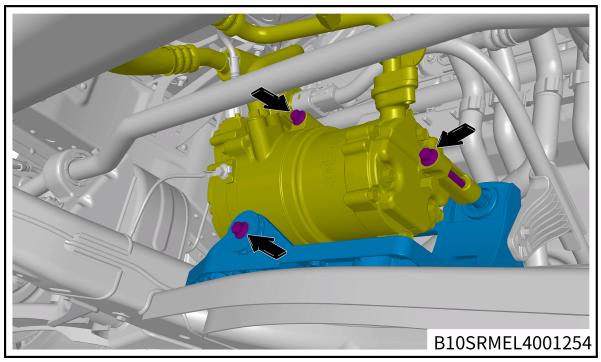
1. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
2. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
3. Remove the right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the drip tube.

a. Remove the drain tube sealing plug ①.

b. Lift the front part of the driver's carpet ①.

c. Disconnect the drain tube from the automatic HVAC assembly -arrow A-, disconnect the 1 grommet of the drain tube -arrow B-, and remove the drain tube ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the drip tube is properly installed.

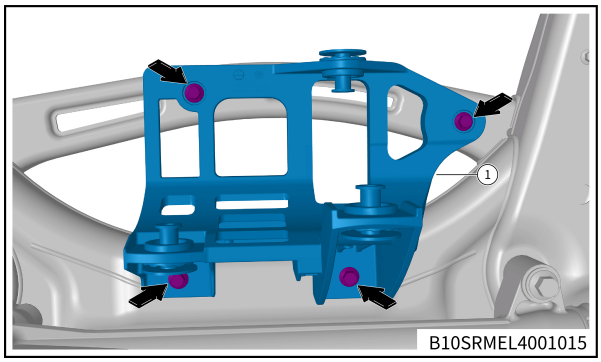
ELECTRIC COMPRESSOR CAST BRACKET

REMOVAL PROCEDURE



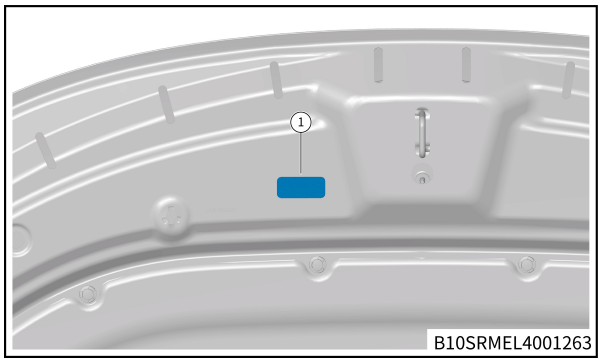
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment undercover assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the electric compressor casting bracket.

a. Unscrew the 3 fixing bolts -arrow- of the electric compressor assembly, and remove the electric compressor.
Recommended tool: 10mm socket
Torque: 23±2N m

b. Unscrew the 1 mounting bolt -arrow- between the compressor cable assembly and the electric compressor cast bracket, and remove the compressor cable assembly.
Recommended tool: 8mm socket
Torque: 9±1N m

c. Unscrew the 4 fixing bolts of the electric compressor casting bracket -arrow-, and remove the electric compressor casting bracket ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

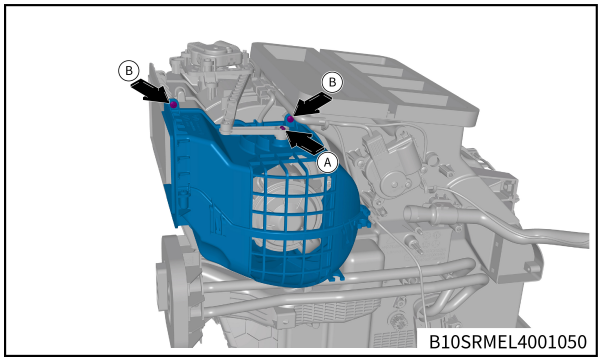
AIR CONDITIONING CHARGING LABEL

REMOVAL PROCEDURE

1. Open the front engine compartment cover assembly.
2. Remove the A/C recharge label.

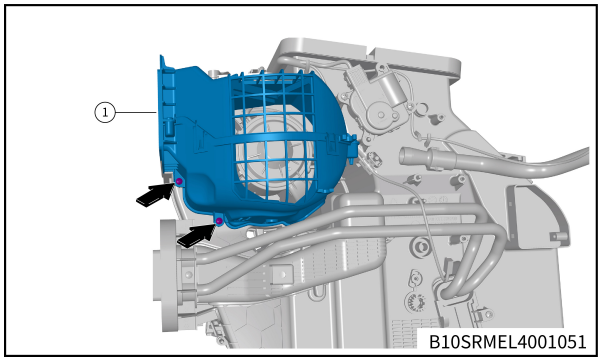
a. Remove the A/C charging label ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT AIR INTAKE VENT

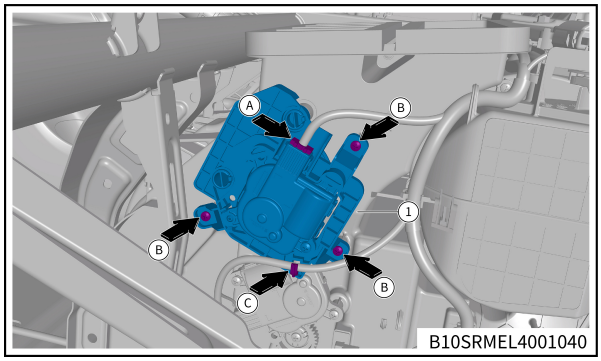
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the outside air seal sponge.
   See:Outside air sealing sponge (page 5169)
5. Remove the left air intake vent.

a. Disconnect the linkage rod of the recirculation flap actuator assembly from the left air intake -arrow A-, and unscrew the 2 fixing screws of the left air intake -arrow B-.
Recommended tool: Phillips screwdriver

b. Unscrew the 2 retaining screws -arrow- of the left air intake vent, and remove the left air intake vent ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

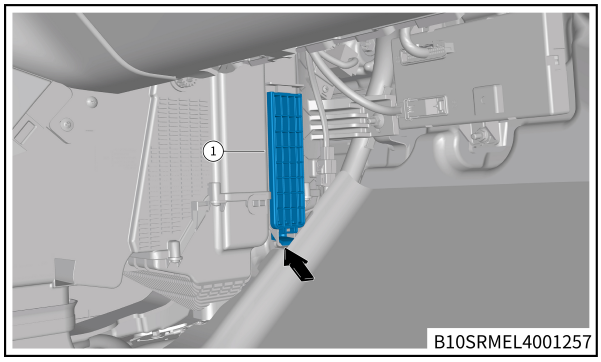
MODE DOOR ACTUATOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the right footwell air duct assembly.
   See:Right footwell air duct assembly (page 5147)
5. Remove the mode door actuator assembly.

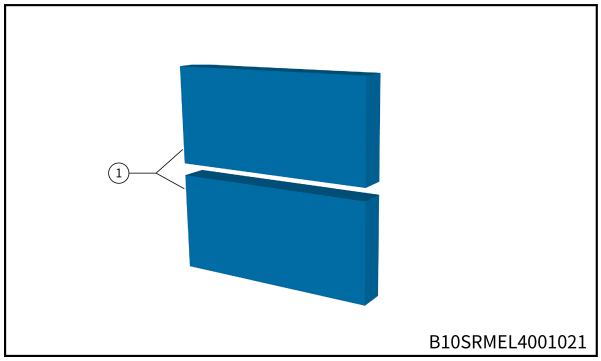
a. Disconnect the 1 connector between the HVAC harness assembly and the mode door actuator assembly - arrow A -, and unscrew the 3 mounting screws of the mode door actuator assembly - arrow B -.
   Recommended tool: Phillips screwdriver
b. Release the 1 retaining clip - arrow C - between the HVAC harness assembly and the mode door actuator assembly, and remove the mode door actuator assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the mode door actuator assembly is working properly.

© 2026, All rights reserved



AIR FILTER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the right extension panel assembly of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
3. Remove the air filter.

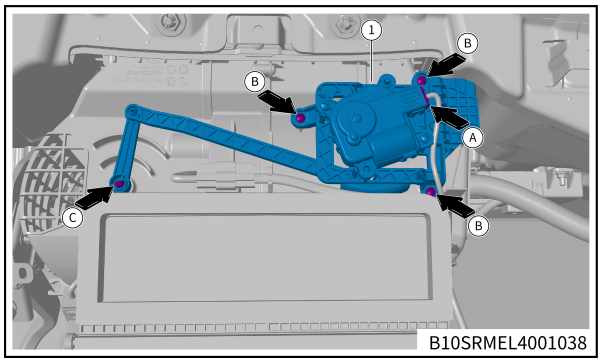
a. Release the 1 retaining clip -arrow- of the filter cover, and remove the filter cover ①.

b. Remove the air filter ①.

NOTE

The air filter is divided into two parts: upper and lower. Exercise caution when removing them.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing, first install the upper air filter in place, and then install the lower air filter.
   b. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

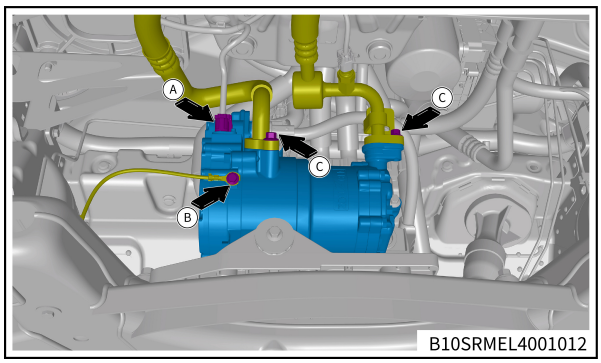
RECIRCULATION DOOR MOTION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the recirculation door actuator.

a. Disconnect the 1 connector between the HVAC harness assembly and the recirculation flap actuator - arrow A -, and unscrew the 3 fixing screws of the recirculation flap actuator - arrow B -.
   Recommended tool: Phillips screwdriver
b. Detach the recirculation flap actuator from the 1 retaining clip on the left air intake -arrow C-, and remove the recirculation flap actuator ①.

SETUP



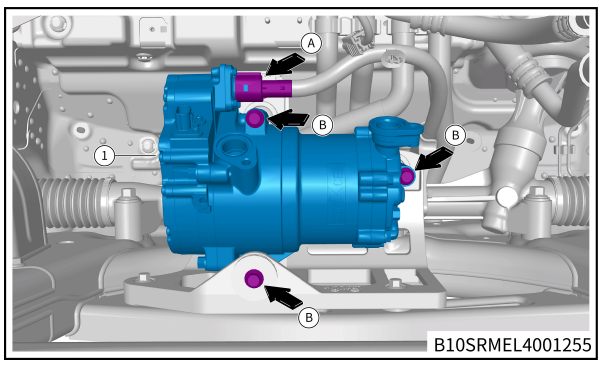
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is complete, check whether the recirculation flap actuator is functioning properly.

© 2026, All rights reserved

ELECTRIC COMPRESSOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment undercover assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the electric compressor assembly.



a. Disconnect the 1 connector between the electric compressor and the engine compartment wiring harness -arrow A-, and unscrew the 1 fixing bolt between the electric compressor assembly and the compressor ground wiring harness -arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew the 2 fixing bolts of the high and low pressure pipes of the compressor -arrow C-, disconnect the high and low pressure pipes of the compressor and move them aside.
Recommended tool: 10mm socket
Torque: 23±2N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

c. Disconnect the 1 connector plug between the electric compressor and the compressor cable assembly -arrow A-, and unscrew the 3 fixing bolts of the electric compressor assembly -arrow B-.
Recommended tool: 10mm socket
Torque: 23±2N m

d. Remove the electric compressor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

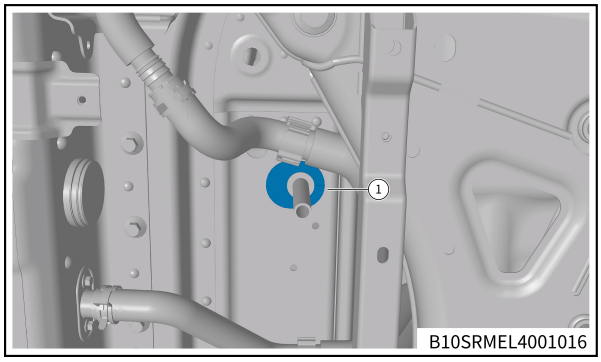
© 2026, All rights reserved

a. Install a new O-ring.
b. Before installing the sealing ring, apply a small amount of refrigerant oil.
c. Fill with refrigerant oil.
   See:Adding Refrigerant Oil (page 205)
d. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

e. After installation, check that the air conditioning system operates normally.
f. Replacing the controller requires following these steps to ensure software version compatibility:
   - Record the old version: Before disassembly, read and record the software version number of the old controller.
   - Check for new version: After installing the new controller, first read its software version number.

   Version Comparison and Processing:
   - If the new version is greater than or equal to the old version, the replacement process will be completed normally.
   - If the new version is lower than the old version, the new controller software must first be updated to the old version or a higher version before it can be put into use.
g. After replacing the electric compressor assembly, use a diagnostic tool to perform the following operations:
   - After replacement, the VIN must be written. The diagnostic tool operation is as follows: Select the corresponding vehicle model - System Diagnostics - Electric Compressor Assembly (CCM) - Data Writing - Write VIN.



> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

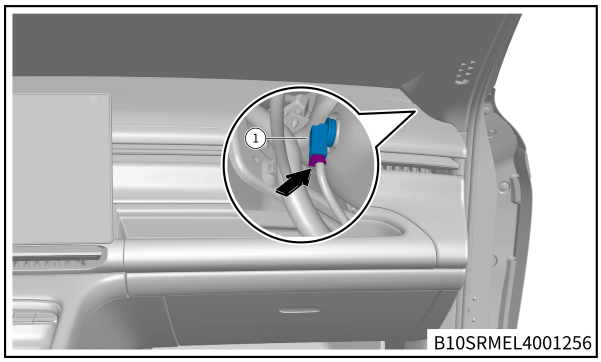
DRAIN HOSE RUBBER SEAL PLUG

REMOVAL PROCEDURE

1. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
2. Remove the sealing plug of the drain tube.

a. Remove the drain tube sealing plug ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the rubber sealing plug of the water drain tube is properly installed.

© 2026, All rights reserved

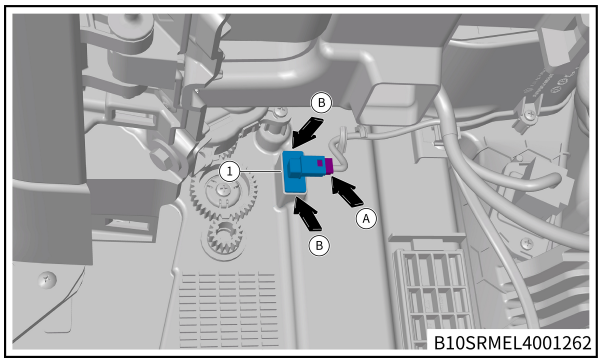
AIR DUCT TEMPERATURE SENSOR (RIGHT FACE-LEVEL AIR DUCT)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
4. Remove the air duct temperature sensor.

a. Reach in from the glove box lower trim panel to disconnect the 1 connector -arrow- of the air duct temperature sensor, and remove the air duct temperature sensor ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the air duct temperature sensor is working properly.

© 2026, All rights reserved

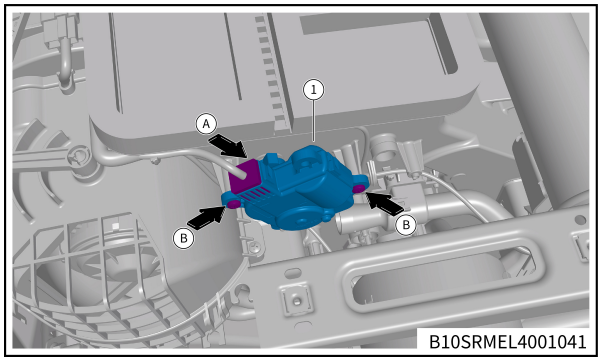
EVAPORATOR TEMPERATURE SENSOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right extension panel assembly of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the evaporator temperature sensor.

a. Disconnect the 1 connector between the HVAC harness and the evaporator temperature sensor -arrow A-, and release the 2 retaining clips of the evaporator temperature sensor -arrow B-.
b. Remove the evaporator temperature sensor ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the evaporator temperature sensor is working properly.

© 2026, All rights reserved

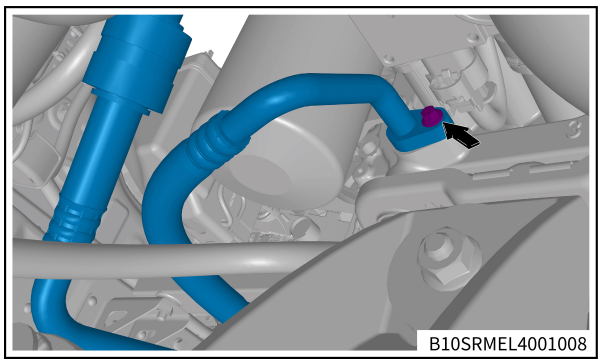
DEFROST DOOR MOTION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the electric power steering column with intermediate shaft assembly.
   See:Electric Power Steering Column with Intermediate Shaft Assembly (page 3081)
5. Remove the defrost door actuator.

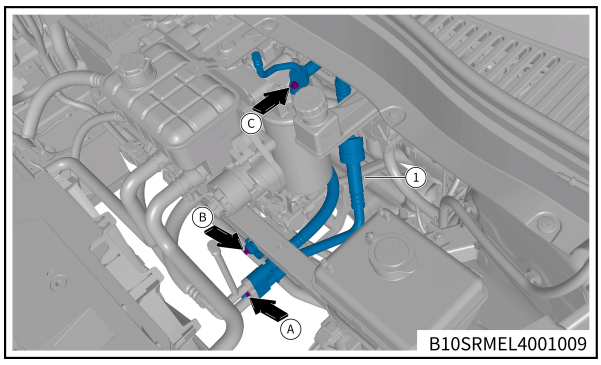
   a. Disconnect the 1 connector plug - arrow A - between the HVAC harness assembly and the defroster flap actuator assembly, and unscrew the 2 fixing screws - arrow B - of the defroster flap actuator assembly.
   Recommended tool: Phillips screwdriver
   b. Remove the defrost door actuator ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the defrost door actuator assembly is working properly.

© 2026, All rights reserved



HIGH AND LOW PRESSURE INLET AND OUTLET LINE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
6. Remove the high- and low-pressure inlet and outlet line assembly.

a. Unscrew the 1 fixing bolt between the high- and low-pressure inlet and outlet pipeline assembly and the super integrated module - arrow -.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Unscrew 1 fixing nut -arrow A- securing the high- and low-pressure inlet and outlet line assembly to the compressor high- and low-pressure lines, and move the compressor high- and low-pressure lines away.
Recommended tool: 10mm socket
Torque: 9±1N m

c. Unscrew the 1 fixing bolt securing the high and low voltage inlet and outlet pipeline assembly to the front crossmember of the three-electric frame - Arrow B -
Recommended tool: 8mm socket
Torque: 9±1N m

d. Unscrew the 1 fixing bolt -Arrow C- between the high- and low-pressure inlet and outlet pipeline assembly and the super integrated module, and remove the high- and low-pressure inlet and outlet pipeline assembly ①.
Recommended tool: 8mm socket

© 2026, All rights reserved

Torque: 9±1N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Fill with refrigerant oil.
      See:Adding Refrigerant Oil (page 205)
   b. After installation, recharge the refrigerant.
      See:Recharging refrigerant (page 223)

      ATTENTION

      Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.

   c. After installation, check that the air conditioning system operates normally.

SPEED CONTROL MODULE

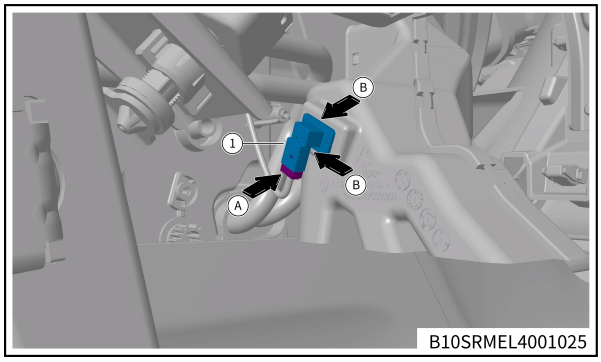
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
4. Remove the right extension panel assembly of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
5. Remove the speed control module.

a. Disconnect the 1 connector between the HVAC harness and the speed control module -arrow-.

b. Unscrew the 2 fixing screws of the speed control module -arrow-, and remove the speed control module ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the speed control module operates normally.

© 2026, All rights reserved

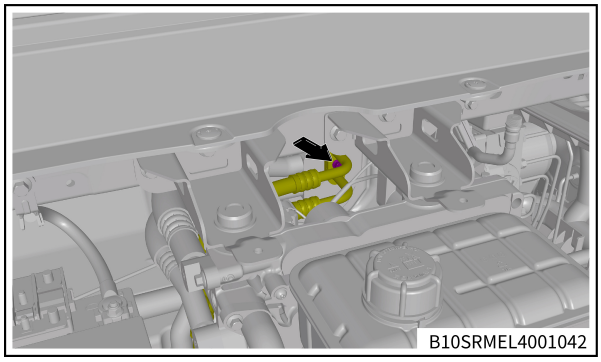
DUCT TEMPERATURE SENSOR (LEFT FOOTWELL AIR DUCT)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the air duct temperature sensor.

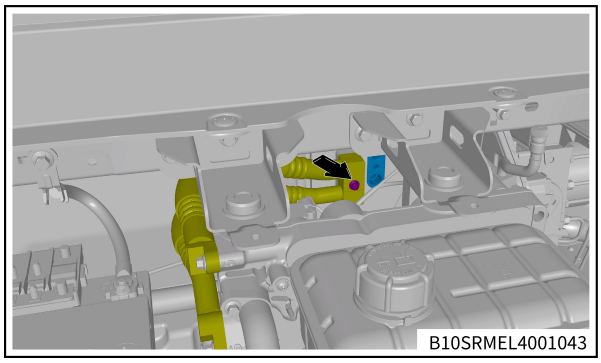
   a. Disconnect the 1 connector of the air duct temperature sensor -arrow A-, and release the 2 retaining clips of the air duct temperature sensor -arrow B-.
   b. Remove the air duct temperature sensor ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the air duct temperature sensor is working properly.

