motor mount assembly: Rear motor front mount bracket assembly.
3. If internal cracking, damage, or other faults occur in the mount assembly, it must be replaced with a new one.
4. After installation, the fastener torque must be rechecked.
5. After removing and installing chassis components, a road test must be performed to ensure the vehicle does not pull to one side and produces no abnormal noises while driving.

5.1.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

1. The mounting structure is: compression rubber mount.
2. The mounting system is primarily used to support the weight of the power unit, suppress the dynamic displacement of the power unit caused by external forces including internal reaction forces, and prevent the transmission of vibration excitation forces from the drive motor assembly and other components to the vehicle body. It is a buffering system.
3. The drive motor assembly is secured to the rear subframe assembly via a three-point mounting. The primary function of the connected mounting cushion assembly is to dampen vehicle body vibrations and ensure the smooth operation of the transmission.
4. If such cushions fail (hardening, damage, or detachment), they will be unable to absorb bumps during driving, resulting in vibration during the operation of the drive motor assembly. Moreover, during vehicle acceleration and braking, the drive motor assembly may lurch back and forth, which can easily lead to the cracking of the housing and other components, damage to internal parts, and reduced driving comfort.

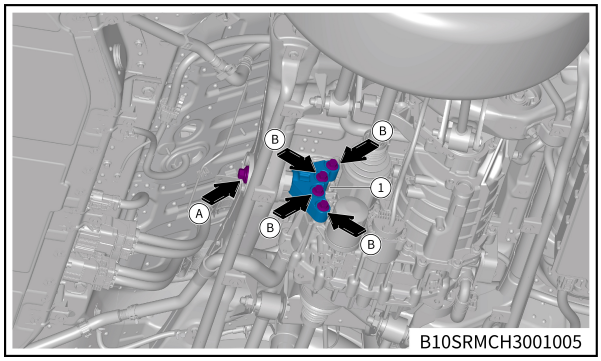
5.1.8 SERVICE AND REPAIR GUIDANCE



REAR MOTOR FRONT MOUNT BRACKET ASSEMBLY

NOTE

The rear motor mounting system is located in a relatively compact space, which imposes high requirements for removal and installation. The mounting components must be moved from multiple angles to be removed or installed. When repairing a single mounting component, it is not necessary to lower the rear subframe assembly.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
3. Remove the rear motor front mount bracket assembly.

a. Use a hydraulic lifting jack to support the electric drive powertrain.
   Recommended tool: Hydraulic lift
b. Unscrew the 1 fixing bolt - Arrow A - connecting the rear motor front mounting bracket assembly to the rear motor front mounting cushion assembly.
   Recommended tool: 18mm socket
   Torque + Angle: 140N m + (135±5)°

ATTENTION

If the bolt needs to be removed and reinstalled, it must be replaced with a new one. This bolt must not be reused.

c. Unscrew the 4 fixing bolts -Arrow B- connecting the rear motor front mounting bracket assembly to the electric drive powertrain.
   Recommended tool: 15mm socket
   Torque + angle: 80N m + (50±5)°
d. Remove the rear motor front mounting bracket assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis mounts, no pulling to one side, or other faults during driving.

5.2 DRIVE SHAFT SYSTEM

5.2.1 PRECAUTIONS

PRECAUTIONS

1. During each vehicle maintenance, the left and right drive shaft assemblies shall be inspected.
2. The drive motor mounting assembly shall be checked during each vehicle maintenance.
3. During vehicle driving, the drive shaft should be in a dynamically balanced state; otherwise, it may cause body resonance at specific speeds.
4. The driveshaft boot must be clean, free from damage, and free of oil contamination.
5. The oil seal between the drive shaft and the differential connecting housing must be intact, with no oil leakage.
6. The nut connecting the driveshaft to the steering knuckle must be tightened to the standard torque.
7. After removing and installing chassis components, a four-wheel alignment and road test must be performed on the vehicle to ensure it does not pull to one side and produces no abnormal noises during driving.

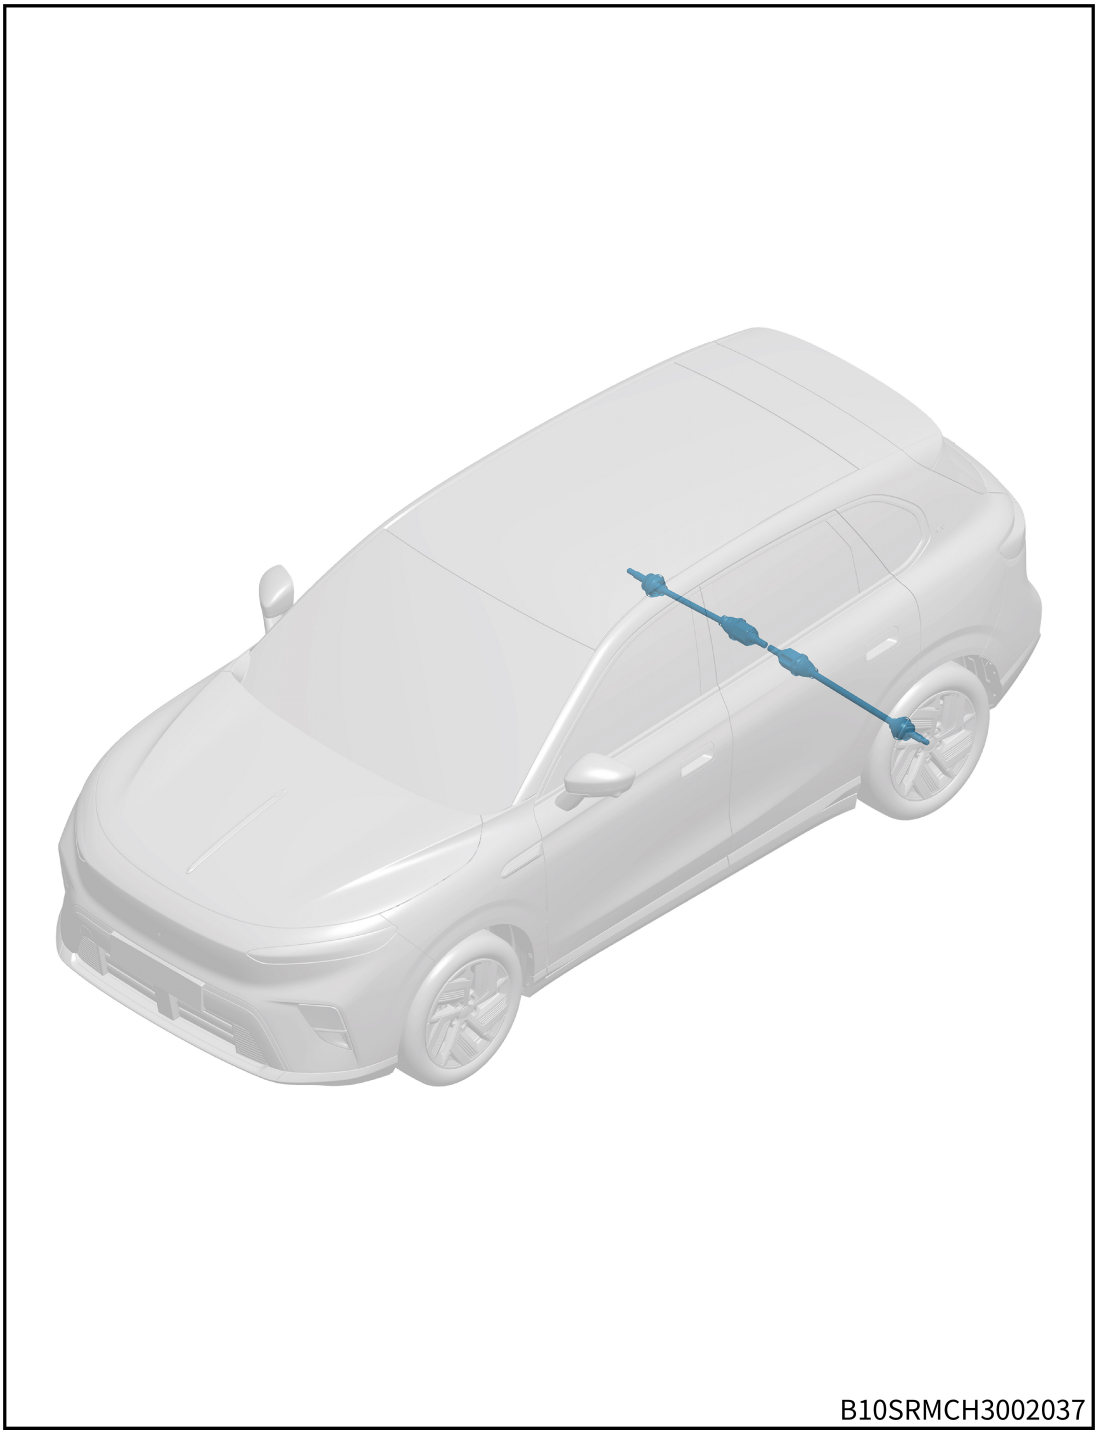
5.2.2 STRUCTURE AND PRINCIPLE INTRODUCTION



STRUCTURE AND PRINCIPLE INTRODUCTION

1. The drive shaft is a critical component for transmitting power in the vehicle drivetrain. It serves as the shaft that transmits torque between the reducer and the drive wheels. Its inner and outer ends each feature a universal joint, which connect to the reducer gear and the inner ring of the wheel hub bearing respectively via the splines on the universal joints.
2. Its function is to transmit power from the drive motor (including the differential) to the wheels, generating driving force for the vehicle.
3. The driveshaft assembly consists of a long (short) shaft tube, a telescopic sleeve, and universal joints.

e. Before installing the drive shaft assembly, first check whether there is a snap ring in the snap ring groove of the inner CV joint of the drive shaft assembly (at the differential connection end). Do not install the assembly on the vehicle without the snap ring. Then, align the outer splines of the rear drive shaft assembly with the inner splines of the differential, and push the drive shaft into the differential assembly. After a clicking sound is heard, grasp the sliding sleeve of the plunge joint and pull it outward along the axial direction. If it cannot be pulled out, it indicates that the assembly is properly installed.

f. During installation, do not pull on the shaft or the outer CV joint end, to prevent the inner CV joint tripod from dislodging from the housing. Reinserting it may rupture the inner boot, causing oil leakage and affecting its service life.

5.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The suspension system absorbs vibrations and impact forces from the road surface to the vehicle body, preventing body sway and bumping, thereby ensuring a smoother and more comfortable ride.
- The function of the vehicle suspension system is to transmit all forces and moments acting between the wheels and the frame (or body), cushion the impact loads transmitted from the uneven road surface to the frame (body), and dampen the resulting vibrations of the load-bearing system, thereby ensuring a smooth ride.
- Cushions and absorbs vibrations from the wheels, transmits driving and braking forces; it can improve the overall comfort and handling stability of the vehicle.

The front suspension adopts the MacPherson strut independent suspension structure, which mainly consists of the following components:

- Front strut assembly: Absorbs road impacts and dampens road vibrations.
- Front stabilizer bar link: Connects the front stabilizer bar to the front strut assembly.
- Front stabilizer bar assembly: Provides roll stiffness and reduces body roll angle.
- Front lower control arm assembly: Provides lateral support and controls the wheel trajectory.

FRONT STRUT ASSEMBLY INSPECTION

1. 1. Front strut assembly is too soft

Step 1 Check whether the front tyre pressure is normal?	
No 》》》 Adjust the tire pressure to the standard value according to the specifications on the tire label.	
Yes 》》》 Go to step 2.	
Step 2 Check if the vehicle is overloaded?	
Yes 》》》 Ask the user and explain what the normal load of the vehicle is.	
No 》》》 Go to step 3.	
Step 3 Check whether the compression and rebound effect of the front strut assembly is normal?	
	A. Quickly press and release the bumper corner closest to t he front strut assembly being inspected, and compare the c ompression and rebound effects with those of a normal veh icle of the same type. B Check the front strut assembly for normal compression a nd rebound.
No 》》》 Replace the front strut assembly.	
Yes 》》》 Go to step 4.	
Step 4 System normal.	

1. 2.Noise from front strut assembly

Step 1 Check if the front strut assembly is properly installed, and check if all components of the front strut assembly are functioning properly? (No looseness or other abnormalities should be present).	
No 》》》 Replace the front strut assembly if necessary.	
Yes 》》》 Go to step 2.	
Step 2 Check whether the compression and rebound effect of the front strut assembly is normal?	
	A Quickly press down and release the bumper corner closes t to the front strut assembly being inspected, and compare

	the compression and rebound characteristics with those of a normal vehicle of the same model. B Check the front strut assembly for normal compression a nd rebound.
No 》 》 》 Replace the front strut assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 While stationary, release the brake and steer at a normal speed to evaluate whether there is any nois e from the front strut.	
	A Inspect the upper mount, bearing, and spring, and replac e the front strut assembly if necessary.
Yes 》 》 》 Replace the front strut assembly.	
No 》 》 》 Go to step 4.	
Step 4 System normal.	

1. 3.Front strut oil leak

Step 1 Check if the front strut assembly is properly installed, and check if all components of the front strut assembly are functioning properly? (No looseness or other abnormalities should be present).
Next 》 》 》 Go to step 2.
Step 2 Check the sealing condition of the front strut assembly when fully extended, and check the dust cov er for any damage or other abnormalities.
Yes 》 》 》 Replace the front strut assembly.
No 》 》 》 Go to step 3.
Step 3 Check whether there is excessive fluid on the front strut assembly?
Yes 》 》 》 Replace the front strut assembly.
No 》 》 》 Go to step 4.
Step 4 System normal.

BALL JOINT AND STEERING KNUCKLE INSPECTION

1. 1. Inspection steps

Step 1 Lift the front of the vehicle so that the front suspension is in a free-hanging state.	
Next 》 》 》 Go to step 2.	
Step 2 Grasp the top and bottom of the front tire, and rock the top of the wheel inward and outward.	
Next 》 》 》 Go to step 3.	
Step 3 Check for any play, and whether the steering knuckle moves horizontally relative to the control arm?	
Next 》 》 》 Go to step 4.	
Step 4 The front lower control arm ball joint must be replaced if any of the following conditions occur.	
	A ball joint is loose. B The ball joint boot is broken. Disconnect the C ball joint bolt from the steering knuckle. Ball stud D is loose on the steering knuckle. The E ball stud will wiggle in its seat when pressed with a fi nger.
Yes 》 》 》 Replace the front lower control arm assembly.	
Next 》 》 》 Go to step 5.	
Step 5 System normal.

NOISE DIAGNOSIS

1. 1.Inspection steps

Step 1 Check whether the torque of each front suspension component is correct?
No 》 》 》 Check the front suspension components for wear?
Yes 》 》 》 Go to step 2.
Step 2 Check the front suspension components for wear?
Yes 》 》 》 Replace damaged front suspension components.
No 》 》 》 Go to step 3.
Step 3 Check whether the front lower control arm bushing is worn?
Yes 》 》 》 Replace the front lower control arm assembly.
No 》 》 》 Go to step 4.
Step 4 Check whether the front stabilizer bar link assembly is loose?
Yes 》 》 》 Tighten the fixing nut of the front stabilizer bar link assembly.
No 》 》 》 Go to step 5.
Step 5 Check whether the front strut assembly or the lower rubber pad of the front coil spring is in good co ndition, properly installed, or if there is any damage or other issues?
Yes 》 》 》 Replace the damaged parts.
No 》 》 》 Go to step 6.
Step 6 Check whether the front coil spring is misaligned?
Yes 》 》 》 Reinstall the front coil spring.
No 》 》 》

© 2026, All rights reserved

Go to step 7.
Step 7 Check whether the front stabilizer bar assembly bushings are excessively worn?
Yes 》 》 》 Replace the front stabilizer bar assembly.
No 》 》 》 Go to step 8.
Step 8 Find a vehicle of the same model and comprehensively evaluate whether the noise is normal operati ng noise.
Next 》 》 》 Go to Step 9.
Step 9 System components are normal.

RIDE COMFORT DIAGNOSIS (TOO SOFT OR TOO HARD)

1. 1.Inspection steps
1. 2. Too soft

Step 1 Check whether the front tire pressure is correct, and if not, adjust it to the correct tire pressure.
Next 》》》 Go to step 2.
Step 2 Check the front strut assembly for wear, proper installation, compatibility with the vehicle model, an d abnormal compression and rebound force. Replace the front strut assembly if necessary.
Next 》》》 Go to step 3.
Step 3 Check whether the front coil spring is broken or deformed, or if the spring does not match the vehicl e model. Replace the front coil spring if necessary.

1. 3. Robust

Step 1 Check whether the front tire pressure is correct, and if not, adjust it to the correct tire pressure.
Next 》》》 Go to step 2.
Step 2 Check whether the front strut assembly is installed correctly, whether it matches the vehicle model, and replace the front strut assembly if necessary.
Next 》》》 Go to step 3.
Step 3 Check whether the front coil spring is correct, and replace the front coil spring if necessary.

ABNORMAL FRONT RIDE HEIGHT

1. 1.Inspection steps

Step 1 Check whether the tire pressure, tire specifications, etc. are normal.
Next 》 》 》 Go to step 2.
Step 2 Check the coil spring in the front strut assembly for breakage or sagging, and replace it if necessary.
Next 》 》 》 Go to step 3.
Step 3 Measure the distance from the lower edge of the front and rear wheel rims to the edge of the fender f lares, and check whether the deviation between the measured value and the design value is less than 10 m m. If the distance exceeds this limit, inspect the coil springs, front shock absorbers, rubber bushings, and fr ont suspension assembly for damage or wear.
Next 》 》 》 Go to step 4.
Step 4 Check whether the vehicle is overloaded, and if necessary, explain the hazards of vehicle overloadin g to the user.
Next 》 》 》 Go to step 5.
Step 5 Check whether the coil spring in the front strut assembly is mismatched with the vehicle model or to o soft, and replace it with a genuine coil spring.

BODY LEAN OR SWAY WHEN TURNING

1. 1.Inspection steps

Step 1 Check the front stabilizer bar link for looseness, and retighten the nut connecting the front stabilizer bar link to the front strut assembly to the specified torque.
Next 》》》 Go to step 2.
Step 2 Check the front strut assembly and front strut upper mount assembly for wear, replace the front strut assembly if necessary, and retighten the fixing nuts of the front strut upper mount assembly.
Next 》》》 Go to step 3.
Step 3 Check whether the vehicle is overloaded, and provide a reasonable explanation to the user.
Next 》》》 Go to step 4.
Step 4 Check the front coil springs for breakage or sagging, and replace them if necessary.

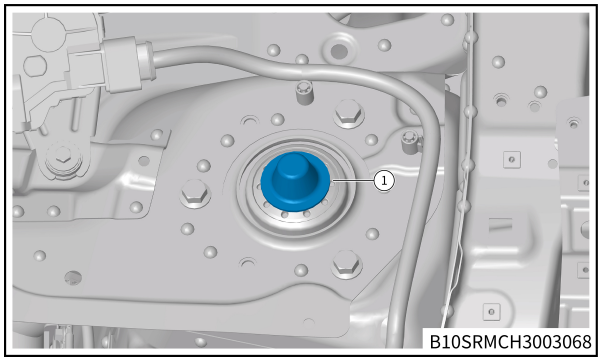
5.3.8 SERVICE AND REPAIR GUIDANCE



FRONT SHOCK ABSORBER PROTECTIVE COVER

NOTE

This section describes the removal and installation of the protective cover for the left front shock absorber, and the removal and installation of the protective cover for the right front shock absorber can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5311)
3. Remove the front shock absorber protective cover.

a. Remove the front shock absorber protective cover ①
Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is performed in reverse order.

FRONT SHOCK ABSORBER DUST COVER

NOTE

This section describes the removal and installation of the left front shock absorber dust cover. The removal and installation of the right front shock absorber dust cover can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
4. Remove the bearing.
   See:Bearing (page 2893)
5. Remove the upper vibration isolator pad of the front coil spring.
   See:Front Coil Spring Upper Vibration Isolator Pad (page 2894)
6. Remove the front coil spring.
   See:Front coil spring (page 2888)
7. Remove the front shock absorber dust cover.

a. Remove the front shock absorber dust cover ①.

ATTENTION

If the front shock absorber dust cover is cracked or damaged, it must be replaced with a new one.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

FRONT SHOCK ABSORBER BUMP STOP

NOTE

This section describes the removal and installation of the left front shock absorber buffer block, and the removal and installation of the right front shock absorber buffer block can generally refer to the left side.

REMOVAL PROCEDURE

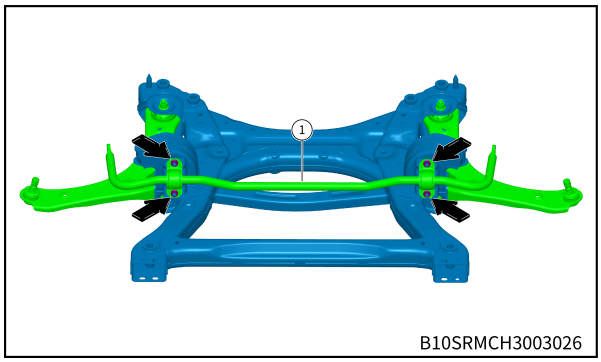
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
4. Remove the bearing.
   See:Bearing (page 2893)
5. Remove the upper vibration isolator pad of the front coil spring.
   See:Front Coil Spring Upper Vibration Isolator Pad (page 2894)
6. Remove the front coil spring.
   See:Front coil spring (page 2888)
7. Remove the front shock absorber bump stop.

a. Remove the front shock absorber bump stop ①.

ATTENTION

If the front shock absorber bump stop is cracked or damaged, the front shock absorber bump stop must be replaced.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

FRONT SUBFRAME ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the left/right front wheel assembly.
   See:Wheel Assembly (page 2962)
5. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
6. Remove the front sub anti-collision beam assembly.
   See:Secondary Anti-collision Beam Assembly (page 6343)
7. Remove the manual steering gear with tie rod assembly.
   See:Mechanical steering gear with tie rod assembly (page 3091)
8. Remove the electric compressor casting bracket.
   See:Electric compressor cast bracket (page 5172)
9. Remove the front subframe assembly.

a. Unscrew the 4 fixing nuts connecting the front stabilizer bar assembly to the front subframe assembly -arrow-, and remove the front stabilizer bar assembly ①.
Recommended tool: 15mm socket
Torque: 70±5N m

b. Unscrew the 2 fixing bolts/nuts connecting the front subframe assembly to the left/right front lower control arm assembly of the front suspension - arrow A -.
Recommended tools: 18mm socket, 21mm wrench
Torque + angle: 130N m + (65±5)°

> **ATTENTION**
>
> During installation, pay attention to the insertion direction of the mounting bolts: from bottom to top.

c. Unscrew the 2 fixing bolts/nuts -arrow B- securing the front subframe assembly to the front suspension left/right front lower control arm assembly.

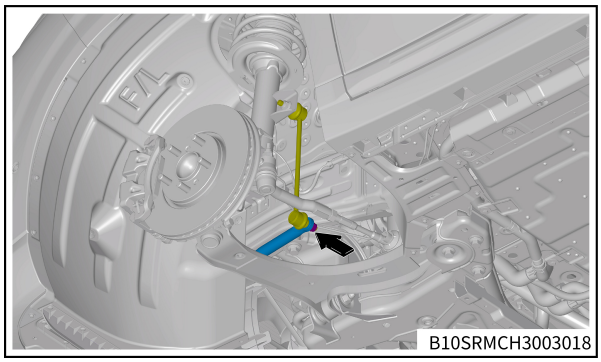
> When installing, pay attention to the insertion direction of the fixing bolts: from the front to the rear of the vehicle.

d. Remove the front suspension left front lower control arm assembly ①, front suspension right front lower control arm assembly ②, and front subframe assembly ③.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the vehicle must undergo four-wheel alignment and a road test to confirm that there are no abnormal noises from the chassis, pulling to one side, or other fault phenomena during driving.

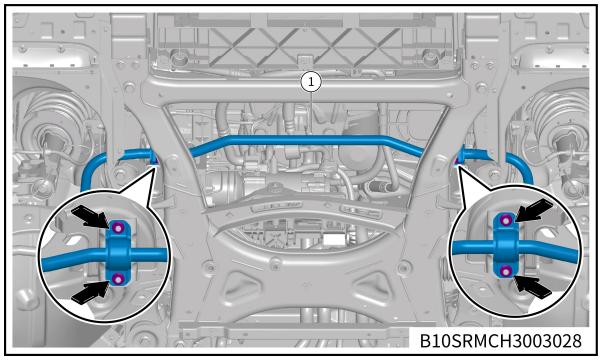
FRONT STABILIZER BAR ASSEMBLY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the left/right front wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the front stabilizer bar assembly.

a. Unscrew the 1 fixing nut - arrow - connecting the front stabilizer bar assembly to the left front stabilizer bar link assembly, and disconnect the connection.
Recommended tools: T40mm hex socket wrench, 18mm wrench
Torque: 125±10N m

> **ATTENTION**
>
> This section describes the removal procedure for the front left stabilizer bar link assembly. For the right side, refer to the removal procedure for the left side.

b. Unscrew the 4 fixing nuts connecting the front stabilizer bar assembly to the front subframe assembly -arrow-, and remove the front stabilizer bar assembly ①.
Recommended tool: 15mm socket
Torque: 70±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to ensure normal vehicle operation, with no abnormal noises from the chassis, no pulling to one side, or other faults.

FRONT SUSPENSION FRONT LEFT LOWER CONTROL ARM ASSEMBLY

NOTE

This section describes the removal and installation of the front left lower control arm assembly. The removal and installation of the front right lower control arm assembly can generally be carried out with reference to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the front left lower control arm assembly of the front suspension.

a. Unscrew the 1 fixing bolt/nut -Arrow A- connecting the front left lower control arm assembly to the front subframe assembly.
Recommended tools: 18mm socket, 21mm wrench
Torque + angle: 130N m + (65±5)°

ATTENTION

During installation, pay attention to the insertion direction of the mounting bolts: from bottom to top.

b. Unscrew the 1 fixing bolt connecting the front left lower control arm assembly to the front subframe assembly -arrow B-.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (120±5)°

ATTENTION

When installing, pay attention to the insertion direction of the fixing bolts: from the front to the rear of the vehicle.

c. Unscrew the 1 fixing bolt/nut - Arrow C - connecting the front left lower control arm assembly to the front left steering knuckle assembly, and disconnect the connection.
Recommended tools: 15mm socket, 18mm wrench

FRONT COIL SPRING

NOTE

This section describes the removal and installation of the left front coil spring. The removal and installation of the right front coil spring can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
4. Remove the bearing.
   See:Bearing (page 2893)
5. Remove the upper vibration isolator pad of the front coil spring.
   See:Front Coil Spring Upper Vibration Isolator Pad (page 2894)
6. Remove the front coil spring.

a. Remove the front coil spring ①.

ATTENTION

Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

FRONT STABILIZER BAR LINK ASSEMBLY

NOTE

This section describes the removal and installation of the front stabilizer bar left link assembly, and the removal and installation of the front stabilizer bar right link assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front stabilizer bar link assembly.

a. Unscrew the 1 fixing nut connecting the left front strut assembly to the front lateral stabilizer bar link assembly - Arrow A -.
Recommended tools: T40mm hex socket wrench, 18mm wrench
Torque: 125±10N m
b. Unscrew the 1 fixing nut connecting the front stabilizer bar assembly to the front stabilizer bar link assembly -Arrow B-.
Recommended tools: T40mm hex socket wrench, 18mm wrench
Torque: 125±10N m
c. Remove the front stabilizer bar link assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the front stabilizer bar link assembly, pay attention to the left and right orientation of the stabilizer bar; there is a yellow mark on the left side of the bar.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while driving.

FRONT STRUT UPPER MOUNT ASSEMBLY

NOTE

This section describes the removal and installation of the front left strut upper mount assembly, and the removal and installation of the front right strut upper mount assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the front left strut assembly.
   See:Front left strut assembly (page 2895)
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.