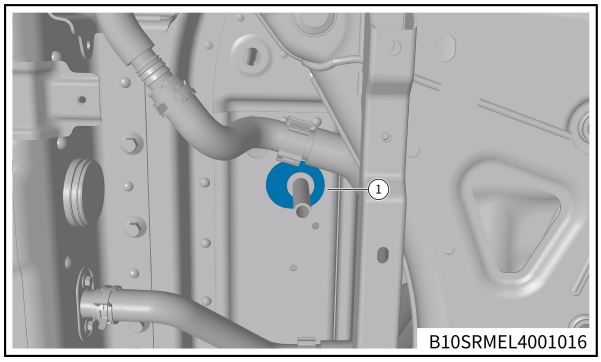
© 2026, All rights reserved



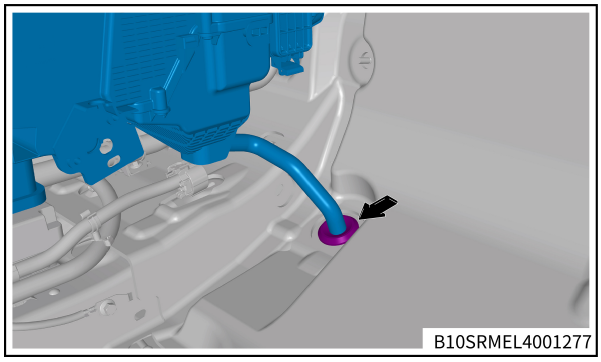
AUTOMATIC HVAC ASSEMBLY

REMOVAL PROCEDURE

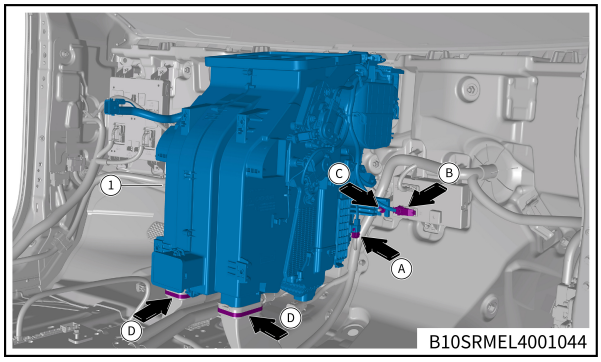
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the instrument panel crossbeam assembly.
   See:Instrument Panel Cross Car Beam Assembly (page 5507)
6. Remove the left footwell air duct assembly.
   See:Left footwell air duct assembly (page 5160)
7. Remove the right footwell air duct assembly.
   See:Right footwell air duct assembly (page 5147)
8. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
9. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
10. Remove the automatic HVAC assembly.



a. Unscrew 1 fixing bolt -arrow- of the interior condenser liquid outlet pipe, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m

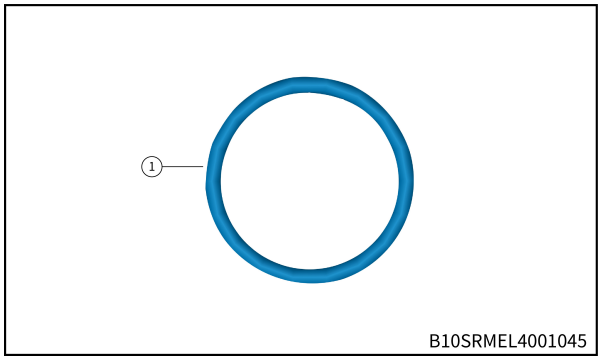


b. Unscrew the 1 fixing bolt -arrow- of the front evaporator outlet pipe, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m



© 2026, All rights reserved

c. Remove the drain tube sealing plug ①.



d. Detach 1 grommet of the drip tube -arrow-.

e. Disconnect 1 connector - arrow A - between the HVAC harness and the engine compartment harness, and disconnect 1 connector - arrow B - between the HVAC harness and the thermal management controller.
f. Unscrew 1 fixing nut of the automatic HVAC assembly -Arrow C-, and disconnect the automatic HVAC assembly from the left and right rear footwell air ducts -Arrow D-.
Recommended tool: 10mm socket
Torque: 5±1N m
g. Remove the automatic HVAC assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

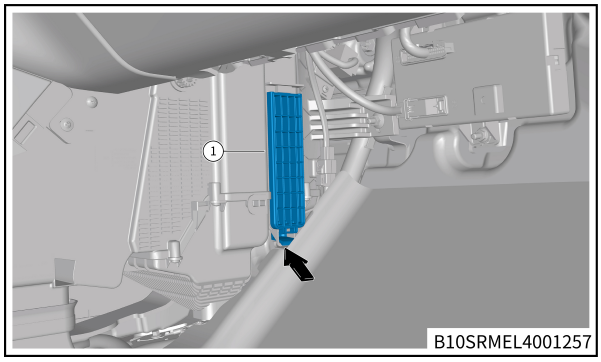
a. When installing, check whether the O-ring ① of the air conditioning pipeline is damaged or deformed. If so, replace it.
b. Fill with refrigerant oil.
See:Adding Refrigerant Oil (page 205)
c. Recharge the refrigerant.

© 2026, All rights reserved

See:Recharging refrigerant (page 223)

ATTENTION

Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.



d. Check that the HVAC assembly operates normally.

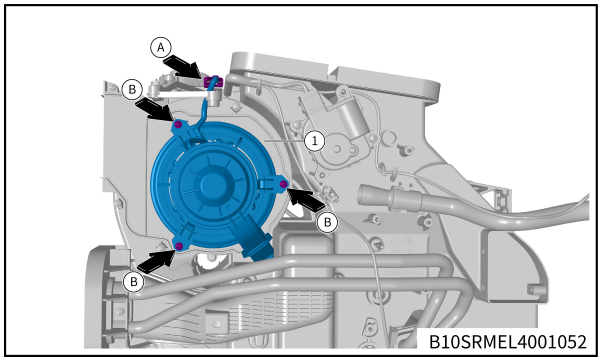
FILTER COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
3. Remove the filter cover.

a. Release the 1 retaining clip -arrow- of the filter cover, and remove the filter cover ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

BLOWER MOTOR FAN BLADE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
4. Remove the left air intake vent.
   See:Left air intake vent (page 5174)
5. Remove the blower motor fan assembly.

a. Disconnect the 1 connector -Arrow A- between the HVAC harness and the blower motor fan assembly, and unscrew the 3 mounting screws -Arrow B- of the blower motor fan assembly.
   Recommended tool: Phillips screwdriver
b. Remove the blower motor fan blade assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the blower motor fan assembly is working properly.

© 2026, All rights reserved

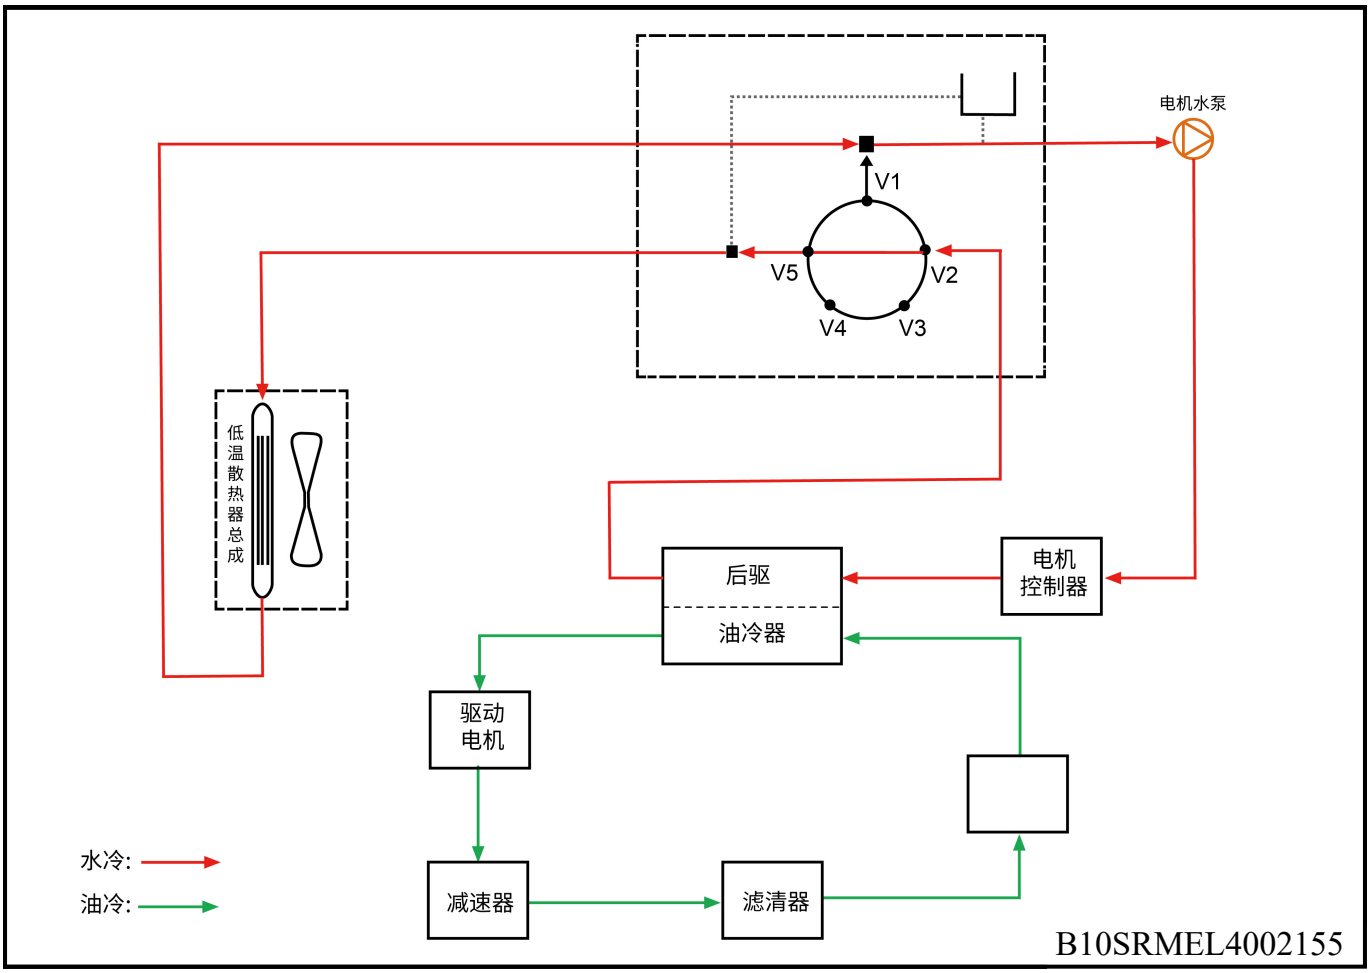
6.2 MOTOR COOLING SYSTEM

6.2.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Do not open the expansion tank cap when the engine is hot, as opening the expansion tank cap when the engine is hot may cause hot coolant or steam to spray out, resulting in personal injury. Wait until the coolant temperature drops below 40℃ before opening the expansion tank cap.
2. When disconnecting the cooling system lines, a dedicated container should be used to collect the residual coolant.
3. Coolant is toxic. If no longer in use, keep it out of reach of children and pets, and dispose of it in accordance with regulations.
4. When disconnecting the cooling system hoses, do not allow debris to enter the cooling system hoses, otherwise the cooling system may be damaged.
5. When disconnecting the cooling system pipe joints. To prevent dirt or impurities from entering, the pipe openings can be sealed with caps.
6. Coolants of different brands may have different formulations. If mixed, chemical reactions are highly likely to occur among the various additives, resulting in coolant failure.
7. The shelf life of coolant is typically two years, and when adding it, ensure the product is within its shelf life.
8. When replacing, drain the old coolant, thoroughly flush the cooling system, and refill with new coolant.
9. Use qualified coolant.
10. When the ambient temperature is below 0℃, the coolant freezing point should be checked regularly.

© 2026, All rights reserved



6.2.2 OVERVIEW AND INTRODUCTION TO PRINCIPLES

INTRODUCTION TO THE STRUCTURE AND WORKING PRINCIPLE OF THE MOTOR COOLING SYSTEM

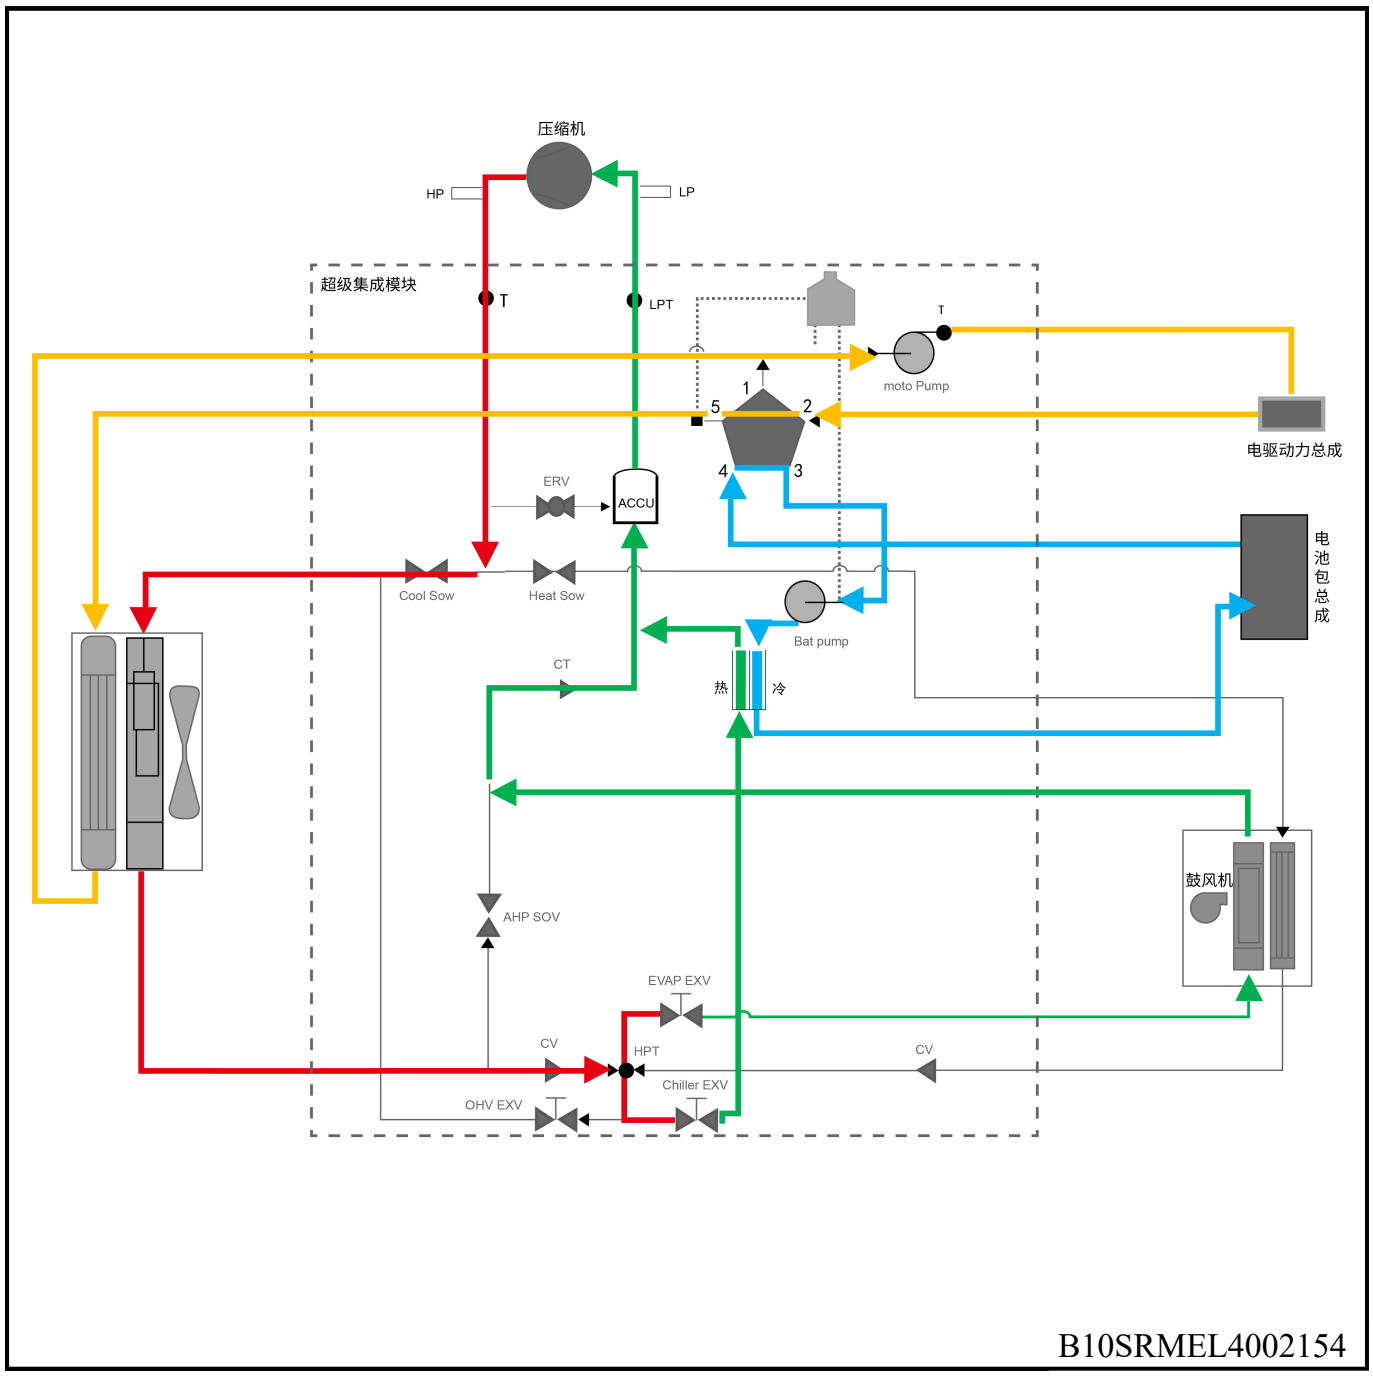
Motor Cooling System Overview:

1. The motor cooling system is controlled by the thermal management controller, and the cooled components include the motor controller and the drive motor, which undergoes heat exchange through the oil cooler.
2. When the temperature of the high-voltage components in the circuit is too high, the coolant pump is triggered to start, and the coolant circulates to cool the components.
3. The coolant pump is controlled by the Thermal Management Controller via a duty cycle signal. Upon power-on, the Thermal Management Controller drives the coolant pump to operate at a low duty cycle. As the coolant pump runs, it circulates the coolant sequentially through the motor controller, oil cooler, and radiator assembly, and then returns it to the coolant pump to form a circulation circuit. The temperature signal from the coolant circuit is transmitted to the Thermal Management Controller in real time. The Thermal Management Controller controls the speed of the coolant pump according to its internal control strategy. If the temperature is too high, it activates the electric fan for rapid cooling to ensure normal system operation.

Motor cooling system circuit diagram:

Battery Thermal Management System Overview:

© 2026, All rights reserved



1. The battery thermal management system adopts liquid cooling and liquid heating. Components include liquid cooling plates, plastic water pipes, connecting pipes, and thermally conductive adhesive. The liquid cooling plate is tightly bonded to the bottom of the battery cells via thermally conductive adhesive to dissipate excess heat generated by the cells.
2. Battery heating principle: When battery heating is requested, the battery circuit and the motor circuit are connected in series, and the antifreeze in the circuit is heated by the heat generated by the motor. The heated antifreeze undergoes heat exchange with the low-temperature battery coolant, and the warmed battery antifreeze flows through the battery, thereby heating the battery. The maximum temperature of the antifreeze for heating the battery is 40℃; throughout the entire heating process, the heat source is the heat generated by the motor, without using traditional PTC heating, resulting in high system integration.
3. Battery cooling principle: The battery coolant is cooled through heat exchange in the air conditioning system and the chiller component. The cooled low-temperature battery antifreeze then flows through the battery pack to cool it down.
4. Cooling Control Strategy:
   - Fast charging mode: The cooling function is turned on when the cell temperature ≥35℃; the cooling function is turned off when the cell temperature ≤30℃.
   - Slow charging mode: When the cell temperature is ≥37℃, the cooling function is turned on; when the cell temperature is ≤32℃, the cooling function is turned off.
   - Driving mode: When the cell temperature is ≥ 35℃, the cooling function is turned on; when the cell temperature is ≤ 30℃, the cooling function is turned off.
   - ATTENTION

     When the maximum cell temperature exceeds 50℃, the battery output power will be limited; when the maximum cell temperature exceeds 60℃, charging and discharging of the battery are not allowed.
5. Heating control strategy:
   - Fast charging mode: When the cell temperature ≤10℃, the heating function is turned on; when the cell temperature ≥25℃, the heating function is turned off.
   - Slow charging mode: When the cell temperature ≤15℃, the heating function is turned on; when the cell temperature ≥20℃, the heating function is turned off.
   - Driving mode: When the cell temperature is ≤1℃, the heating function is turned on; when the cell temperature is ≥5℃, the heating function is turned off.
   - ATTENTION

     If the minimum cell temperature is below -20℃, direct charging is not allowed, and the battery must first be heated using the charging station; if the minimum cell temperature is below -30℃, the battery cannot be heated using the charging station; if the minimum cell temperature is below -30℃, discharging is not allowed.

6.2.7 SERVICE AND REPAIR GUIDANCE

LOW TEMPERATURE RADIATOR WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the water inlet hose of the low-temperature radiator.

a. Disconnect 1 fixing connector between the low-temperature radiator inlet hose and the super integrated module -Arrow A-, and loosen 1 fixing clamp between the low-temperature radiator inlet hose and the low-temperature radiator assembly -Arrow B-.
Recommended tools: Flathead screwdriver, slip-joint pliers
b. Remove the low-temperature radiator inlet water hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

© 2026, All rights reserved

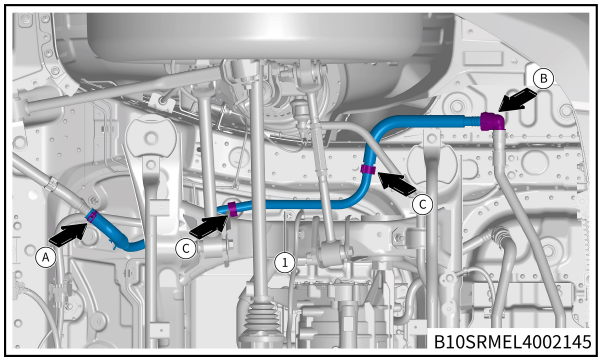
UPPER MOUNTING BRACKET OF COOLING MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Remove the mounting bracket installed on the cooling module assembly.

a. Unscrew the 4 fixing bolts -arrow- of the upper mounting bracket on the cooling module assembly, and remove the upper mounting bracket ①.
Recommended tool: 10mm socket
Torque: 9±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

OBC+DCDC WATER INLET PIPE 1

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the OBC+DCDC water inlet pipe 1.

a. Loosen 1 fixing clamp -Arrow A- between OBC+DCDC water inlet pipe 1 and the rear motor nylon water inlet pipe, and disconnect 1 fixing connector -Arrow B- between OBC+DCDC water inlet pipe 1 and the OBC+DCDC water inlet pipe.
Recommended tool: Slip-joint pliers
b. Disconnect the 2 retaining hose clamps on OBC+DCDC inlet hose 1 -arrow C-, and remove OBC+DCDC inlet hose 1 ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

OBC+DCDC WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the OBC+DCDC water inlet pipe.

a. Loosen 1 fixing clamp -arrow A- between the OBC+DCDC water inlet pipe and the 2-in-1 power assembly, and disconnect 1 fixing connector -arrow B- between OBC+DCDC water inlet pipe 1 and the OBC+DCDC water inlet pipe.
   Recommended tool: Slip-joint pliers
b. Unscrew the 1 fixing bolt of the OBC+DCDC water inlet pipe -arrow C-, and disconnect the 2 fixing hose clamps of the OBC+DCDC water inlet pipe -arrow D-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Remove the OBC+DCDC water inlet pipe ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

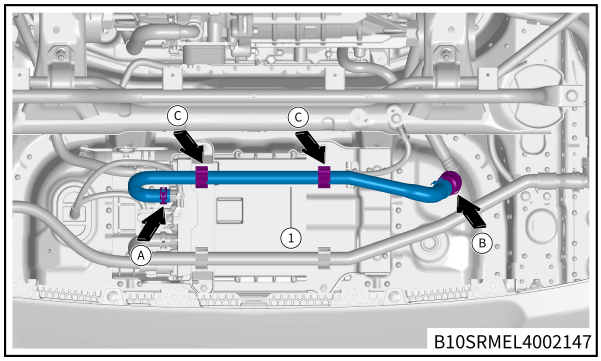
LOW TEMPERATURE RADIATOR ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5212)
4. Remove the low-temperature radiator assembly.

a. Disconnect the 8 retaining clips -arrow- between the low-temperature radiator assembly and the electronic fan, and remove the low-temperature radiator assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

OBC+DCDC WATER OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the OBC+DCDC water outlet pipe.

a. Loosen 1 fixing clamp -arrow A- between the OBC+DCDC outlet hose and the 2-in-1 power assembly, and disconnect 1 fixed connector -arrow B- between the OBC+DCDC outlet hose and the rear motor inlet hose.
   Recommended tool: Slip-joint pliers
b. Release the 2 retaining hose clamps of the OBC+DCDC outlet hose -arrow C-, and remove the OBC+DCDC outlet hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

LOW TEMPERATURE RADIATOR OUTLET WATER PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the low-temperature radiator outlet hose.

a. Disconnect 1 fixing connector between the low-temperature radiator outlet hose and the Super Integrated Module -arrow A-, and loosen 1 fixing clamp between the low-temperature radiator outlet hose and the low-temperature radiator assembly -arrow B-.
   Recommended tools: Flathead screwdriver, slip-joint pliers
b. Remove the low-temperature radiator outlet hose ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR MOTOR WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the water inlet pipe of the rear motor.

a. Loosen 1 fixing clamp - arrow A - between the rear motor water inlet pipe and the electric drive assembly, and disconnect 1 fixing connector - arrow B - between the rear motor water inlet pipe and the 2-in-1 power supply.
Recommended tools: Slip-joint pliers, flathead screwdriver

b. Unscrew 1 fixing bolt of the rear motor water inlet pipe -arrow C-, detach 1 fixing hose clamp of the rear motor water inlet pipe -arrow D-, and remove the rear motor water inlet pipe ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

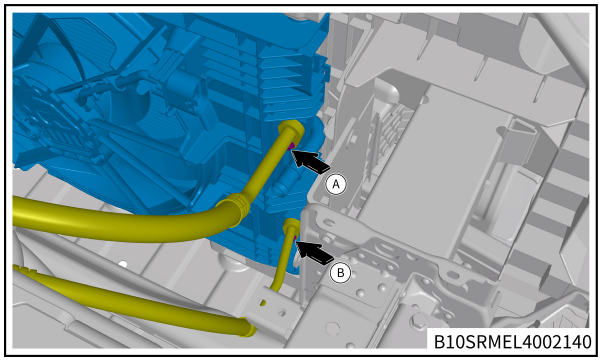
COOLING MODULE ASSEMBLY HEAT PUMP

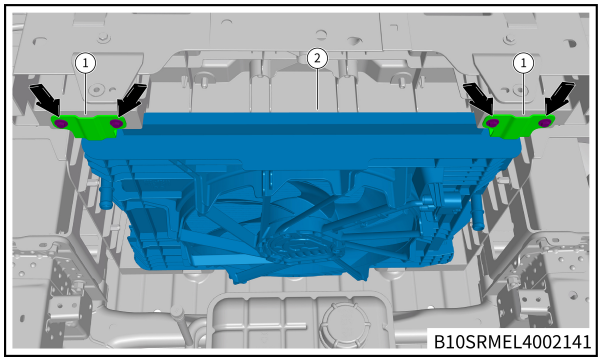


REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the storage box mounting bracket assembly.
   See:Storage Box Mounting Bracket Assembly (page 6358)
5. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
6. Drain coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
7. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
8. Remove the cooling module assembly heat pump.