B10SRMCH3003014

a. Use the shock absorber spring compressor ① to compress the front coil spring - arrow A -.
Recommended tool: Shock absorber spring compressor
b. Use a wrench to rotate the shock absorber nut removal and installation tool ② - Arrow B - clockwise to secure it, and use a wrench to rotate the shock absorber nut removal and installation tool ② - Arrow C - counterclockwise to unscrew the retaining nut of the front strut upper mount assembly.
Special tool: Front shock absorber nut removal and installation tool (7002588DHY1)
Torque: 80±3N m
c. Remove the front strut upper mount assembly ③.

ATTENTION

- Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.
- The fixing nut for the front strut upper mount assembly is a single-use part and cannot be reused. After removal, it must be replaced with a new fixing nut.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

FRONT COIL SPRING LOWER VIBRATION ISOLATING PAD

NOTE

This section describes the removal and installation of the front left lower coil spring isolator, and the removal and installation of the front right lower coil spring isolator can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
4. Remove the bearing.

6. Remove the front coil spring.
   See:Front coil spring (page 2888)
7. Remove the front shock absorber dust cover.
   See:Front shock absorber dust cover (page 2881)
8. Remove the lower insulator pad of the front coil spring.

a. Remove the lower vibration isolator pad of the front coil spring ①.

ATTENTION

If the lower rubber pad of the spring is cracked or damaged, it must be replaced with a new lower front coil spring isolator.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test; ensure that while driving, there are no abnormal noises from the chassis components and no faults such as pulling to one side.

BEARING

NOTE

This section describes the removal and installation of the front left bearing, and the removal and installation of the front right bearing can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
4. Remove the bearing.

a. Remove the bearing ①.

ATTENTION

Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

FRONT COIL SPRING UPPER VIBRATION ISOLATOR PAD

NOTE

This section describes the removal and installation of the upper vibration isolator pad of the left front coil spring. The removal and installation of the upper vibration isolator pad of the right front coil spring can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
3. Remove the front strut upper mount assembly.

4. Remove the bearing.
   See:Bearing (page 2893)
5. Remove the upper vibration isolator pad of the front coil spring.

a. Remove the upper vibration isolator of the front coil spring ①.

ATTENTION

Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the upper isolation pad of the front coil spring, ensure that the mating position of the upper isolation pad aligns with the mating position on the bearing.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

g. Unscrew the 3 fixing bolts -arrow- securing the left front strut assembly to the body, and remove the left front strut assembly ①.
Recommended tool: 15mm socket
Torque + Angle: 25N m + (55±5)°

ATTENTION

- When removing the front strut assembly bolts, another technician must assist in holding the front strut assembly steady to prevent it from falling to the ground and causing component damage.
- When installing the fixing bolts, ensure that the bolts do not interfere with the body sheet metal.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After inserting the brake assembly, check whether the mating surface between the brake assembly and the front strut assembly is fully seated. Once confirmed, tighten the fixing bolts.
   b. After installation, four-wheel alignment and a road test must be performed on the vehicle; confirm that while driving, there are no abnormal noises from the chassis components, no pulling to one side, or other faults.

FRONT LEFT SHOCK ABSORBER BODY ASSEMBLY

NOTE

This section describes the removal and installation of the front left shock absorber body assembly, and the removal and installation of the front right shock absorber body assembly can generally be performed with reference to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left strut assembly.
   See:Front left strut assembly (page 2895)
3. Remove the front shock absorber protective cover.
   See:Front shock absorber protective cover (page 2880)
4. Remove the front strut upper mount assembly.
   See:Front strut upper mount assembly (page 2890)
5. Remove the bearing.
   See:Bearing (page 2893)
6. Remove the upper vibration isolator pad of the front coil spring.
   See:Front Coil Spring Upper Vibration Isolator Pad (page 2894)
7. Remove the front coil spring.
   See:Front coil spring (page 2888)
8. Remove the front shock absorber bump stop.
   See:Front shock absorber bump stop (page 2882)
9. Remove the front shock absorber dust cover.
   See:Front shock absorber dust cover (page 2881)
10. Remove the lower insulator pad of the front coil spring.
    See:Front coil spring lower vibration isolating pad (page 2892)
11. Remove the left front shock absorber body assembly.

a. Remove the front left shock absorber body assembly ①.

ATTENTION

When removing the front shock absorber body assembly, the front strut assembly must be completely disassembled.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.

5.4 REAR SUSPENSION SYSTEM

5.4.1 PRECAUTIONS

PRECAUTIONS

1. Before repairing or replacing parts, thoroughly inspect the parts.
2. Keep the workspace as clean as possible during operation to prevent foreign objects from entering the components.
3. Disassembled parts (excluding rubber parts) shall be cleaned with a cleaner and blown dry.
4. After installation, the fastener torque must be rechecked.
5. After removing and installing some chassis components, a four-wheel alignment and road test must be performed on the vehicle to ensure it does not pull to one side and produces no abnormal noises during driving.
6. Note: Tighten the rear subframe assembly in a diagonal sequence: left front - right rear - left rear - right front, to the specified torque.

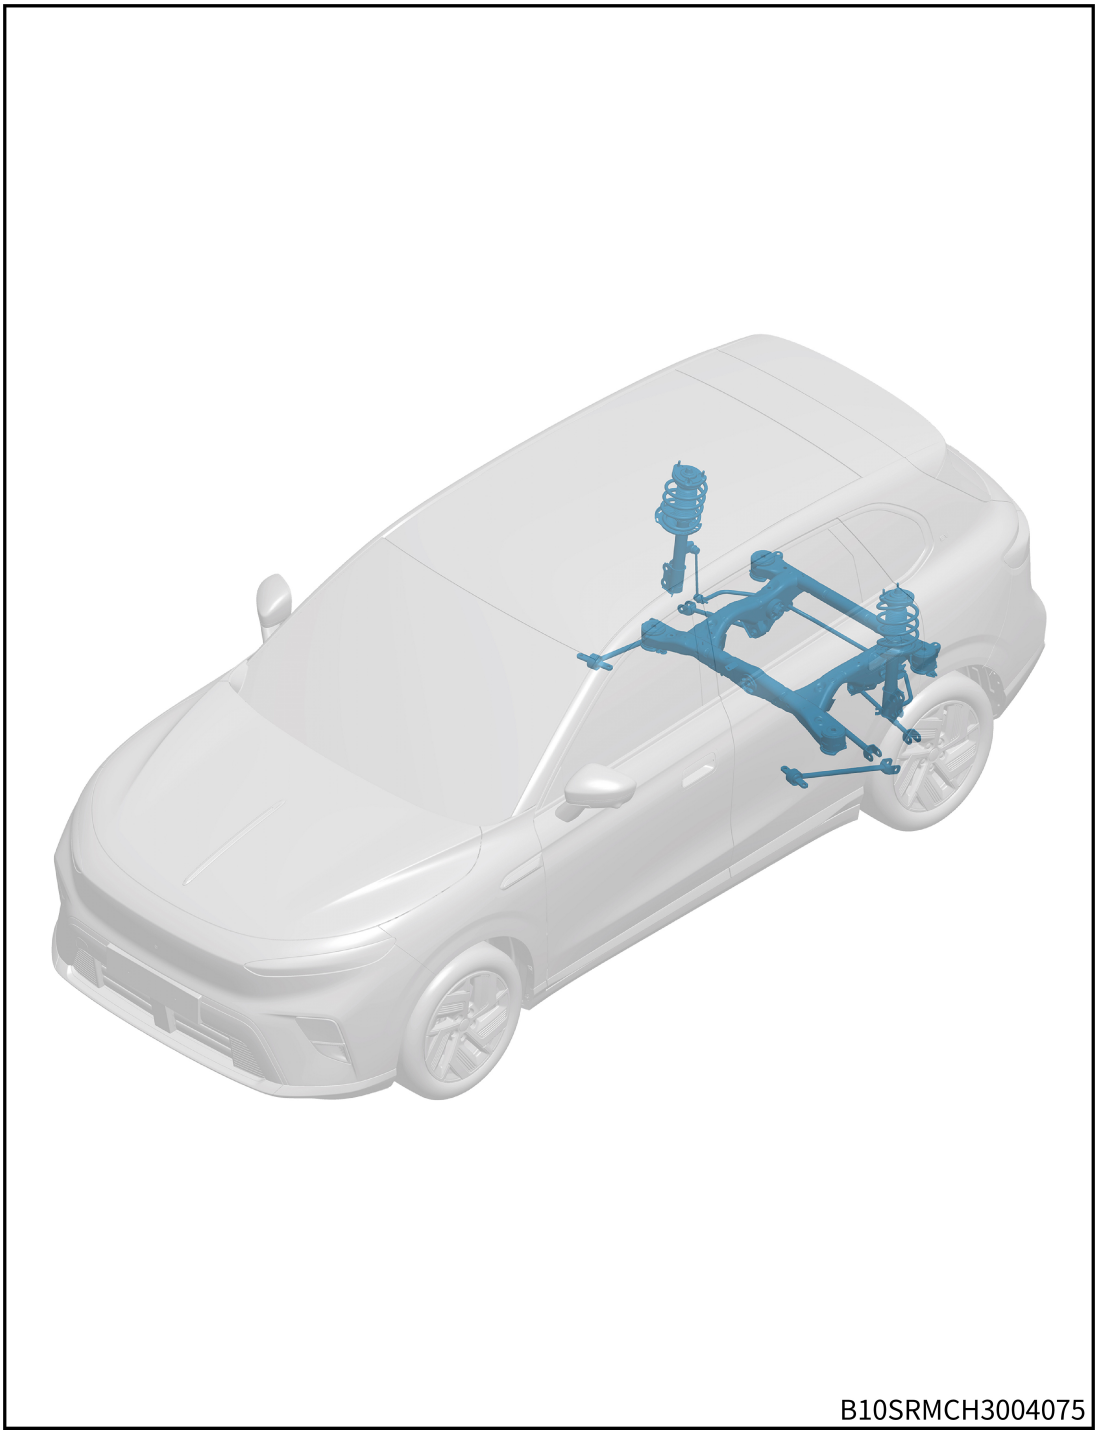
5.4.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The suspension system absorbs vibrations and impact forces from the road surface, reducing vehicle body sway and bumping to make driving smoother and more comfortable.
- The function of the vehicle suspension system is to transmit all forces and moments acting between the wheels and the frame (or body), cushion the impact loads transmitted from the uneven road surface to the frame (body), and dampen the resulting vibrations of the load-bearing system, thereby ensuring a smooth ride.
- Cushions and absorbs vibrations from the wheels, transmits driving and braking forces; it can improve the overall comfort and handling stability of the vehicle.



The rear suspension uses a multi-link independent suspension structure, and mainly consists of the following components: rear subframe assembly, rear suspension longitudinal link assembly, rear suspension front link assembly, rear suspension toe link assembly, rear strut assembly, rear stabilizer bar link assembly, and rear stabilizer bar assembly.

- Rear subframe assembly: Connects the suspension to the body and provides mounting points for the suspension control arm links.
- Rear suspension longitudinal link assembly: Provides longitudinal support and controls the wheel movement trajectory.
- Rear suspension toe link assembly/Rear suspension front link assembly: Provides lateral support, controls wheel movement trajectory, and the toe angle is adjustable via the bolt.
- Rear strut assembly: Cushions road impacts and dampens road vibrations.
- Rear stabilizer bar assembly: Provides roll stiffness and reduces body roll angle.
- Rear stabilizer bar link assembly: Connects the rear stabilizer bar to the control arm.

5.4.5 COMMON FAULTS

NOISE DIAGNOSIS

1. 1.Inspection steps

Step 1 Check whether the torque of each rear suspension component is correct?
No 》》》 Retighten all components to the correct torque
Yes 》》》 Go to step 2.
Step 2 Check whether the rear suspension components are worn?
Yes 》》》 Replace damaged rear suspension components.
No 》》》 Go to step 3.
Step 3 Check all ball joints for insufficient lubrication?
Yes 》》》 Replace the insufficiently lubricated ball joint component.
No 》》》 Go to step 4.
Step 4 Check whether the rear stabilizer bar link assembly is loose?
Yes 》》》 Tighten the fixing nut of the rear stabilizer bar link assembly.
No 》》》 Go to step 5.
Step 5 Check whether the rear strut assembly or the lower rubber pad of the rear coil spring is intact, properly installed, or damaged?
Yes 》》》 Replace the damaged parts.
No 》》》 Go to step 6.
Step 6 Check whether the rear coil spring is misaligned?
Yes 》》》 Reinstall the rear coil spring.

No 》 》 》 Go to step 7.
Step 7 Check whether the bushings of the rear stabilizer bar assembly are excessively worn?
Yes 》 》 》 Replace the rear stabilizer bar assembly.
No 》 》 》 Go to step 8.
Step 8 Find a vehicle of the same model and comprehensively evaluate whether the noise is normal operati ng noise.
Next 》 》 》 Go to Step 9.
Step 9 System components are normal.

RIDE COMFORT DIAGNOSIS (TOO SOFT OR TOO HARD)

1. 1.Inspection steps
1. 2. Too soft

Step 1 Check whether the rear tire pressure is correct, and if not, adjust it to the correct tire pressure.
Next 》 》 》 Go to step 2.
Step 2 Check whether the rear strut assembly is worn, properly installed, or incompatible with the vehicle m odel, and whether the compression rebound force of the rear strut assembly is abnormal. Replace the rear strut assembly if necessary.
Next 》 》 》 Go to step 3.
Step 3 Check whether the rear coil spring is broken or deformed, or whether the spring does not match the vehicle model, and replace the rear coil spring if necessary.
Next 》 》 》 Go to step 4.
Step 4 Check the bushings in the rear suspension assembly for abnormal wear, and replace the components with worn bushings in the rear suspension assembly if necessary.

1. 3. Robust

Step 1 Check whether the rear tire pressure is correct, and if not, adjust it to the correct tire pressure.
Next 》 》 》 Go to step 2.
Step 2 Check whether the rear strut assembly is installed correctly and whether it is compatible with the ve hicle model. Replace the rear strut assembly if necessary.
Next 》 》 》 Go to step 3.
Step 3 Check whether the rear coil spring is correctly installed, and replace it if necessary.

ABNORMAL REAR HEIGHT

1. 1.Inspection steps

Step 1 Check whether the rear tyre pressure is normal? If necessary, adjust the tyre pressure to the standard value according to the specifications on the tyre label.
Next 》 》 》 Go to step 2.
Step 2 Check whether the vehicle is overloaded, and if necessary, explain the hazards of vehicle overloading to the user.
Next 》 》 》 Go to step 3.
Step 3 Check the rear coil spring for breakage or deformation, and replace it with a genuine coil spring if necessary.

BODY LEAN OR SWAY WHEN TURNING

1. 1.Inspection steps

Step 1 Check the rear strut assembly for pressure loss, replace the rear strut assembly if necessary, and retighten the mounting bolts on the rear strut assembly.
Next 》》》 Go to step 2.
Step 2 Check whether the vehicle is overloaded, and provide a reasonable explanation to the user.
Next 》》》 Go to step 3.
Step 3 Check the rear coil spring for breakage or sagging, and replace it if necessary.

EXCESSIVE FRICTION CHECK

1. 1. Inspection steps

Step 1 Park the vehicle on a level surface, and ensure that the tire pressure on the left and right sides of the vehicle is the same.
Next 》》》 Go to step 2.
Step 2 Lift the rear bumper, and raise the vehicle as high as possible.
Next 》》》 Go to step 3.
Step 3 Slowly lower the rear bumper to restore the vehicle to its normal ride height.
Next 》》》 Go to step 4.
Step 4 Measure the distance from the lower edge of the rim to the edge of the fender flare.
Next 》》》 Go to step 5.
Step 5 Press the rear bumper, then slowly release it to allow the vehicle to return to its normal ride height.
Next 》》》 Go to step 6.
Step 6 Measure the distance from the lower edge of the rim to the edge of the fender flare.
Next 》》》 Go to step 7.
Step 7 If the difference between the two measurements exceeds the specified value, check the coil spring, r ear strut assembly, rubber bushing, and rear suspension assembly for damage or wear.

REAR STRUT ASSEMBLY INSPECTION

1. 1. Rear strut assembly is too soft

Step 1 Check whether the rear tire pressure is normal?	
No 》 》 》 Adjust the tire pressure to the standard value according to the specifications on the tire label.	
Yes 》 》 》 Go to step 2.	
Step 2 Check if the vehicle is overloaded?	
Yes 》 》 》 Ask the user and explain what the normal load of the vehicle is.	
No 》 》 》 Go to step 3.	
Step 3 Check whether the compression and rebound of the rear strut assembly are normal?	
	A Quickly press and release at the corner closest to the rear strut assembly being inspected and the rear bumper, and c ompare the compression and rebound effects with those of a normal vehicle of the same type.
No 》 》 》 Replace the rear strut assembly.	
Yes 》 》 》 Go to step 4.	
Step 4 System normal.	

1. 2. Noise from rear strut assembly

Step 1 Check whether the installation of the rear sliding pillar assembly is normal? (No looseness or other a bnormalities should be present).
No 》 》 》 Properly reinstall the rear strut assembly.
Yes 》 》 》 Go to step 2.
Step 2 Check whether all components of the rear strut assembly are functioning normally? (There should be no looseness or other abnormalities).
No 》 》 》 Tighten the fixing bolts or nuts of the components in the rear strut assembly to the specified torque.
Yes 》 》 》

© 2026, All rights reserved

Go to step 3.
Step 3 Check whether the rear strut assembly is damaged?
No 》 》 》 Replace the damaged rear strut assembly.
Yes 》 》 》 Go to step 4.
Step 4 Check whether the compression and rebound of the rear strut assembly are normal?
A Quickly press and release at the rear bumper corner closest to the rear strut being inspected, and compare the compression and rebound with those of a normal vehicle of the same type.
No 》 》 》 Replace the rear strut assembly.
Yes 》 》 》 Go to step 5.
Step 5 System normal.

1. 3. Rear strut oil leak

Step 1 Check the sealing condition when the rear strut assembly is fully extended, and check for any damage or other issues with the dust boot.
Yes 》 》 》 Replace the rear strut assembly.
No 》 》 》 Go to step 3.
Step 2 Check whether there is excessive fluid on the rear strut assembly?
Yes 》 》 》 Replace the rear strut assembly.
No 》 》 》 Go to step 4.
Step 3 System normal.

REAR SHOCK ABSORBER BUMP STOP

NOTE

This section describes the removal and installation of the left rear shock absorber buffer block, and the removal and installation of the right rear shock absorber buffer block can be performed with reference to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the dust cover of the rear shock absorber.
   See:Rear shock absorber dust cover (page 2917)
3. Remove the rear strut upper mount assembly.
   See:Rear strut upper mount assembly (page 2930)
4. Remove the upper rubber pad of the rear coil spring.
   See:Rear coil spring upper rubber pad (page 2929)
5. Remove the rear coil spring.
   See:Rear coil spring (page 2936)
6. Remove the rear shock absorber dust cover.
   See:Rear shock absorber dust cover (page 2919)
7. Remove the rear shock absorber bump stop.

a. Remove the rear shock absorber bump stop ①.

ATTENTION

Take care not to damage the dust cover of the shock absorber assembly.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR SHOCK ABSORBER DUST COVER

NOTE

This section describes the removal and installation of the rear left shock absorber dust cover, and the removal and installation of the rear right shock absorber dust cover can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
3. Remove the dust cover of the rear shock absorber.

a. Remove the rear shock absorber dust cover ①.

   See:Rear coil spring lower rubber pad (page 2932)
9. Remove the rear shock absorber body assembly.

a. Remove the rear shock absorber body assembly ①.

ATTENTION

When removing the rear shock absorber body assembly, the rear strut assembly must be completely disassembled.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

5. Remove the rear coil spring.
   See:Rear coil spring (page 2936)
6. Remove the rear shock absorber dust cover.

a. Remove the rear shock absorber dust cover ①.

ATTENTION

If the rear shock absorber dust cover is cracked or damaged, it must be replaced with a new one.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

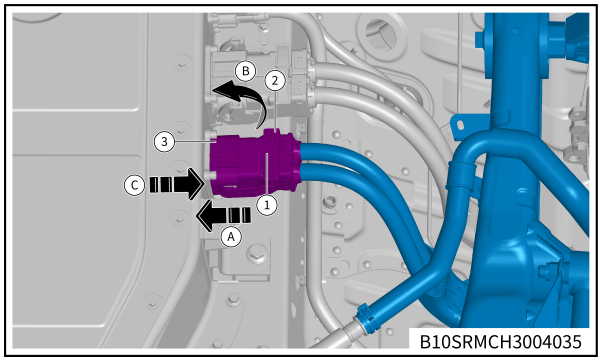
REAR SUBFRAME ASSEMBLY

NOTE

The mounting bracket of the drive motor assembly is connected to the rear subframe assembly, when removing the rear subframe assembly, the drive motor assembly should be removed together with the rear subframe assembly, and disassembled after being removed from the vehicle.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right rear wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the rear compartment lower cover assembly.

suspension components, and remove the rear subframe assembly ①.

> **ATTENTION**
>
> Remove the various control arms and tie rods on the rear subframe assembly. For specific procedures, refer to the individual removal sections for each component. When removing the mounting cushion assemblies of the drive motor, the drive motor assembly must be lifted; avoid the drive motor tilting and falling to the ground, which may damage the drive motor assembly and, in severe cases, cause personal injury.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, top up or replace the coolant as necessary.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

   > **ATTENTION**
   >
   > Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. After replacing or topping up the coolant, check that the coolant level is between the MAX (maximum) and MIN (minimum) marks.

   b. Tighten the fixing bolts of the rear subframe assembly to the specified torque in a diagonal sequence: left front - right rear - left rear - right front.
   c. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR SUSPENSION TOE LINK ASSEMBLY

NOTE

This section describes the removal and installation of the left rear suspension toe link assembly. The removal and installation of the right rear suspension toe link assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the rear suspension toe link assembly.

a. Unscrew the 1 fixing bolt connecting the rear suspension toe link assembly to the rear subframe assembly - Arrow A -.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (55±5)°

ATTENTION

Note the insertion direction of the bolt: from the rear to the front of the vehicle, and tighten the bolt to the specified torque.

b. Unscrew the 1 fixing bolt/nut - Arrow B - connecting the rear suspension toe link assembly to the left rear steering knuckle assembly.
Recommended tools: 18mm socket, 19mm wrench
Torque + angle: 130N m + (65±5)°

ATTENTION

Note the insertion direction of the bolt: from the rear to the front of the vehicle, tighten the bolt to the specified torque, the torque or preload must not be applied to the nut, but only to the bolt.

c. Remove the rear suspension toe link assembly ①.

REAR SUSPENSION LONGITUDINAL LINK ASSEMBLY

NOTE

This section describes the removal and installation of the left rear suspension longitudinal link assembly, and the removal and installation of the right rear suspension longitudinal link assembly can generally be performed with reference to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the rear lower guard plate assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the rear suspension longitudinal link assembly.

a. Unscrew the 2 fixing bolts connecting the rear suspension longitudinal link assembly to the vehicle body -arrow A-.
Recommended tool: 18mm socket
Torque + Angle: 130N m+(45±5)°

b. Unscrew the 1 fixing bolt/nut connecting the rear suspension longitudinal link assembly to the left rear steering knuckle assembly - Arrow B -.
Recommended tools: 18mm socket, 19mm wrench
Torque + Angle: 130N m + (70±5)°

ATTENTION

Note the bolt insertion direction: from the interior to the exterior of the vehicle, tighten the bolt to the specified torque, torque or preload must not be applied to the nut, only to the bolt.

c. Remove the rear suspension longitudinal link assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR SUSPENSION FRONT LINK ASSEMBLY

NOTE

This section describes the removal and installation of the left front link assembly of the rear suspension. The removal and installation of the right front link assembly of the rear suspension can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the rear lower guard plate assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the rear suspension front link assembly.

a. Unscrew the 1 fixing bolt/nut - Arrow A - that connects the rear suspension front link assembly to the rear subframe assembly.
Recommended tools: 18mm socket, 21mm wrench
Torque + Angle: 130N m + (55±5)°

ATTENTION

Note the insertion direction of the bolt: from the rear to the front of the vehicle, tighten the nut to the specified torque.

b. Unscrew the 1 fixing bolt/nut connecting the rear suspension front link assembly to the left rear steering knuckle assembly - Arrow B -.
Recommended tools: 18mm socket, 19mm wrench
Torque + angle: 130N m + (65±5)°

ATTENTION

Note the insertion direction of the bolt: from the front to the rear of the vehicle, tightening the bolt to the specified torque, ensuring the torque or preload is not applied to the nut, but only to the bolt.

c. Remove the rear suspension front link assembly ①.

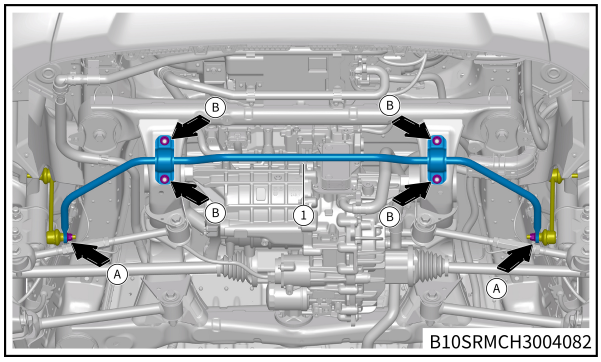
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR STABILIZER BAR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
3. Remove the rear stabilizer bar assembly.

a. Unscrew the 2 fixing nuts -arrow A- connecting the left/right link assembly to the rear stabilizer bar assembly.
Recommended tools: T30mm hexagon socket wrench, 15mm wrench
Torque: 60±5N m

b. Unscrew the 4 fixing nuts connecting the rear stabilizer bar assembly to the rear subframe assembly - Arrow B -, and remove the rear stabilizer bar assembly ①.
Recommended tool: 15mm socket
Torque + Angle: 45N m + (25±5)°

> **ATTENTION**
>
> When installing the rear stabilizer bar and the subframe, use a torque gun (23Nm) to tighten the upper and lower fastening points on the same side simultaneously, or use an equivalent synchronous tightening method (maintaining synchronous tightening in steps) until the rear stabilizer bar mounting bracket is flush with the rear subframe mounting surface; tighten the nuts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After assembly, the dust cover of the rear stabilizer bar link assembly must not interfere with the ball joint seat. If interference occurs, manually rotate the lower control arm to ensure that the dust cover does not interfere with the ball joint seat.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while driving.

REAR COIL SPRING UPPER RUBBER PAD

NOTE

This section describes the removal and installation of the upper rubber pad of the left rear coil spring, and the removal and installation of the upper rubber pad of the right rear coil spring can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the dust cover of the rear shock absorber.
   See:Rear shock absorber dust cover (page 2917)
3. Remove the rear strut upper mount assembly.
   See:Rear strut upper mount assembly (page 2930)
4. Remove the upper rubber pad of the rear coil spring.

a. Remove the upper rubber pad ① on the rear coil spring.

ATTENTION

Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR STRUT UPPER MOUNT ASSEMBLY

NOTE

This section describes the removal and installation of the rear left strut upper mount assembly, and the removal and installation of the rear right strut upper mount assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the left rear strut assembly.
   See:Rear left strut assembly (page 2934)
3. Remove the dust cover of the rear shock absorber.
   See:Rear shock absorber dust cover (page 2917)
4. Remove the rear strut upper mount assembly.

a. Use the shock absorber spring compressor ① to compress the rear coil spring - arrow A -.
Recommended tool: Shock absorber spring compressor
b. Use a wrench to rotate the shock absorber nut removal and installation tool ②-Arrow B- clockwise to secure it, and use a wrench to rotate the shock absorber nut removal and installation tool ②-Arrow C- counterclockwise to unscrew the fixing nut of the rear strut upper mount assembly.
Special tool: Front shock absorber nut removal and installation tool (7002588DHY1)
Torque: 80±3N m
c. Remove the rear strut upper mount assembly ③.

ATTENTION

- Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.
- The fixing nut for the rear strut upper mount assembly is a one-time use part and cannot be reused. It must be replaced with a new fixing nut after removal.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

REAR COIL SPRING LOWER RUBBER PAD

NOTE

This section describes the removal and installation of the lower rubber pad of the left rear coil spring, and the removal and installation of the lower rubber pad of the right rear coil spring can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the dust cover of the rear shock absorber.
   See:Rear shock absorber dust cover (page 2917)
3. Remove the rear strut upper mount assembly.
   See:Rear strut upper mount assembly (page 2930)
4. Remove the upper rubber pad of the rear coil spring.
   See:Rear coil spring upper rubber pad (page 2929)
5. Remove the rear coil spring.
   See:Rear coil spring (page 2936)
6. Remove the lower rubber pad of the rear coil spring.

a. Remove the lower rubber pad ① of the rear coil spring.

ATTENTION

If the lower rubber pad of the spring is cracked or damaged, it must be replaced with a new lower rubber pad for the rear coil spring.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR STABILIZER BAR LINK ASSEMBLY

NOTE

This section describes the removal and installation of the rear stabilizer bar left link assembly, and the procedure for the right link assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the rear stabilizer bar link assembly.

a. Unscrew the 2 fixing nuts connecting the rear stabilizer bar link assembly -arrow-.
   Recommended tools: T30 Torx wrench, 15mm wrench
   Torque: 60±5N m
b. Remove the rear stabilizer bar link assembly ①.

ATTENTION

When removing the rear stabilizer bar link assembly, the rear stabilizer bar assembly may be under spring tension.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After assembly, the dust cover of the rear stabilizer bar link assembly must not interfere with the ball joint seat. If interference occurs, manually rotate the lower control arm to ensure that the dust cover does not interfere with the ball joint seat.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while driving.

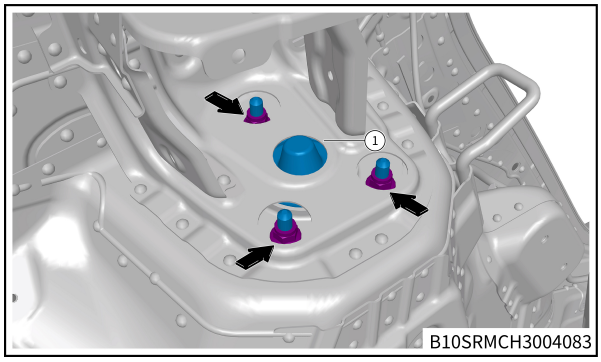
REAR LEFT STRUT ASSEMBLY

NOTE

This section describes the removal and installation of the rear left strut assembly, and the removal and installation of the rear right strut assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
5. Remove the left rear strut assembly.



a. Unscrew the 1 fixing bolt -arrow A- connecting the left rear steering knuckle assembly to the left rear brake hose assembly, and move it aside and secure it.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Detach the 1 fixing rubber sleeve connecting the left rear strut assembly to the left rear intelligent wheel speed sensor - Arrow B -, and move the wiring harness aside and secure it.
c. Unscrew the 1 fixing nut connecting the rear left strut assembly to the rear stabilizer bar assembly - arrow C -.
   Recommended tools: T30 Torx wrench, 15mm wrench
   Torque: 60±5N m
d. Unscrew the 2 fixing nuts connecting the left rear strut assembly and the left rear steering knuckle assembly - arrow D -.
   Recommended tool: 24mm socket
   Torque + Angle: 200N m + (75±5)°

ATTENTION

Note the insertion direction of the fixing bolt: from the front to the rear of the vehicle, and tighten the nut.

© 2026, All rights reserved

e. Unscrew the 3 fixing nuts -arrow- connecting the rear left strut assembly to the vehicle body, and remove the rear left strut assembly ①.
Recommended tool: 15mm socket
Torque + angle: 45N m + (22±5)°

> **ATTENTION**
>
> When unscrewing the fixing nut of the rear strut upper mount assembly, another technician must assist in holding the rear strut assembly steady to prevent it from falling to the ground and causing damage to the components.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During installation, fully insert the brake assembly onto the fixing pin block of the rear strut assembly.

   > **ATTENTION**
   >
   > After inserting the brake assembly, check whether the contact surface between the brake assembly and the rear sliding pillar assembly is fully fitted. Once confirmed, tighten the fixing bolts.

   b. After assembly, the dust cover of the rear stabilizer bar link assembly must not interfere with the ball joint seat. If interference occurs, manually rotate the lower control arm to ensure that the dust cover does not interfere with the ball joint seat.
   c. After installation, wheel alignment and a road test must be performed on the vehicle to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

REAR COIL SPRING

NOTE

This section describes the removal and installation of the left rear coil spring. The removal and installation of the right rear coil spring can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the dust cover of the rear shock absorber.
   See:Rear shock absorber dust cover (page 2917)
3. Remove the rear strut upper mount assembly.
   See:Rear strut upper mount assembly (page 2930)
4. Remove the upper rubber pad of the rear coil spring.
   See:Rear coil spring upper rubber pad (page 2929)
5. Remove the rear coil spring.

a. Remove the rear coil spring ①.

ATTENTION

Safely use the shock absorber spring compressor to compress the spring in accordance with the tool's operating instructions.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During the removal and installation of the coil spring, do not loosen the spring compressor to avoid injury from the spring.
   b. After installation, the vehicle must undergo four-wheel alignment and a road test to ensure that there are no abnormal noises from the chassis components and no faults such as pulling to one side during driving.

5.5 WHEEL SYSTEM

5.5.1 PRECAUTIONS

PRECAUTIONS

1. During each vehicle maintenance, the tire pressure of all four tires must be checked and inflated to the standard value.
2. Check the vehicle tires for damage (punctures, cuts, tears, dents, and bulges).
3. Check and remove any foreign objects from the tire tread.
4. Prevent tires from coming into contact with oil, grease, and fuel.
5. If the valve stem cap is lost, promptly replace it with a new one.
6. Removed wheels or tires should be stored in a cool, dry place, away from light as much as possible.
7. When installing or removing wheels, never grip the wheel with your fingers to avoid crushing your fingers.
8. Do not apply engine oil or lubricant to wheel bolts.

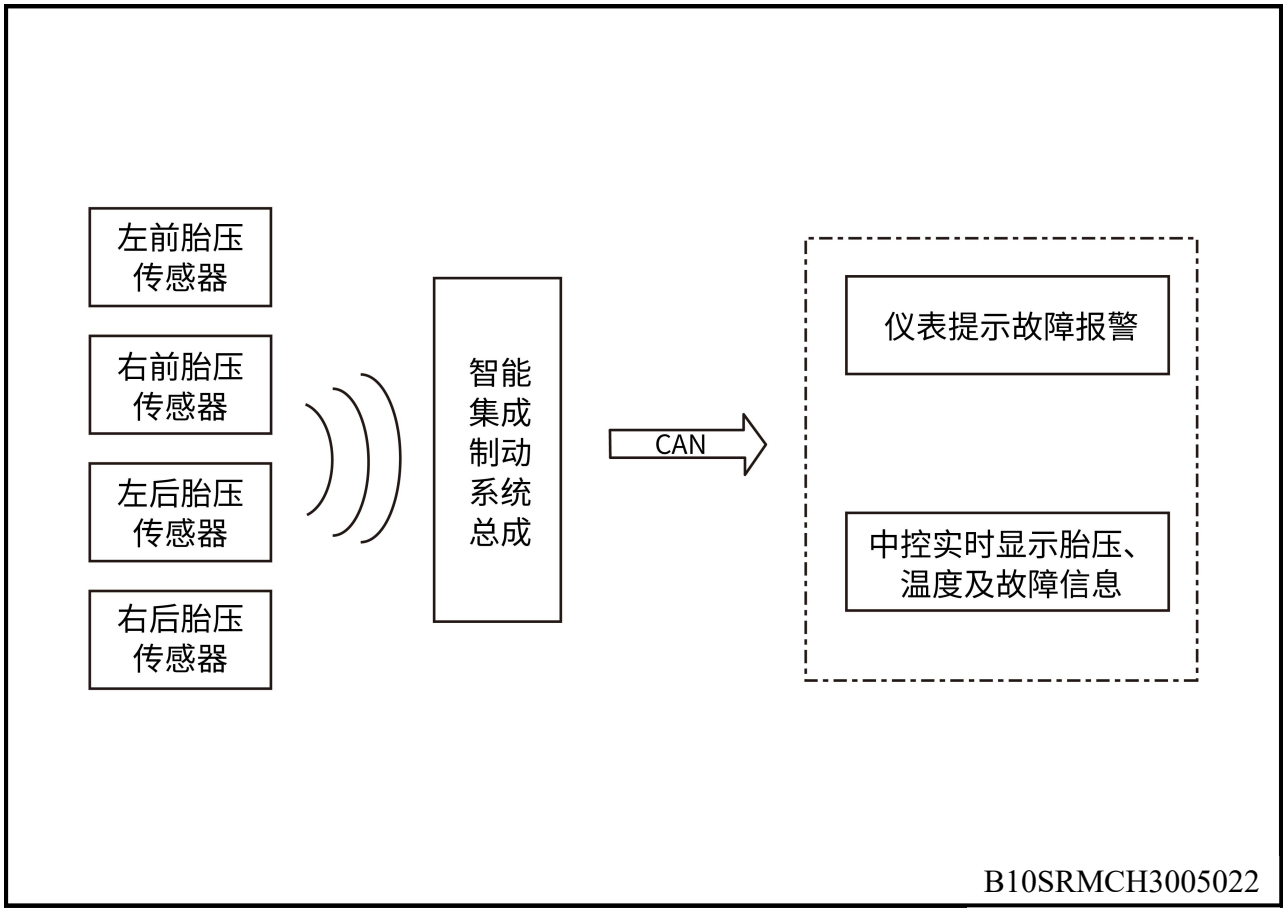
5.5.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION



Tire System

Tires are one of the most important components of a vehicle. Their main functions include: supporting the entire weight of the vehicle and bearing the vehicle load; transmitting traction and braking torque to ensure adhesion between the wheels and the road surface; reducing and absorbing vibrations and impacts during driving to prevent vehicle components from severe vibrations and premature damage; adapting to the high-speed performance of the vehicle and reducing driving noise; and ensuring driving safety, handling stability, comfort, and fuel efficiency.

Tire Pressure Monitoring System

1. Function:
   - Real-time automatic monitoring of tire pressure and temperature during driving.
   - It also issues an alarm for tire air leakage, abnormal tire pressure, and excessive temperature to ensure driving safety.
2. System Component Composition:
   - Tire pressure receiver (integrated in the smart integrated braking system assembly).
   - Wheel speed sensor (distributed on the four wheels).
3. Working principle:
   - The Intelligent Integrated Brake System Assembly receives high-frequency radio frequency (RF) signals from the tire pressure sensors, analyzes and processes them, and then transmits the data via the CAN bus to the instrument cluster and center display for the user. In the event of a tire fault, the control module sends the processed warning message to the instrument cluster to alert the driver.

5.5.8 SERVICE AND REPAIR GUIDANCE

FOUR-WHEEL ALIGNMENT

NOTE

- Four-wheel alignment is extremely important for maintaining driving safety, steering stability, and normal tire wear. Incorrect vehicle alignment angles may cause the vehicle to pull to one side or skid during emergency braking, leading to serious accidents. During normal operation, it may shorten tire life, while the misadjustment or failure of components such as the steering tie rod often leads to a loss of steering control, the consequences of which are unimaginable. Therefore, it is crucial to perform four-wheel alignment on the vehicle.
- Wheel alignment includes front wheel alignment and rear wheel alignment. Front wheel alignment includes front wheel camber, kingpin caster, kingpin inclination, and front wheel toe-in. Rear wheel alignment includes rear wheel camber and rear wheel toe-in.

1. Pre-alignment check.
   a. Ensure all four tires are of the same specification, and the tire pressure should be within the specified pressure range.
   No load:
   Front tire pressure: 230kPa
   Rear tire pressure: 230kPa
   b. Ensure the vehicle is unoccupied and unloaded.
   c. Check the steering linkage and suspension for excessive play, inspect the outer tie rod ends and ball joints for wear, ensure the springs are not sagging, and check the control arms and front struts for excessive play.
   d. Check that the corresponding height positions on both sides of the vehicle are consistent.
   e. When the wheels are in the straight-ahead position, the steering wheel must be centered. If necessary, remove the steering wheel for adjustment.
2. Locate the reference data.

Item	Alignment parameters	Standard value
Front wheel	Camber	—0.283°±0.75°
	Toe-in angle	3.5′±6′
	Caster angle	3.85°±1°
	Kingpin inclination angle	13.04°±1°
Rear wheels	Camber	−0.83°±0.75°
	Toe-in angle	6.7′±6′

3. Detection parameters.
   Recommended equipment: Wheel alignment machine
4. Check the wheel alignment according to the operating instructions of the wheel alignment machine.

5. Rear wheel camber value, the adjustment position is at the eccentric bolt of the left (right) lower control arm of the rear suspension; rear wheel toe value, the adjustment position is at the eccentric bolt of the left (right) toe link body of the rear suspension; front wheel toe value, the adjustment position is at the tie rod of the steering gear.

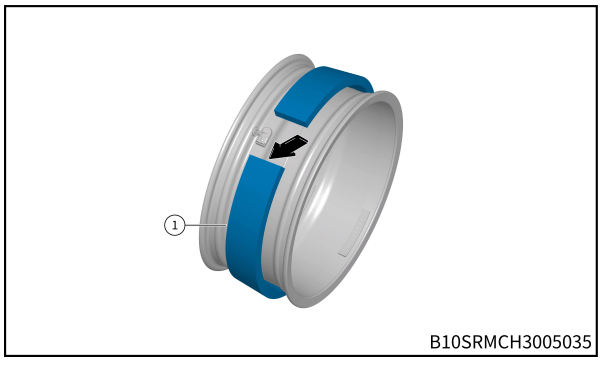
SOUND-ABSORBING COTTON



NOTE

Replace the sound-absorbing cotton when any of the following conditions occur:

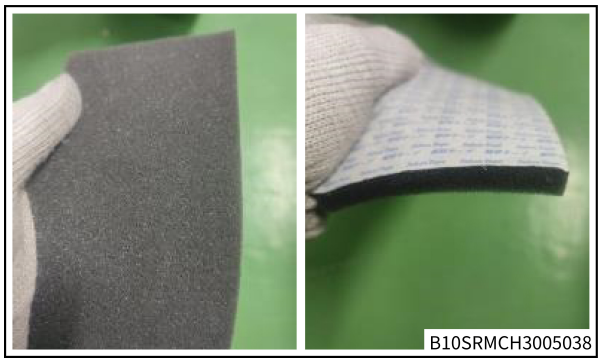
- When the sound-absorbing cotton shows no delamination and the total length of cosmetic defects is ≥200mm.
- If the adhesive backing of the sound-absorbing cotton is detached at the initial/end positions and the circumferential detachment length is ≤50mm, trim off the detached portion to ensure no detachment at the initial/end positions; if the circumferential detachment length is ≥50mm, replace the sound-absorbing cotton.
- If the detachment length in the width direction is ≤20mm, trim off the detached portion to ensure no detachment remains; if the detachment length in the width direction is ≥20mm, replace the sound-absorbing cotton.
- When 4 or more areas of the inner sound-absorbing material around the circumference have unglued and fallen off.
- After using the tire sealant.

REMOVAL PROCEDURE

1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, and tap "Vehicle Maintenance Power Off" on the central control screen.
3. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the radial tire.
   See:Radial tire (page 2954)
5. Remove the sound-absorbing cotton.

a. Tear off the sound-absorbing cotton ① along the seam - arrow -.

b. Spray adhesive remover/alcohol onto the adhesive backing of the sound-absorbing cotton. Once the adhesive backing loses its adhesion, begin peeling off the sound-absorbing cotton while simultaneously spraying adhesive remover/alcohol to further weaken the adhesive backing, until the entire ring of sound-absorbing cotton is peeled off.

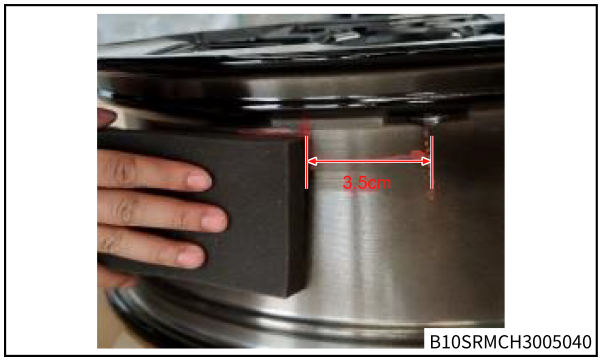


© 2026, All rights reserved

B10SRMCH3005037

c. After removing the sound-absorbing cotton, if any adhesive residue remains on the rim, continue to spray adhesive remover/alcohol onto the adhesive surface, then use a plastic scraper to scrape off the residual adhesive, and finally wipe the surface clean with a cloth.

SETUP



1. Perform the installation procedure in reverse order, and note the following:

B10SRMCH3005038

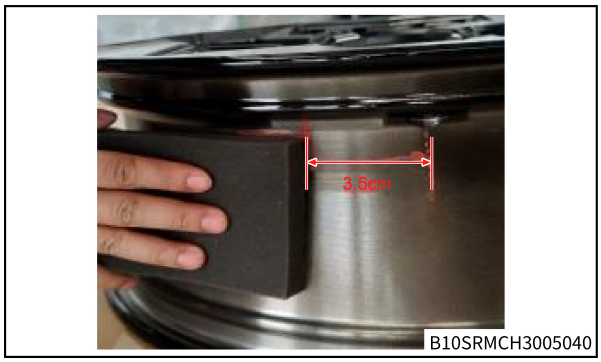
a. Check that the release paper of the acoustic cotton is fully bonded, with no peeling edges, dust, or oil stains.

B10SRMCH3005039

b. Clean the dust from the rim surface, and wipe it clean with a non-woven cloth.

B10SRMCH3005040

c. Axial positioning: Mark lines 3.5cm to the left and right of the centerline at the valve hole position; circumferential positioning: Apply parallel to the bottom fillet of the rim well (apply as close to the outer rim flange as possible).



© 2026, All rights reserved

B10SRMCH3005041

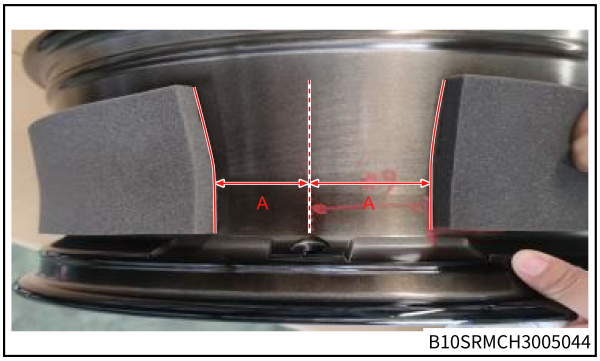
d. Press the boundary between the foam and the release paper with your fingers, and the release paper will separate automatically. Remove the first 10 cm of the release paper (do not touch the adhesive surface with your fingers).

ATTENTION

- The operating environment should be maintained above 10℃, the application temperature should ideally be between 20~30℃, and low temperatures will reduce the initial tack of the tape, making it difficult to apply; it is recommended to preheat the tape and the substrate before application to improve the initial bonding performance.
- It is recommended to apply it immediately after removing the release liner to prevent environmental substances (such as dust, moisture, etc.) from affecting its use.

B10SRMCH3005040

e. Secure the sponge ends according to the positioning boundary.



B10SRMCH3005042

f. Continue to remove the rear release liner (as the foam is stretchable, removing the release liner will stretch the foam; do not apply it at this time).

© 2026, All rights reserved

B10SRMCH3005043

g. After removing the release liner, restore the sponge to its unstressed state and apply it (when applying, do not pull the acoustic foam forcefully; only adjust it in the left-right direction to ensure the acoustic foam is parallel to the fillet at the bottom of the rim groove).

B10SRMCH3005044

h. Repeat the above operation until the attachment is complete, ensuring that the reserved position at the end and distance A are the same.

B10SRMCH3005045

i. After bonding, use a roller or your hand to apply back-and-forth pressure (2kg force) over the sponge for one full cycle, ensuring the sponge is fully adhered, and make sure the ends and edges of the sponge are completely bonded.

B10SRMCH3005046

j. Check whether the acoustic foam is properly attached and whether the clearance reserved

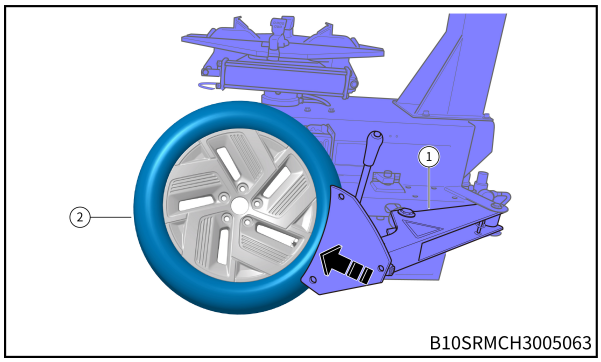
for the TPMS/valve stem installation tool is correct.

> **ATTENTION**
>
> After the sound-absorbing cotton is bonded, proceed with the wheel assembly as soon as possible.

k. After confirming there are no issues, use a tire changer to assemble the wheel assembly and inflate it to the specified tire pressure.

> **ATTENTION**
>
> After assembly, the wheel assembly must be left to stand for 24h before being installed on the vehicle.



l. Perform a dynamic balance check on the wheel assembly, dynamic balance requirements: single side ≤ 8g, both sides ≤ 16g.

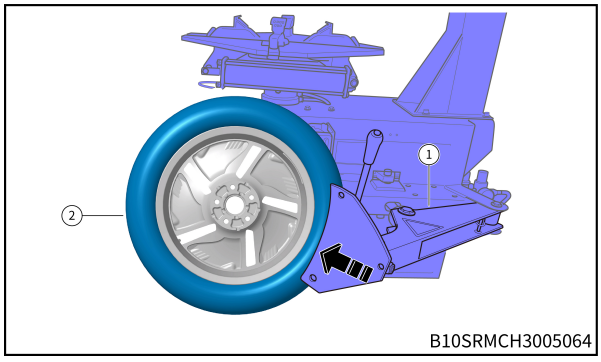
RADIAL TIRE

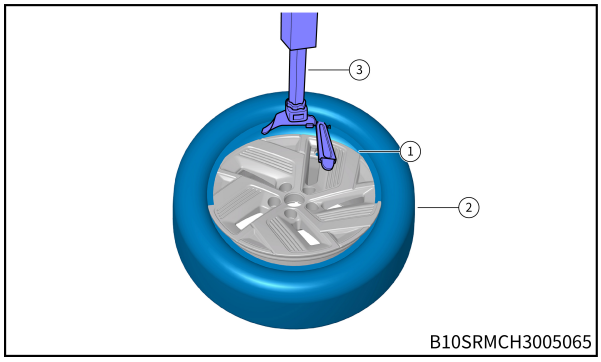
REMOVAL PROCEDURE

1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the radial tire.



a. Unscrew the valve core to fully deflate the tire.

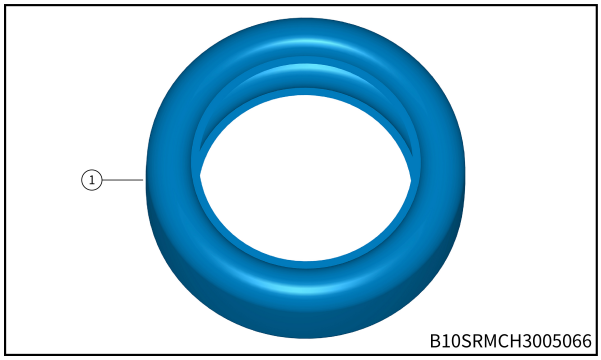
> **ATTENTION**
>
> Promptly reinstall the valve core, and do not lose it.



b. Use the tire pry bar ① to pry loose the outer side of the tire ② in the direction of the arrow.

> **ATTENTION**
>
> When using the tire lever, pay attention to the distance between the tire lever and the wheel rim to avoid scratching or damaging the wheel rim.

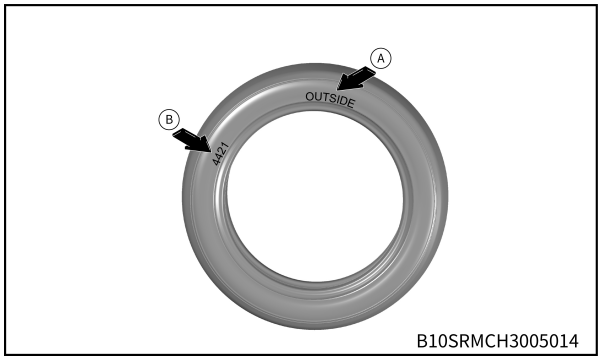
c. Use the tire lever ① to pry loose the inside of the tire ② in the direction of the arrow.



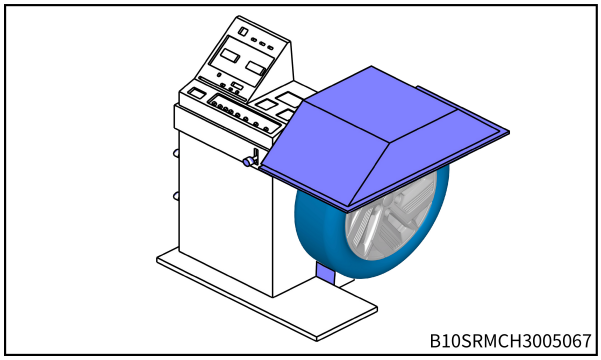
© 2026, All rights reserved

d. Use the mounting head ③ of the tire changer and the pry bar to separate the outer sidewall ② of the tire from the rim ①.

ATTENTION



When the tire changer is rotating, pay attention to the contact surface between the mount/demount head and the wheel rim to avoid scratching the rim surface.



e. Separate the tire from the aluminum alloy wheel, and remove the radial tire ①.

SETUP

1. Perform the installation procedure in reverse order, while observing the following precautions:

a. Before mounting the tire, apply glycerin or soapy water circumferentially to the contact surface between the tire bead and the rim.
b. When mounting the tyre, install it with the side marked "OUTSIDE" - Arrow A - or "production period" - Arrow B - facing outward.

c. After installing the tire, inflate it to the standard inflation pressure.
d. A dynamic balance check must be performed on this tire.

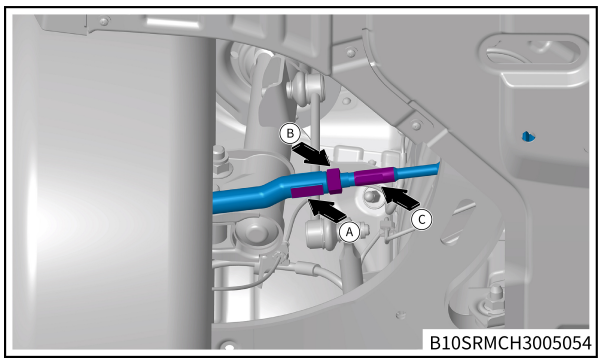
FOUR-WHEEL ALIGNMENT ADJUSTMENT STEPS

NOTE

The wheel alignment adjustment sequence is: rear wheel toe - front wheel toe.

ADJUSTMENT PROCEDURE

1. Adjust the rear wheel toe-in.



a. Loosen the lock nut - arrow A -, use an open-end wrench to turn the inner ball joint of the steering gear - arrow B -, and adjust the front wheel toe-in to the standard range according to the alignment parameters.
b. After the adjustment is completed, use an open-end wrench to hold the inner ball joint of the steering gear in place -arrow B-, then tighten the lock nut -arrow A-. Recheck the front wheel toe-in value.
Recommended tool: 22mm wrench
Torque: 90±5N m

ATTENTION

The adjustment method for the left rear wheel toe is the same as that for the right rear wheel toe.

2. Adjust the front wheel toe-in.

a. Use a wrench to hold the flat part of the outer tie rod -Arrow A-, loosen the lock nut -Arrow B-, and use an open-end wrench to turn the inner ball joint of the steering gear -Arrow C-, adjusting the front wheel toe-in to the standard range according to the alignment parameters.
b. After the adjustment is completed, use an open-end wrench to hold the flat part of the outer tie rod in place -Arrow A-, then tighten the lock nut -Arrow B-. Recheck the front wheel toe-in value.
Recommended tools: 15mm wrench, 24mm wrench, 25mm wrench

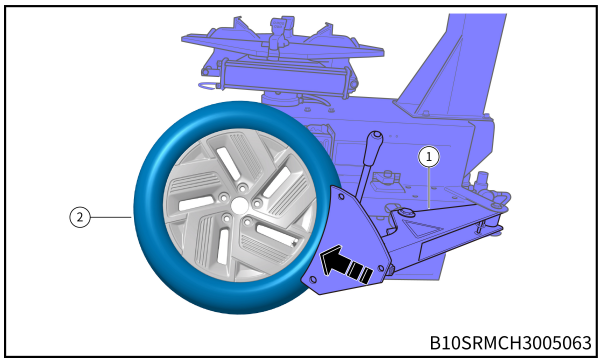
Torque: 70±5N m

ATTENTION



The adjustment method for the left front wheel toe-in is the same as that for the right front wheel.