B10SRMEL4002139

a. Disconnect the 1 connector between the engine compartment wiring harness and the electronic fan -arrow A-.
b. Loosen 1 fixing clamp on the low-temperature radiator inlet hose -Arrow B-, and loosen 1 fixing clamp on the low-temperature radiator outlet hose -Arrow C-.
   Recommended tool: Slip-joint pliers

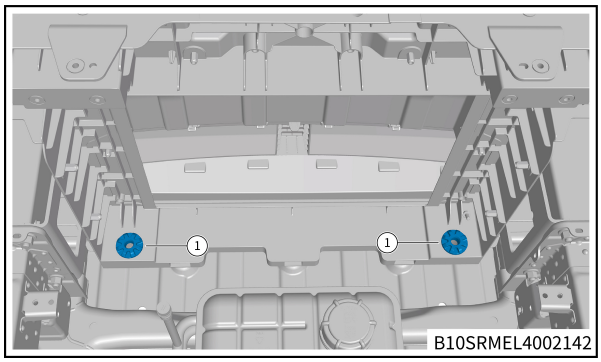


B10SRMEL4002140

c. Unscrew the 1 fixing bolt -Arrow A- securing the condenser liquid outlet pipe to the outdoor heat exchanger assembly, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m
d. Unscrew the 1 fixing bolt - arrow B - between the condenser inlet pipe and the outdoor heat exchanger assembly, and move the A/C line aside.
   Recommended tool: 8mm socket
   Torque: 9±1N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.



© 2026, All rights reserved

e. Unscrew the 4 fixing bolts -arrow- of the upper mounting bracket on the cooling module assembly, and remove the upper mounting bracket ①.
Recommended tool: 10mm socket
Torque: 9±1N m
f. Remove the heat pump ② from the cooling module assembly.

SETUP

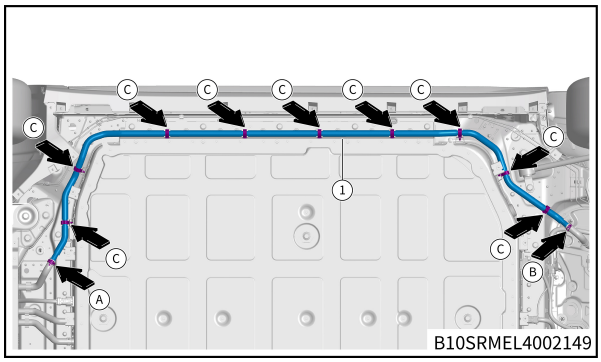
1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing the cooling module assembly heat pump, ensure proper alignment of the shock pad ① at its lower end.
b. After installation, fill coolant.
See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

c. Check the cooling system for leaks.
d. After installation, recharge the refrigerant.
See:Recharging refrigerant (page 223)

> **ATTENTION**
>
> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.



e. After installation, check that the air conditioning system operates normally.

REAR MOTOR NYLON WATER INLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Remove the left lower cover assembly.
   See:Left lower undercover assembly (page 5320)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
7. Remove the nylon water inlet pipe of the rear motor.

a. Loosen 1 fixing clamp -arrow A- securing the rear motor water inlet hose 1 to the rear motor nylon water inlet pipe, and loosen 1 fixing clamp -arrow B- securing the OBC+DCDC water inlet pipe 1 to the rear motor nylon water inlet pipe.
Recommended tool: Slip-joint pliers
b. Release the 9 retaining clips of the rear motor nylon water inlet pipe -Arrow C-, and remove the rear motor nylon water inlet pipe ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR EDU WATER OUTLET PIPE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
5. Remove the rear EDU water outlet pipe.

a. Loosen 1 fixing clamp - arrow A - between the rear EDU outlet water pipe and the electric drive assembly, and loosen 1 fixing clamp - arrow B - between the rear EDU outlet water pipe and the rear EDU outlet nylon pipe.
   Recommended tool: Slip-joint pliers
b. Disconnect the 1 retaining clip of the rear EDU outlet pipe -Arrow C-, and unscrew the 2 fixing bolts of the rear EDU outlet pipe -Arrow D-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Remove the rear EDU water outlet pipe ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR MOTOR WATER INLET HOSE 1

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the battery assembly.
   See:Battery Assembly (page 9594)
5. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
7. Remove the water inlet hose 1 for the rear motor.

a. Disconnect the 1 fixing connector between the DSP water inlet pipe and the Super Integrated Module -arrow-.
Recommended tool: Flathead screwdriver

b. Loosen the 1 securing clamp - arrow A - between the rear motor water inlet hose 1 and the rear motor nylon water inlet pipe, and detach the 2 securing clips - arrow B - on the rear motor water inlet hose 1.
Recommended tools: slip-joint pliers, clip remover

c. Remove the rear motor water inlet hose 1①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR MOTOR WATER OUTLET HOSE 2

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
6. Remove the rear motor water outlet hose 2.

a. Disconnect the 1 fixed connector -Arrow A- between the rear motor water outlet hose 2 and the Super Integrated Module, and loosen the 1 fixed clamp -Arrow B- between the rear motor water outlet hose 2 and the battery pack assembly.
Recommended tools: Flathead screwdriver, slip-joint pliers

b. Release the 2 retaining hose clamps -arrow C- of the rear motor outlet hose 2, and remove the rear motor outlet hose 2 ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

REAR EDU WATER OUTLET NYLON TUBE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Remove the right lower cover assembly.
   See:Left lower undercover assembly (page 5320)
6. Drain the motor coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
7. Remove the rear EDU water outlet nylon tube.

a. Loosen 1 retaining clamp - arrow A - between the rear motor coolant outlet hose 2 and the rear EDU coolant outlet nylon tube, and loosen 1 retaining clamp - arrow B - between the rear EDU coolant outlet pipe and the rear EDU coolant outlet nylon tube.
Recommended tool: Slip-joint pliers

b. Detach the 9 fixing hose clamps -Arrow C- of the rear EDU outlet nylon pipe, and remove the rear EDU outlet nylon pipe ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

> **ATTENTION**
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

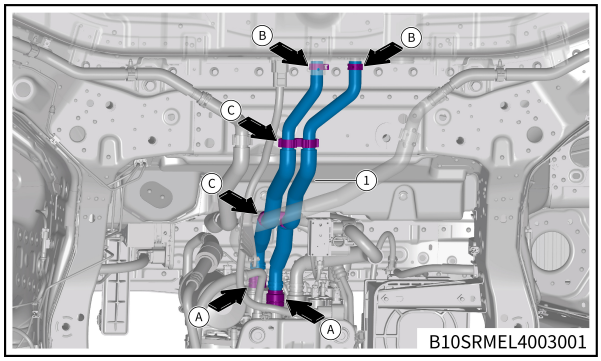
OUTDOOR HEAT EXCHANGER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5212)
4. Remove the low-temperature radiator assembly.
   See:Low temperature radiator assembly (page 5208)
5. Remove the outdoor heat exchanger assembly.

a. Release the 8 retaining clips -arrow- between the outdoor heat exchanger assembly and the electric fan, and remove the outdoor heat exchanger assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

BATTERY PACK INLET AND OUTLET WATER PIPE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Drain the battery pack coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
6. Remove the battery pack inlet and outlet water pipe assembly.

a. Disconnect the 2 fixing connectors between the battery pack inlet and outlet water pipe assembly and the super integrated module -Arrow A-, and loosen the 2 fixing clamps between the battery pack inlet and outlet water pipe assembly and the battery pack assembly -Arrow B-.
Recommended tools: Flathead screwdriver, slip-joint pliers

b. Detach the 2 retaining clamps of the battery pack inlet and outlet water pipe assembly -arrow C -, and remove the battery pack inlet and outlet water pipe assembly ①.
Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill coolant.
      See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

      ATTENTION

      Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   b. Check the cooling system for leaks.

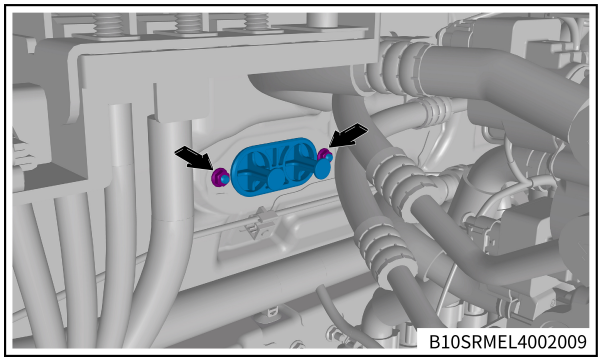
ELECTRIC FAN ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the cooling module assembly heat pump.
   See:Cooling module assembly heat pump (page 5212)
4. Remove the low-temperature radiator assembly.
   See:Low temperature radiator assembly (page 5208)
5. Remove the electric fan assembly.

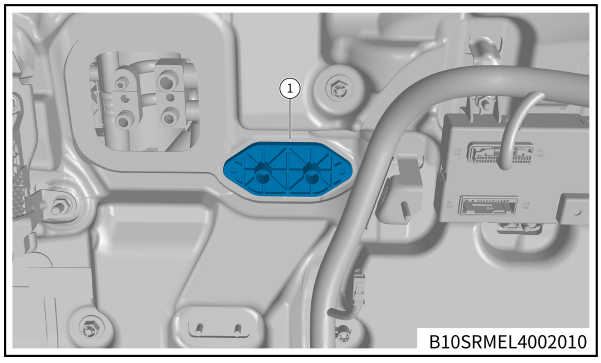
a. Release the 8 retaining clips -arrow- between the outdoor heat exchanger assembly and the electric fan, and remove the electric fan assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the electric fan is working properly.

© 2026, All rights reserved



SEALING RETAINING PLATE

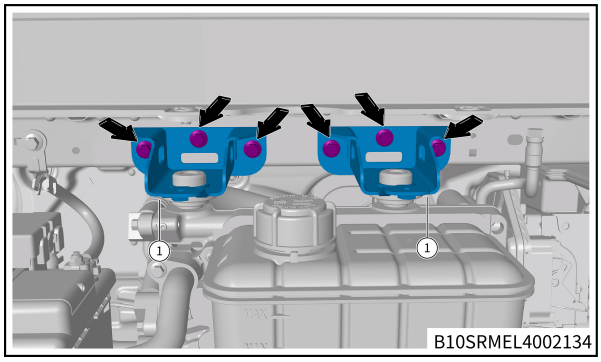
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
5. Remove the battery assembly.
   See:Battery Assembly (page 9594)
6. Remove the seal pressure plate.

a. Unscrew the 2 fixing nuts of the sealing pressure plate -arrow-.
Recommended tool: 10mm socket
Torque: 7±1N m

b. Remove the sealing pressure plate ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

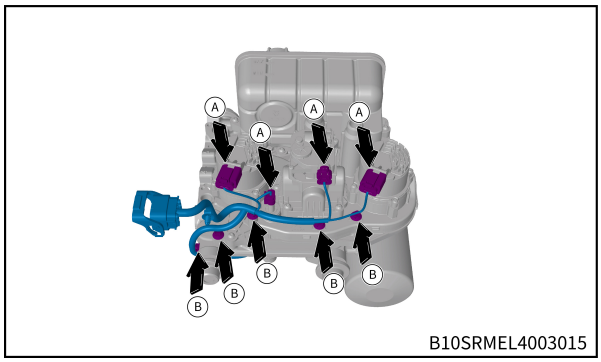
SUPER INTEGRATED MODULE UPPER BRACKET

REMOVAL PROCEDURE

1. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
2. Remove the upper bracket of the super integrated module.

a. Unscrew the 6 mounting bolts -arrow- of the super integrated module upper bracket, and remove the super integrated module upper bracket ①.
Recommended tool: 10mm socket
Torque: 23±2N m

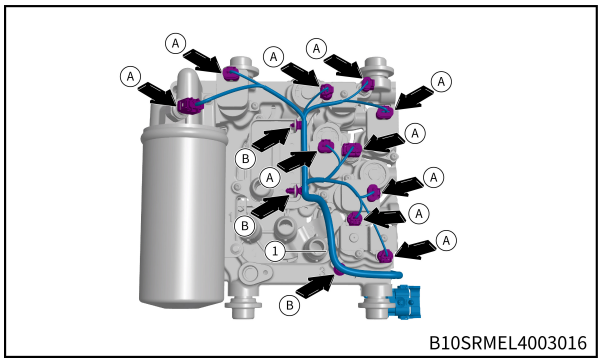
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

INTEGRATED MODULE WIRING HARNESS



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5226)
4. Remove the integrated module wiring harness.

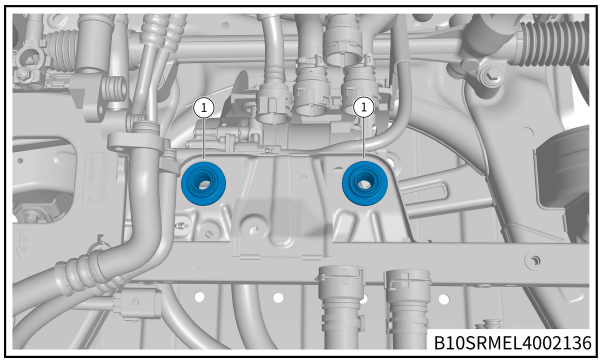
B10SRMEL4003015

a. Disconnect the 4 connectors of the integrated module wiring harness -arrow A-, and release the 5 retaining clips of the integrated module wiring harness -arrow B-.
   Recommended tool: Clip remover

B10SRMEL4003016

b. Disconnect the 10 connectors of the integrated module wiring harness - arrow A -, and release the 3 retaining clips of the integrated module wiring harness - arrow B -.
   Recommended tool: Clip remover
c. Remove the integrated module wiring harness ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

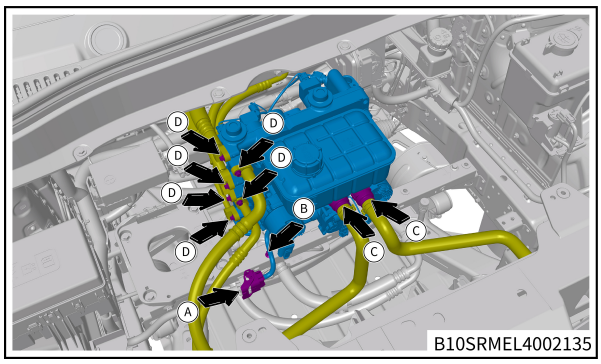
INTEGRATED MODULE SHOCK PAD (LOWER)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5226)
4. Remove the integrated module damper pad (lower).

a. Remove the integrated module damper pad (lower) ①.

SETUP



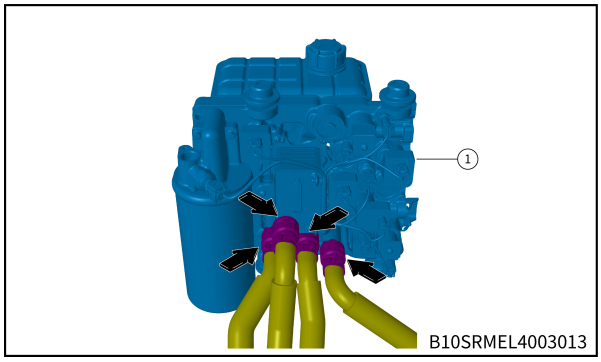
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

SUPER INTEGRATED MODULE

REMOVAL PROCEDURE

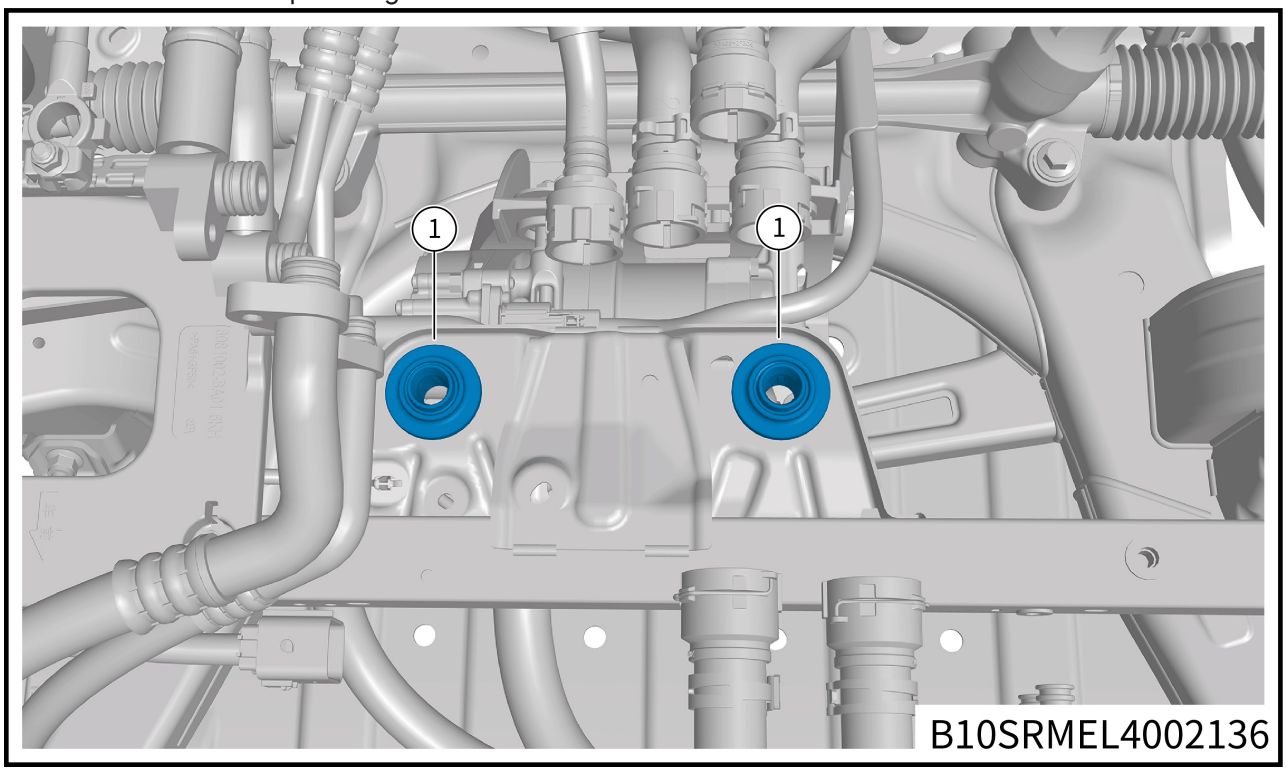
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the upper bracket of the super integrated module.
   See:Super Integrated Module Upper Bracket (page 5223)
5. Remove the high- and low-pressure inlet and outlet line assembly.
   See:High and low pressure inlet and outlet line assembly (page 5184)
6. Drain coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)
7. Recover refrigerant.
   See:Refrigerant Recovery (page 217)
8. Remove the super integrated module.



a. Disconnect 1 connector -Arrow A- between the engine compartment wiring harness and the integrated module wiring harness, and release 1 retaining clip -Arrow B- of the integrated module wiring harness.
   Recommended tool: Clip remover
b. Disconnect the 2 fixing connectors of the inlet and outlet water hoses for the low-temperature radiator - arrow C -, and move the hoses aside.
   Recommended tool: Flathead screwdriver
c. Unscrew the 6 fixing bolts - arrow D - of the A/C line and the Super Integrated Module, and remove the A/C line.
   Recommended tool: 8mm socket
   Torque: 9±1N m

NOTE

Seal the A/C pipe connections to prevent foreign objects from entering the A/C system.



© 2026, All rights reserved

d. Disconnect the 4 fixing arrows - arrows - connecting the rear of the Super Integrated Module to the water pipe, and remove the Super Integrated Module ①.
Recommended tool: Flathead screwdriver

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the Super Integrated Module, ensure proper alignment of the shock absorber pad ① at the lower end of the Super Integrated Module.

   b. After installation, fill coolant.
   See:Replace the coolant for the air conditioning, drive motor, and power battery (page 207)

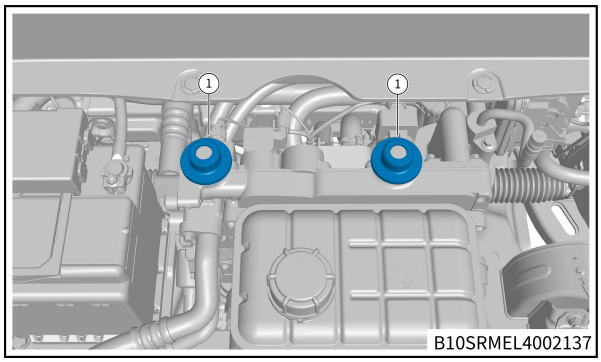
> ATTENTION
>
> Coolant must not be reused or mixed, and must not be replaced with coolant of a different color. Check that the coolant level is between the MAX (maximum) and MIN (minimum) marks, and tighten the expansion tank cap.

   c. Check the cooling system for leaks.
   d. After installation, recharge the refrigerant.
   See:Recharging refrigerant (page 223)

> ATTENTION

© 2026, All rights reserved

> Check the air conditioning system for leaks, and tighten the filler caps of the high and low pressure pipes.



e. After installation, check that the air conditioning system operates normally.

© 2026, All rights reserved

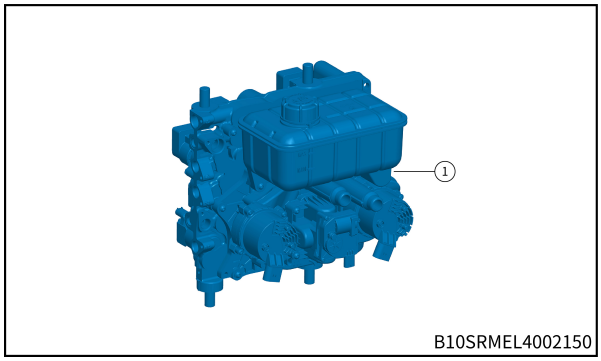
INTEGRATED MODULE DAMPER PAD (UPPER)

REMOVAL PROCEDURE

1. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
2. Remove the upper bracket of the super integrated module.
   See:Super Integrated Module Upper Bracket (page 5223)
3. Remove the integrated module shock pad (upper).

a. Remove the integrated module damper pad (upper) ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

INTEGRATED MODULE BODY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the super integrated module.
   See:Super Integrated Module (page 5226)
4. Remove the integrated module wiring harness.
   See:Integrated module wiring harness (page 5224)
5. Remove the integrated module body.

a. Remove the integrated module body ①.

SETUP

1. The installation procedure is performed in reverse order.

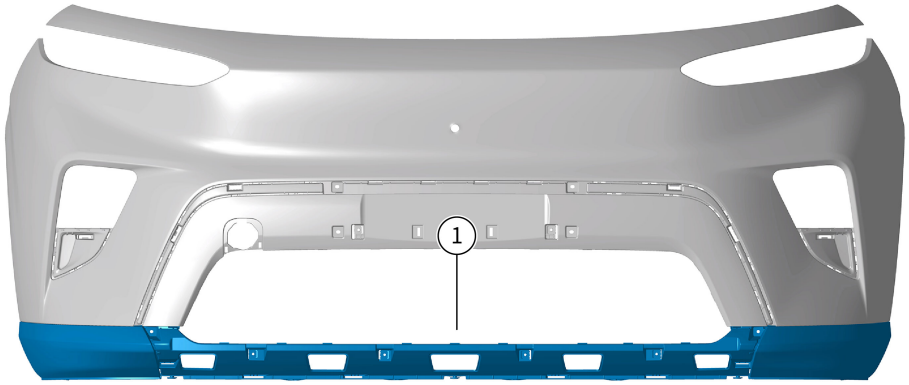
7 INTERIOR AND EXTERIOR TRIM SYSTEM

7.1 FRONT BUMPER AND ACCESSORY SYSTEM

7.1.1 PRECAUTIONS



PRECAUTIONS

1. When removing the bumper assembly, exercise caution to avoid damaging the bumper retaining tabs.
2. Use an interior trim pry tool to assist with removal, do not pry with metal tools, to avoid damaging the bumper.
3. When disconnecting the bumper assembly wiring harness connector, be careful not to tear or damage the connector or other components.
4. The bumper placement area should be clean and flat to avoid scratching the paint surface.
5. After installing the bumper, adjust the gap and flush according to the specified values.

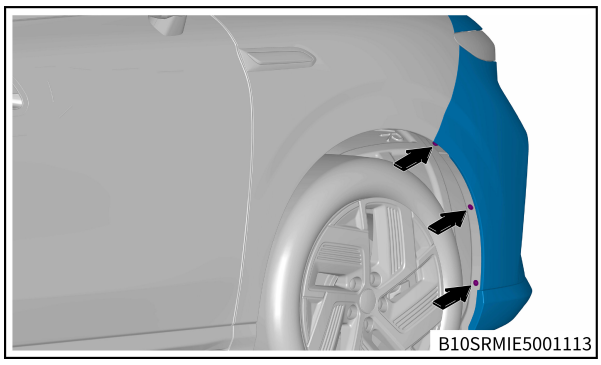
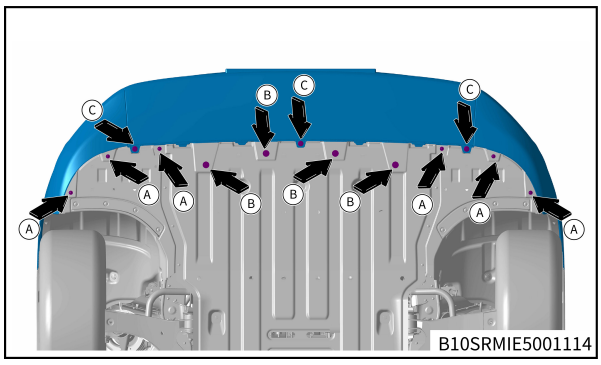
7.1.6 SERVICE AND REPAIR GUIDANCE



FRONT BUMPER ASSEMBLY

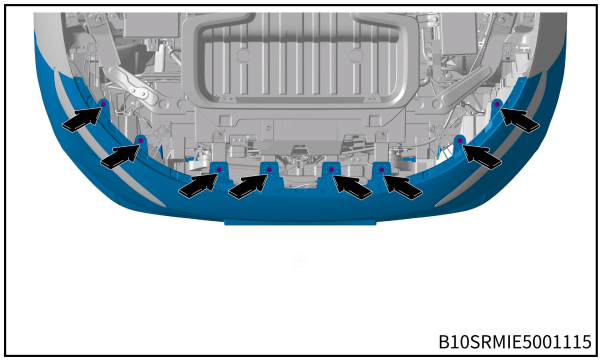
REMOVAL PROCEDURE



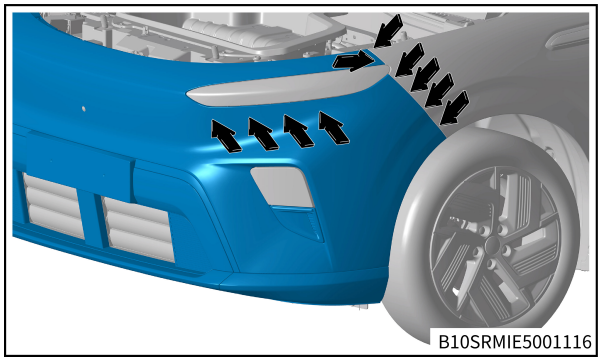
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front sealing strip of the front cover.
   See:Hood front weatherstrip (page 6399)
4. Remove the front bumper assembly.

a. Unscrew the 3 fixing screws on the left side of the front bumper assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

b. Unscrew the 3 fixing screws on the right side of the front bumper assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

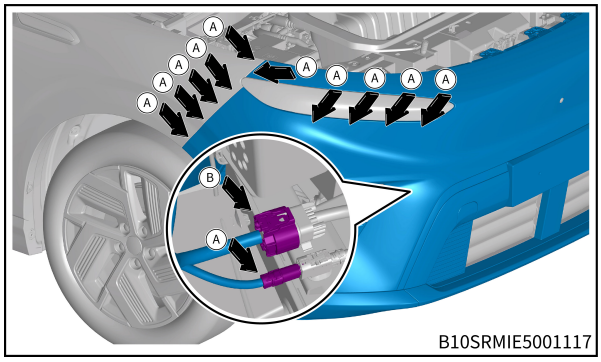


c. Unscrew the 6 fixing screws at the bottom of the front bumper assembly - arrow A -.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m



d. Unscrew the 4 fixing bolts at the bottom of the front bumper assembly -Arrow B-.
Recommended tool: 10mm socket
Torque: 5±1N m

e. Release the 3 retaining clips of the front bumper assembly - arrow C -.
Recommended tool: Clip remover

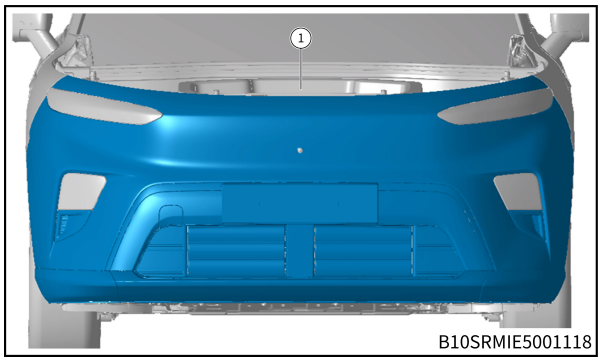


© 2026, All rights reserved

B10SRMIE5001115

f. Unscrew the 8 fixing bolts of the front bumper assembly -arrow-.
Recommended tool: 10mm socket
Torque: 5±1N m

B10SRMIE5001116



g. Detach the 10 retaining clips -arrow- connecting the front bumper assembly to the front bumper left mounting bracket and the front left position turn signal assembly.

B10SRMIE5001117

h. Release the 10 retaining clips connecting the front bumper assembly to the front bumper right mounting bracket and the right front position turn signal lamp assembly -Arrow A-.

i. Disconnect the 2 connectors between the front bumper wiring harness and the engine compartment wiring harness -arrow B-, -arrow C-, and remove the front bumper assembly ①.

B10SRMIE5001118

j. Disconnect the 1 connector -arrow- between the front bumper wiring harness and the front surround view camera assembly, and remove the front bumper assembly with the active grille assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- If painting is required, it is recommended to use pre-sale paint. The film thickness should be controlled within the normal TDS range to meet the radar wave attenuation requirements (one-way attenuation ≤ 1.5 dB, one-way reflection ≤ -15 dB).
- Screws and bolts should be stored in a box to prevent loss.
- Tighten the fixing bolts and screws to the specified torque.

© 2026, All rights reserved

- After installation, check whether the relevant electrical components function properly.

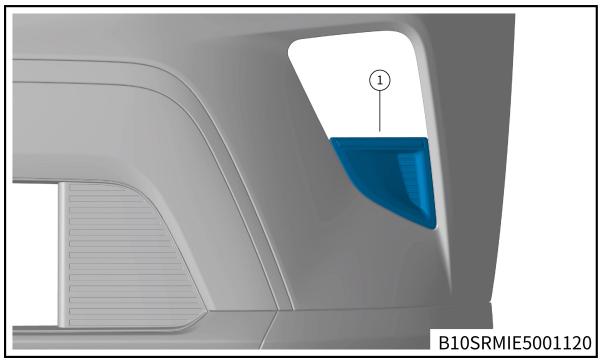
FRONT BUMPER LEFT TRIM PANEL

REMOVAL PROCEDURE



NOTE

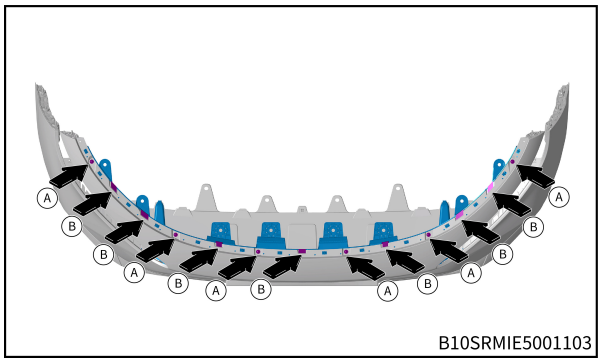
This section describes the removal and installation of the left trim panel of the front bumper, with the removal and installation of the right trim panel generally following the procedures for the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5246)
5. Remove the left trim panel of the front bumper.

a. Detach the 4 retaining clips on the front bumper left side trim panel -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim panel ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

FRONT BUMPER UPPER MOUNTING BRACKET

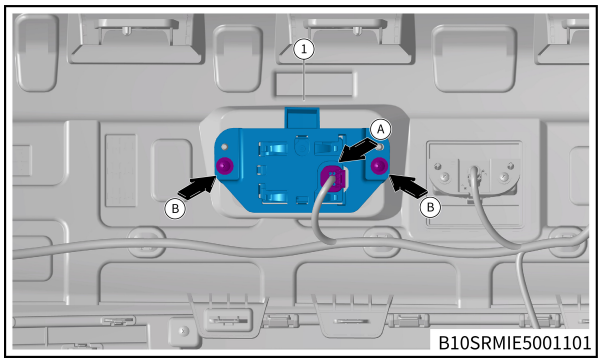
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5248)
5. Remove the front surround-view camera assembly.
   See:Front surround view camera assembly (page 9116)
6. Remove the ACC mounting bracket.
   See:ACC mounting bracket (page 5242)
7. Remove the upper mounting bracket of the front bumper.

a. Unscrew the 6 mounting screws connecting the front bumper upper mounting bracket to the front bumper upper main body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.2N m
b. Release the 7 retaining clips connecting the front bumper upper mounting bracket to the front bumper upper body - arrow B -.

c. Disconnect the 1 connector between the front bumper wiring harness and the front surround view camera -Arrow A-, and release the 9 wiring harness retaining clips of the front bumper wiring harness -Arrow B-.
   Recommended tool: Clip remover
d. Unscrew the 4 fixing screws of the upper mounting bracket on the front bumper -Arrow C-.
   Recommended tool: Phillips screwdriver
e. Release the 6 retaining clips - arrow D - of the front bumper upper mounting bracket, and remove the front bumper upper mounting bracket ①.
   Recommended tool: Clip remover

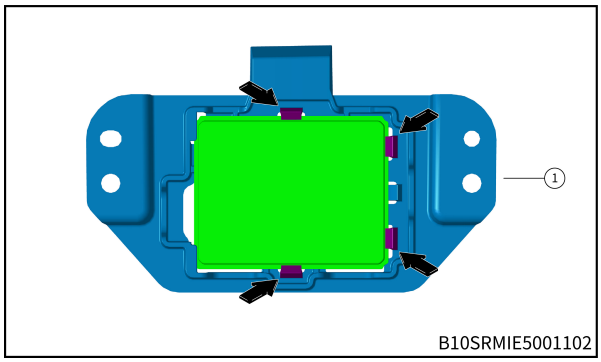
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

ACC MOUNTING BRACKET



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the ACC mounting bracket.

B10SRMIE5001101

a. Disconnect the 1 connector of the forward collision radar -arrow A-, and unscrew the 2 fixing screws of the ACC mounting bracket -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.2N m
b. Remove the forward collision radar with ACC mounting bracket ①.

B10SRMIE5001102

c. Release the 4 retaining clips -arrow- between the forward collision avoidance radar and the ACC mounting bracket, and remove the ACC mounting bracket ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- After installation is completed, the following operations need to be performed on the forward collision avoidance radar:
  - Write the VIN. The diagnostic tool operation is: MRS-Data Write-VIN.
  - Angle calibration. Diagnostic tool operation: After angle calibration, go to MRS - Routine Control - Angle Write, and write the deviation angle after angle calibration.
  - Target corner reflector detection. Diagnostic tool operation: MRS-Routine Control-Target Corner Reflector Detection Test.
- Calibrate the forward collision avoidance radar.
  See:Calibration (page)
- After calibration is completed, check that the forward collision avoidance radar is functioning properly.

FRONT BUMPER LEFT MOUNTING BRACKET 2

NOTE

This section describes the removal and installation of the front bumper left mounting bracket 2, and the removal and installation of the front bumper right mounting bracket 2 can generally refer to the left side.

REMOVAL PROCEDURE

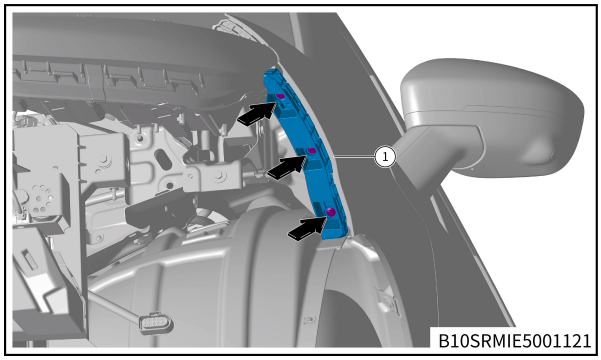
1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
2. Remove the front bumper left mounting bracket 2.

a. Unscrew the 1 fixing bolt -arrow- of the front bumper left mounting bracket 2, and remove the front bumper left mounting bracket 2 ①.
Recommended tool: 8mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT BUMPER LEFT MOUNTING BRACKET ASSEMBLY 1

NOTE

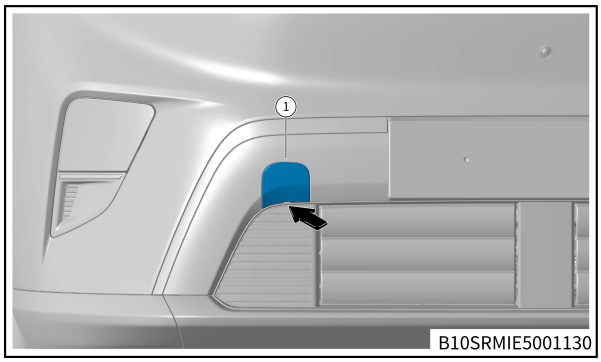
This section describes the removal and installation of the front bumper left mounting bracket assembly 1, and the removal and installation of the front bumper right mounting bracket assembly 1 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
2. Remove the front bumper left mounting bracket assembly 1.

a. Unscrew the 3 fixing bolts -arrow- of the front bumper left mounting bracket assembly 1, and remove the front bumper left mounting bracket assembly 1 ①.
Recommended tool: 8mm socket
Torque: 5±1N m

SETUP



1. The installation procedure is performed in reverse order.

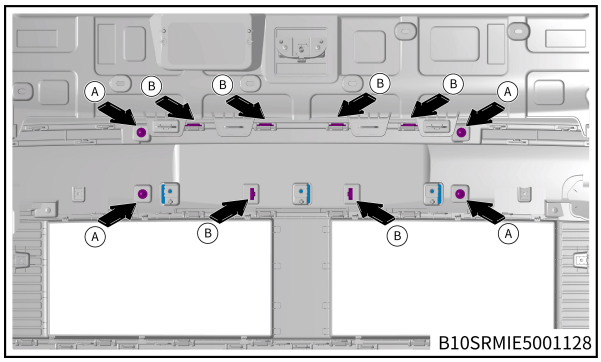
FRONT TOW HOOK COVER

REMOVAL PROCEDURE

1. Remove the front towing hook cover.

a. Use a flat-head screwdriver to detach the front towing hook cover ① - arrow -, and remove the front towing hook cover ①.

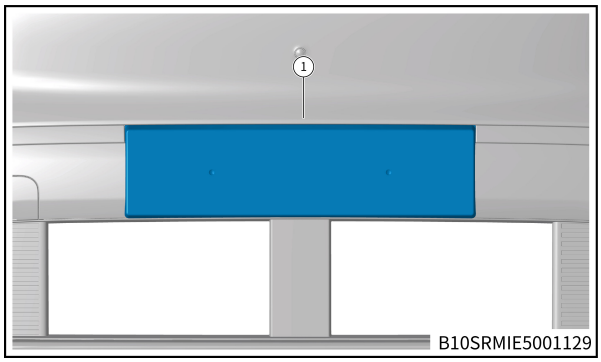
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT LICENSE PLATE FRAME TRIM



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front license plate frame trim.

B10SRMIE5001128

a. Unscrew the 4 mounting screws of the front license plate frame trim -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.2N m
b. Detach the 6 retaining clips connecting the front license plate frame trim to the front bumper upper body -arrow B-.
   Recommended tool: Clip remover

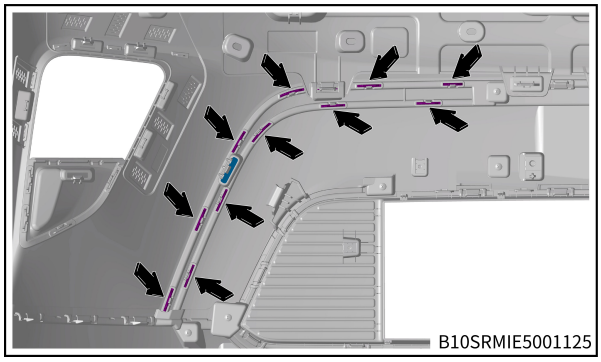
B10SRMIE5001129

c. Remove the front license plate frame trim ①.

SETUP

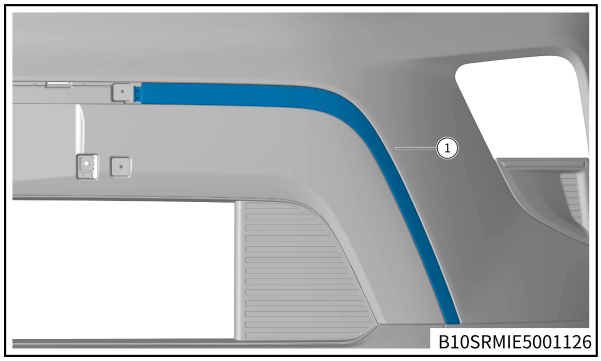
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



LEFT FRONT BUMPER MOLDING

REMOVAL PROCEDURE



NOTE

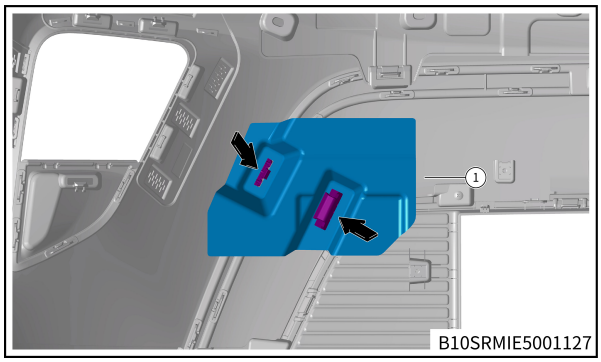
This section describes the removal and installation of the left front bumper trim, and the removal and installation of the right front bumper trim can generally be performed by referring to the left side.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5246)
5. Remove the front towing hook cover.
   See:Front tow hook cover (page 5245)
6. Remove the left front bumper trim.

a. Detach the 11 retaining clips connecting the left front bumper trim to the front bumper upper main body -arrow-.
Recommended tool: Flathead screwdriver

b. Remove the front bumper left trim ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

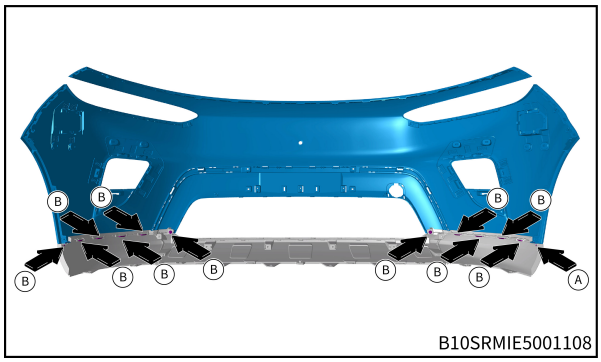
LEFT FRONT BUMPER ENERGY-ABSORBING FOAM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the left energy-absorbing foam of the front bumper.

a. Release the 2 retaining clips -arrow- of the left front bumper energy-absorbing foam, and remove the left front bumper energy-absorbing foam ①.
Recommended tool: Flathead screwdriver

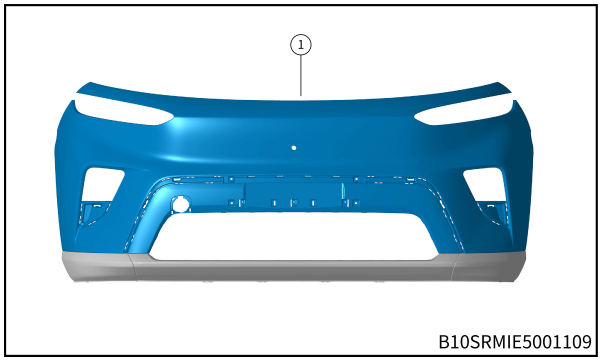
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER UPPER BODY



REMOVAL PROCEDURE

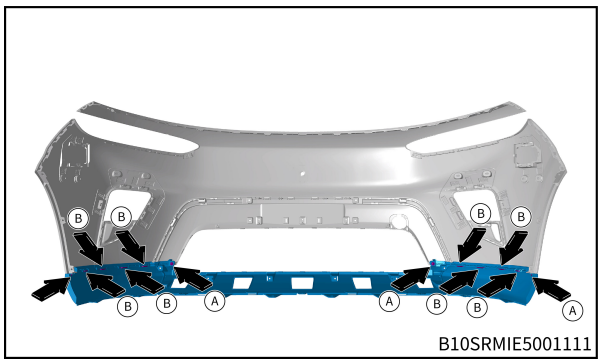
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5246)
5. Remove the left/right side trim panel of the front bumper.
   See:Front bumper left trim panel (page 5240)
6. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5248)
7. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5344)
8. Remove the front bumper wiring harness assembly.
   See:Front bumper wiring harness assembly (page 9538)
9. Remove the front towing hook cover.
   See:Front tow hook cover (page 5245)
10. Remove the blind spot monitoring radar (front bumper).
    See:Blind Spot Detection Radar (Front Bumper) (page 9430)
11. Remove the ACC mounting bracket.
    See:ACC mounting bracket (page 5242)
12. Remove the upper mounting bracket of the front bumper.
    See:Front bumper upper mounting bracket (page 5241)
13. Remove the front monocular camera assembly.
    See:Front-view monocular camera assembly (page 9117)
14. Remove the upper part of the front bumper.

a. Unscrew the 4 retaining screws -arrow A- on the upper part of the front bumper, and disengage the 8 retaining clips -arrow B- on the upper part of the front bumper.
Recommended tools: Phillips screwdriver, flathead screwdriver
Torque: 1.5±0.2N m

© 2026, All rights reserved

b. Remove the upper body ① of the front bumper.