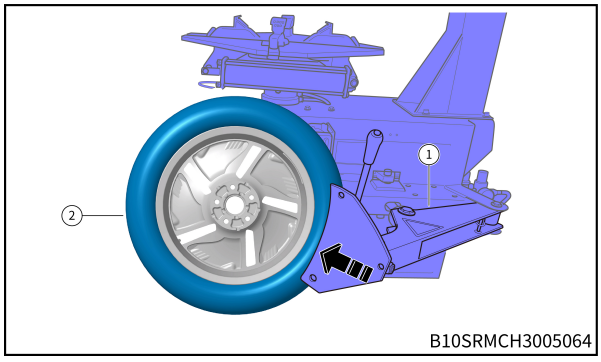
TIRE PRESSURE MONITORING SENSOR

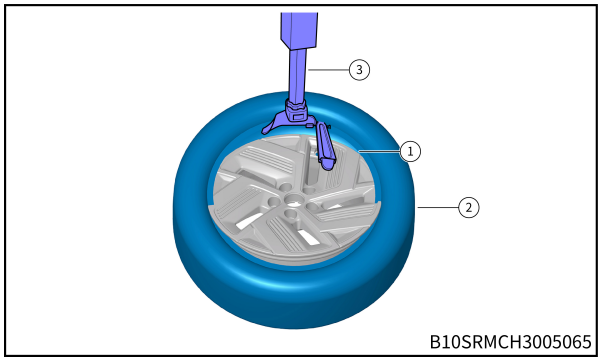
REMOVAL PROCEDURE

1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the tire pressure monitoring sensor.



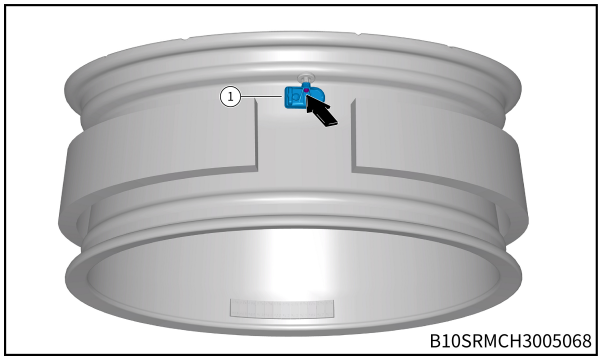
a. Unscrew the tire valve core to completely deflate the tire.

> **ATTENTION**
>
> Keep the valve core in a safe place to avoid losing it.



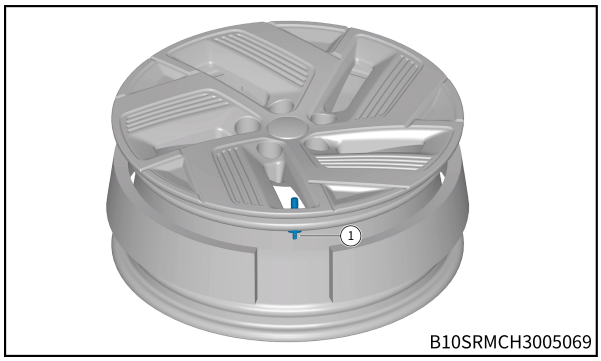
b. Use the tire pry bar ① to pry loose the outer side of the tire ② in the direction of the arrow.

> **ATTENTION**
>
> When using the tire lever, pay attention to the distance between the tire lever and the wheel rim to avoid scratching or damaging the wheel rim.



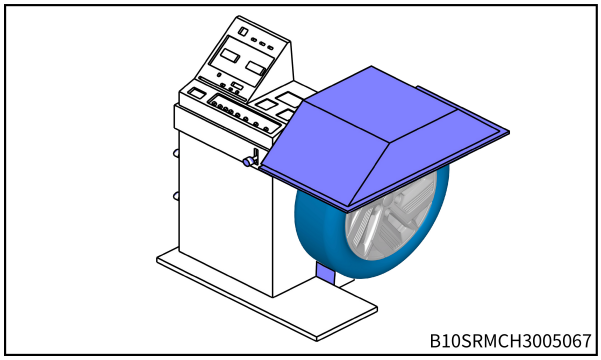
c. Use the tire lever ① to pry loose the inside of the tire ② in the direction of the arrow.

© 2026, All rights reserved



d. Use the mounting head ③ of the tire changer and the pry bar to separate the outer sidewall ② of the tire from the rim ①.

> **ATTENTION**
>
> When the tire changer is rotating, pay attention to the contact surface between the mount/demount head and the wheel rim to avoid scratching the rim surface.



e. Unscrew the 1 fixing screw of the tyre pressure monitoring sensor -arrow-, and remove the tyre pressure monitoring sensor part ①.

f. Remove the valve stem part of the tire pressure monitoring sensor ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:

a. After installing the valve, the tire must be inflated to the standard pressure value.
b. A dynamic balance check must be performed on this tire.
c. Tire pressure matching must follow the steps below to ensure software version compatibility:
   - Record the old version: Before removal, read and record the software version number of the old tire pressure monitoring sensor.
   - Check for new version: After installing the new tire pressure monitoring sensor, first read its software version number.

© 2026, All rights reserved

Version Comparison and Processing:

- If the new version ≥ the old version, the replacement process will be completed normally.
- If the new version < the old version, the new tire pressure monitoring sensor software must first be updated to the old version or a higher version before it can be put into use.

d. **Tire pressure matching and learning:**
During the matching and learning process with the diagnostic tool, the corresponding tire pressure monitoring sensor is triggered via an external device (low-frequency activator), and the tire pressure monitoring sensor returns the ID to the receiving controller to complete the learning process. Specific operation: After connecting the diagnostic tool to the vehicle, select the corresponding vehicle model-System Diagnostics-ZCUM-Routine Control-TPMS Tire Pressure Learning. Select the tire to be matched and learned-follow the operation prompts, place a low-frequency activator near the corresponding tire pressure monitoring sensor and press the activation button, the learning process must not exceed 60 seconds. After the learning is completed, the diagnostic tool prompts successful

learning, and the vehicle turn signals flash- exit the matching and learning.

ATTENTION

- After tapping "Exit Matching Learning", if prompted with "Unmatched wheel" or "Duplicate match", please re-learn all four wheels to ensure accuracy.
- Once the learning is successful, the tire pressure information on the central control screen changes to "--". After "Exit Learning", place the "low-frequency activator" near each of the 4 wheels and press to activate it (within an operating distance of 0.3m). The screen will then update the tire pressure information to ensure normal tire pressure.

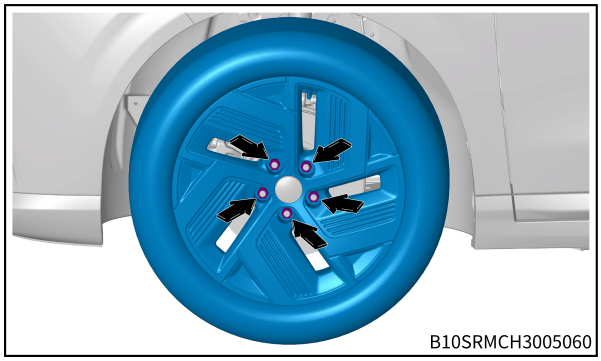
WHEEL ASSEMBLY

This section describes the removal and installation of the front left wheel assembly, and the removal and installation methods for other wheel assemblies are the same.

REMOVAL PROCEDURE



1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the wheel nut ornament cap.
   See:Wheel Nut Decorative Cover (page 2965)
4. Remove the wheel assembly.

a. In a diagonal sequence, loosen each of the 5 lug nuts by one turn (to evenly relieve the tension on the lug nuts).
b. Lift the vehicle until the wheels are approximately 3 cm off the ground.
c. Remove the 5 wheel nuts in a diagonal sequence -arrow-, and remove the wheel assembly ①.
   Recommended tool: 21mm socket
   Torque: 170±15N m

SETUP

1. Perform the installation procedure in reverse order, while observing the following precautions:

a. Screw in and preliminarily tighten the wheel nuts manually in a diagonal pattern.

ATTENTION

Confirm that the inner surface of the rim is fully seated against the steering knuckle.

b. Lower the vehicle until the wheels touch the ground.
c. Tighten the 5 wheel nuts in a diagonal sequence according to the standard torque requirements - arrow -.
   Recommended tool: 21mm socket

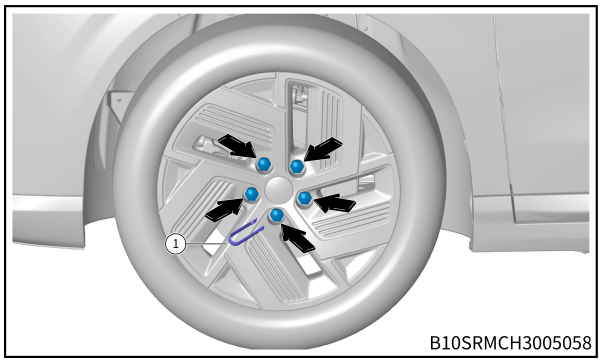
ALUMINUM ALLOY WHEELS

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the wheel hub decorative cover.
   See:Wheel hub decorative cover (page 2966)
3. Remove the radial tire.
   See:Radial tire (page 2954)
4. Remove the tire pressure monitoring sensor.
   See:Tire Pressure Monitoring Sensor (page 2958)
5. Remove the aluminum alloy wheel.

a. Remove the aluminum alloy wheel ①.

SETUP



1. The installation procedure is performed in reverse order.

WHEEL NUT DECORATIVE COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the wheel nut ornament cap.

a. Use the wheel nut trim cover removal clip tool ① to remove the 5 wheel nut trim covers in sequence -arrow-.
Recommended tool: Nut cover removal clip

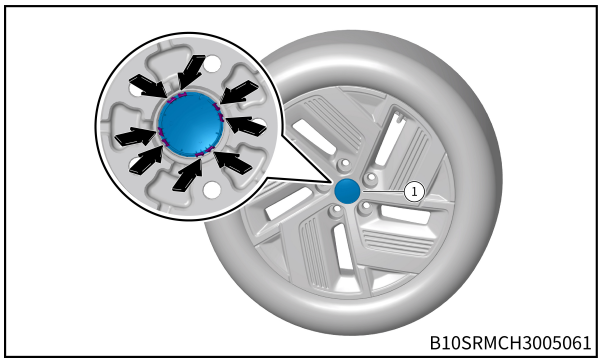
ATTENTION

Do not disassemble with non-professional tools to avoid scratching the surfaces of the decorative cover and the wheel rim.

WARNING

When repairing the vehicle on the ground, ensure the surrounding environment is safe and the parking brake has been applied. It is strictly prohibited for unauthorized personnel to power on or start the vehicle without permission.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The wheel nut trim cover must be properly installed; if the trim cover is cracked or cannot be installed securely, it must be replaced with a new one.

WHEEL HUB DECORATIVE COVER

REMOVAL PROCEDURE

1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the wheel hub decorative cover.

a. Release the 8 retaining clips - arrow - securing the wheel hub trim cover, and remove the wheel hub trim cover ①.
Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Press the wheel center cap into the center hole of the wheel hub by hand. If the retaining clips of the wheel center cap are broken, replace it with a new one.

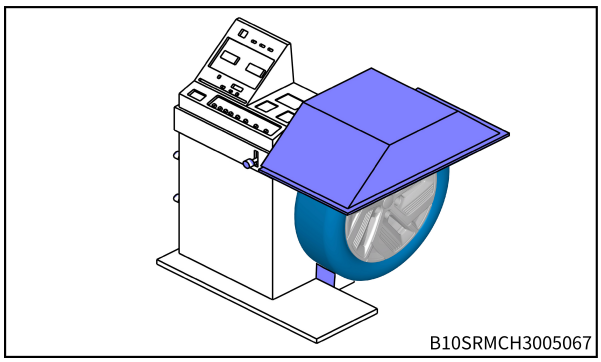
APPENDIX 1: WHEEL DYNAMIC BALANCING

NOTE



An imbalance in the vehicle tires or steel wheels will cause vibrations when the wheels rotate at high speeds, especially for the front wheels, where this vibration will cause the front wheels to shimmy, affecting the driving safety and ride comfort of the vehicle, while also increasing tire wear at the same time, therefore making dynamic balancing inspection and adjustment of the tires crucial.

1. Pre-inspection preparations.
   a. Clean the wheel under test, removing mud, sand, and gravel.

      NOTE

      - If debris in the tread crown is not removed, it will be thrown off the tire by centrifugal force, which may easily cause personal injury.
      - Check the tread and sidewall for defects. These defects may affect wheel balance.

   b. Remove the old wheel weights.
   c. Inflate the tire to the standard pressure.
2. Check the wheel balance.

B10SRMCH3005067

   a. Mount the wheel correctly on the wheel balancer.
      Recommended equipment: Wheel balancer
   b. Secure the tire, and enter the three parameters: rim width, rim diameter, and the distance from the outer edge of the rim to the wheel balancer.
   c. Lower the guard, start the balancing machine, and begin measurement.
   d. After the tire stops rotating, open the guard, rotate the tire by hand, read the unbalance amount from the left and right display screens, and determine the unbalance position.

3. Adjust the wheel balance.

B10SRMCH3005070

   a. Based on the imbalance amount displayed by the wheel balancer, use the balance weight installation and removal tool ① to attach the

corresponding balance weight at the unbalanced position on the steel rim -arrow-.

> **ATTENTION**
>
> Before installing the balance weights, be sure to clean the mating surface of the wheel.

b. When installing wheel weights on the wheel, align the center of the wheel weight with the position (or angle) indicated by the wheel balancer.
c. Single wheel assembly single-sided dynamic balance: inboard ≤60g, outboard ≤80g; install the balance weights in a straight line.

> **ATTENTION**
>
> - Balance weights cannot be reused; always replace them with new ones.
> - Always use genuine wheel balance weights.
> - Both the inner and outer sides of the aluminum alloy wheel rims of this vehicle are fitted with adhesive weights. It is prohibited to use hammer-on lead weights to avoid damaging the wheel rims.
> - Do not stack one balance weight on top of another.

d. Restart the wheel balancer and confirm that the remaining unbalance value does not exceed 5g. If the remaining unbalance value on either side exceeds 5g, repeat the steps for installing the balance weights.

5.6 STEERING SYSTEM

5.6.1 PRECAUTIONS

PRECAUTIONS

1. When checking the steering system, the vehicle should be parked on a level, dry surface.
2. After the steering gear is serviced, check the wheel alignment.
3. Do not weld any parts of the steering gear and system linkages in any way.
4. Keep the battery in good condition, as insufficient battery charge can cause heavy steering.
5. When performing maintenance on the electric power steering system, disconnect the negative battery terminal.
6. Do not move the vehicle when the steering wheel is locked, to avoid damaging the steering system components.
7. Carefully inspect the steering system components for any abnormal impact, and replace any damaged parts promptly.
8. After the steering system is reassembled, perform a comprehensive check on the ease and flexibility of the steering. Turn the steering wheel; you should not feel any heaviness in the steering, nor should there be any looseness.
9. The bolts/nuts of steering system components must be tightened to the specified torque.

5.6.2 STRUCTURE AND PRINCIPLE INTRODUCTION

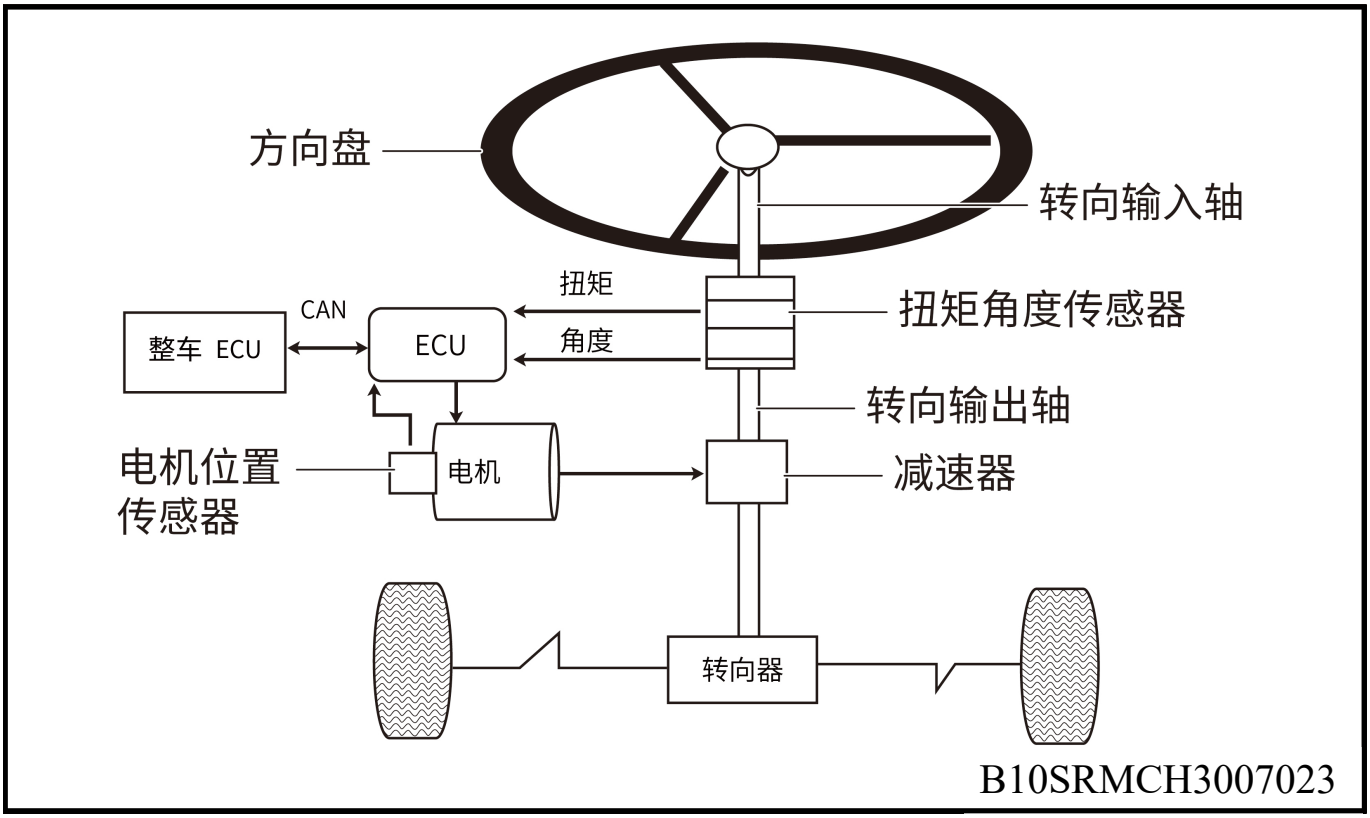
STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The Electric Power Steering (EPS) system is a new type of electromechanical power steering system, consisting of two assemblies: the electric power steering column with intermediate shaft assembly and the mechanical steering gear with tie rod assembly.
- The electric power steering column with intermediate shaft assembly consists of the electric steering column, integrated motor controller, and intermediate shaft.
- The manual steering gear with tie rod assembly consists of the steering gear, dust boots, left/right tie rods, fastening nuts, etc.

© 2026, All rights reserved

Main components of the system



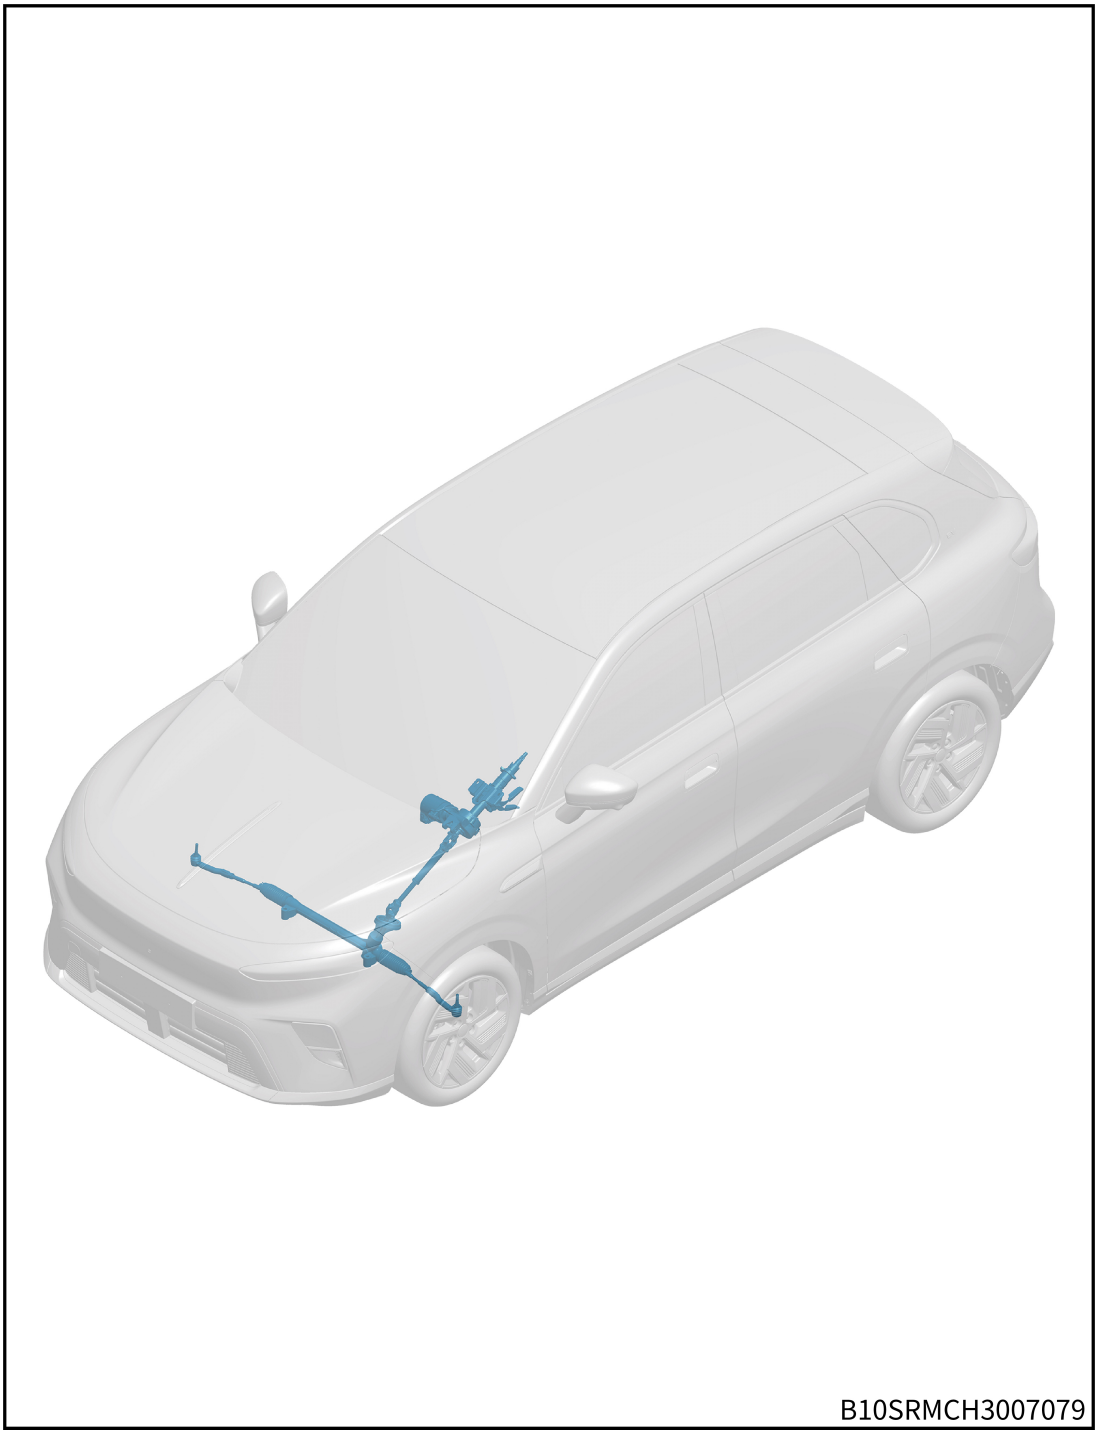
1. Electric steering column:
   - Manage the system crush path and energy absorption during a collision.

© 2026, All rights reserved

- Adjust the steering wheel angle and fore-and-aft position to select the optimal driving position.
- Transmits steering torque.

2. Power Assist Motor Assembly:
   - It outputs the required assist torque according to the controller's instructions and is the power source for EPS assist.
3. Controller:
   - Responsible for receiving and transmitting internal and external signals, and controlling the magnitude of the assist torque.
4. Torque and angle sensor:
   - Detect the input torque and steering angle signals during steering.
5. Reduction mechanism:
   - The worm gear reduction mechanism achieves steering assistance through speed reduction and torque multiplication of the motor assistance.

Working principle:



When the driver turns the steering wheel, the torque sensor transmits the detected torque signal (including the steering angle signal) to the controller, which, based on the torque signal (including the steering angle signal), vehicle speed signal, vehicle status signal, and other control signals, determines the magnitude and direction of the motor steering assist according to a specific control strategy, and the drive motor provides steering assist through the reduction mechanism, thereby driving the rack to complete the steering.

5.6.5 COMMON FAULTS

LIST OF FAULT SYMPTOMS

Symptom	Possible causes	Recommended Measures
Heavy steering, binding	1. Mechanical steering gear with tie rod assembly damaged	Replacement of mechanical steering gear with tie rod assembly
	2.Abnormal motor operation and overheating leading to power reduction	Replacement of integrated motor controller
	3.Intermediate shaft assembly damage	Replacement of intermediate shaft assembly
	4. Torque sensor damaged	Replacement of integrated motor controller
	5. Integrated Motor Controller damaged	Replacement of integrated motor controller
Steering abnormal noise	1. Intermediate shaft assembly installed incorrectly	Reinstall the intermediate shaft assembly </think> Reinstall the intermediate shaft assembly
	2. Abnormal Noise from Steering Electronic Control Motor	Replacement of integrated motor controller
	3. Wear or poor lubrication of the outer tie rod	Replacement of outer tie rod
	4.Steering system component mounting bolts/nuts are loose	Retighten the bolt/nut
Intermittent Electric Power Steering	1. Poor contact of the wiring harness or connector	Inspect and repair the related wiring harness according to the wiring diagram.
	2. Damage to internal electrical components of the integrated motor controller	Replacement of integrated motor controller
Steering pull and improper steering return	1. Excessive clearance due to wear between the mechanical steering gear and the tie rod	Replacement of mechanical steering gear with tie rod assembly
	2.Incorrect wheel alignment	Perform wheel alignment

5.6.6 FAULT DIAGNOSIS

DIAGNOSTIC DESCRIPTION – EPS

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the EPS data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without removing any components. Reading the data list is the first step in troubleshooting and one of the ways to reduce diagnostic time.