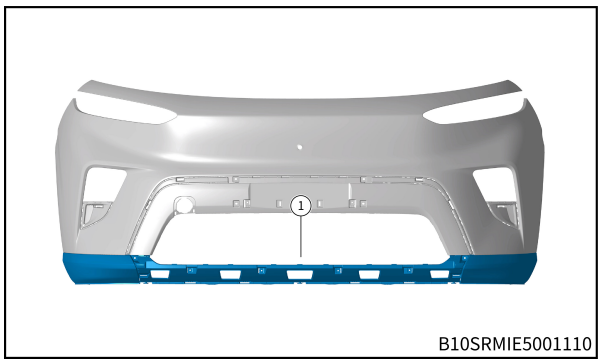
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved

FRONT BUMPER LOWER BODY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5344)
5. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5246)
6. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5248)
7. Remove the front bumper lower trim panel.
   See:Front bumper lower trim panel (page 5252)
8. Remove the front bumper lower cover.

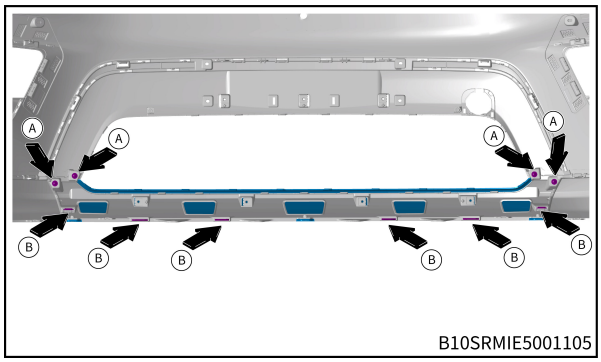
B10SRMIE5001111

a. Unscrew the 4 fixing screws -arrow A- on the lower part of the front bumper, and disengage the 8 retaining clips -arrow B- on the lower part of the front bumper.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

B10SRMIE5001110

b. Remove the front bumper lower body ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

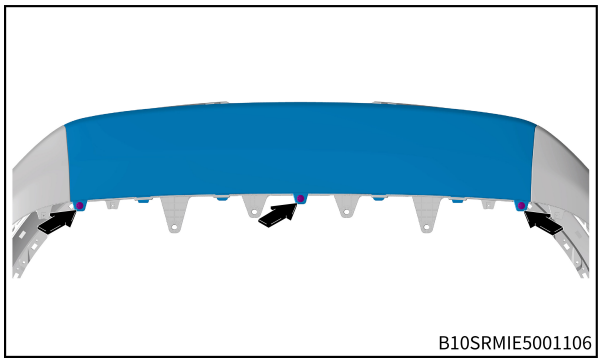
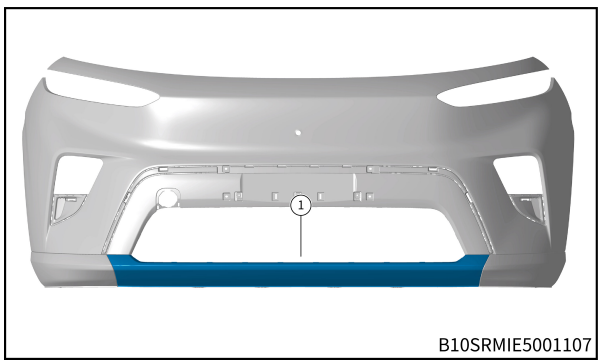
FRONT BUMPER LOWER TRIM PANEL



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front license plate frame trim.
   See:Front license plate frame trim (page 5246)
5. Remove the left/right side trim panel of the front bumper.
   See:Front bumper left trim panel (page 5240)
6. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5248)
7. Remove the front bumper lower trim panel.



B10SRMIE5001105

a. Unscrew the 4 fixing screws of the lower front bumper trim -Arrow A-, and release the 6 fixing clips of the lower front bumper trim -Arrow B-.
Recommended tools: Phillips screwdriver, flathead screwdriver
Torque: 1.5±0.2N m

B10SRMIE5001106

b. Release the 3 retaining clips connecting the front bumper lower trim to the front bumper upper main body -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

B10SRMIE5001107

c. Remove the front bumper lower trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. After installation, check whether the retaining clips are properly installed.

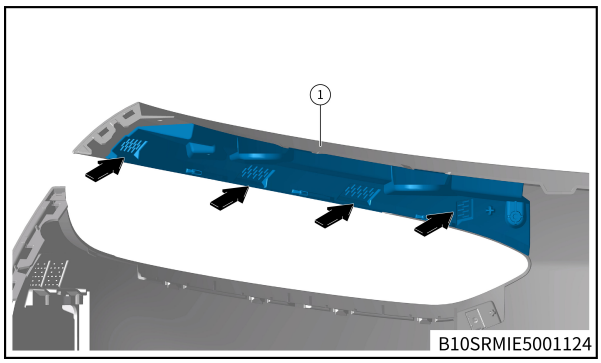
FRONT BUMPER UPPER LEFT MOUNTING BRACKET

NOTE



This section describes the removal and installation of the upper left mounting bracket of the front bumper. The removal and installation of the upper right mounting bracket of the front bumper can generally be performed by referring to the left side.

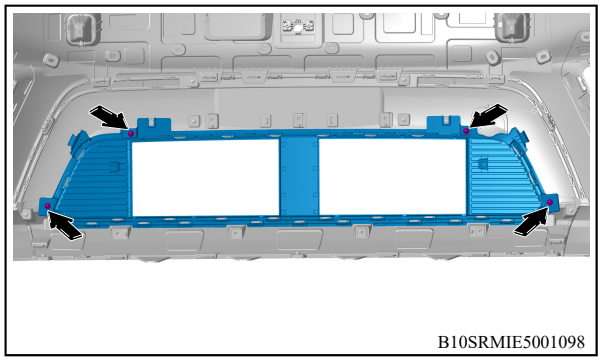
REMOVAL PROCEDURE

1. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
2. Remove the upper mounting bracket of the front bumper.
   See:Front bumper upper mounting bracket (page 5241)
3. Remove the upper left mounting bracket of the front bumper.

a. Unscrew the 1 fixing screw -arrow A- of the front bumper upper left mounting bracket, and disengage the 2 fixing clips -arrow B- of the front bumper upper left mounting bracket.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

b. Release the 4 retaining clips - arrow - between the front bumper upper left mounting bracket and the front bumper upper mounting bracket.
c. Remove the front bumper upper left mounting bracket ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

FRONT BUMPER LOWER GRILLE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the left/right energy-absorbing foam of the front bumper.
   See:Left Front Bumper Energy-Absorbing Foam (page 5248)
5. Remove the front bumper lower grille.

a. Unscrew the 4 retaining screws of the front bumper lower grille -arrow-.
Recommended tool: Phillips screwdriver

b. Release the 17 retaining clips -arrow- between the front bumper lower grille and the front bumper upper body and lower body, and remove the front bumper lower grille ①.

SETUP

1. The installation procedure is performed in reverse order.

7.2 REAR BUMPER AND ACCESSORY SYSTEM

7.2.1 PRECAUTIONS

PRECAUTIONS

1. When removing the bumper assembly, exercise caution to avoid damaging the bumper retaining tabs.
2. Use an interior trim pry tool to assist with removal, do not pry with metal tools, to avoid damaging the bumper.
3. When disconnecting the bumper assembly wiring harness connector, be careful not to tear or damage the connector or other components.
4. The bumper placement area should be clean and flat to avoid scratching the paint surface.
5. After completing the removal and installation of the bumper, adjust the gap and flush to the specified values.

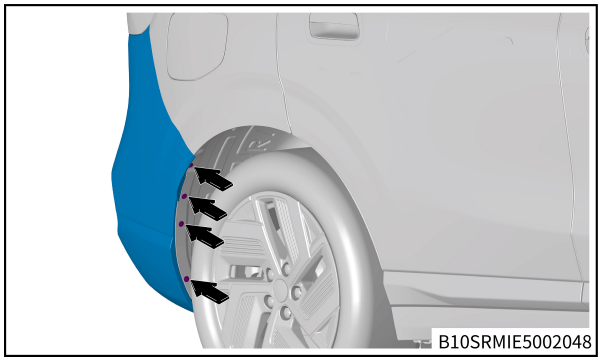
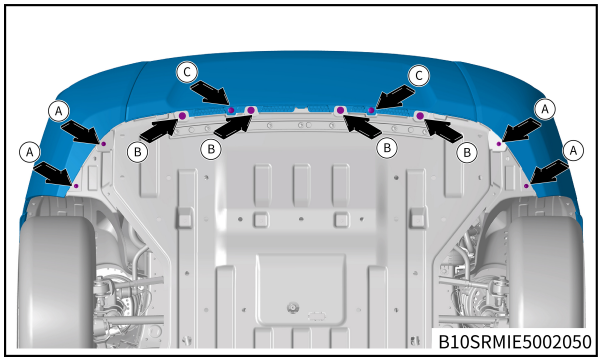
7.2.6 SERVICE AND REPAIR GUIDANCE



REAR BUMPER ASSEMBLY

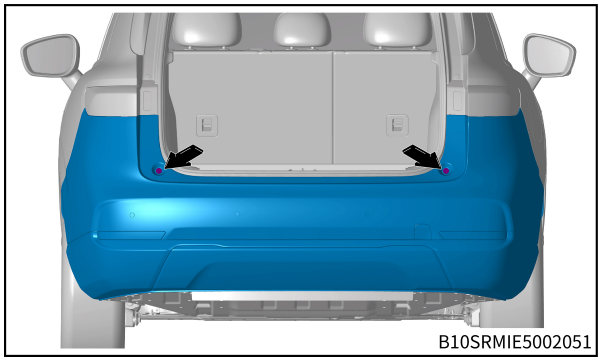
REMOVAL PROCEDURE



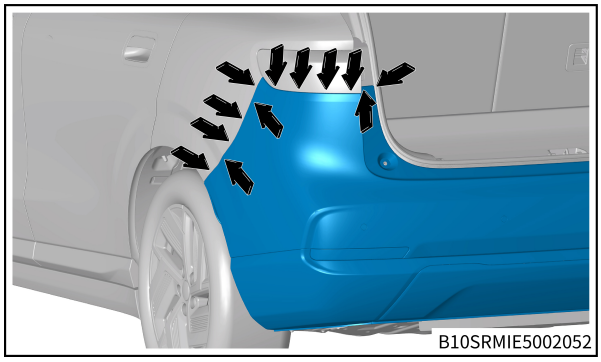
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.

a. Unscrew the 4 fixing screws on the left side of the rear bumper assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

b. Unscrew the 4 fixing screws on the right side of the rear bumper assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

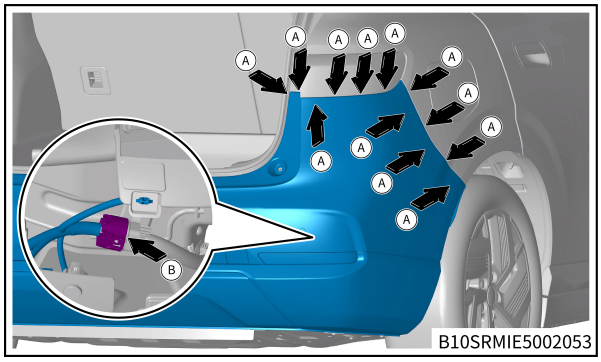


c. Unscrew the 4 mounting screws at the bottom of the rear bumper assembly -Arrow A-.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m



d. Unscrew the 4 fixing bolts at the bottom of the rear bumper assembly -Arrow B-.
Recommended tool: 10mm socket
Torque: 5±1N m

e. Unscrew the 2 fixing screws at the bottom of the rear bumper assembly -arrow C-.
Recommended tool: Flathead screwdriver



© 2026, All rights reserved

B10SRMIE5002051

f. Open the liftgate assembly.
g. Unscrew the 2 fixing bolts of the rear bumper assembly -arrow-.
Recommended tool: 5mm hexagon socket wrench
Torque: 5±1N m

B10SRMIE5002052

h. Detach the 12 retaining clips on the left side of the rear bumper assembly -arrow-.

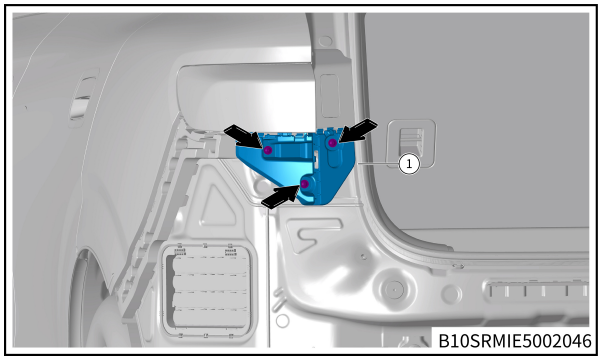
B10SRMIE5002053

i. Detach the 12 retaining clips on the right side of the rear bumper assembly -arrow A-, and disconnect the 1 connector between the rear bumper wiring harness and the floor wiring harness -arrow B-.
j. Remove the rear bumper assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



REAR BUMPER LEFT MOUNTING BRACKET ASSEMBLY 2

NOTE

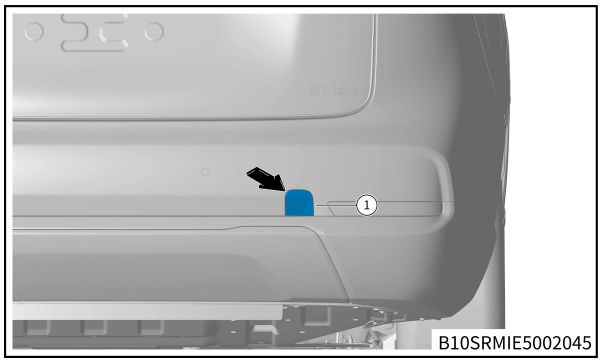
This section describes the removal and installation of the rear bumper left mounting bracket assembly 2, and the removal and installation of the rear bumper right mounting bracket assembly 2 can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
2. Remove the rear bumper left mounting bracket assembly 2.

a. Unscrew the 3 fixing screws -arrow- of the rear bumper left mounting bracket assembly 2, and remove the rear bumper left mounting bracket assembly 2①.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR TOW HOOK COVER

REMOVAL PROCEDURE

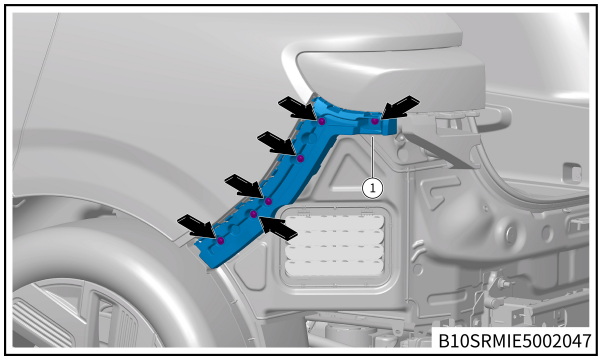
1. Remove the rear towing hook cover.

a. Press the arrow position to detach the rear towing hook cover ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

© 2026, All rights reserved



REAR BUMPER LEFT MOUNTING BRACKET ASSEMBLY 1

NOTE

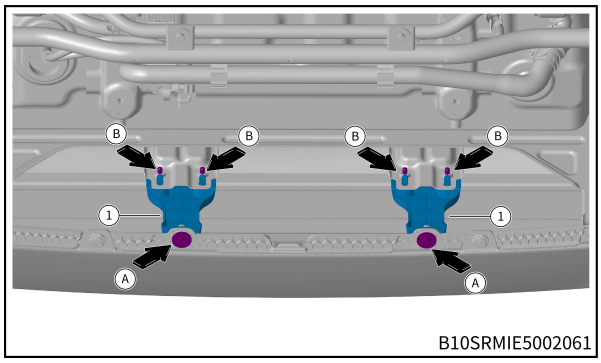
This section describes the removal and installation of the rear bumper left mounting bracket assembly 1, and the removal and installation of the rear bumper right mounting bracket assembly 1 can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
2. Remove the rear bumper left mounting bracket assembly 1.

a. Unscrew the 6 fixing screws of the rear bumper left mounting bracket assembly 1 -arrow-, and remove the rear bumper left mounting bracket assembly 1 ①.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR BUMPER MOUNTING BRACKET ASSEMBLY 4

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear bumper mounting bracket assembly 4.

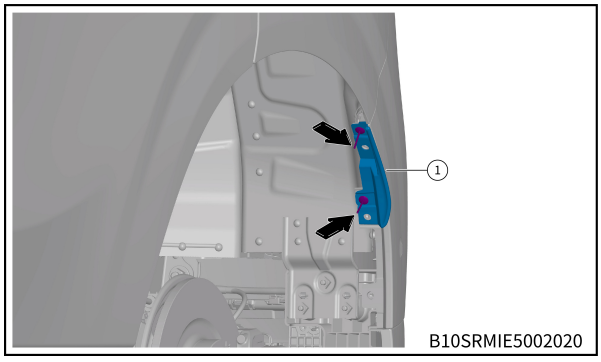
B10SRMIE5002061

a. Unscrew the 2 fixing bolts at the lower part of the rear bumper mounting bracket assembly 4 -arrow A-.
Recommended tool: 10mm socket
Torque: 5±1N m
b. Unscrew the 4 fixing bolts at the top of the rear bumper mounting bracket assembly 4 -arrow B-, and remove the rear bumper mounting bracket assembly 4 ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



REAR BUMPER LEFT TRIM

NOTE

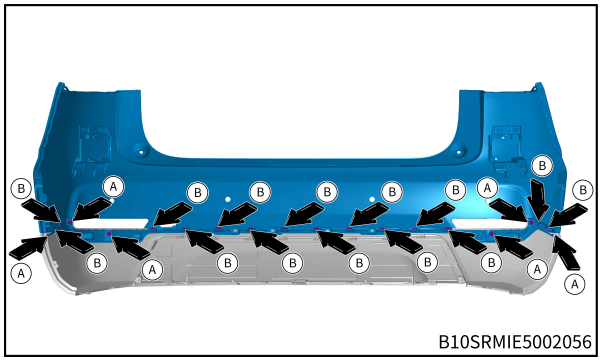
This section describes the removal and installation of the left rear bumper trim. The removal and installation of the right rear bumper trim can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the left rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
2. Remove the left rear bumper trim.

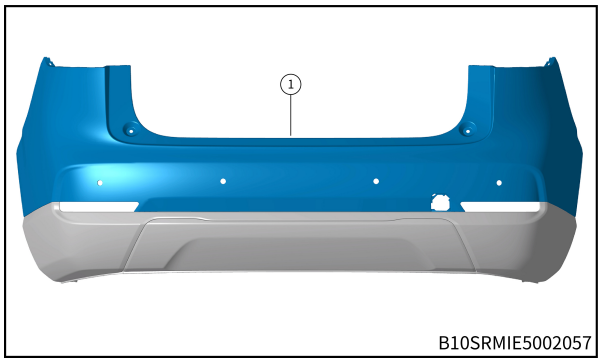
a. Use a tool to detach the 2 retaining rivets -arrow- of the left rear bumper trim, and remove the left rear bumper trim ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the fixing rivets are properly installed.

© 2026, All rights reserved



REAR BUMPER UPPER BODY

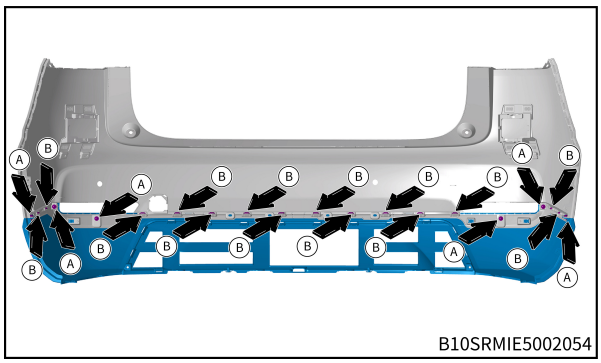
REMOVAL PROCEDURE

1. Turn off all electrical loads, and tap Vehicle Maintenance Power On on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the left/right rear fog lamp assembly.
   See:Rear left fog lamp reflector assembly (page 9450)
5. Remove the rear parking ultrasonic sensor (rear bumper).
   See:Reversing ultrasonic sensor (rear bumper) (page 9431)
6. Remove the blind spot monitoring radar (rear bumper).
   See:Blind spot detection radar (rear bumper) (page 9433)
7. Remove the license plate lamp.
   See:License plate light (page 9454)
8. Remove the rear surround view camera assembly.
   See:Rear surround view camera assembly (page 9115)
9. Remove the rear bumper wiring harness assembly.
   See:Rear Bumper Wiring Harness Assembly (page 9539)
10. Remove the upper body of the rear bumper.

a. Unscrew the 6 fixing screws -Arrow A- on the upper body of the rear bumper, and release the 14 fixing clips -Arrow B- between the lower body and the upper body of the rear bumper.
Recommended tools: Phillips screwdriver, flathead screwdriver
Torque: 2±0.2N m

b. Remove the upper body of the rear bumper ①.

SETUP



1. The installation procedure is performed in reverse order, while observing the above precautions:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

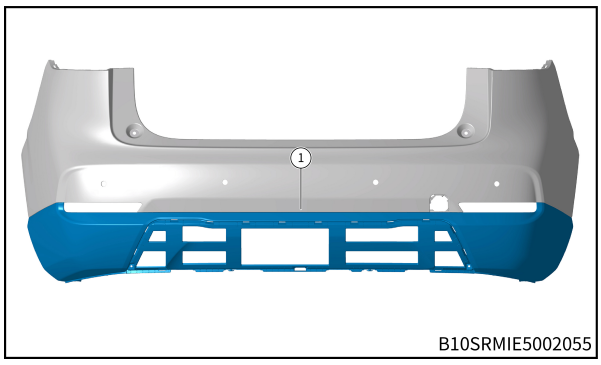
REAR BUMPER LOWER BODY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the rear bumper lower trim panel.
   See:Rear bumper lower trim panel (page 5270)
5. Remove the left/right rear fog lamp assembly.
   See:Rear left fog lamp reflector assembly (page 9450)
6. Remove the rear bumper lower body.

B10SRMIE5002054

a. Unscrew the 6 mounting screws of the lower rear bumper -arrow A-, and release the 14 retaining clips between the lower and upper rear bumpers -arrow B-.
Recommended tools: Phillips screwdriver, flathead screwdriver
Torque: 2±0.2N m

B10SRMIE5002055

b. Remove the rear bumper lower body ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.
   b. Tighten the fixing bolt to the specified torque.

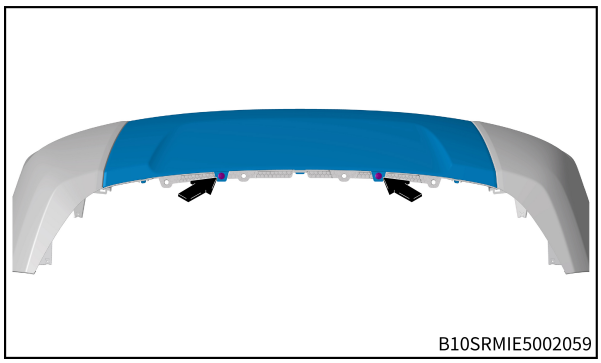
REAR BUMPER LOWER TRIM PANEL

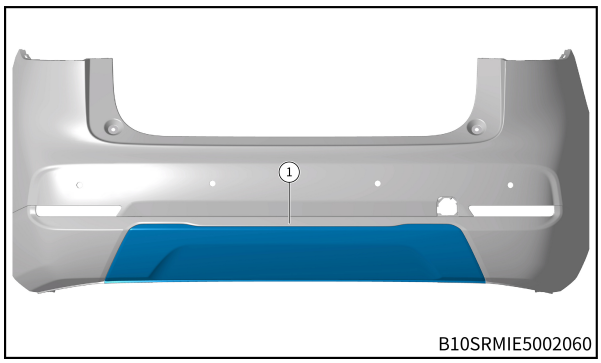
NOTE

This section describes the removal and installation of the rear bumper lower left trim panel, and the removal and installation of the rear bumper lower right trim panel can generally be performed by referring to the left side.



REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
3. Remove the rear bumper lower trim panel.



B10SRMIE5002058

a. Unscrew the 2 retaining screws of the rear bumper lower trim - Arrow A -, and release the 14 retaining clips of the rear bumper lower trim - Arrow B -.
Recommended tools: Phillips screwdriver, interior trim removal tool

B10SRMIE5002059

b. Release the 2 retaining clips -arrow- connecting the rear bumper lower trim and the rear bumper lower main body.

B10SRMIE5002060

b. Remove the rear bumper lower trim panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the retaining clips are properly installed.

7.3 REARVIEW MIRROR SYSTEM

7.3.1 PRECAUTIONS

PRECAUTIONS

1. When removing glass components, wear protective gloves and safety goggles to avoid injury to the skin or eyes.
2. When removing the glass, handle it with care and place it securely to prevent damage to the glass during the operation.
3. When prying the latch tongue and pawl, do not apply excessive force to avoid damaging the latch tongue or pawl.

© 2026, All rights reserved

7.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION

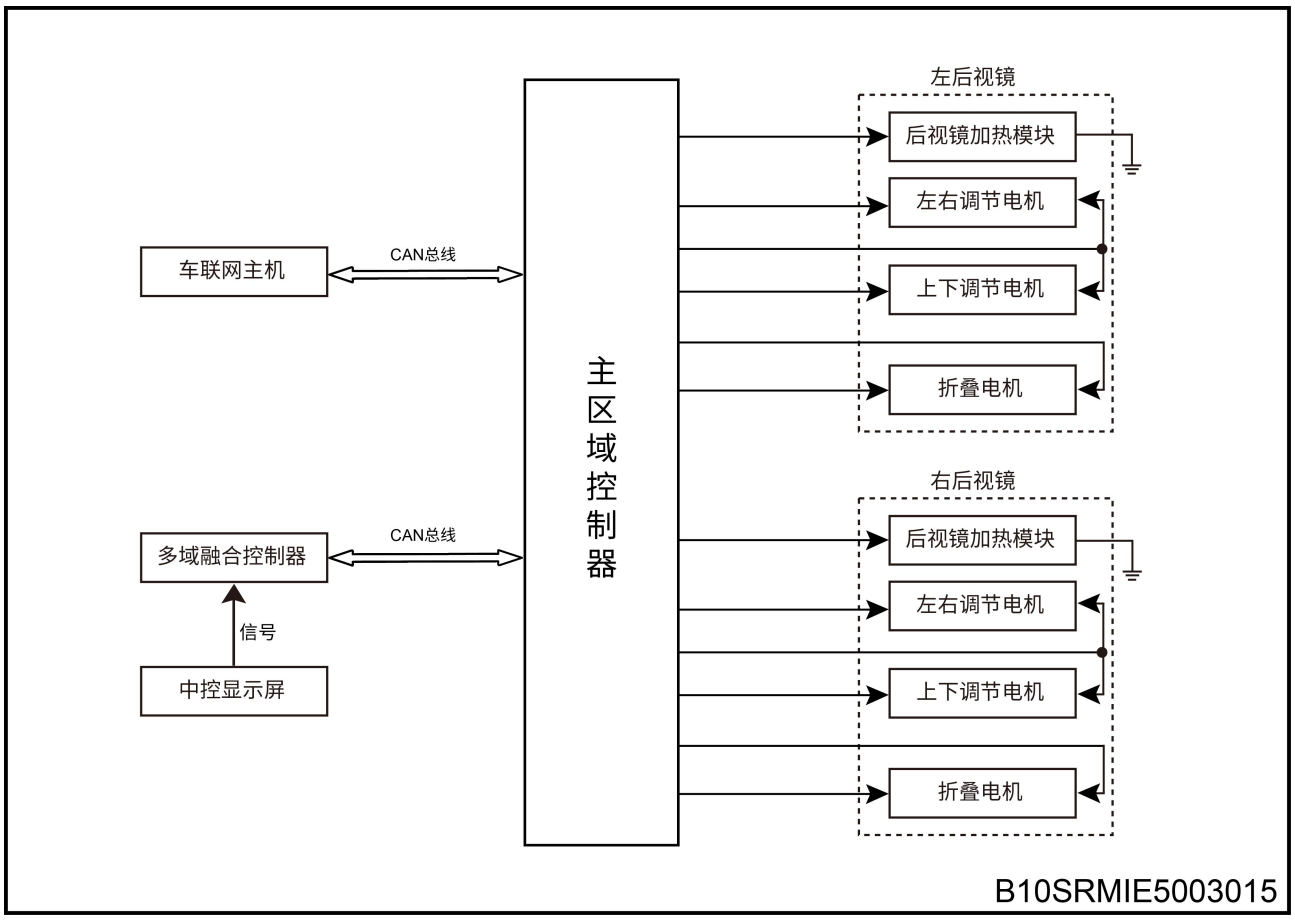
STRUCTURE AND PRINCIPLE INTRODUCTION

The rearview mirror system consists of the following components:

1. Upper mirror housing
2. Lens assembly
3. Mirror bezel
4. Left and right turn signal lamp assemblies
5. Lower mirror housing
6. Exterior rearview mirror assembly
7. Interior rearview mirror assembly

Operating principle of power-folding exterior rearview mirrors:

1. The power exterior rearview mirror consists of the rearview mirror adjustment switch (integrated in the central control panel), reflective mirror glass, motor, control unit, and communication network.
2. The Main Zone Controller receives the exterior rearview mirror folding signal from the Multi-domain Fusion Controller/Telematics Host via CAN communication, and controls the exterior rearview mirror to perform the folding operation.



Exterior rearview mirror heating principle:

1. The main zone controller receives the exterior rearview mirror heating request signal from the multi-domain fusion controller/telematics host via CAN communication, and controls the operation of the exterior rearview mirror heating wire to achieve rapid defogging and defrosting.

Schematic diagram of exterior rearview mirror adjustment principle:

1. The Main Zone Controller receives the exterior rearview mirror adjustment signal from the Multi-Domain Fusion Controller/Telematics Host via CAN communication, and controls the exterior rearview mirror glass for position adjustment.

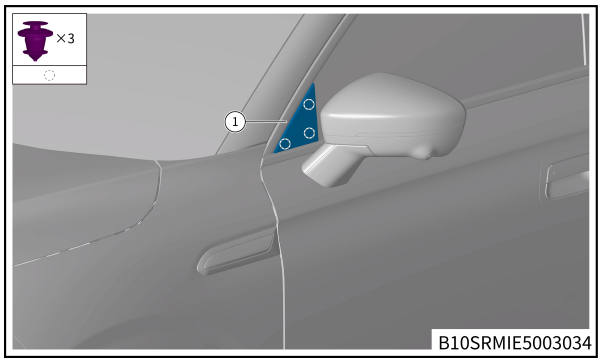
7.3.7 SERVICE AND REPAIR GUIDANCE



LEFT TRIANGULAR OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left triangular outer trim panel assembly, and the removal and installation of the right triangular outer trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

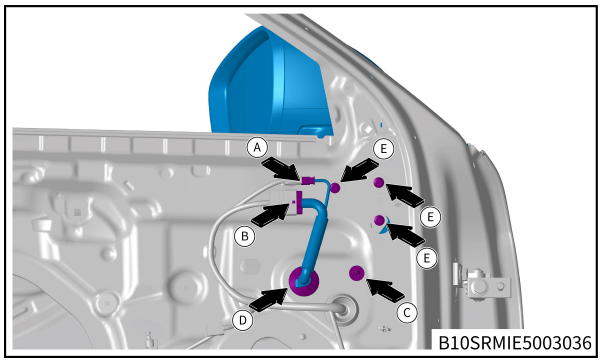
1. Remove the left triangular outer trim panel assembly.

a. Release the 3 retaining clips of the left triangular outer trim panel assembly, and remove the left triangular outer trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

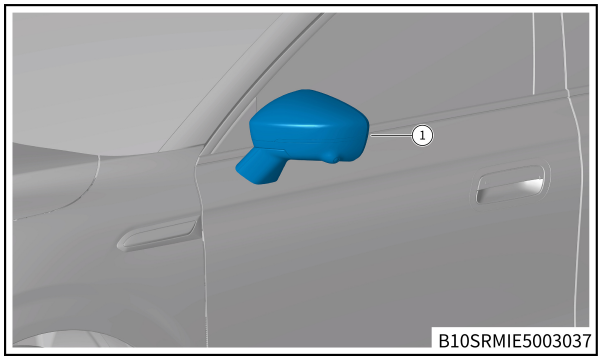
© 2026, All rights reserved



LEFT EXTERIOR REARVIEW MIRROR ASSEMBLY

NOTE

This section describes the removal and installation of the left exterior rearview mirror assembly, and the removal and installation of the right exterior rearview mirror assembly can generally refer to the left side.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door trim panel assembly.,
   See:Front left door trim panel assembly (page 5352)
4. Remove the rubber pad of the screw on the front left door handle box.
   See:Left front door handle box screw rubber pad (page 5357)
5. Remove the front left door pull cup cover.
   See:Front left door inner handle recess cover (page 5355)
6. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
7. Remove the left exterior rearview mirror assembly.

B10SRMIE5003036

a. Lower the front left door window to the bottom position.
b. Disconnect the 2 connectors -arrow A-, -arrow B- of the left exterior mirror assembly wiring harness, and release the 1 retaining clip -arrow C- of the mirror wiring harness.
c. Detach the 1 grommet from the wiring harness of the left exterior rearview mirror assembly -arrow D-, and unscrew the 3 mounting bolts of the left exterior rearview mirror assembly -arrow E-.
   Recommended tool: 8mm socket
   Torque: 9±1N m

B10SRMIE5003037

d. Remove the left exterior rearview mirror assembly ①.

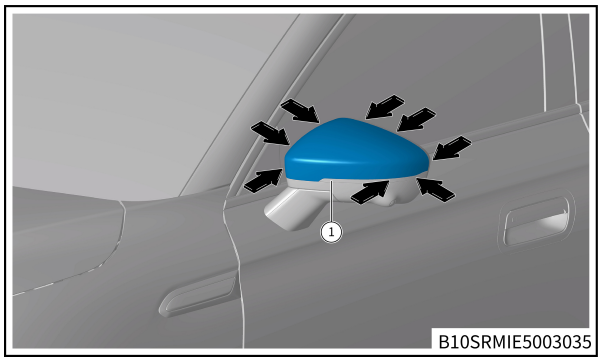
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. When installing the wiring harness, check whether the pins of the wiring harness connector are damaged. If damaged, replace the wiring harness with a new one.
b. After installation, check whether the relevant electrical components can function properly.
c. After installation, the camera must be calibrated.
   See:Calibration (page)

© 2026, All rights reserved



UPPER LEFT MIRROR COVER

NOTE

This section describes the removal and installation of the upper left mirror shell, and the removal and installation of the upper right mirror shell can generally follow the procedure for the left side.

REMOVAL PROCEDURE

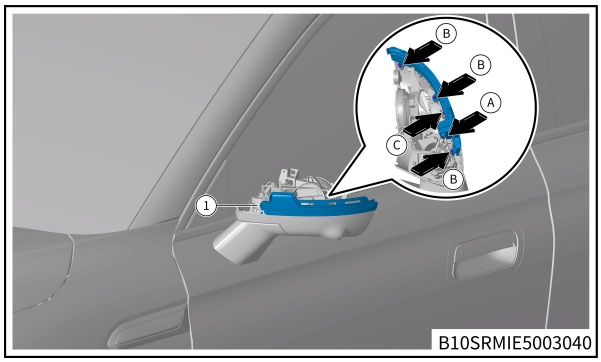
1. Remove the upper left mirror cover.

a. Release the 8 retaining clips -arrow- of the upper left mirror housing, and remove the upper left mirror housing ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



LEFT TURN SIGNAL LAMP ASSEMBLY

NOTE

This section describes the removal and installation of the left turn signal lamp assembly, and the removal and installation of the right turn signal lamp assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

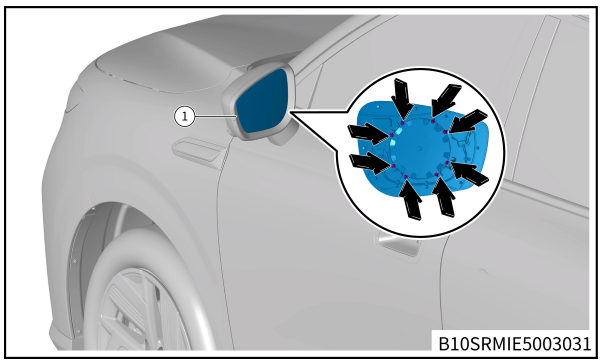
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper left mirror cover.
   See:Upper left mirror cover (page 5281)
4. Remove the left turn signal lamp assembly.

a. Disconnect 1 connector of the left turn signal lamp assembly -arrow A-, and unscrew 3 fixing screws of the left turn signal lamp assembly -arrow B-.
Recommended tool: Phillips screwdriver
b. Release the 1 retaining clip -arrow C- of the left turn signal lamp assembly, and remove the left turn signal lamp assembly ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the left turn signal assembly operates normally.

© 2026, All rights reserved

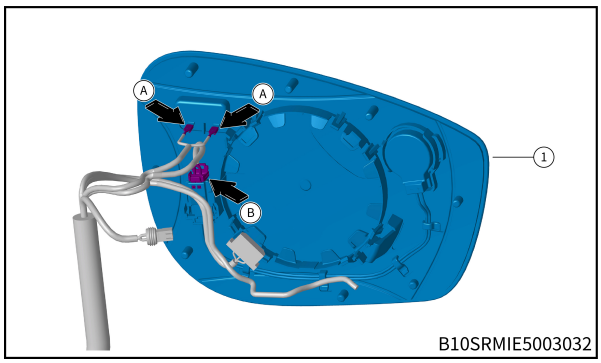


LEFT LENS BODY ASSEMBLY

NOTE

This section describes the removal and installation of the left mirror glass body assembly, and the removal and installation of the right mirror glass body assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left mirror glass assembly.

a. Use a tool to pry open the 8 retaining clips -arrow- of the left lens body assembly, and slowly remove the lens body assembly ①.
Recommended tool: Interior trim removal tool

ATTENTION

The lens body is fragile, so please handle with care during installation and removal.

b. Disconnect the 2 connectors of the heating coil for the left mirror glass body assembly - arrow A -, disconnect the 1 connector of the left blind spot warning assembly - arrow B -, and remove the left mirror glass body assembly ①.

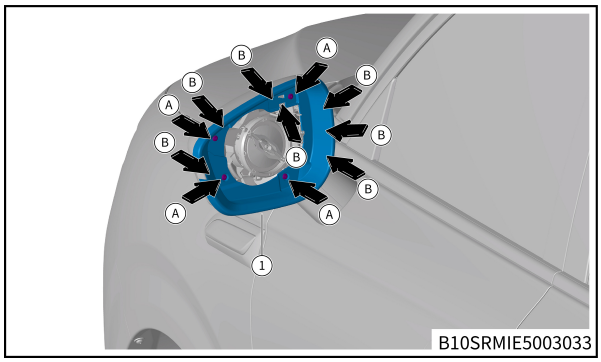
ATTENTION

The lens body is fragile, so please handle with care during installation and removal.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When removing the lens, handle it with care to avoid damaging it during the operation.

© 2026, All rights reserved



LEFT MIRROR RING

NOTE

This section describes the removal and installation of the left lens ring. The removal and installation of the right lens ring can generally follow the procedure for the left side.

REMOVAL PROCEDURE

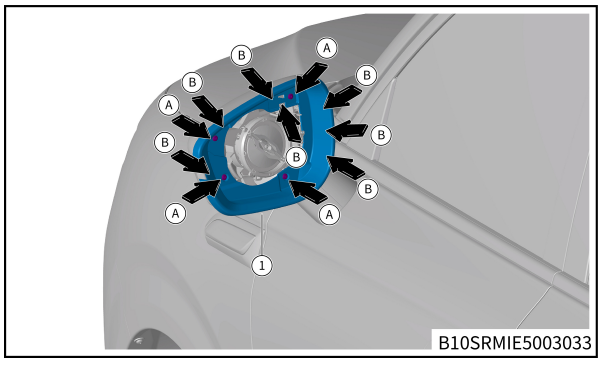
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left mirror glass assembly.
   See:Left lens body assembly (page 5283)
4. Remove the left mirror ring.

a. Unscrew the 4 retaining screws - arrow A - of the left lens ring, and disengage the 7 retaining clips - arrow B - of the left lens ring.
Recommended tool: Phillips screwdriver
b. Remove the left mirror ring ①.

SETUP

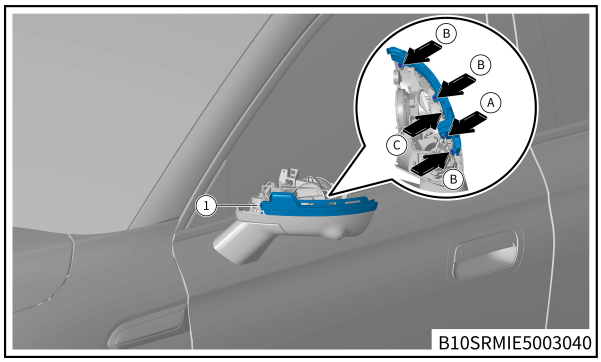
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



LEFT AND RIGHT SURROUND VIEW CAMERA ASSEMBLY

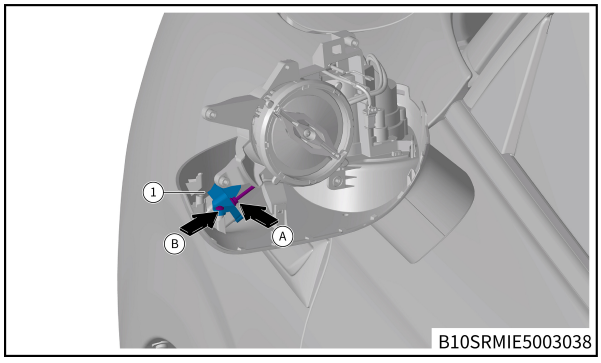
NOTE



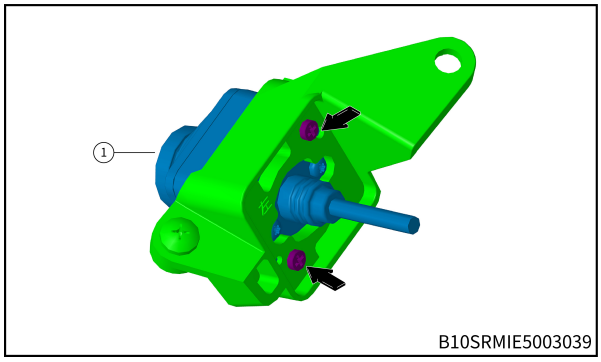
This section describes the removal and installation of the left surround view camera assembly, and the removal and installation of the right surround view camera assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper left mirror cover.
   See:Upper left mirror cover (page 5281)
4. Remove the left mirror glass assembly.
   See:Left lens body assembly (page 5283)
5. Remove the left and right surround view camera assemblies.



a. Unscrew the 4 fixing screws of the left mirror bezel - arrow A -, release the 7 fixing clips of the left mirror bezel - arrow B -, and remove the left mirror bezel assembly ①.
Recommended tool: Phillips screwdriver



b. Disconnect 1 connector of the left turn signal lamp assembly -arrow A-, unscrew 3 mounting screws of the left turn signal lamp assembly -arrow B-, and remove the left turn signal lamp assembly ①.
Recommended tool: Phillips screwdriver

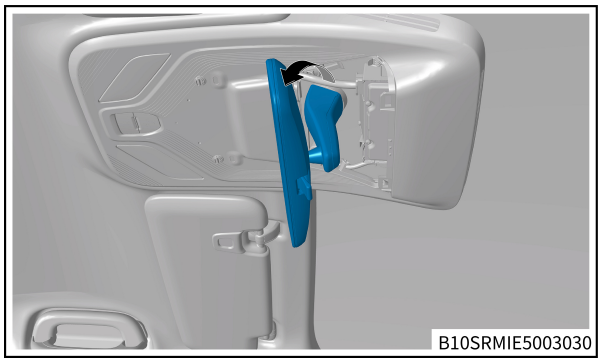
c. Release the 1 retaining clip -arrow C- of the left turn signal lamp assembly, and remove the left turn signal lamp assembly ①.
Recommended tool: Clip remover

d. Disconnect the 1 connector of the left surround view camera -arrow A-, unscrew the 1 fixing screw of the left surround view camera bracket -arrow B-, and remove the left surround view camera bracket with the surround view camera assembly ①.
Recommended tool: Phillips screwdriver

© 2026, All rights reserved

e. Unscrew the 2 fixing screws -arrow- between the left surround-view camera assembly and the left surround-view camera bracket, and remove the left and right surround-view camera assemblies ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the left and right surround view camera assemblies.
   See:Calibration (page)
   b. After calibration is completed, check that the left and right surround-view camera assemblies are functioning properly.