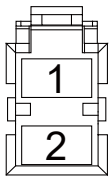
VISUAL INSPECTION-EPS



1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

CH020-2 Integrated Motor Controller

B10DMEPS1211009

CH024 Intelligent Integrated Brake System Assembly

B10DMEPS1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector CH020-2 of the integrated motor controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the integrated motor controller wire harness connector CH020-2 and terminal 39 of the intelligent integrated brake system assembly wire harness connector CH024 to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the wire harness connector CH020-2 of the integrated motor controller and terminal 40 of the wire harness connector CH024 of the intelligent integrated brake system assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω

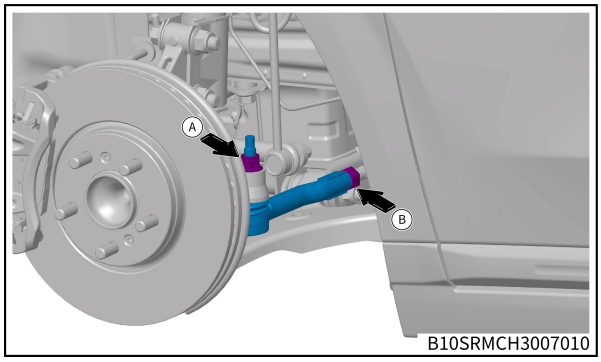
5.6.9 SERVICE AND REPAIR GUIDANCE



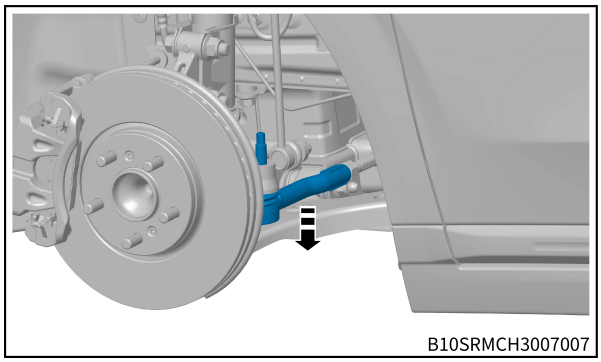
LEFT TIE ROD

NOTE

This section describes the removal and installation of the left outer tie rod, and the removal and installation of the right outer tie rod can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the left tie rod.

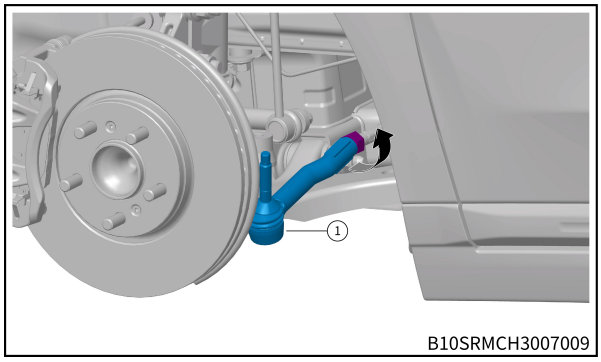


a. Unscrew the 1 fixing nut connecting the left tie rod to the left front steering knuckle assembly - arrow A -.
Recommended tool: 18mm socket
Torque: 70±5N m

ATTENTION

After removing the fixing bolt, it must be replaced with a new fixing bolt.

b. Loosen the adjusting nut of the left tie rod -arrow B-.
Recommended tool: 24mm wrench
Torque: 70±5N m



c. Disconnect the left tie rod from the left front steering knuckle assembly in the direction of the arrow.

ATTENTION

When removing the left tie rod ball joint, do not strike it with metal tools to avoid damaging the top of the ball joint stud.

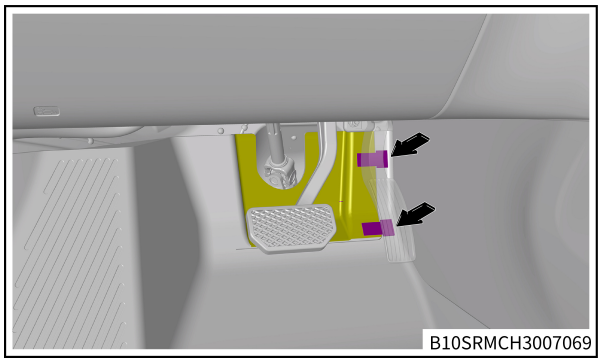
d. Unscrew the left pull rod ① counterclockwise in the direction of the arrow.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a four-wheel alignment and road test must be performed to ensure that no fault phenomena such as pulling to one side occur.
   b. Check whether the relevant electrical components can function normally.

ELECTRIC POWER STEERING COLUMN WITH INTERMEDIATE SHAFT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the steering wheel assembly.

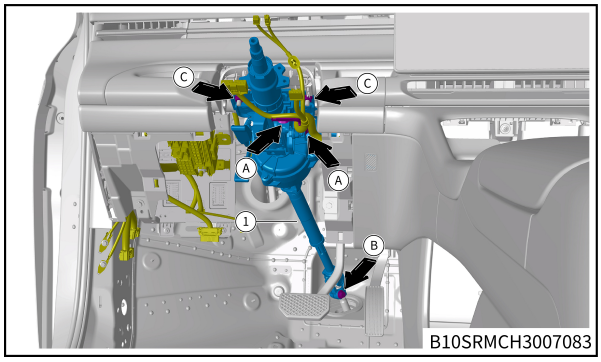
8. Remove the combination switch.
   See:Combination switch (page 8635)
9. Remove the electric power steering column with intermediate shaft assembly.



a. Detach the hook and loop fastener at the -arrow- position, and lift up the driver's carpet assembly.

b. Disconnect the 2 connectors connecting the engine compartment wiring harness assembly to the integrated motor controller - Arrow A -.

c. Unscrew 1 fixing bolt connecting the electric steering column to the instrument panel cross car beam assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 23±2N m

d. Release the 2 retaining clips connecting the instrument panel wiring harness to the electric steering column - arrow A -.
Recommended tool: Clip remover
e. Unscrew 1 fixing bolt -arrow B- connecting the steering gear with tie rod assembly to the electric steering column with intermediate shaft assembly.
Recommended tool: 13mm socket
Torque: 70±5N m
f. Unscrew the 2 fixing nuts - Arrow C - connecting the electric steering column with intermediate shaft assembly to the instrument panel crosscar beam assembly.
Recommended tool: 13mm socket
Torque: 23±2N m
g. Remove the electric steering column with intermediate shaft assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a four-wheel alignment and road test must be performed to ensure that no fault phenomena such as pulling to one side occur.
   b. If a new electric steering column with intermediate shaft assembly is replaced, relevant matching work must be performed.
   c. Replacing the electric power steering column with intermediate shaft assembly requires the following steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old Electric Power Steering (EPS).
      - Check for new version: After installing the new Electric Power Steering (EPS), first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new Electric Power Steering (EPS) software must first be updated to the old version or a higher version before being put into use.
   d. After installation, the calibration procedure for the Electric Power Steering (EPS) must be performed:
      - Update the EPS to the latest software version, ensure the software is upgraded to the latest version, and use a diagnostic tool to write the configuration code and VIN.
      - During the four-wheel alignment procedure, after adjusting the toe-in, leave the steering wheel angle gauge in place and use the diagnostic tool to perform the angle zero-point calibration.
      - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System diagnosis - Electric Power Steering (EPS) - Data writing - VIN.
      - Write the end-of-line configuration. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Electric Power Steering (EPS) - System Diagnostics - Write end-of-line configuration.
      - Steering angle midpoint calibration. Diagnostic scanner operation: Select the corresponding vehicle model - System Diagnostics - Electronic Power Steering (EPS) - Routine Execution - Steering Angle Midpoint Calibration.

© 2026, All rights reserved

> **ATTENTION**
>
> The EPS zero-point calibration must be performed after the four-wheel alignment, specifically after the toe adjustment is completed, and while the steering wheel alignment tool is still attached to the steering wheel. Failure to perform the zero-point calibration under this condition may result in the vehicle pulling to one side during straight-line driving.

e. Turn off and restart the vehicle, and read the EPS steering angle data using a diagnostic tool. If the difference between the left and right steering angles is less than 15°, it is considered acceptable. After re-performing the rack end learning procedure, the fault indicator light will turn off.
   - EPS steering angle information. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Electric Power Steering (EPS) - Read data stream.

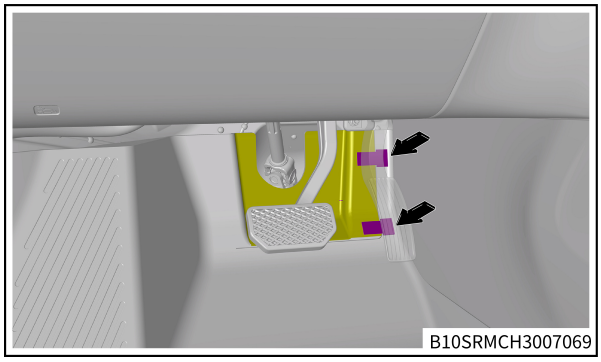
f. Rack end learning procedure:

Reason for rack end stop protection learning
- After the vehicle has undergone wheel alignment and the center position calibration is successfully completed, the EPS warning light on the instrument cluster will illuminate, indicating a fault that the rack end protection has not been learned. At this point, the rack end protection learning procedure must be performed to turn off the EPS warning light.

Prerequisites for Rack End Protection Learning
- Steering wheel center position has been calibrated
- Vehicle READY status
- The vehicle is stationary.
- Maximum left and right steering angle > 490° and maximum left and right steering angle deviation < 40°
- Battery voltage is normal (9-16V)
- No angle sensor fault

Rack end protection learning procedure
- The vehicle is stationary, in the READY state.
- Turn the steering wheel fully to one side; when approaching the end, the steering wheel rotation speed < 15°/s; after reaching the mechanical limit position, hold the steering wheel steady with a hand torque > 5N m, and maintain for 2s;
- Turn the steering wheel fully to the other side, keep the steering wheel rotation speed < 15°/s when approaching the end, hold the steering wheel stationary after reaching the mechanical limit position with a hand torque > 5 N m, and maintain for 2s;
- Return the steering wheel to the center position, the EPS warning light turns off, and the rack end protection learning is completed.

> **ATTENTION**
>
> The learning of the rack end stop protection on both the left and right sides must be completed in the same cycle. If the learning is unsuccessful, check whether all prerequisites are met before repeating the learning process.



g. Turn off and restart the vehicle, and read the EPS steering angle data using a diagnostic tool. If the difference between the left and right steering angles is less than 15°, it is considered acceptable. After re-performing the rack end learning procedure, the fault indicator light will turn off.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
3. Remove the steering intermediate shaft assembly.

a. Detach the hook and loop fastener at the -arrow- position, and lift up the driver's carpet assembly.

b. Unscrew the 1 fixing bolt -arrow A- securing the mechanical steering gear with tie rod assembly to the steering intermediate shaft assembly.
   Recommended tool: 13mm socket

After re-performing the rack end learning procedure, the fault indicator light will turn off.
   - EPS steering angle information. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Electric Power Steering (EPS) - Read data stream.

f. Rack end learning procedure:

Reason for rack end stop protection learning

- After the vehicle has undergone wheel alignment and the center position calibration is successfully completed, the EPS warning light on the instrument cluster will illuminate, indicating a fault that the rack end protection has not been learned. At this point, the rack end protection learning procedure must be performed to turn off the EPS warning light.

Prerequisites for Rack End Protection Learning

- Steering wheel center position has been calibrated
- Vehicle READY status
- The vehicle is stationary.
- Maximum left and right steering angle > 490° and maximum left and right steering angle deviation < 40°
- Battery voltage is normal (9-16V)
- No angle sensor fault

Rack end protection learning procedure

- The vehicle is stationary, in the READY state.
- Turn the steering wheel fully to one side; when approaching the end, the steering wheel rotation speed < 15°/s; after reaching the mechanical limit position, hold the steering wheel steady with a hand torque > 5N m, and maintain for 2s;
- Turn the steering wheel fully to the other side, keep the steering wheel rotation speed < 15°/s when approaching the end, hold the steering wheel stationary after reaching the mechanical limit position with a hand torque > 5 N m, and maintain for 2s;
- Return the steering wheel to the center position, the EPS warning light turns off, and the rack end protection learning is completed.

> **ATTENTION**
>
> The learning of the rack end stop protection on both the left and right sides must be completed in the same cycle. If the learning is unsuccessful, check whether all prerequisites are met before repeating the learning process.

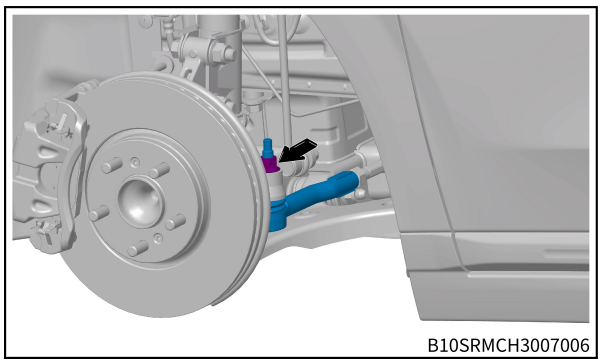
MECHANICAL STEERING GEAR WITH TIE ROD ASSEMBLY

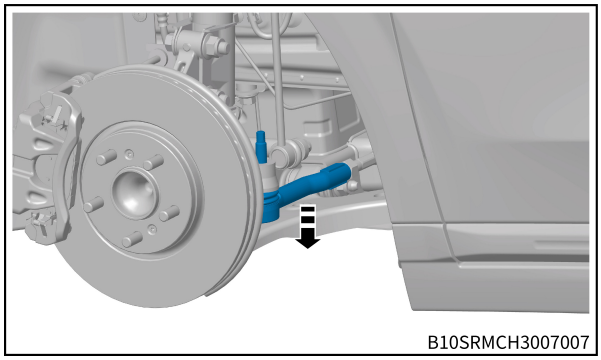
REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the left/right front wheel assembly.
   See:Wheel Assembly (page 2962)
5. Remove the front sub anti-collision beam assembly.
   See:Secondary Anti-collision Beam Assembly (page 6343)
6. Remove the manual steering gear with tie rod assembly.

a. Detach the hook and loop fastener at the -arrow- position, and lift up the driver's carpet assembly.

b. Unscrew the 1 fixing bolt - arrow - connecting the mechanical steering gear with tie rod assembly to the intermediate shaft assembly, and disconnect the connection.
Recommended tool: 13mm socket
Torque: 70±5N m



c. Unscrew the 1 fixing nut connecting the left tie rod to the left front steering knuckle assembly - arrow -.

o. Remove the mechanical steering gear with tie rod assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a four-wheel alignment and road test must be performed to ensure that no fault phenomena such as pulling to one side occur.
   b. Replacing the mechanical steering gear with tie rod assembly requires following these steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old Electric Power Steering (EPS).
      - Check for new version: After installing the new Electric Power Steering (EPS), first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new Electric Power Steering (EPS) software must first be updated to the old version or a higher version before being put into use.
   c. If a new mechanical steering gear with tie rod assembly is replaced, relevant matching work must be performed.
   d. After installation, the calibration procedure for the Electric Power Steering (EPS) must be performed:
      - During the four-wheel alignment procedure, after the toe-in is adjusted, leave the steering wheel angle gauge in place and use the diagnostic tool to perform the steering angle center position calibration.
      - Write the VIN. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Electric Power Steering (EPS) - Data Write - Write VIN.

- Write the end-of-line configuration. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Electric Power Steering (EPS) - System Diagnostics - Write end-of-line configuration.
- Steering angle midpoint calibration. Diagnostic scanner operation: Select the corresponding vehicle model - System Diagnostics - Electronic Power Steering (EPS) - Routine Execution - Steering Angle Midpoint Calibration.

ATTENTION

The EPS zero-point calibration must be performed after the four-wheel alignment, specifically after the toe adjustment is completed, and while the steering wheel alignment tool is still attached to the steering wheel. Failure to perform the zero-point calibration under this condition may result in the vehicle pulling to one side during straight-line driving.

e. Turn off and restart the vehicle, and read the EPS steering angle data using a diagnostic tool. If the difference between the left and right steering angles is less than 15°, it is considered acceptable. After re-performing the rack end learning procedure, the fault indicator light will turn off.

5.7 FRONT BRAKE SYSTEM

5.7.1 PRECAUTIONS

PRECAUTIONS

1. When servicing or cleaning the brakes, wear a dust mask to avoid inhaling dust from the brake friction pads into the lungs.
2. When servicing the brake system, avoid contaminating the brake pads and brake discs with oil or grease, otherwise the braking performance may be affected.
3. Do not use compressed air or a brush to clean the front brake assembly; use a vacuum cleaner or brake cleaner instead.
4. When removing and installing the fuel line, use a line wrench.
5. Do not reuse drained brake fluid. Brake fluid is highly hygroscopic and must be stored in a sealed container when collected.
6. Brake fluid is highly corrosive. If it splashes on the skin, immediately wipe it off with a cloth, then wash thoroughly with soap and water. Brake fluid is also highly corrosive to the vehicle paint. Avoid splashing brake fluid on the body paint; if it splashes on the paint, rinse immediately with water.
7. When removing the brake caliper, do not press the brake pedal to prevent the piston from being ejected, which could result in piston damage and brake fluid leakage.
8. When replacing brake system components, genuine parts with the same part number must be used.
9. When installing the front brake components, the mounting bolts or nuts for each component must be tightened strictly in accordance with the tightening torque specified in this manual.

5.7.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Front brake system:

1. The front brake system consists of the following components:
   - Brake pad repair kit: Transmits the mechanical output force from the hydraulic brake caliper to the friction surface of the brake disc.
   - Brake pad return spring: Located between the brake pad and the brake pad mounting bracket, it keeps the brake pad moving smoothly and eliminates noise.
   - Brake disc: Utilizes the mechanical output force applied by the brake friction pads to the friction surface of the brake disc to reduce the rotational speed of the wheel assembly, thereby braking the vehicle.
   - Brake caliper: Receives hydraulic pressure from the master cylinder and converts it into mechanical output force applied to the inner brake pad; when the master cylinder returns, the brake caliper piston automatically retracts.
   - Brake caliper and brake pad bracket: Used to secure the brake pads and brake caliper in place, and maintain the correct mating position with the hydraulic brake caliper, allowing the brake pads to slide when the mechanical output force is applied to the inner brake pad.
   - Brake caliper guide pin: Used to install the hydraulic brake caliper, secure the brake caliper in place, and maintain the correct mating position with the brake caliper bracket. When a mechanical output force is applied, it enables the brake caliper to slide relative to the brake friction pads.
2. Working principle:
   - The mechanical output force from the hydraulic brake caliper piston acts on the inner brake pad. As the piston pushes outward against the inner brake pad, the brake caliper housing simultaneously pulls the outer brake pad inward, thereby evenly distributing the output force. The brake pads apply the output force to the friction surfaces on both sides of the brake disc, thus reducing the rotational speed of the wheel assembly.

LIST OF FAULT SYMPTOMS

Symptom	Possible causes	Recommended Measures
Insufficient braking force	1. Low brake fluid	Filling Brake Fluid
	2. Air in the brake hydraulic system	Brake System Bleeding
	3. Deformation of brake discs and brake pads, or wear exceeding the limit value	Replace the brake disc/Replace the friction pad
	4.Oil on friction pads	Remove oil stains
	5. Front brake caliper assembly failure	Replace the front brake caliper assembly
	6. Aging, deformation, and sticking of the brake wheel cylinder seal ring	Replace the front brake caliper assembly
	7. Damage to the Intelligent Integrated Braking System Assembly	Replacement of Intelligent Integrated Brake System Assembly
Brake drag	1. Smart wheel speed sensor damaged	Replacement of intelligent wheel speed sensor
	2. No free play in the brake pedal	Adjust the brake pedal free play
	3. Brake lines contaminated or deformed	Replace the corresponding brake line.
	4. No play in the brake caliper guide pin	Clean off oil and apply grease
	5. Brake pedal does not return	Replacement and inspection of brake pedal assembly
Brake pull	1. Brake disc has oil stains.	Clean off oil or replace the brake disc
	2. Significant difference in tire pressure	Adjust tire pressure

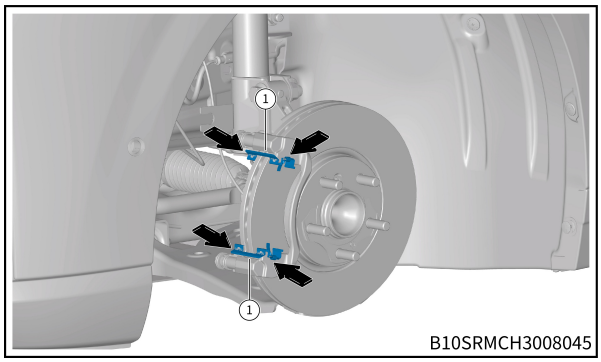
5.7.8 SERVICE AND REPAIR GUIDANCE



BRAKE PAD RETAINING CLIP

NOTE

This section describes the removal and installation of the left brake pad retaining spring. The removal and installation of the right brake pad retaining spring can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Drive the vehicle into the lift area.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the repair kit - front friction plates.
   See:Repair Kit - Front Friction Plates (page 3117)
4. Remove the brake pad retaining clip.

a. Disconnect the connection of the brake pad retaining spring -arrow-, and remove the brake pad retaining spring ①.

ATTENTION

Check the condition of the brake pad retaining spring. If it is deformed, has lost its function, etc., it must be replaced with a new return spring clip.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

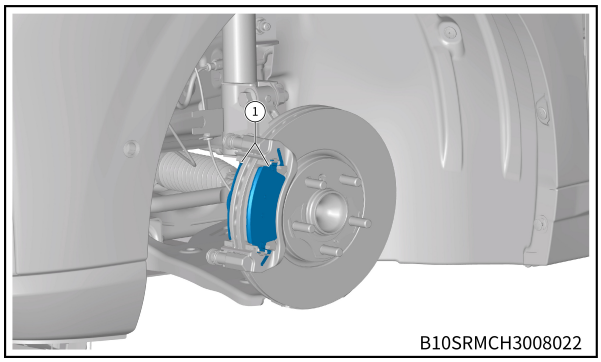
REPAIR KIT - FRONT FRICTION PLATES

NOTE

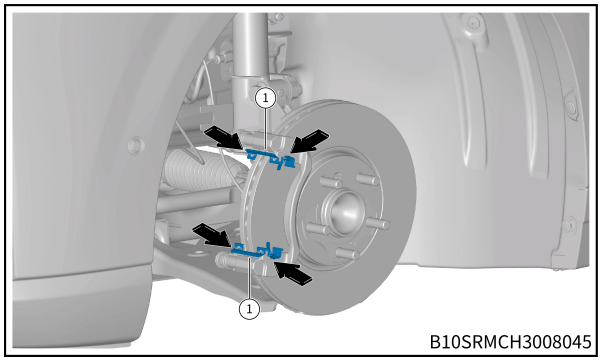
This section describes the removal and installation of the left front repair kit - front friction pads. The removal and installation of the right front repair kit - front friction pads can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the repair kit - front friction plates.

a. Use a tool to secure the guide pin connected to the front brake caliper assembly -Arrow A-, and unscrew the 2 fixing bolts connecting the front brake caliper assembly to the caliper mounting bracket -Arrow B-.
   Recommended tools: 13mm socket, 17mm wrench
   Torque: 34.5±3.5N m
b. Remove the front brake caliper assembly ①.



ATTENTION

Use cloth straps, wire, or similar objects to secure the left front brake caliper assembly ①, and take care to avoid excessive bending of the brake hose assembly to prevent hose rupture.

c. Remove the front friction plate ①.

d. Disconnect the connection of the brake pad retaining spring -arrow-, and remove the brake pad retaining spring ①.
Recommended tool: Flathead screwdriver

ATTENTION

Check the condition of the brake pad retaining spring. If it is deformed, has lost its function, etc., it must be replaced with a new return spring clip.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing new brake pads, use the front brake caliper piston rewind tool ① to press the piston back into the caliper.
Recommended tool: Brake caliper reset tool (7002595DHY1)
b. After the wheel cylinder piston is pushed in, watch for brake fluid overflow. Check the brake fluid condition using a brake fluid tester. If the brake fluid does not meet the requirements for continued use, replace it with new brake fluid and bleed the system.
c. When installing the friction plate return spring, ensure it is fully seated in place; otherwise, it will affect the guiding and return functions of the brake pad.
d. Brake fluid must not be reused or mixed, and different types of brake fluid must not be used. After filling the brake fluid, check that the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

FRONT BRAKE DISC

NOTE

This section describes the removal and installation of the left front brake disc, and the removal and installation of the right front brake disc can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the repair kit - front friction plates.
   See:Repair Kit - Front Friction Plates (page 3117)
4. Remove the caliper mounting bracket.
   See:Caliper mounting bracket (page 3122)
5. Remove the front brake disc.

a. Unscrew the 2 fixing screws -arrow- connecting the front brake disc to the front wheel hub unit assembly, and remove the front brake disc ①.
Recommended tool: T30mm hexagon socket wrench
Torque: 10.5±1.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. During installation, the brake disc must be free from any grease or oil.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.
   c. If the wear of the front brake disc reaches the maximum limit, replace the front brake disc.
   d. If the runout of the front brake disc exceeds the standard value, resurface the front brake disc, and replace it if necessary.
   e. The new front brake disc is thicker than the old one. Refer to the brake pad replacement procedure and use a brake caliper piston reset tool to retract the piston to facilitate the installation of the brake pads.

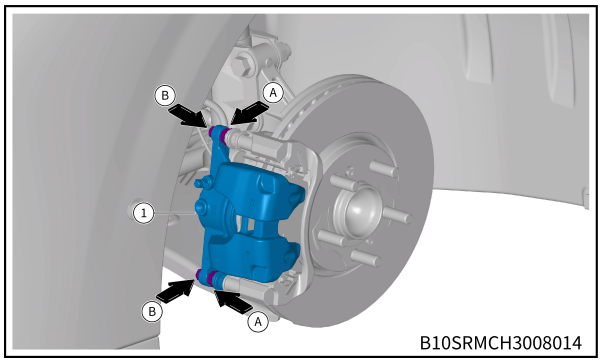
FRONT BRAKE CALIPER ASSEMBLY

NOTE

This section describes the removal and installation of the left front brake caliper assembly, and the removal and installation of the right front brake caliper assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
4. Remove the front brake caliper assembly.

a. Unscrew the 1 hollow bolt -arrow- connecting the left front brake hose assembly to the front brake caliper assembly, and remove the left front brake hose assembly.
Recommended tool: 11mm socket
Torque: 32±2N m

ATTENTION

Use a drain pan to catch the spilled brake fluid, and the spilled brake fluid must be cleaned up promptly to prevent corrosion of the hoses and other components.

b. Use a tool to secure the guide pin connected to the front brake caliper assembly - Arrow A -, unscrew the 2 fixing bolts - Arrow B - connecting the front brake caliper assembly to the caliper mounting bracket, and remove the front brake caliper assembly ①.
Recommended tools: 13mm socket, 17mm wrench
Torque: 34.5±3.5N m

ATTENTION

Apply threadlocker when installing the fixing bolts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installing the front brake caliper assembly, refill the brake fluid.
   See:Replace Brake Fluid (page 212)

   > **ATTENTION**
   >
   > Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   b. After filling the brake fluid, bleed the brake system.
   See:Brake System Bleeding (page 214)
   c. After installation, a road test must be conducted. Confirm that there are no faults such as abnormal noises from chassis components or leaks in the brake lines while driving.

CALIPER MOUNTING BRACKET

NOTE

This section describes the removal and installation of the left front caliper mounting bracket, and the removal and installation of the right front caliper mounting bracket can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the repair kit - front friction plates.
   See:Repair Kit - Front Friction Plates (page 3117)
4. Remove the brake pad retaining clip.
   See:Brake pad retaining clip (page 3116)
5. Remove the caliper mounting bracket.

a. Unscrew the 2 fixing bolts -arrow- connecting the caliper mounting bracket to the left front steering knuckle assembly, and remove the caliper mounting bracket ①.
Recommended tool: 18mm socket
Torque: 130±10N m

ATTENTION

Apply threadlocker when installing the fixing bolts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

FRONT WHEEL HUB UNIT ASSEMBLY

NOTE

This section describes the removal and installation of the left front hub unit assembly, and the removal and installation of the right front hub unit assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front brake disc.
   See:Front brake disc (page 3119)
4. Remove the front left mudguard.
   See:Front left mudguard (page 3124)
5. Remove the front hub unit assembly.

B10SRMCH3008006

a. Unscrew the 1 fixing bolt -Arrow A- connecting the front intelligent wheel speed sensor to the front hub unit assembly, and remove the front intelligent wheel speed sensor.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 4 fixing bolts -arrow B- connecting the front wheel hub unit assembly to the left front steering knuckle assembly, and remove the front wheel hub unit assembly ①.
   Recommended tool: 15mm socket
   Torque: 120±10N m

ATTENTION

Apply threadlocker when installing the fixing bolts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before removing the front hub unit assembly, the front intelligent wheel speed sensor must be removed and protected first to prevent damage to the sensor body.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while driving.

FRONT LEFT MUDGUARD

NOTE

This section describes the removal and installation of the left front fender splash guard, and for the right front fender splash guard, you can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front brake disc.
   See:Front brake disc (page 3119)
4. Remove the front left mudguard.

a. Unscrew the 3 mounting bolts connecting the left front mudguard to the left front steering knuckle assembly -arrow-, and remove the left front mudguard ①.
Recommended tool: 8mm socket
Torque: 10.5±1.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the splash guard is deformed, it must be replaced with a new one.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

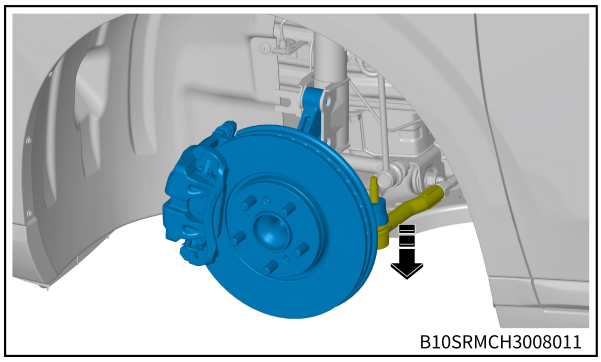
FRONT LEFT BRAKE ASSEMBLY

NOTE

This section describes the removal and installation of the front left brake assembly, and the removal and installation of the front right brake assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
4. Remove the front left brake assembly.

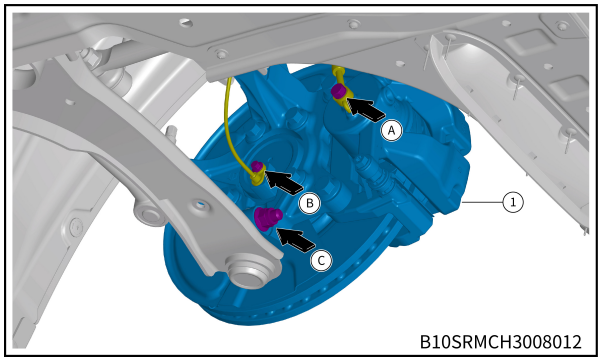


a. Disconnect the 1 fixing rubber sleeve connecting the left front brake hose assembly to the left front strut assembly -arrow A-.
b. Unscrew the 2 fixing nuts connecting the left front steering knuckle assembly to the left front strut assembly -arrow B-.
   Recommended tool: 24mm socket
   Torque + Angle: 200N m + (75±5)°

ATTENTION

When installing, pay attention to the insertion direction of the fixing bolts: from the front to the rear of the vehicle.

c. Unscrew the 1 fixing nut connecting the left tie rod to the left front steering knuckle assembly - arrow C -.
   Recommended tool: 18mm socket
   Torque: 70±5N m



d. Disconnect the left tie rod from the left front steering knuckle assembly in the direction of the arrow.

ATTENTION

When removing the left tie rod ball joint, do not strike it with metal tools to avoid damaging the top of the ball joint stud.

>
> Use a drain pan to catch the spilled brake fluid, and the spilled brake fluid must be cleaned up promptly to prevent corrosion of the hoses and other components.

f. Unscrew the 1 fixing bolt -arrow B- connecting the front intelligent wheel speed sensor to the front hub unit assembly, and disconnect the connection.
Recommended tool: 8mm socket
Torque: 9±1N m

g. Unscrew the 1 fixing bolt/nut - Arrow C - connecting the left front steering knuckle assembly to the left front lower control arm assembly, and disconnect the connection.
Recommended tools: 15mm socket, 18mm socket
Torque + angle: 80N m + (70±5)°

> **ATTENTION**
>
> During installation, note the insertion direction of the fixing bolts: from the rear to the front of the vehicle.

h. Remove the front left brake assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill with brake fluid.
   See:Replace Brake Fluid (page 212)

   > **ATTENTION**
   >
   > Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   b. After filling the brake fluid, bleed the brake system.

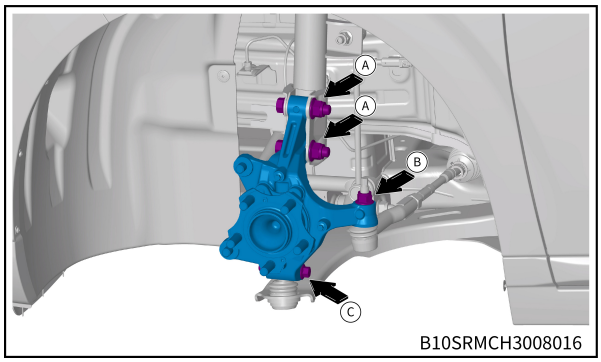
FRONT LEFT STEERING KNUCKLE ASSEMBLY

NOTE

This section describes the removal and installation of the left front steering knuckle. The removal and installation of the right front steering knuckle can generally refer to the left side.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the front brake disc.
   See:Front brake disc (page 3119)
4. Remove the front left mudguard.
   See:Front left mudguard (page 3124)
5. Remove the front left steering knuckle assembly.

a. Unscrew the 1 fixing bolt connecting the front intelligent wheel speed sensor to the left front steering knuckle assembly - arrow A -.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Detach the 1 fixing rubber sleeve connecting the front intelligent wheel speed sensor to the left front strut assembly -Arrow B-, and move the front intelligent wheel speed sensor aside.

c. Unscrew the 2 fixing nuts connecting the left front steering knuckle assembly to the left front strut assembly -arrow A-.
Recommended tool: 24mm socket
Torque + Angle: 200N m + (75±5)°

ATTENTION

When installing, pay attention to the insertion direction of the fixing bolts: from the front to the rear of the vehicle.

d. Unscrew the 1 fixing nut securing the left tie rod to the left front steering knuckle assembly -arrow B-.

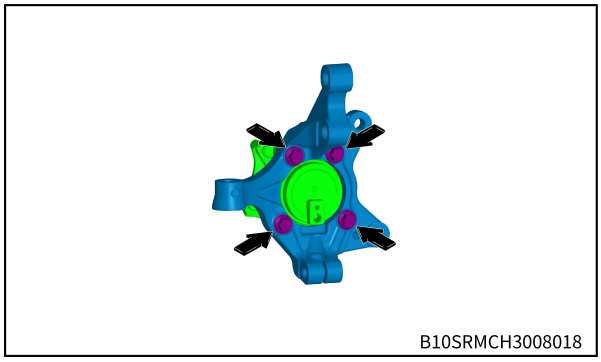
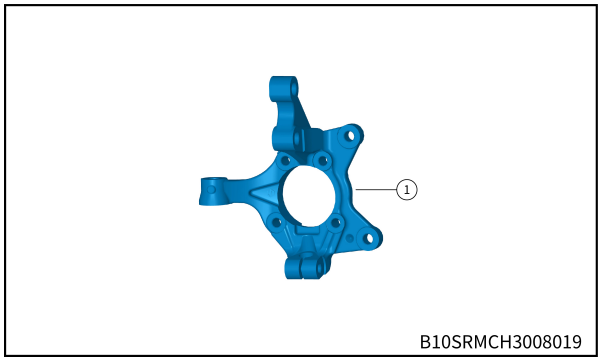
assembly to the left front lower control arm assembly, and disconnect the connection.
Recommended tools: 15mm socket, 18mm socket
Torque + angle: 80N m + (70±5)°

ATTENTION



During installation, note the insertion direction of the fixing bolts: from the rear to the front of the vehicle.



f. Disconnect the left tie rod from the left front steering knuckle assembly in the direction of the arrow, and remove the left front steering knuckle assembly ①.

ATTENTION

When removing the left tie rod ball joint, do not strike it with metal tools to avoid damaging the top of the ball joint stud.

g. Unscrew the 4 fixing bolts connecting the left front steering knuckle assembly to the front wheel hub unit assembly -arrow-.
Recommended tool: 15mm socket
Torque: 120±10N m

h. Remove the front left steering knuckle assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the front brake assembly, also ensure the correct routing of the related pipes and wiring harnesses, and make sure all connecting components are properly installed in place.

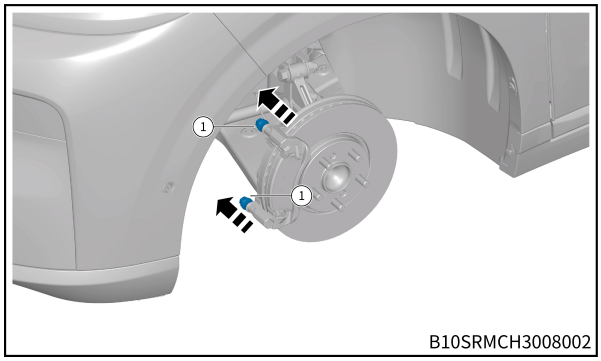
GUIDE PIN AND LOCATING PIN REPAIR KIT

NOTE

This section describes the removal and installation of the front left guide pin and locating pin repair kit, and the removal and installation of the front right guide pin and locating pin repair kit can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the guide pin and locating pin repair kit.



B10SRMCH3008021

a. Use a tool to secure the guide pin connected to the front brake caliper assembly -Arrow A-, and unscrew the 2 fixing bolts connecting the front brake caliper assembly to the caliper mounting bracket -Arrow B-.
   Recommended tools: 13mm socket, 17mm wrench
   Torque: 34.5±3.5N m
b. Remove the front brake caliper assembly ①.

ATTENTION

Secure the front brake caliper assembly ① with a cloth strap, wire, or similar object, and pay attention to the bending of the brake hose assembly to prevent hose rupture.

B10SRMCH3008002

c. Remove the guide pin and locating pin repair kit ① in the direction of the arrow.

SETUP

1. The installation procedure is performed in reverse order.

BLEED SCREW, SCREW CAP

NOTE

This section describes the removal and installation of the front left bleed screw and screw cap, and the removal and installation of the front right bleed screw and screw cap can generally be performed with reference to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove the bleeder screw and the screw cap.

a. Remove the bleed screw and screw cap ① in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill with brake fluid and bleed the air.
      See:Replace Brake Fluid (page 212)

      ATTENTION

      Brake fluid must not be reused or mixed.

   b. After installation, a road test must be conducted. Confirm that there are no faults such as abnormal noises from chassis components or leaks in the brake lines while driving.
   c. Brake fluid must not be reused or mixed, and must not be replaced with a different type. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

5.8 REAR BRAKE SYSTEM

5.8.1 PRECAUTIONS

PRECAUTIONS

1. When servicing or cleaning the brakes, wear a dust mask to avoid inhaling dust from the brake friction pads into the lungs.
2. When servicing the brake system, avoid contaminating the brake pads and brake discs with oil or grease, otherwise the braking performance may be affected.
3. Do not use compressed air or a brush to clean the front brake assembly; use a vacuum cleaner or brake cleaner instead.
4. When removing and installing the fuel line, use a line wrench.
5. Do not reuse drained brake fluid. Brake fluid is highly hygroscopic and must be stored in a sealed container when collected.
6. Brake fluid is highly corrosive. If it splashes on the skin, immediately wipe it off with a cloth, then wash thoroughly with soap and water. Brake fluid is also highly corrosive to the vehicle paint. Avoid splashing brake fluid on the body paint; if it splashes on the paint, rinse immediately with water.
7. When removing the brake caliper, do not press the brake pedal to prevent the piston from being ejected, which could result in piston damage and brake fluid leakage.
8. When replacing brake system components, genuine parts with the same part number must be used.
9. When installing the brake components, the fixing bolts or nuts of each component must be tightened strictly according to the tightening torque specified in this manual.

5.8.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Rear brake system:

1. The rear brake system consists of the following components:
   - Brake pads: Apply the mechanical output force from the hydraulic brake caliper to the friction surface of the brake rotor.
   - Brake pad return spring: Located between the brake pad and the brake pad mounting bracket, it keeps the brake pad moving smoothly and eliminates noise.
   - Brake disc: Utilizes the mechanical output force applied by the brake friction pads to the friction surface of the brake disc to reduce the rotational speed of the wheel assembly, thereby braking the vehicle.
   - Brake caliper with EPB assembly: Receives hydraulic pressure from the master cylinder and converts it into mechanical output force applied to the inner brake friction pad; the brake caliper piston automatically retracts when the master cylinder returns. The electronic parking brake (EPB) motor is integrated into the brake caliper, capable of receiving the EPB request signal sent by the P gear button to the ESC control module to implement electronic parking.
   - Brake caliper guide pin: Used to install the hydraulic brake caliper, secure the brake caliper in place, and maintain the correct mating position with the brake caliper bracket. When a mechanical output force is applied, it enables the brake caliper to slide relative to the brake friction pads.
2. Working principle:
   - The output force of the piston in the brake caliper with EPB assembly acts on the inner brake pad. When the piston pushes outward against the inner brake pad, the brake caliper housing simultaneously pulls the outer brake pad inward, thereby distributing the output force evenly. The brake pads apply the output force to the friction surfaces on both sides of the brake disc, thereby reducing the rotational speed of the wheel assembly.

5.8.5 COMMON FAULTS

LIST OF FAULT SYMPTOMS

Symptom	Possible causes	Recommended Measures
Insufficient braking force	1. Low brake fluid	Filling Brake Fluid
	2. Air in the brake hydraulic system	Brake System Bleeding
	3. Deformation of brake discs and brake pads, or wear exceeding the limit value	Replace the brake disc/Replace the friction pad
	4.Oil on friction pads	Remove oil stains
	5. Rear Brake Caliper Assembly Fault	Replace rear brake caliper assembly
	6. Aging, deformation, and sticking of the brake wheel cylinder seal ring	Replace rear brake caliper assembly
	7. Damage to the Intelligent Integrated Braking System Assembly	Replacement of Intelligent Integrated Brake System Assembly
Brake drag	1. Smart wheel speed sensor damaged	Replacement of intelligent wheel speed sensor
	2. No free play in the brake pedal	Adjust the brake pedal free play
	3. Brake lines contaminated or deformed	Replace the corresponding brake line.
	4. No play in the brake caliper guide pin	Clean off oil and apply grease
	5. Brake pedal does not return	Replacement and inspection of brake pedal assembly
Brake pull	1. Brake disc has oil stains.	Clean off oil or replace the brake disc
	2. Significant difference in tire pressure	Adjust tire pressure
	3. Incorrect wheel alignment	Adjust four-wheel alignment

© 2026, All rights reserved

Symptom	Possible causes	Recommended Measures
	4.Abnormal deformation of rear steering knuckle assembly	Replace the rear steering knuckle assembly
	5.Rear wheel hub bearing assembly damaged	Replacement of rear wheel hub bearing assembly
	6. A suspension component is loose	Check/tighten the corresponding loose parts.
	7. Left/Right wheelbase unequal	Repair Damaged Parts
	8. A suspension control arm bushing is deteriorated and loose.	Replacement of a rear suspension control arm assembly
Excessive brake pedal travel	1. Low brake fluid	Adding Brake Fluid
	2. Brake pedal assembly damaged	Replace the brake pedal assembly
	3. Severe wear of friction pads	Replace friction plates
Brake noise	1.Friction plate is severely worn or contaminated with impurities.	Replace friction plates
	2. Severe scoring on the brake disc	Brake disc replacement
	3.Incorrect installation of noise reduction pad	Reinstall the noise reduction pad
	4. Loose brake system components	Tighten loose components
	5. Abnormal Noise Due to Excessive Wear of Rear Wheel Hub Bearing	Replacement of rear hub bearing
Brake rotor overheating	1. Insufficient brake pedal free play	Adjust the brake pedal free play
	2. Wheel cylinder fails to return	Replace rear brake caliper assembly
	3. Incorrect installation of friction plates	Reinstall the friction plate
Spongy brake pedal	1.Brake line leak	Inspect and repair the corresponding brake lines.
	2. Air in the brake system	Brake System Bleeding

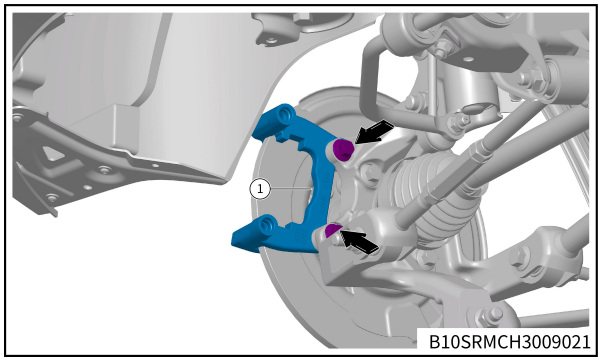
5.8.8 SERVICE AND REPAIR GUIDANCE



CALIPER MOUNTING BRACKET

NOTE

This section describes the removal and installation of the left rear caliper mounting bracket. The removal and installation of the right rear caliper mounting bracket can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove repair kit - rear friction plate.
   See:Repair Kit - Rear Friction Plate (page 3146)
4. Remove the caliper mounting bracket.

a. Unscrew the 2 fixing bolts -arrow- connecting the caliper mounting bracket to the left rear steering knuckle assembly, and remove the caliper mounting bracket ①.
Recommended tool: 15mm socket
Torque: 100±10N m

ATTENTION

- Do not power on the vehicle during removal and installation.
- Apply threadlocker when installing the fixing bolts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

BRAKE PAD RETAINING CLIP

NOTE

This section describes the removal and installation of the rear left brake pad retaining spring. The removal and installation of the rear right brake pad retaining spring can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove repair kit - rear friction plate.
   See:Repair Kit - Rear Friction Plate (page 3146)
4. Remove the brake pad retaining clip.

a. Remove the brake pad retaining spring ①.

ATTENTION

Check the condition of the brake pad retaining spring. If it is deformed, has lost its function, etc., it must be replaced with a new return spring clip.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

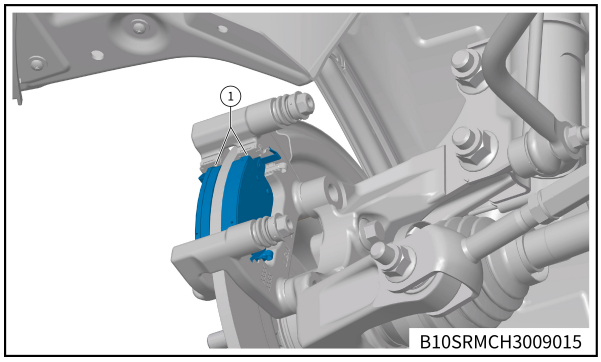
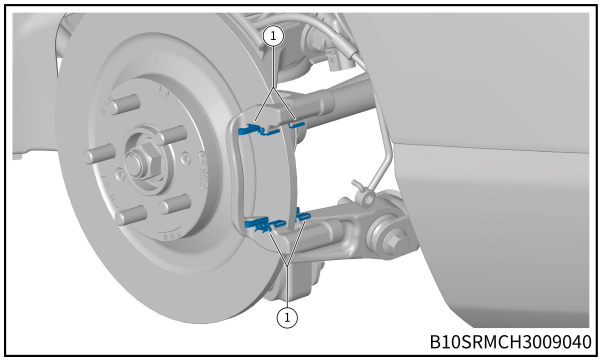
This section describes the removal and installation of the left rear repair kit - rear friction pads, and the removal and installation of the right rear repair kit - rear friction pads can generally refer to the left side.

REMOVAL PROCEDURE

1. Before removing the repair kit - rear friction pads, use a diagnostic tool to put the rear brake caliper into service mode. The specific procedure is as follows:
   - After connecting the diagnostic tool to the vehicle, set the vehicle to the READY state, depress the brake pedal, press the electronic parking brake switch to release the electronic parking brake, and access the diagnostic tool operating interface. Operation steps: Corresponding model-System diagnostics-Electronic Stability System (IBC)-Routine control-Enter maintenance mode via diagnostics.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
5. Remove repair kit - rear friction plate.



a. Disconnect the 1 connector between the parking brake motor and the floor wiring harness assembly-Arrow A-.
b. Use a tool to secure the 2 guide pins connected to the rear brake caliper assembly - Arrow B -, unscrew the 2 fixing bolts connecting the rear brake caliper assembly to the rear caliper mounting bracket - Arrow C -, and remove the rear brake caliper assembly.
Recommended tools: 13mm socket, 15mm wrench
Torque: 32.5±2.5N • m



ATTENTION

Secure the left rear brake caliper assembly with a cloth strap, wire, or similar object, and pay attention to the bending degree of the brake hose assembly to avoid hose rupture.

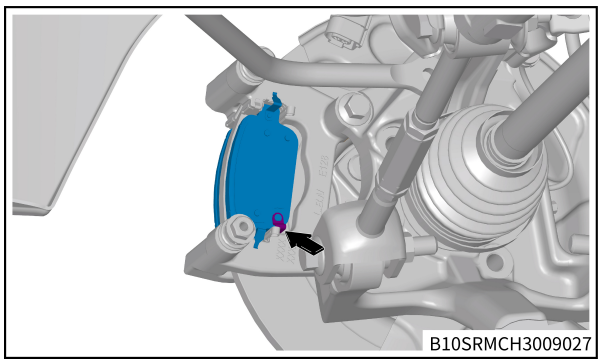
c. Remove the rear friction plate ①.



d. Remove the brake pad retaining spring ①.

ATTENTION

Check the condition of the brake pad retaining spring, and if it is deformed, has lost its function, etc., it must be replaced with a new brake pad retaining spring.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. During installation, pay attention to the metal tab on the inner friction pad - arrow -, and do not install the inner and outer friction pads in reverse.

b. After maintenance is completed, a diagnostic tool must be used to take the rear brake caliper out of maintenance mode. The specific procedure is as follows:
   - After connecting the diagnostic tool to the vehicle, place the vehicle in the READY state, and enter the diagnostic tool operation interface. Operation steps: Corresponding vehicle model - System diagnostics - Electronic Stability System (IBC) - Routine control - Diagnostic exit maintenance mode.

c. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.

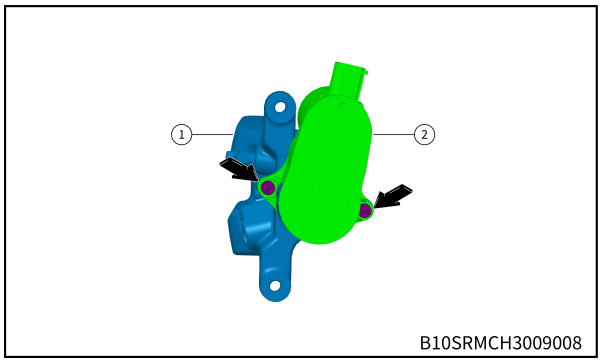
REAR BRAKE CALIPER ASSEMBLY

NOTE

This section describes the removal and installation of the left rear brake caliper assembly. The removal and installation of the right rear brake caliper assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Drive the vehicle into the lift area.
2. Before removing the rear brake caliper assembly, you must use a diagnostic tool to put the rear brake caliper assembly into service mode. The specific procedure is as follows:
   - After connecting the diagnostic tool to the vehicle, set the vehicle to the READY state, depress the brake pedal, press the electronic parking brake switch to release the electronic parking brake, and access the diagnostic tool operating interface. Operation steps: Corresponding model-System diagnostics-Electronic Stability System (IBC)-Routine control-Enter maintenance mode via diagnostics.
3. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
4. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
5. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
6. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
7. Remove the rear brake caliper assembly.



a. Disconnect 1 connector between the drive brake motor and the floor wiring harness assembly -Arrow A-.
b. Unscrew the 1 hollow bolt -Arrow B- connecting the left rear brake hose assembly to the rear brake caliper assembly, and move the left rear brake hose assembly aside.
   Recommended tool: 11mm socket
   Torque: 32±2N m
c. Use a tool to secure the 2 guide pins connected to the rear brake caliper assembly - Arrow C -, unscrew the 2 mounting bolts connecting the rear brake caliper assembly to the rear caliper mounting bracket - Arrow D -, and remove the rear brake caliper assembly ①.
   Recommended tools: 13mm socket, 15mm wrench

© 2026, All rights reserved

Torque: 32.5±2.5N • m

ATTENTION

- Use a drain pan to catch the drained brake fluid, and promptly clean up any spilled brake fluid to prevent corrosion of hoses and other components. The rear brake calipers must be stored separately; handle them with care to avoid impact, and be cautious of residual brake fluid spilling from the wheel cylinders.
- Apply threadlocker when installing the fixing bolts.

d. Unscrew the 2 fixing bolts -arrow- connecting the drive brake motor to the rear brake caliper assembly.
Recommended tool: 5mm hexagon socket wrench
Torque: 7.65±0.15N m
e. Remove the rear brake caliper assembly ① and the drive brake motor ②.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installing the rear brake caliper assembly, fill the brake fluid.
   See:Replace Brake Fluid (page 212)

   ATTENTION

   Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   b. After filling the brake fluid, bleed the brake system.
   See:Brake System Bleeding (page 214)
   c. After maintenance is completed, use a diagnostic tool to exit the brake caliper from maintenance mode. The specific procedure is as follows:
      - After connecting the diagnostic tool to the vehicle, place the vehicle in the READY state, and enter the diagnostic tool operation interface. Operation steps: Corresponding vehicle model - System diagnostics - Electronic Stability System (IBC) - Routine control - Diagnostic exit maintenance mode.
   d. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components and no leakage in the pipelines during vehicle operation.

REAR BRAKE DISC

NOTE

This section describes the removal and installation of the rear left brake disc, and the removal and installation of the rear right brake disc can generally be performed with reference to the left side.

REMOVAL PROCEDURE

1. Drive the vehicle into the lift area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove repair kit - rear friction plate.
   See:Repair Kit - Rear Friction Plate (page 3146)
5. Remove the rear caliper mounting bracket.
   See:Caliper mounting bracket (page 3144)
6. Remove the rear brake disc.

a. Unscrew the 2 fixing screws -arrow- connecting the rear brake disc and the rear hub unit assembly, and remove the rear brake disc ①.
Recommended tool: T30mm hexagon socket wrench
Torque: 10.5±1.5N m

ATTENTION

If the screw is damaged, it must be replaced with a new one.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, a road test must be conducted to confirm that there are no abnormal noises or other faults in the chassis components while the vehicle is driving.
   b. Strictly follow the manufacturer's requirements, use a dial indicator to measure the thickness of the rear brake disc, and if it is less than the standard value, a new rear brake disc must be replaced.

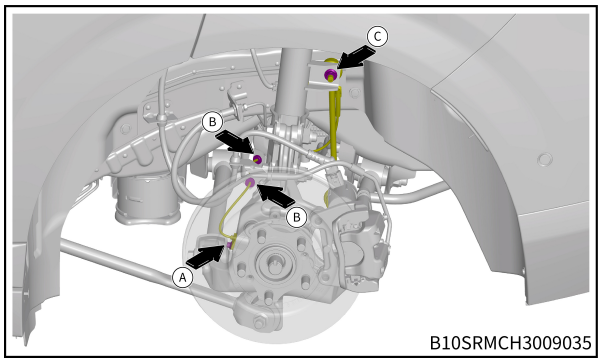
REAR WHEEL HUB UNIT ASSEMBLY

NOTE

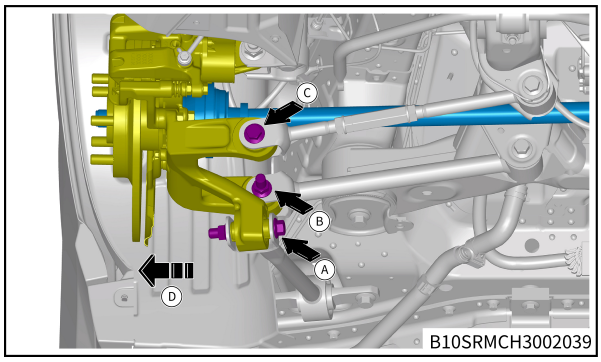
This section describes the removal and installation of the rear left hub unit assembly. The removal and installation of the rear right hub unit assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove repair kit - rear friction plate.
   See:Repair Kit - Rear Friction Plate (page 3146)
5. Remove the rear caliper mounting bracket.
   See:Caliper mounting bracket (page 3144)
6. Remove the rear brake disc.
   See:Rear brake disc (page 3150)
7. Remove the rear wheel hub unit assembly.

a. Unscrew the rear left drive shaft lock nut -arrow-.
   Recommended tool: 32mm socket
   Torque: 300±15N m



ATTENTION

Use a suitable tool to secure the rear brake disc to prevent it from rotating.

b. Unscrew the 1 fixing bolt connecting the rear left intelligent wheel speed sensor to the rear left steering knuckle assembly -arrow A-, and disconnect the connection.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Detach the 2 fixing rubber grommets -arrow B- connecting the left rear intelligent wheel speed sensor to the left rear brake hose assembly and the left rear strut assembly, and move the wiring harness aside.
d. Unscrew the 1 fixing nut connecting the left rear strut assembly to the rear stabilizer bar link assembly - arrow C -, and disconnect the connection.
   Recommended tool: 15mm socket

© 2026, All rights reserved

Torque: 60±5N m

e. Unscrew the 1 fixing bolt/nut - Arrow A - connecting the rear suspension longitudinal link assembly to the left rear steering knuckle assembly.
Recommended tools: 18mm socket, 21mm wrench
Torque + Angle: 130N m + (70±5)°

> **ATTENTION**
>
> Note the bolt insertion direction: from the interior to the exterior of the vehicle, tighten the bolt to the specified torque, torque or preload must not be applied to the nut, only to the bolt.