© 2026, All rights reserved

INTERIOR REARVIEW MIRROR ASSEMBLY

REMOVAL PROCEDURE

1. Remove the blind cover.
   See:Plug cover (page 5391)
2. Remove the monocular lower cover.
   See:Monocular lower cover assembly (page 5390)
3. Remove the interior rearview mirror assembly.

a. Rotate the interior rearview mirror assembly 60° counterclockwise along the arrow to unscrew it, and remove the interior rearview mirror assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Rotate the interior rearview mirror assembly counterclockwise by 60° (toward the front of the vehicle), align it with the mounting hole, then press it into the mounting base on the windshield, and rotate it clockwise by 60° to complete the installation.

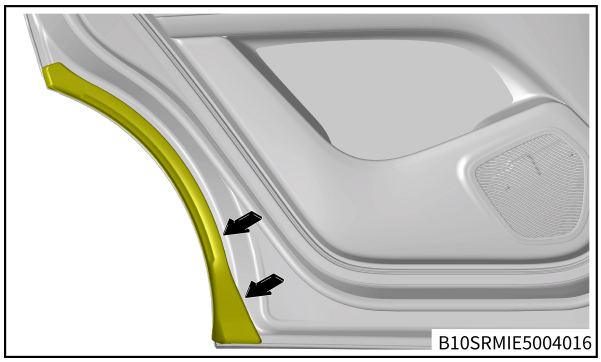
7.4.6 SERVICE AND REPAIR GUIDANCE

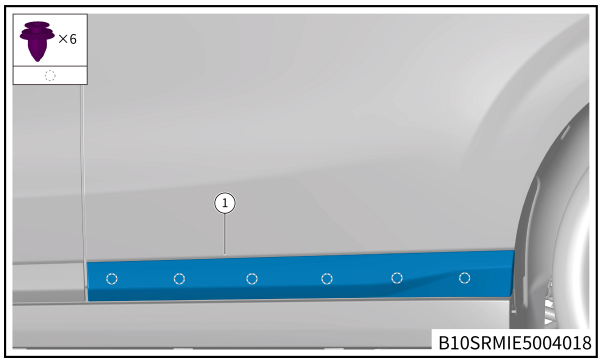


LEFT REAR DOOR EXTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left rear door exterior trim panel assembly, and the removal and installation of the right rear door exterior trim panel assembly can generally follow the same procedures as the left side.

REMOVAL PROCEDURE



1. Open the left rear door.
2. Remove the left rear door exterior trim panel assembly.

a. Release the 2 retaining clips of the rear left wheel arch weatherstrip - arrow -, and peel back the lower end of the rear left wheel arch weatherstrip.
Recommended tool: Clip remover

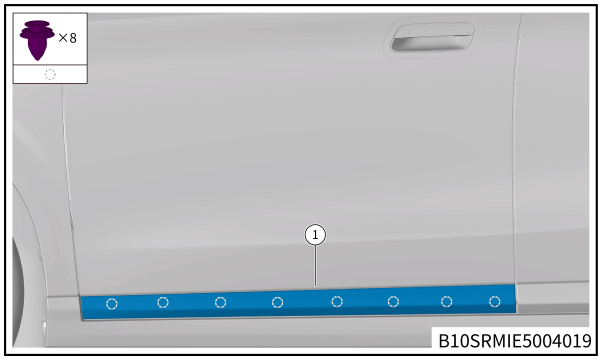
b. Unscrew the 1 retaining screw -arrow- of the left rear door exterior trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

c. Release the 6 waterproof clips on the left rear door outer trim panel assembly, and remove the left rear door outer trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



FRONT LEFT DOOR EXTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left front door exterior trim panel assembly, and the removal and installation of the right front door exterior trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the front left door.
2. Remove the front left door exterior trim assembly.

a. Release the 8 waterproof clips of the left front door outer trim panel assembly, and remove the left front door outer trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

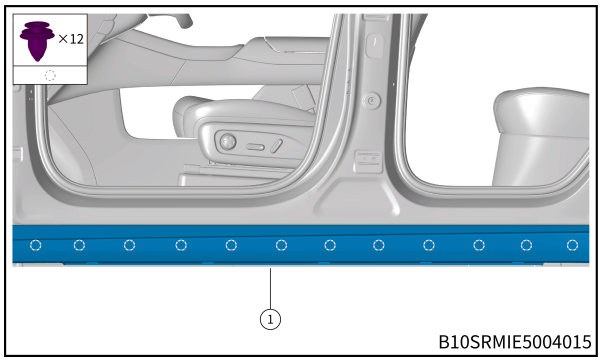
LEFT SIDE SKIRT ASSEMBLY

NOTE



This section describes the removal and installation of the left side skirt assembly, and the removal and installation of the right side skirt assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the left front/left rear door.
2. Remove the left side skirt panel assembly.

a. Release the 2 retaining clips -arrow A- of the left side skirt assembly, and unscrew the 9 fixing screws -arrow B- of the left side skirt assembly.
Recommended tools: Clip remover, Phillips screwdriver
Torque: 2±0.2N m

b. Release the 12 retaining clips of the left side skirt assembly, and remove the left side skirt assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

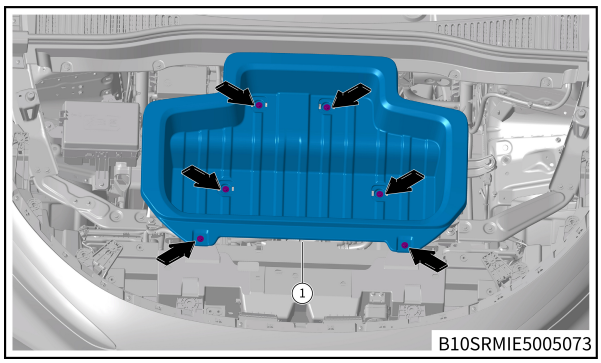
7.5.6 SERVICE AND REPAIR GUIDANCE



FRONT COMPARTMENT STORAGE BOX ASSEMBLY

REMOVAL PROCEDURE

1. Remove the front compartment storage box assembly.

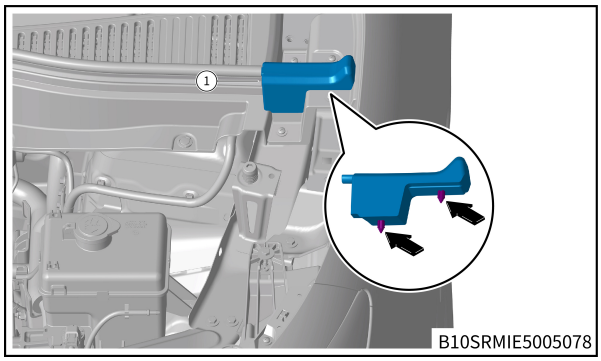
a. Release the 4 retaining clips - arrow - of the screw plug cover, and remove the screw plug cover.

b. Unscrew the 6 fixing bolts -arrow- of the front compartment storage box assembly, and remove the front compartment storage box assembly ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT WATER-BLOCKING FOAM

NOTE

This section describes the removal and installation of the left water deflector foam, and the removal and installation of the right water deflector foam can generally refer to the left side.

REMOVAL PROCEDURE

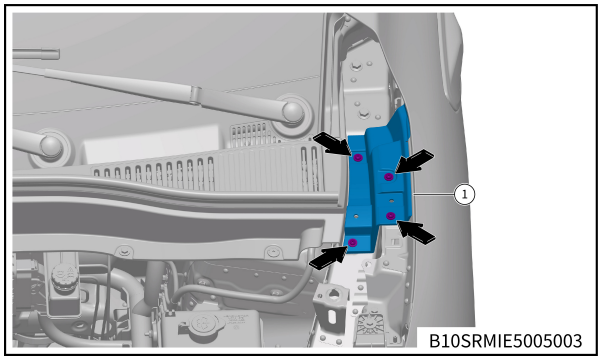
1. Open the hood assembly.
2. Remove the left water shield foam.

a. Release the 2 retaining clips -arrow- of the left water baffle foam, and remove the left water baffle foam ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT HINGE TRIM PANEL

NOTE

This section describes the removal and installation of the left hinge trim panel, and the removal and installation of the right hinge trim panel can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the left water shield foam.
   See:Left water-blocking foam (page 5303)
3. Remove the left hinge trim panel.

a. Unscrew the 4 mounting screws -arrow- of the left hinge trim panel, and remove the left hinge trim panel ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

LEFT END COVER OF VENTILATION WINDOW COVER

NOTE

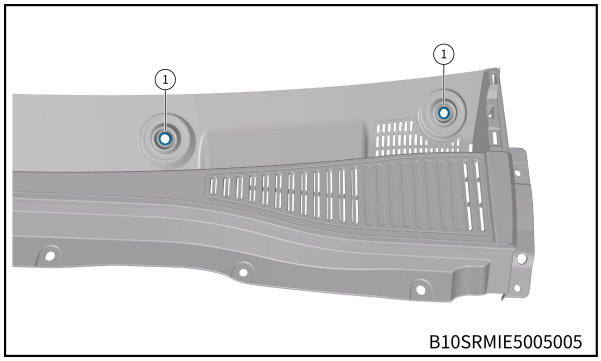
This section describes the removal and installation of the left end cover of the ventilation window cover, and the removal and installation of the right end cover of the ventilation window cover can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the left end cover of the ventilation window cover.

a. Release the 2 double-sided clips - Arrow A - on the left end cover of the ventilation window cover, and release the 6 retaining clips - Arrow B - on the left end cover of the ventilation window cover.
b. Remove the left end cover ① of the ventilation window cover.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

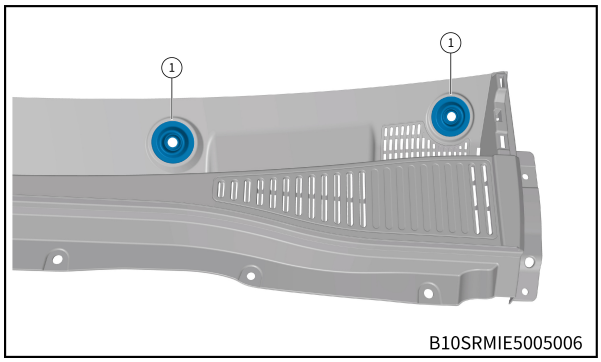
WIPER SHAFT SEALING BUSHING

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5311)
3. Remove the wiper shaft seal bushing.

a. Remove the wiper shaft seal sleeve ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

WIPER SHAFT SEAL

REMOVAL PROCEDURE

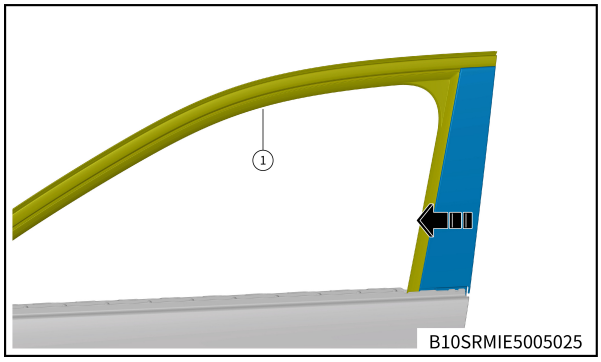
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the driver/passenger wiper blade assembly.
   See:Main wiper arm blade assembly (page 9489)
4. Remove the wiper shaft seal.

a. Remove the wiper shaft seal ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

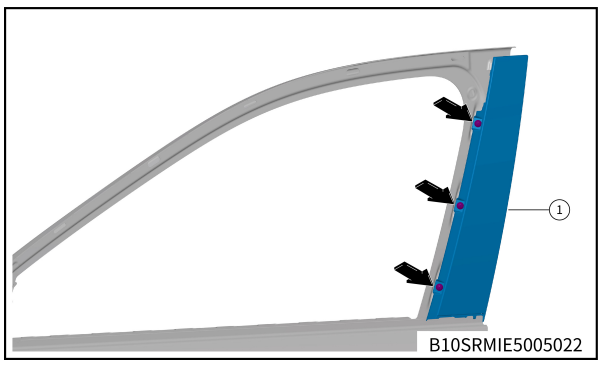


B-PILLAR FRONT LEFT OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the B-pillar left front outer trim panel assembly, and the removal and installation of the B-pillar right front outer trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door outer belt molding.
   See:Front left door outer belt molding (page 6401)
4. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6400)
5. Remove the left front B-pillar outer trim panel assembly.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

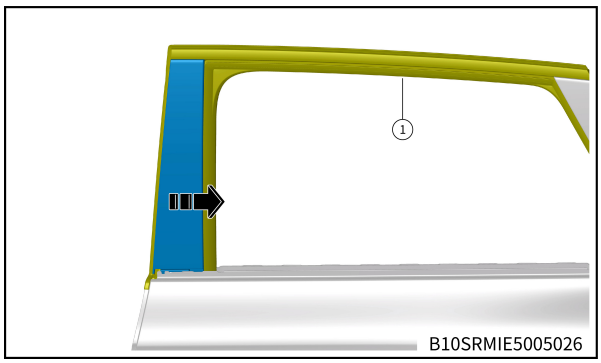
The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 fixing screws - arrow - of the B-pillar front left outer trim panel assembly, and remove the B-pillar front left outer trim panel assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

© 2026, All rights reserved

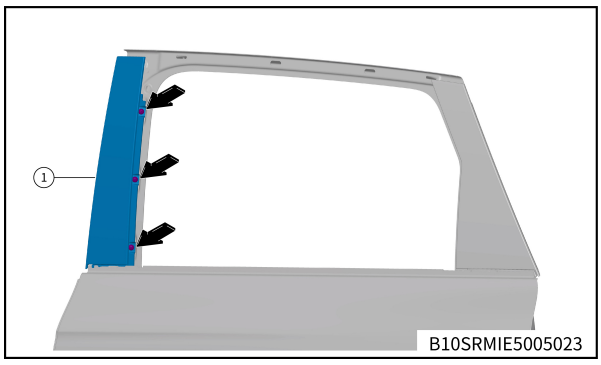


REAR LEFT B-PILLAR OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the B-pillar rear left outer trim panel assembly, and the removal and installation of the B-pillar rear right outer trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6412)
4. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6413)
5. Remove the rear left door glass assembly.
   See:Rear left door glass assembly (page 6377)
6. Remove the B-pillar left rear outer trim panel assembly.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 mounting screws -arrow- of the B-pillar rear left outer trim panel assembly, and remove the B-pillar rear left outer trim panel assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

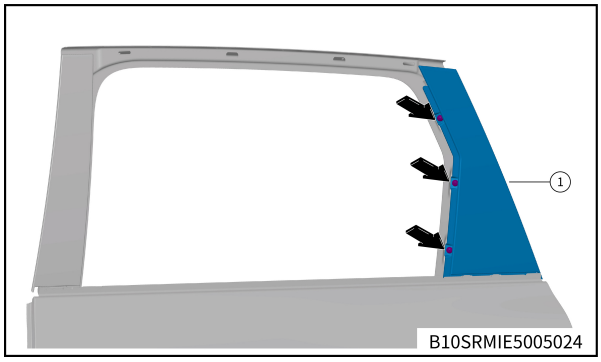
LEFT C-PILLAR OUTER TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left C-pillar outer trim panel assembly, and the removal and installation of the right C-pillar outer trim panel assembly can generally follow the procedures for the left side.

REMOVAL PROCEDURE



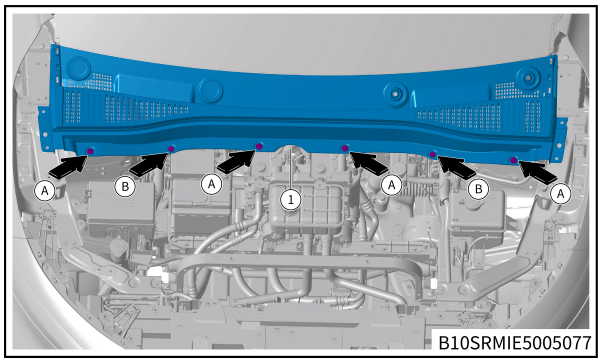
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6412)
4. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6413)
5. Remove the left outer trim panel assembly of the C-pillar.

a. Peel off the guide groove seal ① in the direction of the arrow.

NOTE

The guide channel weatherstrip does not need to be completely removed; simply peel back one side.

b. Unscrew the 3 mounting screws -arrow- of the left C-pillar outer trim panel assembly, and remove the left C-pillar outer trim panel assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m



1. Perform the installation procedure in reverse order, while noting the following.
   a. After installation, check that the window operates normally.

© 2026, All rights reserved

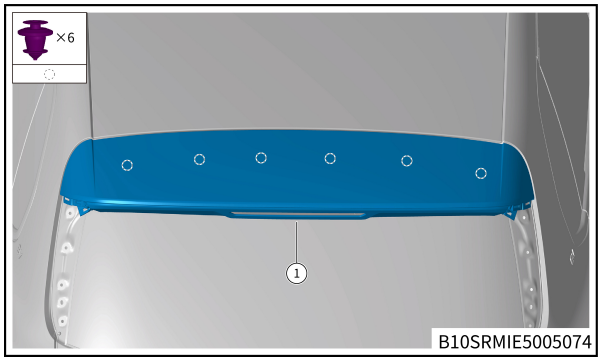
COWL GRILLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right hinge trim panel.
   See:Left hinge trim panel (page 5304)
4. Remove the left/right end covers of the ventilation window cover plate.
   See:Left end cover of ventilation window cover (page 5305)
5. Remove the driver/passenger wiper blade assembly.
   See:Main wiper arm blade assembly (page 9489)
6. Remove the rear seal of the front cover.
   See:Rear hood seal (page 6398)
7. Remove the cowl panel grille assembly.

a. Release the 4 retaining clips of the ventilation window cover assembly -arrow A-.
   Recommended tool: Clip remover
b. Unscrew the 2 mounting bolts -arrow B- of the ventilation window cover assembly, and remove the ventilation window cover assembly ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

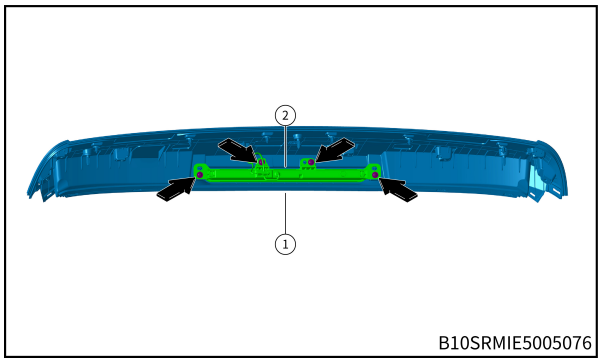
SPOILER ASSEMBLY

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the liftgate upper inner panel assembly.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the spoiler assembly.

a. Disconnect the connector between the high-mounted brake lamp and the liftgate wiring harness -arrow A-, and detach the grommet -arrow B-.
b. Unscrew the 8 fixing bolts of the spoiler assembly -arrow C-.
Recommended tool: 8mm socket
Torque: 6±1N m

c. Release the 6 waterproof clips of the spoiler assembly, and remove the spoiler and accessory assembly ①.
Recommended tool: Interior trim removal tool

d. Unscrew the 4 fixing screws -arrow- of the high-mounted brake lamp, and detach the spoiler assembly ① and the high-mounted brake lamp ②.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
e. Remove the spoiler assembly ②.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

LEFT SPOILER TRIM PANEL ASSEMBLY

NOTE

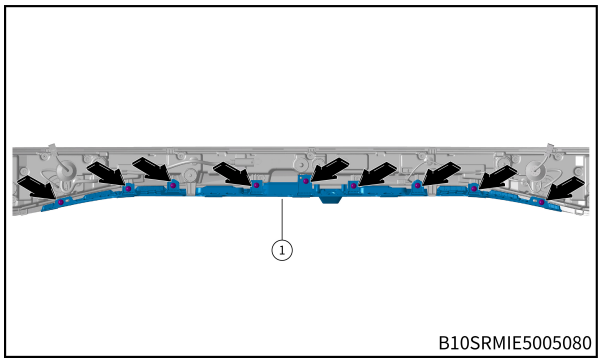
This section describes the removal and installation of the left spoiler trim panel assembly, and the removal and installation of the right spoiler trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the liftgate upper inner panel assembly.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the spoiler assembly.

a. Release the 7 retaining clips -arrow- of the left spoiler trim panel assembly, and remove the left spoiler trim panel assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

REAR FULL-WIDTH LAMP LOWER TRIM PANEL

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the liftgate upper inner panel assembly.
   See:Liftgate upper interior trim panel assembly (page 5377)
3. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
4. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5375)
5. After removal, route through the left/right trim panel.
   See:Rear full-width light left trim panel (page 9444)
6. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9457)
7. Remove the liftgate microswitch.
   See:Liftgate micro switch (page 8630)
8. Remove the license plate lamp.
   See:License plate light (page 9454)
9. Remove the lower trim panel of the rear full-width lamp.

a. Unscrew the 9 mounting screws -arrow- connecting the lower trim panel of the rear full-width lamp to the rear full-width combination lamp, and remove the lower trim panel of the rear full-width lamp ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. The installation procedure is performed in reverse order.