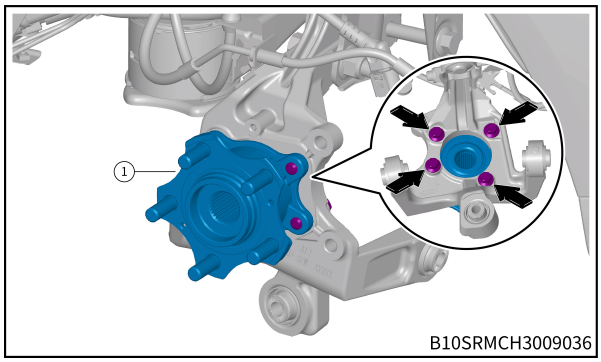
f. Unscrew the 1 fixing bolt/nut connecting the rear suspension front link assembly to the left rear steering knuckle assembly - Arrow B -.
Recommended tools: 18mm socket, 21mm wrench
Torque + angle: 130N m + (65±5)°

> **ATTENTION**
>
> Note the insertion direction of the bolt: from the front to the rear of the vehicle, tightening the bolt to the specified torque, ensuring the torque or preload is not applied to the nut, but only to the bolt.

g. Unscrew the 1 fixing bolt/nut - arrow C - connecting the rear suspension toe link assembly to the left rear steering knuckle assembly.
Recommended tools: 18mm socket, 21mm wrench

© 2026, All rights reserved

Torque + angle: 130N m + (65±5)°



ATTENTION

Note the insertion direction of the bolt: from the rear to the front of the vehicle, tighten the bolt to the specified torque, the torque or preload must not be applied to the nut, but only to the bolt.

h. Disconnect the left rear brake assembly from the left rear drive shaft assembly in the direction of arrow D.

ATTENTION

As the connection between the rear brake assembly and the rear drive shaft assembly is quite tight, appropriate tools must be used to loosen the connection first; avoid disconnecting the CV joint of the rear drive shaft assembly.

i. Unscrew the 4 fixing bolts -arrow- connecting the left rear steering knuckle assembly to the rear wheel hub unit assembly, and remove the rear wheel hub unit assembly ①.
Recommended tool: 15mm socket
Torque: 120±10N m

ATTENTION

Apply threadlocker when installing the fixing bolts.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After assembly, the dust cover of the rear stabilizer bar link assembly must not interfere with the ball joint seat. If interference occurs, manually rotate the lower control arm to ensure that the dust cover does not interfere with the ball joint seat.
   b. Before removing the rear hub bearing, you must first remove and protect the rear intelligent wheel speed sensor to avoid damaging the sensor body.
   c. After installation, four-wheel alignment and a road test must be performed to ensure that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while the vehicle is in motion.

GUIDE PIN AND LOCATING PIN REPAIR KIT

NOTE

This section describes the removal and installation of the left rear guide pin and locating pin repair kit. The removal and installation of the right rear guide pin and locating pin repair kit can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Before servicing the guide pin and locating pin repair kit, use a diagnostic tool to set the brake caliper to service mode. The specific procedure is as follows:
   - After connecting the diagnostic tool to the vehicle, set the vehicle to the READY state, depress the brake pedal, press the electronic parking brake switch to release the electronic parking brake, and access the diagnostic tool operating interface. Operation steps: Corresponding model-System diagnostics-Electronic Stability System (IBC)-Routine control-Enter maintenance mode via diagnostics.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the guide pin and locating pin repair kit.

   a. Disconnect the 1 connector between the parking brake motor and the floor wiring harness assembly-Arrow A-.
   b. Use a tool to secure the 2 guide pins connected to the rear brake caliper assembly - Arrow B -, unscrew the 2 fixing bolts connecting the rear brake caliper assembly to the rear caliper mounting bracket - Arrow C -, and remove the rear brake caliper assembly.
   Recommended tools: 13mm socket, 15mm wrench
   Torque: 32.5±2.5N • m

ATTENTION

When removing the rear brake caliper assembly, pay attention to the bending degree of the brake fluid hose to avoid hose rupture.

c. Remove the guide pin and locating pin repair kit ① in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After maintenance is completed, use a diagnostic tool to exit the brake caliper from maintenance mode. The specific procedure is as follows:
      - After connecting the diagnostic tool to the vehicle, place the vehicle in the READY state, and enter the diagnostic tool operation interface. Operation steps: Corresponding vehicle model - System diagnostics - Electronic Stability System (IBC) - Routine control - Diagnostic exit maintenance mode.
   b. After maintenance is completed, check the parking status.

REAR LEFT MUDGUARD

NOTE

This section describes the removal and installation of the left rear mudguard, and the removal and installation of the right rear mudguard can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Remove repair kit - rear friction plate.
   See:Repair Kit - Rear Friction Plate (page 3146)
4. Remove the rear caliper mounting bracket.
   See:Caliper mounting bracket (page 3144)
5. Remove the rear brake disc.
   See:Rear brake disc (page 3150)
6. Remove the rear left mudguard.

a. Unscrew the 3 mounting bolts -arrow- connecting the left rear mudguard to the left rear steering knuckle assembly, and remove the left rear mudguard ①.
Recommended tool: 8mm socket
Torque: 10.5±1.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the rear mudguard is deformed, it must be replaced with a new one.
   b. After installation, a road test must be conducted to confirm that there are no abnormal noises from the chassis components, no pulling, or other malfunctions while the vehicle is in motion.

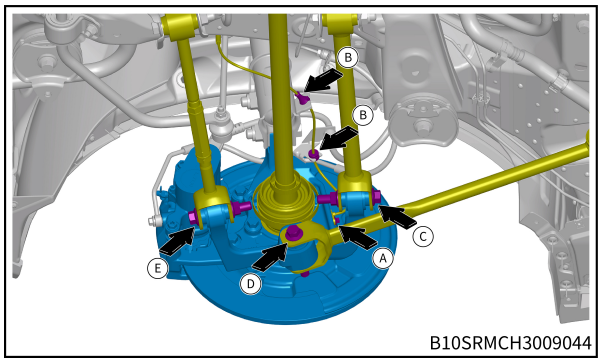
REAR LEFT BRAKE ASSEMBLY

NOTE

This section describes the removal and installation of the rear left brake assembly. The removal and installation of the rear right brake assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
4. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
5. Remove the left rear brake assembly.

a. Unscrew the rear left drive shaft lock nut -arrow-.
Recommended tool: 32mm socket
Torque: 300±15N m

ATTENTION

Use a suitable tool to secure the rear brake disc to prevent it from rotating.

b. Unscrew the 1 fixing bolt securing the left rear intelligent wheel speed sensor to the left rear steering knuckle assembly - arrow A -, and move the left rear intelligent wheel speed sensor aside.
Recommended tool: 8mm socket
Torque: 9±1N m

c. Detach the 2 fixing rubber sleeves -arrow B- connecting the left rear intelligent wheel speed sensor to the left rear brake hose assembly and the left rear strut assembly, and remove the left rear intelligent wheel speed sensor.

d. Unscrew the 1 fixing bolt/nut connecting the rear suspension front link assembly to the left rear steering knuckle assembly - Arrow C -.
Recommended tools: 18mm socket, 19mm wrench

© 2026, All rights reserved

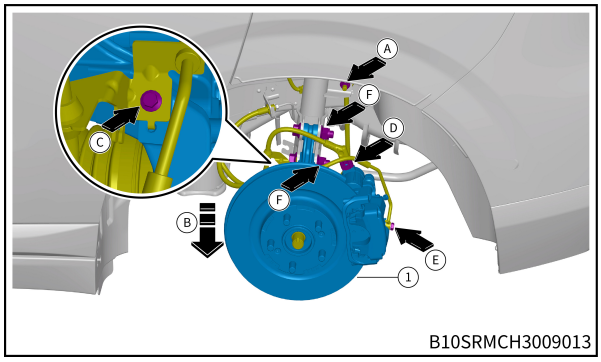
Torque + angle: 130N m + (65±5)°

ATTENTION

Note the insertion direction of the bolt: from the front to the rear of the vehicle, tightening the bolt to the specified torque, ensuring the torque or preload is not applied to the nut, but only to the bolt.

e. Unscrew the 1 fixing bolt/nut - Arrow D - connecting the rear suspension longitudinal link assembly to the left rear steering knuckle assembly, and disconnect the connection.
Recommended tools: 18mm socket, 19mm wrench
Torque + Angle: 130N m + (70±5)°

ATTENTION



Note the bolt insertion direction: from the interior to the exterior of the vehicle, tighten the bolt to the specified torque, torque or preload must not be applied to the nut, only to the bolt.

f. Unscrew the 1 fixing bolt/nut - Arrow E - connecting the rear suspension toe link assembly to the left rear steering knuckle assembly.
Recommended tools: 18mm socket, 19mm wrench
Torque + angle: 130N m + (65±5)°

ATTENTION

Note the insertion direction of the bolt: from the rear to the front of the vehicle, tighten the bolt to the specified torque, the torque or preload must not be applied to the nut, but only to the bolt.

g. Unscrew the 1 fixing nut - Arrow A - that connects the rear stabilizer bar link assembly to the left rear strut assembly.
Recommended tool: 15mm socket
Torque: 60±5N m

h. Disconnect the left rear brake assembly from the left rear drive shaft assembly in the direction of arrow B.

> **ATTENTION**
>
> As the connection between the rear brake assembly and the rear drive shaft assembly is quite tight, appropriate tools must be used to loosen the connection first; avoid disconnecting the CV joint of the rear drive shaft assembly.

i. Unscrew the 1 fixing bolt connecting the left rear brake hose assembly to the left rear steering knuckle assembly -arrow C-.
Recommended tool: 8mm socket
Torque: 9±1N m

j. Disconnect the 1 connector between the floor wiring harness assembly and the parking brake motor -arrow D-, and move the wiring harness connector aside.

k. Unscrew the 1 hollow bolt - arrow E - connecting the left rear brake hose assembly to the rear brake caliper assembly, and move the left rear brake hose assembly aside.
Recommended tool: 11mm socket
Torque: 32±2N m

> **ATTENTION**
>
> Use a drain pan to catch the spilled brake fluid, and the spilled brake fluid must be cleaned up promptly to prevent corrosion of the hoses and other components.

l. Unscrew the 2 fixing nuts connecting the left rear strut assembly to the left rear steering knuckle assembly - arrow F -.
Recommended tool: 24mm socket

Torque + Angle: 200N m + (75±5)°

ATTENTION

- Note the bolt insertion direction: from the front to the rear of the vehicle, and tighten the nut.
- Since the bolt connecting the rear strut assembly and the rear steering knuckle assembly is a special bolt and the connection is relatively tight, appropriate tools must be used to tap out the bolt.

m.Remove the rear left brake assembly ①.

ATTENTION

Since the rear brake assembly is relatively heavy, it requires at least two technicians to work together to lift and remove the left rear brake assembly; avoid dropping it to the ground to prevent component damage, which may cause personal injury in severe cases.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After assembly, the dust cover of the rear stabilizer bar link assembly must not interfere with the ball joint seat. If interference occurs, manually rotate the lower control arm to ensure that the dust cover does not interfere with the ball joint seat.
   b. When installing the rear steering knuckle assembly, ensure all connecting components are properly installed in place, and verify the correct routing of nearby related wiring harnesses.
   c. During removal and installation, pay attention to the position of the oil pipe to avoid damaging it.
   d. After installation, fill with brake fluid.
   See:Replace Brake Fluid (page 212)

   ATTENTION

   Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   e. After filling the brake fluid, bleed the brake system.
   See:Brake System Bleeding (page 214)
   f. After installation, four-wheel alignment and a road test must be performed to ensure that there are no abnormal noises from the chassis components, no pulling to one side, or other faults while the vehicle is in motion.

BLEED SCREW, SCREW CAP

NOTE

This section describes the removal and installation of the rear left bleed screw and screw cap; the removal and installation of the rear right bleed screw and screw cap can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
3. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
4. Remove the bleeder screw and the screw cap.

a. Remove the bleed screw and screw cap ① in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installing the assembly, fill with brake fluid and bleed the system.
      See:Replace Brake Fluid (page 212)

      ATTENTION

      Brake fluid must not be reused or mixed.

   b. Brake fluid must not be reused or mixed, and must not be replaced with a different type. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

DRIVE THE BRAKE MOTOR

NOTE

This section describes the removal and installation of the rear left drive brake motor, and the removal and installation of the rear right drive brake motor can generally be performed with reference to the left side.

REMOVAL PROCEDURE

1. Before servicing the drive brake motor, use a diagnostic tool to set the rear brake caliper to service mode. The specific procedure is as follows:
   - After connecting the diagnostic tool to the vehicle, set the vehicle to the READY state, depress the brake pedal, press the electronic parking brake switch to release the electronic parking brake, and access the diagnostic tool operating interface. Operation steps: Corresponding model-System diagnostics-Electronic Stability System (IBC)-Routine control-Enter maintenance mode via diagnostics.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
5. Remove the parking brake motor.

a. Disconnect the 1 connector between the parking brake motor and the floor wiring harness assembly-Arrow A-.
b. Unscrew the 2 mounting bolts - arrow B - connecting the parking brake motor to the rear brake caliper assembly, and remove the parking brake motor ①.
Recommended tool: 5mm hexagon socket wrench
Torque: 7.65±0.15N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   b. After maintenance is completed, a diagnostic tool must be used to take the rear brake caliper out of maintenance mode. The specific procedure is as follows:
      - After connecting the diagnostic tool to the vehicle, place the vehicle in the READY state, and enter the diagnostic tool operation interface. Operation steps: Corresponding vehicle model - System diagnostics - Electronic Stability System (IBC) - Routine control - Diagnostic exit maintenance mode.
   c. After maintenance is completed, check the parking status.

5.9 BRAKE LINE SYSTEM

5.9.1 PRECAUTIONS

PRECAUTIONS

1. Brake fluid is corrosive; take care not to spill it on other parts of the vehicle.
2. Brake fluid is corrosive. Do not get brake fluid on your skin. If it comes into contact with your skin, wash it off immediately with plenty of water.
3. After the brake hard pipe fitting nut is removed, the interfaces of the Intelligent Integrated Brake System assembly and the associated pipelines must be sealed to prevent foreign objects from entering.
4. The oil pipe joint nut is prone to misalignment during installation. First, align it with the threaded hole by hand and engage 3 to 5 threads before tightening it with a flare nut wrench.
5. The brake line system must be serviced by professionally trained and skilled technicians, and only genuine parts shall be used for replacement.
6. After the brake pipeline control system is repaired, a strict inspection must be conducted before a road test. The vehicle can be delivered to the customer only after everything is confirmed to be normal.
7. Avoid excessive bending or twisting of the brake lines during removal.
8. After replacing the brake lines, the bleeding procedure must be performed.
9. The brake hard line must be tightened to the specified torque.

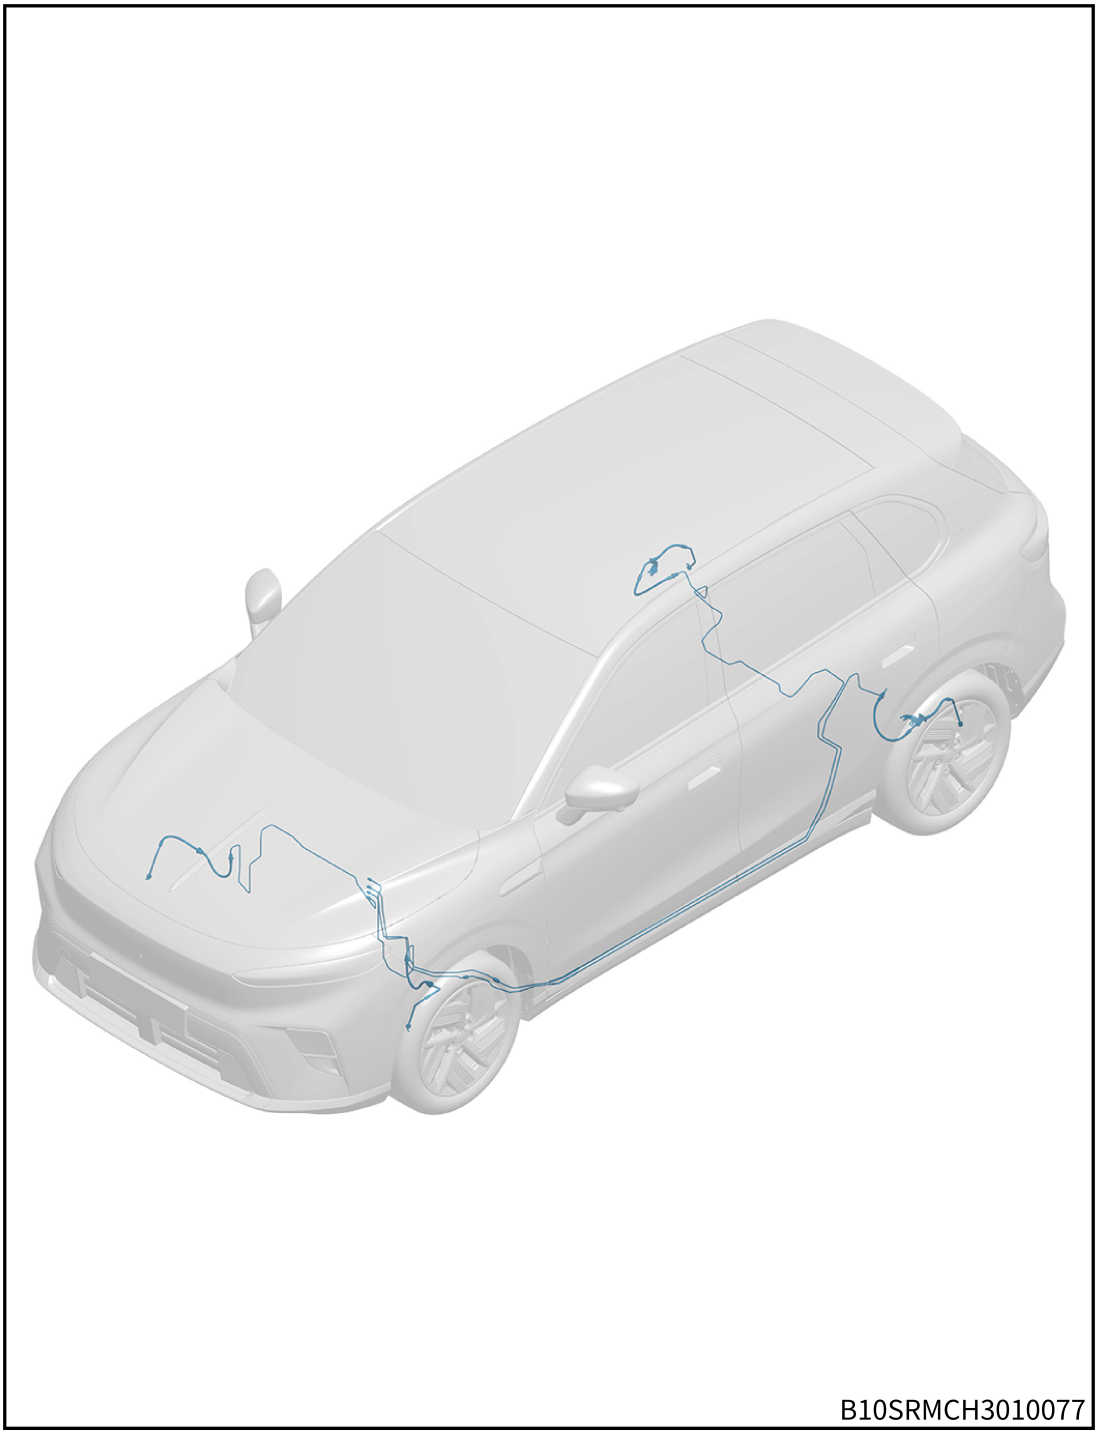
5.9.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION



- The brake hose is a critical automotive component in the braking system. Its primary function is to transmit brake fluid from the master cylinder to the pistons of each caliper when the brake pedal is depressed. The pistons then clamp the brake disc to generate immense frictional force, thereby achieving the braking effect.
- In the braking system, since brake fluid is corrosive to the brake hose, the brake hose must be used with the appropriate brake fluid grade. The higher the brake fluid grade, the greater the corrosiveness to the brake hose.
- Since the brake lines need to transmit brake fluid from the master cylinder to the wheel cylinders located on the moving suspension components, they are divided into rigid lines that do not move and flexible hoses that do. The rigid lines of the brake fluid lines in OEM vehicles are made of special metal tubing, providing ideal strength. The flexible hoses are generally made of rubber hoses reinforced with nylon and metal wire mesh. During continuous braking or repeated hard braking, the flexible hoses may expand, resulting in a drop in brake fluid pressure, which affects the accuracy and reliability of braking. This is particularly the case for vehicles equipped with an Anti-lock Braking System (ABS), where the brake hoses may develop continuous expansion points, leading to damage to the brake hoses.

- The brake lines consist of the following components:
  a. Left/Right Front Brake Hard Line Assembly.
  b. Left/Right front brake hose assembly.
  c. Left/Right Rear Brake Hose Assembly.
  d. Left/Right Rear No. 1 Brake Hard Pipe Assembly.
  e. Left/Right Rear No. 2 Brake Hard Line Assembly.

5.9.5 COMMON FAULTS

COMMON FAULTS

1. Check the brake hard line for cracks, damage, and corrosion.
2. Check the brake hose for cracks, kinks, or deterioration.
3. Check whether the fitting nuts of each brake hard line are properly tightened and if there is any leakage.
4. Check that all hose clamps are securely tightened.
5. Avoid contact between the brake lines and welds or moving parts.

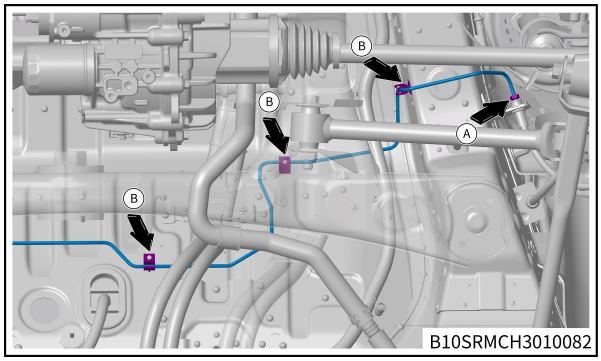
5.9.8 SERVICE AND REPAIR GUIDANCE



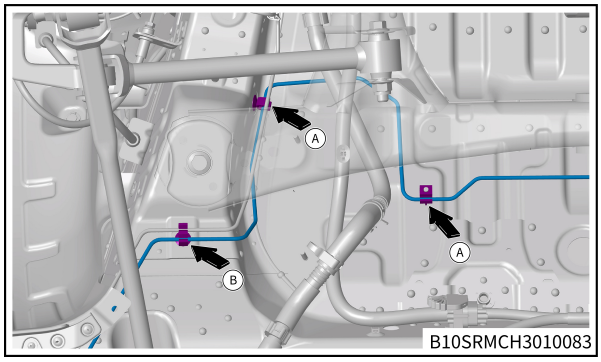
REAR RIGHT NO. 2 BRAKE HARD PIPE ASSEMBLY

ATTENTION

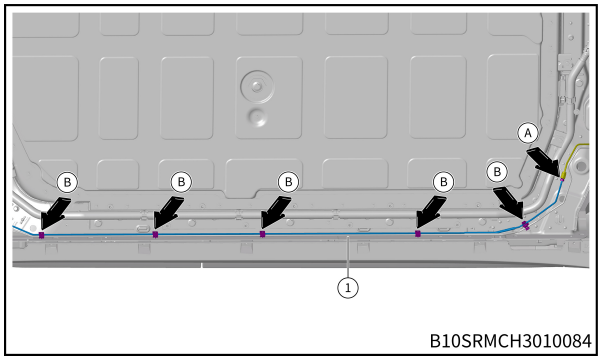
When removing any brake line, the brake fluid in the brake fluid reservoir must first be drained, and the remaining brake fluid in the system lines must be drained. After installation, new brake fluid must be refilled, and the system must be bled.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the left lower cover assembly.
   See:Left lower undercover assembly (page 5320)
5. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
6. Remove the right rear wheel assembly.
   See:Wheel Assembly (page 2962)
7. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
8. Remove the rear right No. 2 brake pipe assembly.



a. Unscrew the 1 pipe nut connecting the right rear No. 2 brake hard pipe assembly to the right rear brake hose assembly - arrow A -.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m



ATTENTION

Spilled brake fluid must be cleaned promptly to prevent corrosion of other components.

b. Disconnect the 3 connections of the right rear No. 2 brake hard pipe assembly from the body single-groove pipe clamp -Arrow B-.
Recommended tool: Clip remover

c. Disconnect the 2 connections between the right rear No. 2 brake hard pipe assembly and the body single-groove pipe clamp -Arrow A-.
Recommended tool: Clip remover

d. Disconnect 1 connection of the right rear No. 2 brake hard pipe assembly from the body double-groove pipe clamp - arrow B -.
Recommended tool: Clip remover

e. Unscrew the 1 pipe nut connecting the right rear No. 2 brake hard pipe assembly to the right rear No. 1 brake hard pipe assembly - Arrow A -.
Recommended tools: 11mm fuel line wrench, 13mm fuel line wrench
Torque: 17±3N m

> **ATTENTION**
>
> Spilled brake fluid must be cleaned promptly to prevent corrosion of other components.

f. Disconnect the 5 connections between the right rear No. 2 brake hard pipe assembly and the body double pipe clip - Arrow B -.
Recommended tool: Clip remover

g. Remove the rear right No. 2 brake hard pipe assembly ①.

> **ATTENTION**
>
> Removing the right rear No. 2 brake hard pipe assembly requires two technicians to work together during removal and installation to prevent severe bending and deformation of the pipe.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After replacing the brake hard line, new brake fluid must be used.
   See:Replace Brake Fluid (page 212)

> **ATTENTION**

© 2026, All rights reserved

Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

b. After filling the brake fluid, bleed the brake system.
See:Brake System Bleeding (page 214)
c. Check whether all lines are properly installed and check for any fluid leaks.
d. The pipe clamps are correctly oriented, and the rigid brake lines do not interfere with surrounding components.
e. After the fittings at both ends of the rigid brake pipe are tightened, if removal is required, the ends shall be inspected. If significant deformation is found, it shall not be reassembled.
f. After installation is completed, a road test must be conducted to check the braking performance of the vehicle while driving.

REAR LEFT BRAKE HOSE ASSEMBLY

NOTE

This section describes the removal and installation of the rear left brake hose assembly, and the removal and installation of the rear right brake hose assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
4. Drain the brake fluid.
   See:Replace Brake Fluid (page 212)
5. Remove the rear left brake hose assembly.

a. Unscrew the 1 hollow bolt -Arrow A- connecting the left rear brake hose assembly to the left rear brake caliper assembly.
Recommended tool: 11mm socket
Torque: 32±2N m

ATTENTION

Use a drain pan to catch the draining brake fluid, and clean up any spilled brake fluid promptly to prevent corrosion of hoses and other components.

b. Unscrew the 1 brake pipe nut -arrow B- connecting the left rear brake hose assembly to the left rear No. 2 brake pipe assembly.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m
c. Remove the U-shaped spring clip -Arrow C-.
Recommended tool: Slip-joint pliers
d. Detach the 1 retaining rubber sleeve connecting the left rear intelligent wheel speed sensor to the left rear brake hose assembly -arrow D-.
e. Detach the 1 fixing rubber sleeve connecting the floor wiring harness assembly to the left rear brake hose assembly - Arrow E -.

f. Unscrew the 1 fixing bolt connecting the left rear brake hose assembly to the left rear steering knuckle assembly - arrow F -.
Recommended tool: 8mm socket
Torque: 9±1N m
g. Remove the rear left brake hose assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After replacing the rear brake hose, the brake fluid must be replaced with new brake fluid.
   See:Replace Brake Fluid (page 212)

   ATTENTION

   Brake fluid must not be reused or mixed, and must not be replaced with a different type of brake fluid. After filling the brake fluid, check whether the brake fluid level is between the MAX (maximum) and MIN (minimum) marks.

   b. After filling the brake fluid, bleed the brake system.
   See:Brake System Bleeding (page 214)
   c. Check whether all lines are properly installed and check for any fluid leaks.
   d. During the tightening torque process of the hollow bolt, ensure that the caliper is fixed and does not shake to avoid generating false torque.
   e. After the fittings at both ends of the rigid brake pipe are tightened, if removal is required, the ends shall be inspected. If significant deformation is found, it shall not be reassembled.
   f. After installation is completed, a road test must be conducted to check the braking performance of the vehicle while driving.

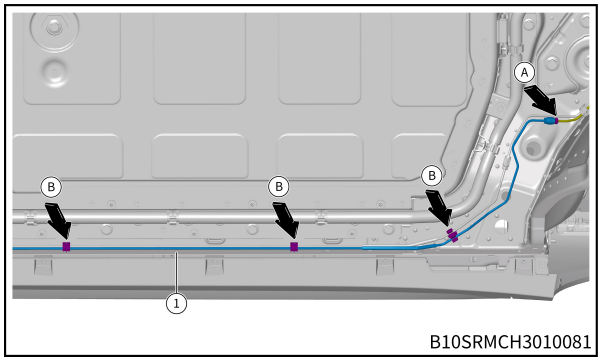
8. Remove the rear left No. 2 brake hard pipe assembly.

a. Unscrew 1 pipe nut - arrow A - connecting the left rear No. 2 brake hard pipe assembly to the left rear brake hose assembly.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m



ATTENTION

Spilled brake fluid must be cleaned up promptly to prevent corrosion of hoses and other components.

b. Disconnect 1 connection between the left rear No. 2 brake hard pipe assembly and the body single-groove pipe clamp -arrow B-.

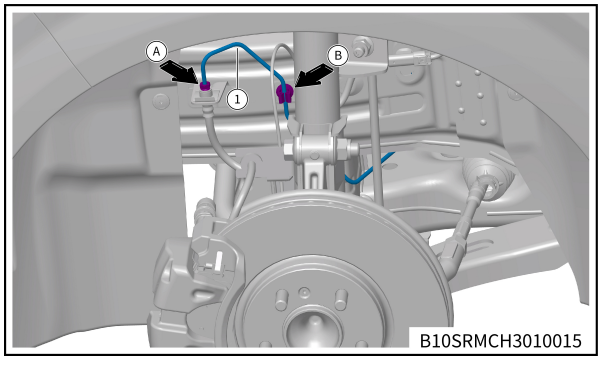
6. Remove the front left brake hard pipe assembly.



a. Unscrew the 1 pipe nut connecting the front left brake hard pipe assembly to the smart integrated brake system assembly - Arrow A -.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m

ATTENTION

Spilled brake fluid must be cleaned up promptly to prevent corrosion of hoses and other components.

b. Disconnect 1 connection of the left front brake hard pipe assembly from the body double pipe clip -Arrow B-.
Recommended tool: Clip remover

c. Unscrew the 1 pipe nut connecting the left front brake rigid pipe assembly to the left front brake hose assembly -Arrow A-.
Recommended tool: 11mm fuel line wrench

5. Remove the front left brake hose assembly.

a. Unscrew the 1 hollow bolt -arrow- connecting the front left brake hose assembly to the front left brake caliper assembly.
Recommended tool: 11mm socket
Torque: 32±2N m

ATTENTION

Residual brake fluid remains in the brake hoses, and any spilled brake fluid must be cleaned up promptly to prevent corrosion of the hoses and other components.

b. Unscrew the 1 pipe nut connecting the left front brake hose assembly to the left front brake pipe assembly - arrow A -.
Recommended tool: 11mm fuel line wrench
Torque: 17±3N m
c. Remove the U-shaped spring clip -arrow B-.
Recommended tool: Slip-joint pliers
d. Disconnect the front left brake hose assembly from the front left strut assembly -Arrow C-, and remove the front left brake hose assembly ①.

5.10 CONTROL SYSTEM

5.10.1 PRECAUTIONS

PRECAUTIONS

1. Before repairing or replacing any parts, thoroughly inspect them to ensure they meet technical requirements.
2. After installing the brake light switch, check whether it is properly seated. Gently wiggle the brake switch a few times by hand to avoid misalignment, and visually inspect the switch and the pedal to ensure there is no contact between them.
3. The fixing bolts/nuts must be tightened to the specified torque.

5.10.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- When the driver depresses the electronic accelerator pedal, the electronic accelerator pedal position sensor detects the driver's operation and transmits the signal to the electronic control system. The electronic control system controls the output power of the motor based on the input signal, thereby propelling the vehicle forward.
- The control system enables the stationary vehicle to park securely under various road conditions, and allows the moving vehicle to decelerate forcefully or even come to a stop as required by the driver.
- The brake pedal is the pedal that limits power, namely the foot brake (service brake) pedal, and is used for deceleration and stopping.

The operating parts system mainly consists of the following components:

- Electronic accelerator pedal assembly: Enables the vehicle to accelerate forward.
- Brake light switch assembly: Provides brake light signals; meanwhile, the electronic control unit also receives a signal indicating the driver's braking intention, thereby controlling vehicle deceleration.
- Brake pedal pad: Improves comfort during braking.
- Brake pedal assembly: Provides parking, stopping, and braking functions.

ELECTRONIC ACCELERATOR PEDAL ASSEMBLY

REMOVAL PROCEDURE

1. Park the vehicle in the lifting area.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the electronic accelerator pedal assembly.

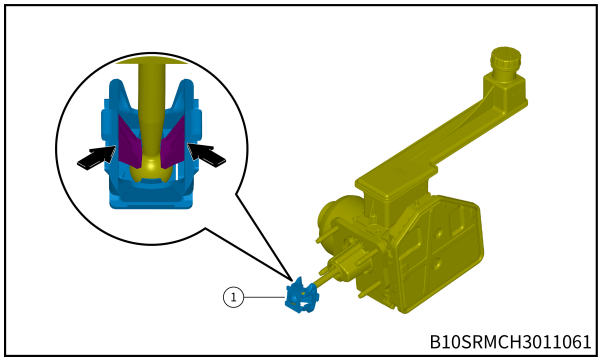
a. Disconnect 1 connector -arrow- between the electronic accelerator pedal assembly and the engine compartment wiring harness assembly.

b. Unscrew the 3 fixing nuts -arrow- connecting the electronic accelerator pedal assembly to the electronic accelerator pedal mounting bracket.
   Recommended tool: 10mm socket
   Torque: 9±1N m
c. Remove the electronic accelerator pedal assembly ①.

ATTENTION

Do not bump or drop the electronic accelerator pedal assembly, and do not lose the accelerator pedal nut.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, verify that the electronic accelerator pedal assembly functions properly.

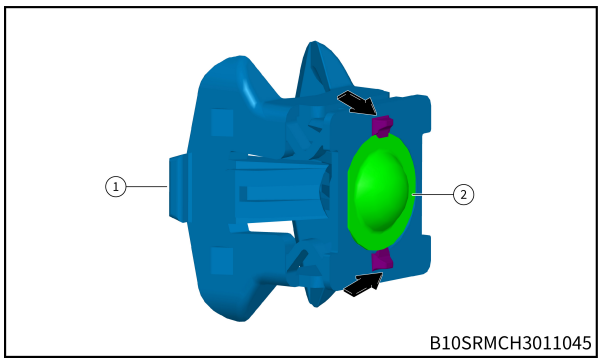
PLASTIC BALL JOINT SEAT



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the brake pedal assembly.
   See:Brake Pedal Assembly (page 3201)
3. Remove the plastic ball joint socket.

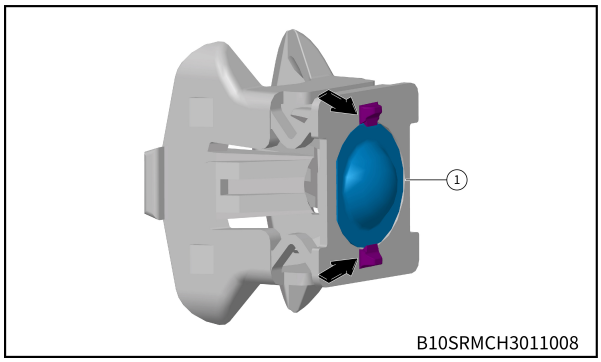
a. Detach the 2 retaining clips -arrow- between the plastic ball socket seat and the Smart Integrated Brake System assembly, and remove the plastic ball socket seat with ball bowl ①.
Recommended tool: Flathead screwdriver

> **ATTENTION**
>
> The plastic ball joint socket is a single-use part and must be replaced with a new one after removal.

b. Release the 2 retaining clips -arrow- connecting the plastic ball joint seat and the ball socket, and remove the plastic ball joint seat ① and the ball socket ②.

> **ATTENTION**
>
> Check the ball socket for cracks or damage. If any are found, replace it with a new ball socket.

SETUP



1. The installation procedure is performed in reverse order.

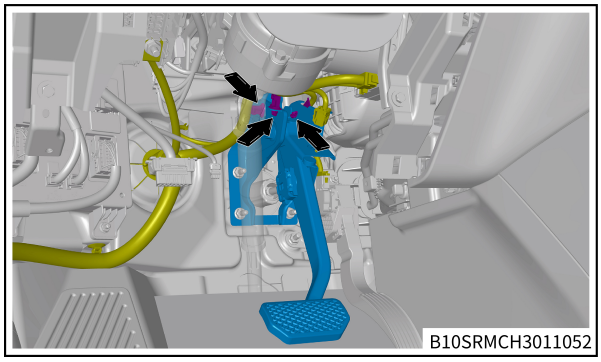
5. Remove the electronic accelerator pedal mounting bracket.

a. Unscrew the 3 fixing nuts securing the electronic accelerator pedal mounting bracket to the vehicle body -arrow-.
   Recommended tool: 13mm socket
   Torque: 23±2N m
b. Remove the electronic accelerator pedal mounting bracket ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, verify that the electronic accelerator pedal assembly functions properly.

a. With one hand, lift the pedal arm upward, and with the other hand, push the push rod of the smart integrated brake system assembly upward to align the ball joint with the ball joint mounting hole on the pedal arm. Then, apply a longitudinal force of ≤100N on the pedal surface to press the ball joint of the push rod into the ball socket (it is considered properly assembled only after hearing a "click" sound). Apply a reverse longitudinal force of ≥100N to check whether the ball joint will be pulled out from the ball socket, and confirm whether it is properly assembled.
b. After installation, ensure that the Intelligent Integrated Braking System is securely engaged with the clip-arrow-clip.
c. After installation, the vehicle must be road-tested and the braking performance checked.

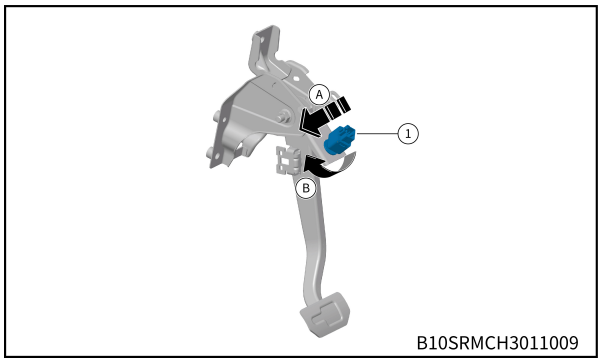
STOP LAMP SWITCH ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the brake light switch assembly.



a. Disconnect the 1 connector between the brake light switch assembly and the engine compartment wiring harness assembly -arrow-.

b. Unscrew the brake light switch assembly ① counterclockwise in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing the stop lamp switch assembly ①, keep the brake pedal arm stationary (you can gently pull the pedal arm toward the driver by hand or secure it with a fixture to prevent the pedal arm from being depressed due to excessive force applied by the technician during switch installation).
b. First, press the black switch base into the mounting hole of the pedal bracket, then pass the brake switch screw through the switch bracket hole. Using an axial force in the direction of - Arrow A -, gently push the brake switch forward. Stop when the switch contact is fully compressed to the bottom, then rotate it clockwise in the direction of - Arrow B - to lock it in place (the switch contact protrudes by 1.5±0.2 mm; this

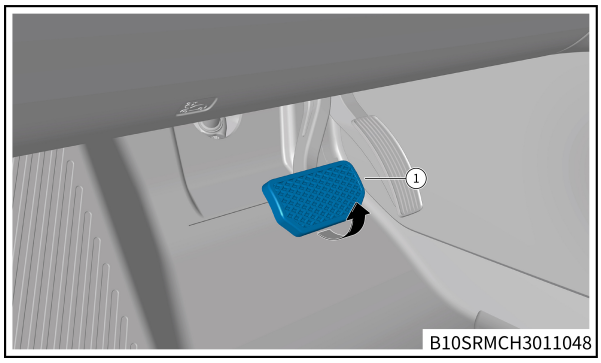
clearance is controlled by the screw pitch and requires no measurement).



c. During rotation, do not apply excessive downward force to the switch body, as this may depress the pedal arm and prevent the switch contacts from protruding after assembly.
d. After the brake light switch assembly ① is assembled, gently shake the brake switch by hand a few times to avoid misalignment, and visually inspect the switch to ensure it is properly seated.
e. After installation, check whether the brake light switch assembly is functioning properly.

5.11 BRAKE SERVO SYSTEM

5.11.1 PRECAUTIONS

PRECAUTIONS

1. Repairs must be performed by professionally trained technicians with proper repair skills, and only genuine parts shall be used for replacement.
2. Before diagnosing the IBC system, any faults in the base braking system must be rectified first, such as:
   - Brake system noise.
   - The brake pedal is too hard.
   - During normal braking, the brake pedal or the vehicle vibrates.
   - Vehicle pulls to one side during braking.
3. The Intelligent Integrated Brake System Assembly can only be replaced as a complete unit and must not be disassembled for inspection or partially replaced/interchanged. Furthermore, the Intelligent Integrated Brake System Assembly will not be covered by warranty once it has been disassembled, and we assume no responsibility for any adverse consequences resulting from the disassembly for inspection, partial replacement, or interchange of the Intelligent Integrated Brake System Assembly.
4. When connecting the sensor wiring harness of the Intelligent Integrated Brake System Assembly, please note the following points:
   - Before disconnecting the Intelligent Integrated Braking System assembly wiring harness and the sensor wiring harness, the negative battery terminal must be disconnected.
   - Ensure the connector is dry and clean, and prevent any foreign objects from entering.
   - The ABS wiring harness connector must be fully seated both horizontally and vertically to prevent damage to the connector.
5. When connecting the brake lines of the Intelligent Integrated Brake System Assembly, ensure correct connection. Incorrect connection may lead to serious accidents. When connecting the brake lines, you must follow the markings on the Intelligent Integrated Brake System Assembly:
   - FL: Brake line connecting to the front left wheel cylinder;
   - FR: Brake line connecting the right front wheel brake wheel cylinder;
   - RL: Brake line connecting to the rear left wheel brake cylinder;
   - RR: Brake line connecting to the right rear wheel brake cylinder.
6. The Intelligent Integrated Braking System Assembly will generate noise under the following conditions:
   - When the vehicle is powered on or started, a brief "buzzing" sound will be heard. This is the sound of the Onebox performing its self-check, which is normal. The Intelligent Integrated Braking System assembly will produce sounds during normal operation, mainly manifested in the following aspects:
     - The sound of the motor, solenoid valves, and return pump operating within the hydraulic unit of the Intelligent Integrated Brake System assembly.
     - Noise caused by brake pedal kickback.
     - Impact noise between the suspension and the vehicle body caused by emergency braking.

5.11.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

The Intelligent Integrated Brake System Assembly (onebox) mainly includes the following parts:

- Brake Control Unit (ECU): Responsible for precise calculations, controlling brake pressure, and distributing braking force to ensure braking performance and stability under various vehicle operating conditions;
- Brake actuation unit: Includes the master cylinder, booster cylinder, and motor, and controls the release and increase of pressure according to ECU commands;
- Sensors: including pressure sensors, stroke sensors, and motor position sensors;
- Brake pedal simulator: The pedal force curve corresponding to pedal travel (pedal feel curve) can be designed according to requirements.

Feature Introduction

The Intelligent Integrated Braking System Assembly integrates ESC vehicle stability control and EHB brake boost functions, including ABS, TCS, ESC, EBD, EBA, EPB, HHC, AVH, HDC, and CDP.

Anti-lock Braking System (ABS):

- During vehicle braking, the wheel speed sensors promptly transmit the wheel speed signals of each wheel to the ABS. The ABS control unit processes the input signals from the four wheel speed sensors according to the set control logic and calculates the slip ratio of the wheels. By controlling the operation of the solenoid valves, the slip ratio of each wheel is maintained within the ideal range (around 20%) to prevent the wheels from locking.

TCS: Traction Control System, ESC: Electronic Stability Control:

- It features a function to assist the driver in controlling the driving direction. After the motor is started, the system automatically enters standby mode. When the system detects a deviation between the actual vehicle state and the driver's driving intention (steering angle sensor, vehicle speed, and accelerator pedal position signal) via the yaw-G sensor on the vehicle body, it takes measures such as selectively applying the brakes and intervening through the torque management system to prevent drive wheel slip, avoid vehicle skidding, correct understeer and oversteer, and help stabilize the direction. The anti-skid switch is integrated into the vehicle display screen interface!

EBD-Electronic Brakeforce Distribution system:

- Prevent the rear axle from locking before the front axle to avoid the unstable working condition of rear axle lockup.

EBA-Brake Assist System:

- The primary function is to automatically monitor the speed at which the brake pedal is depressed during emergency braking when the pedal is not fully depressed, to determine whether greater braking force is required, thereby preventing accidents.

HHC Hill Hold Control:

© 2026, All rights reserved

The hill-start assist system helps the driver start the vehicle on an uphill slope and prevents the vehicle from rolling back when starting. The hill-start assist system is activated when the following conditions are met simultaneously:

- The vehicle is parked on an uphill slope with a gradient exceeding 3% for more than 2 seconds.
- No fault in the Electronic Stability Control (ESC).
- The Electronic Parking Brake (EPB) has no faults and is in the released state.
- In Drive or Reverse gear (automatic transmission).
- Apply sufficient force to the brake pedal.
- If the driver releases the brake pedal on an uphill slope, the Hill Start Assist system will keep the vehicle stationary for about 1 to 2 seconds. If the vehicle does not pull away within 1 to 2 seconds, the brakes will automatically release and the vehicle may roll back, in which case you should immediately press the brake pedal.

Auto Hold:

Auto Hold is a function that maintains automatic braking. Once this function is activated, when stopping at a traffic light, the driver depresses the brake pedal to bring the vehicle to a stop, the AVH indicator on the instrument cluster illuminates, and the actuator automatically holds the vehicle, eliminating the need for the driver to keep the brake pedal depressed. To resume driving, simply depress the accelerator pedal, and the actuator automatically releases.

Operating Principle

- The Auto Hold switch is integrated into the central control touchscreen, tap "Driving" to view the Auto Hold switch.
- When the Auto Hold function is enabled, and the user applies sufficient braking force to bring the vehicle to a complete stop with the vehicle speed at 0, the ESC braking system automatically applies the brakes to the vehicle.
- To start off, simply lightly press the accelerator pedal, and the Auto Hold will be automatically released.

Limitations

Auto Hold must meet the following conditions:

- The infotainment system is turned on.
- The vehicle is in the READY mode.
- The door is closed.
- Fasten your seat belt.
- The accelerator pedal signal is received.

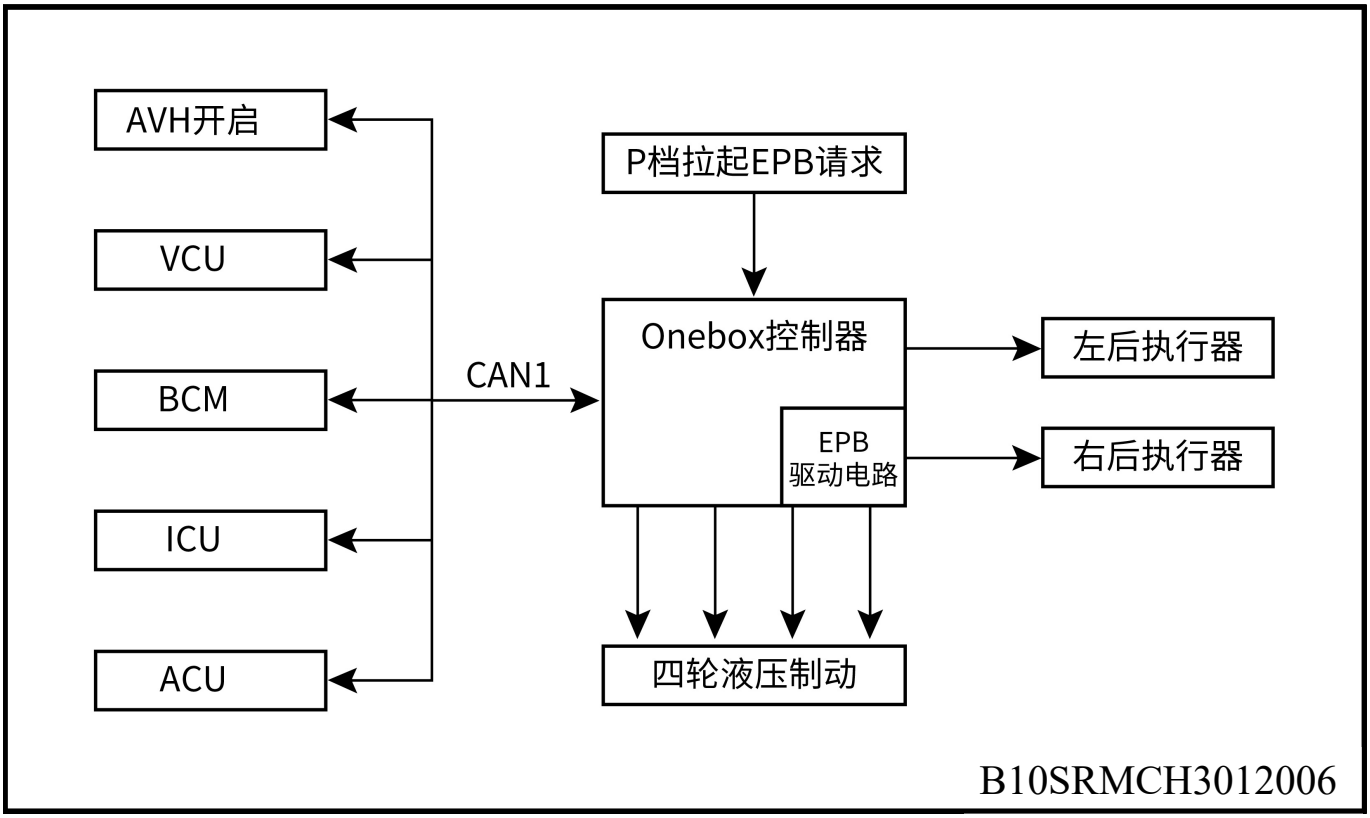
Hill Descent Control (HDC):

- HDC is a speed control function. When the vehicle is descending a steep slope, HDC actively applies the brakes to the wheels based on system inputs (HDC switch, vehicle speed setting, accelerator/brake pedal status, motor torque/speed, gear position, etc.), ensuring that the driver can comfortably and safely navigate steep slope conditions at low speeds without having to operate the brake pedal.
- The HDC function is actively deactivated under operating conditions such as ABS/ESC/EHB malfunction, brake disc overheating, or when the driver presses the accelerator pedal and the vehicle speed exceeds the HDC set threshold.

ARP-Anti-Rollover Protection Function:

© 2026, All rights reserved

- The rollover mitigation function is a sub-function of the Electronic Stability Control function. By sensing the driver's steering wheel operations and combining them with the vehicle's wheel speed signals and inertial sensor signals, it intervenes in the wheel braking force and powertrain drive torque at the appropriate time to reduce the risk of vehicle rollover during dynamic conditions (such as lane changes) and steady-state conditions (such as constant radius turning).



CDP-Deceleration and Stop Control Function:

- The deceleration stop control function is an enhanced emergency braking function that provides a secondary backup braking system in addition to the service brake. While the vehicle is in motion, if the driver continuously presses the Park switch, it can provide a certain amount of braking force to assist in braking. The DBF function can also work in conjunction with the ABS function to ensure vehicle stability and maintain steering capability during deceleration.

Parking system:

- EPB Composition: The Electronic Parking Brake system is a technology that implements parking braking through electronic control.
- System composition: EPB switch, control module integrated in the onebox assembly, and actuator.
- Input signal: The VCU internally uses the column shifter signal to identify the driver's intent, thereby controlling the parking and release of the rear wheels.
- Execution signal: Upon recognizing the driver's intent, the Intelligent Integrated Brake System assembly outputs a 12V voltage to drive the actuator motor to apply and release the parking brake.

5.11.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-IBC

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the IBC data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION-IBC

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

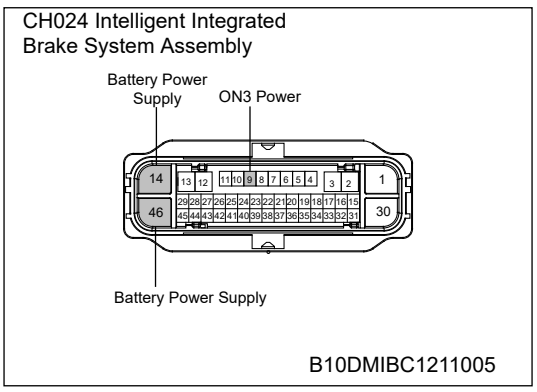
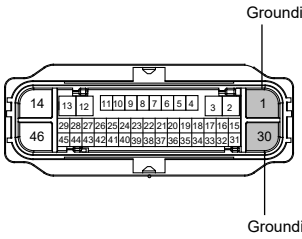
DTC: B171717-IBC

Fault code	Description
B171717	System electrode high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the intelligent integrated braking system assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check fuses BF03, BF04, and FF31 of the Intelligent Integ rated Brake System Assembly. Fuse specifications: BF03 60A, BF04 60A, FF31 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.

CH010 Brake Fluid Level Sensor

B10DMIBC1211033

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector CH010 of the brake fluid level sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 31 of harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 3 of harness connector CH010 of the brake fluid level sensor to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 1 of the wire harness connector CH010 of the brake fluid level sensor to check whether the resistance value is normal.
F Using a multimeter, select the resistance range, and measure whether the resistance value between terminal 43 of the wire harness connector CH024 of the intelligent integrated brake system assembly and terminal 2 of the wire harness connector CH010 of the brake fluid level sensor is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System Assembly and the vehicle body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 31, 43, and 45 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and the body ground to check if it is normal.

Go to step 2.

Step 2 Check whether the wiring harness between the right drive brake motor and the Intelligent Integrated Brake System assembly is normal.

CH024 Intelligent Integrated Brake System Assembly

B10DMIBC1211024

CH016 Right Drive Brake Motor

B10DMIBC1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wire harness connector CH016 of the right drive brake motor.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 12 of the wiring harness connector CH024 of the smart integrated brake system assembly and terminal 1 of the wiring harness connector CH016 of the right drive brake motor to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 2 of the wire harness connector CH016 of the right drive brake motor to check if it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 1 and 2 of the wire harness connector CH016 for the right drive brake motor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the wiring harness connector CH016 of the right drive brake motor and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