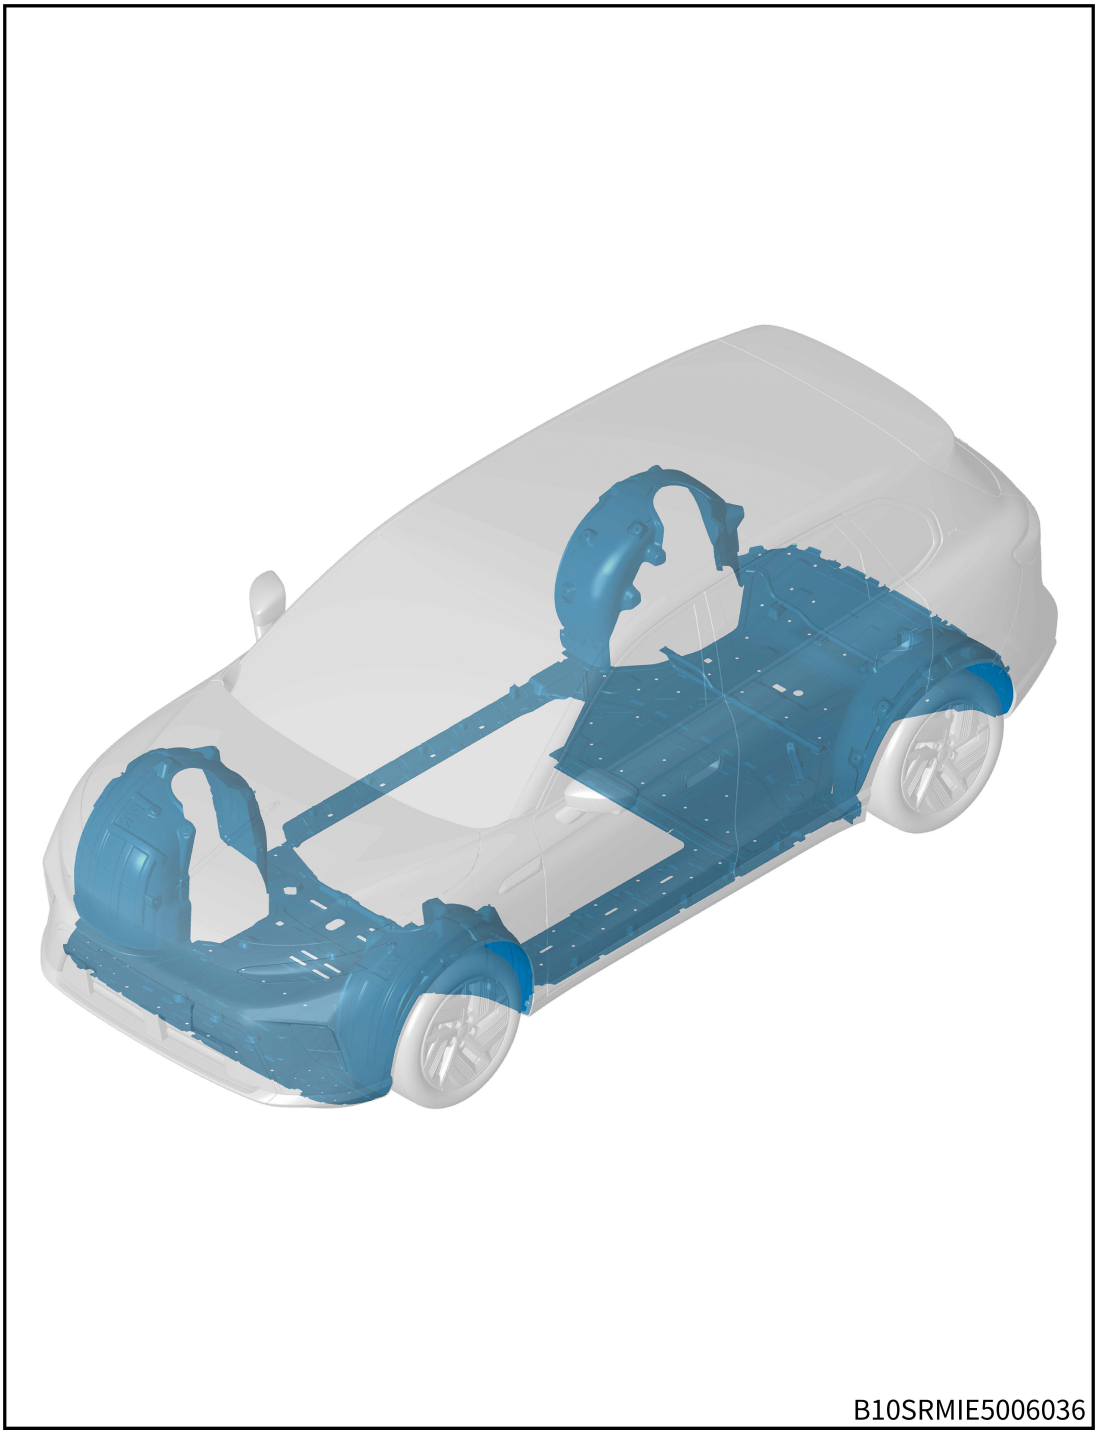
7.6 TRIM PANELS AND PROTECTION PANELS SYSTEM

7.6.1 PRECAUTIONS



PRECAUTIONS

1. When removing the underbody cover, a transmission jack must be used to support the underbody cover, or two technicians must work together to remove and install it, to prevent the underbody cover from falling suddenly and causing injury.
2. After removing the wheelhouse liner, check the fixing clips for damage and replace them if necessary.
3. When removing the wheel arch liner, a professional removal wedge must be used to avoid damaging the liner surface with other tools.

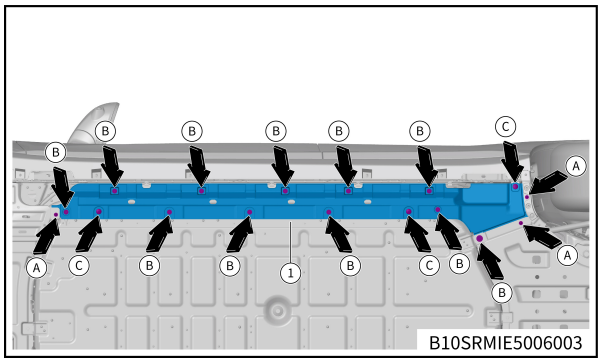
7.6.6 SERVICE AND REPAIR GUIDANCE



LEFT LOWER UNDERCOVER ASSEMBLY

NOTE

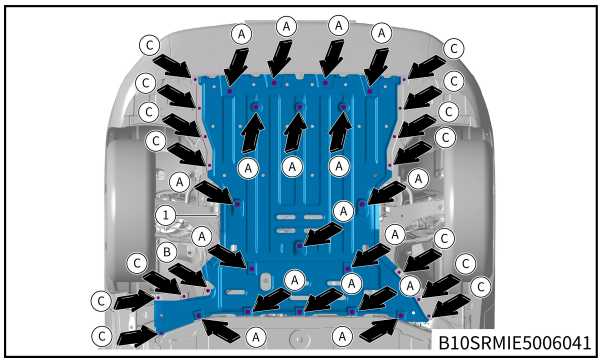
This section describes the removal and installation of the left lower splash shield assembly, and the removal and installation of the right lower splash shield assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the left lower cover assembly.

a. Unscrew the 3 retaining screws of the left lower trim panel assembly -arrow A-.
Recommended tool: 10mm socket
Torque: 5±1N m
b. Unscrew the 11 retaining bolts of the left lower cover assembly -arrow B-, and disengage the 3 retaining clips of the left lower cover assembly -arrow C-.
Recommended tools: Phillips screwdriver, trim clip remover
Torque: 2±0.2N m
c. Remove the left lower cover assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

FRONT COMPARTMENT LOWER SHIELD ASSEMBLY

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the front compartment bottom shield assembly.

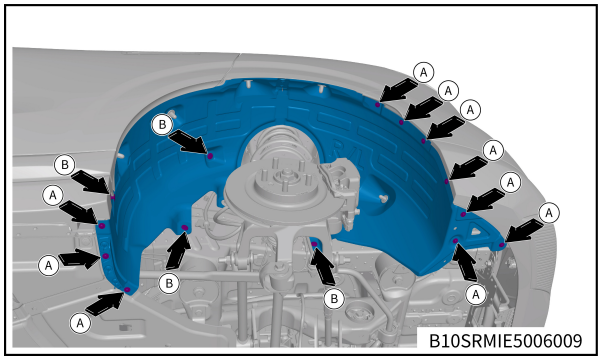
a. Unscrew the 18 fixing bolts of the front compartment lower cover assembly -Arrow A-, -Arrow B-.
Recommended tool: 10mm socket
Torque at arrow A: 5±1N m
Arrow B torque: 5±1N m

b. Unscrew the 15 fixing screws -Arrow C- of the front compartment lower cover assembly, and remove the front compartment lower cover assembly ①.
Recommended tool: Phillips screwdriver
Torque: 2±0.5N m

SETUP

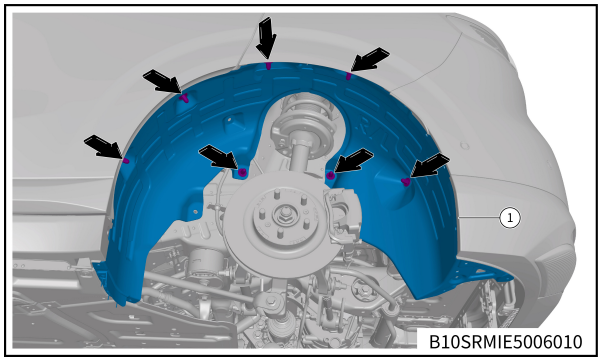
1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved



LEFT REAR WHEELHOUSE TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the left rear wheelhouse liner assembly, and the removal and installation of the right rear wheelhouse liner assembly can generally be performed by referring to the left side.

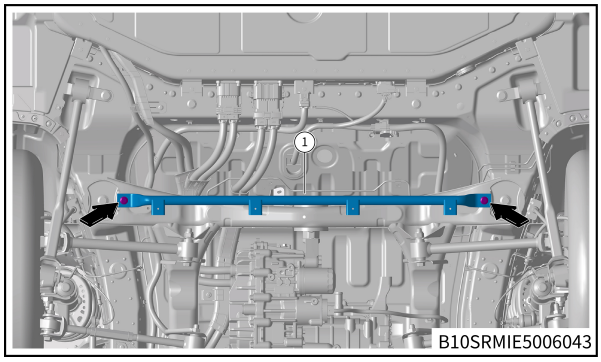
REMOVAL PROCEDURE

1. Remove the rear left wheel assembly.
   See:Wheel Assembly (page 2962)
2. Remove the left rear wheelhouse liner assembly.

a. Unscrew the 10 fixing screws of the left rear wheelhouse liner assembly -arrow A-, and disengage the 4 fixing clips of the left rear wheelhouse liner assembly -arrow B-.
Recommended tools: Phillips screwdriver, trim clip remover
Torque: 2±0.5N m

b. Unscrew the 7 plastic nuts -arrow- of the left rear wheelhouse liner assembly, and remove the left rear wheelhouse liner assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

REAR UNDERBODY SHIELD BRACKET ASSEMBLY 1

REMOVAL PROCEDURE

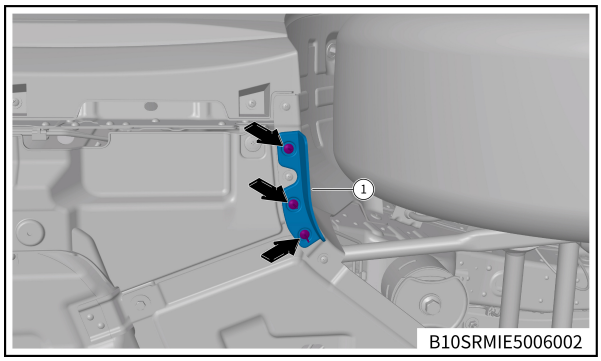
1. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
2. Remove the rear underbody shield bracket assembly 1.

a. Unscrew the 2 fixing bolts -arrow- of the rear underbody protector bracket assembly 1, and remove the rear underbody protector bracket assembly 1 ①.
Recommended tool: 13mm socket
Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



REAR LEFT WHEEL SPOILER

NOTE

This section describes the removal and installation of the left rear wheel spoiler, and the removal and installation of the right rear wheel spoiler can generally follow the procedure for the left side.

REMOVAL PROCEDURE

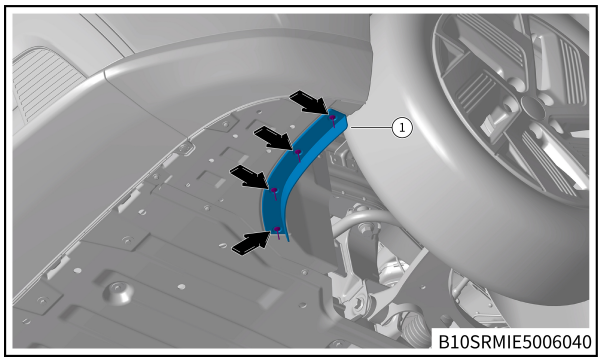
1. Lift the vehicle.
2. Remove the left rear wheel spoiler.

a. Use a tool to detach the 3 retaining rivets -arrow- of the left rear wheel spoiler, and remove the left rear wheel spoiler ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT WHEEL SPOILER

NOTE

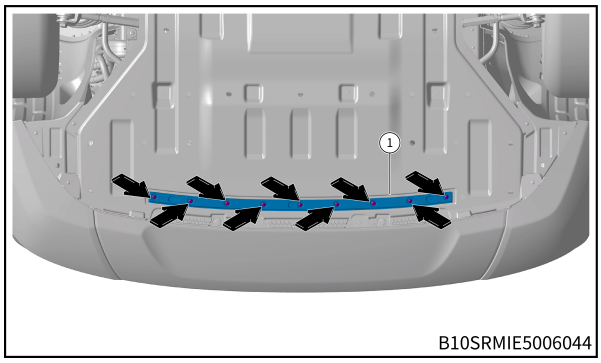
This section describes the removal and installation of the left front wheel spoiler, and the removal and installation of the right front wheel spoiler can generally refer to that of the left side.

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the front left wheel spoiler.

a. Use a tool to remove the 4 retaining rivets - arrow - of the left front wheel spoiler, and remove the left front wheel spoiler ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

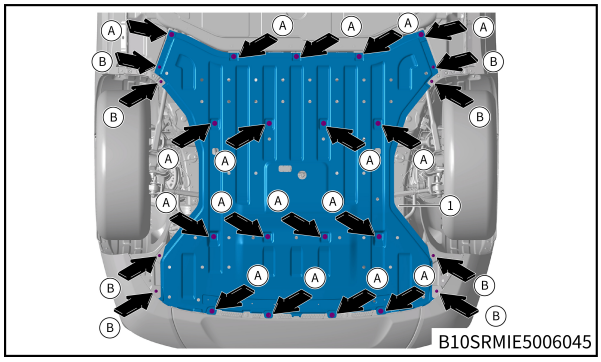
REAR UNDERBODY SPOILER 1

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the rear underbody cover spoiler 1.

a. Use a tool to remove the 9 fixing rivets -arrow- of the rear underbody spoiler 1, and remove the rear underbody spoiler 1 ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

REAR COMPARTMENT UNDER COVER ASSEMBLY

REMOVAL PROCEDURE

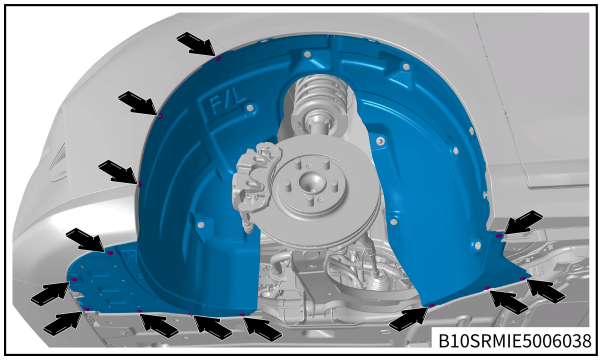
1. Lift the vehicle.
2. Remove the rear underbody cover spoiler 1.
   See:Rear underbody spoiler 1 (page)
3. Remove the rear compartment lower cover assembly.

a. Unscrew the 17 fixing bolts of the rear compartment bottom protective panel assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Unscrew the 8 fixing screws - Arrow B - of the rear compartment bottom cover assembly, and remove the rear compartment bottom cover assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m

SETUP

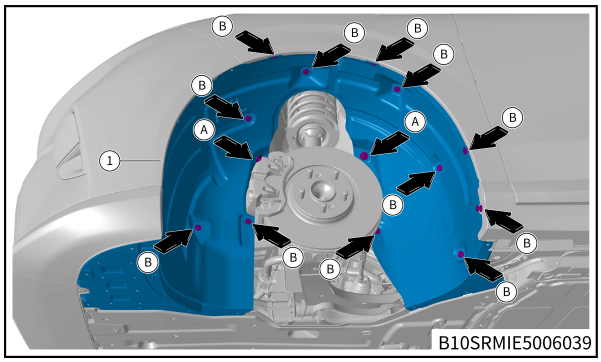
1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved



FRONT LEFT WHEEL ARCH LINER ASSEMBLY

NOTE



This section describes the removal and installation of the left front wheelhouse liner assembly, and the removal and installation of the right front wheelhouse liner assembly can generally refer to the left side.

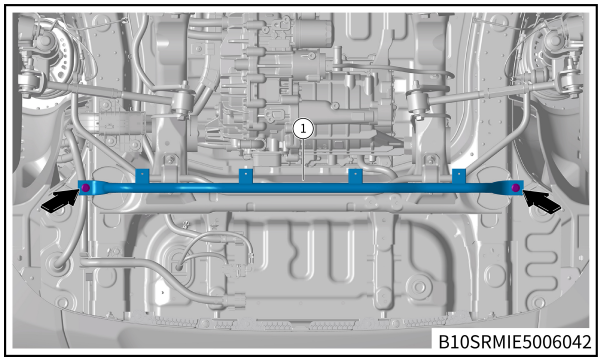
REMOVAL PROCEDURE

1. Remove the front left wheel assembly.
   See:Wheel Assembly (page 2962)
2. Remove the front left wheel arch liner assembly.

a. Unscrew the 13 fixing screws of the left front wheelhouse liner assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 2±0.5N m

b. Unscrew the 2 plastic nuts -arrow A- of the left front wheelhouse liner assembly, and disengage the 12 retaining clips -arrow B- of the left front wheelhouse liner assembly.
Recommended tool: Clip remover
c. Remove the left front wheelhouse liner assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws and bolts should be stored in a box to prevent loss.

© 2026, All rights reserved

REAR UNDERBODY SHIELD BRACKET ASSEMBLY 2

REMOVAL PROCEDURE

1. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
2. Remove rear underbody shield bracket assembly 2.

a. Unscrew the 2 fixing bolts -arrow- of the rear underbody protector bracket assembly 2, and remove the rear underbody protector bracket assembly 2 ①.
Recommended tool: 13mm socket
Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

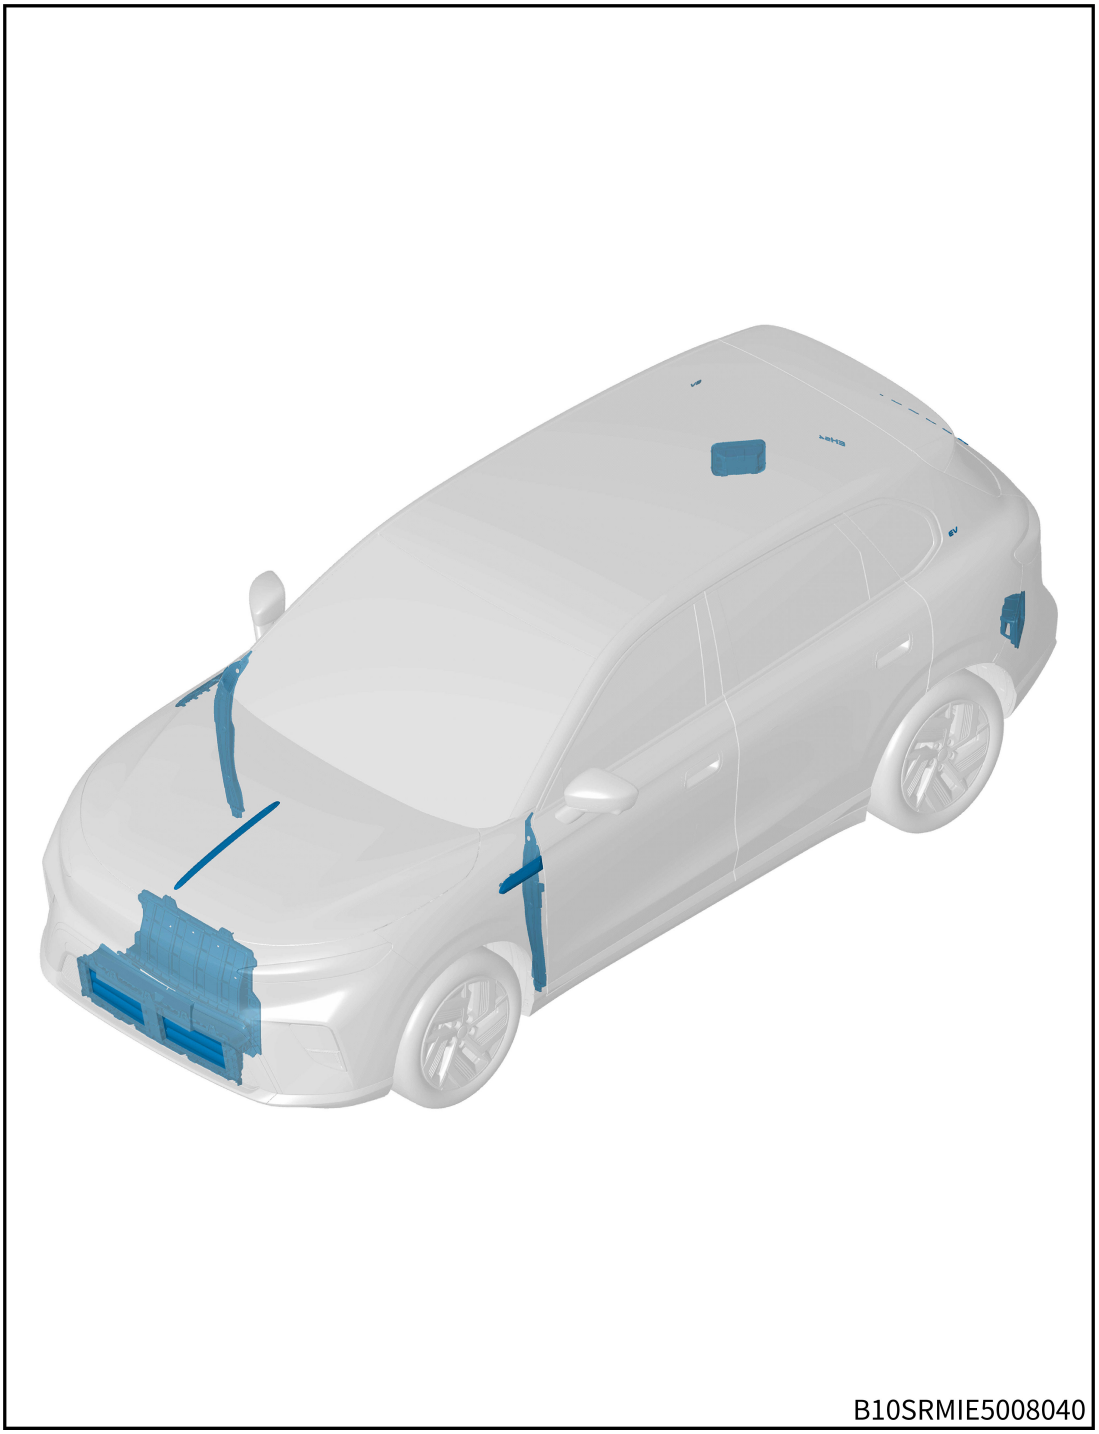
7.7 EMBLEM AND EXTERIOR ACCESSORY SYSTEM

7.7.1 PRECAUTIONS

PRECAUTIONS



1. When removing exterior accessories, handle with care to avoid damaging the retaining tabs of the trim.
2. When removing, use an interior trim pry tool to assist, do not pry with metal tools, to avoid damaging the trim panel.
3. When disconnecting the wiring harness connectors, take care not to damage the connectors or other components.
4. Exercise caution when removing and installing the front and rear badges to avoid scratching the paint surface.

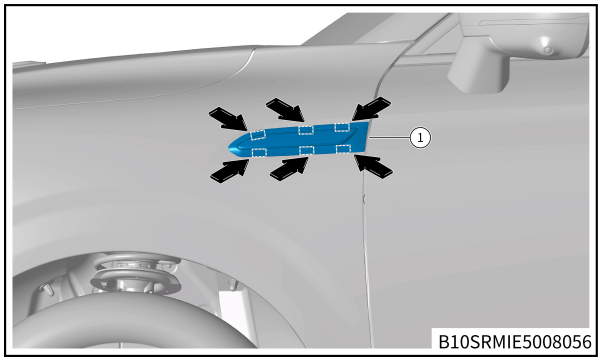
7.7.6 SERVICE AND REPAIR GUIDANCE



LEFT BLIND SPOT CAMERA TRIM PANEL ASSEMBLY

NOTE

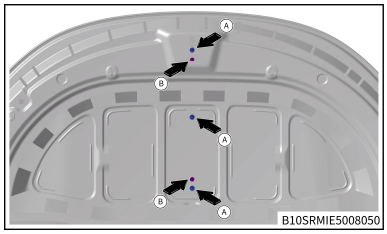
This section describes the removal and installation of the left blind spot camera trim panel assembly. The removal and installation of the right blind spot camera trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left blind spot camera trim panel assembly.

a. Release the 6 retaining clips of the left blind spot camera trim assembly, and remove the left blind spot camera trim assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT BADGE

REMOVAL PROCEDURE

1. Remove the front hood insulation pad.
   See:Front hood insulation pad (page 5569)
2. Remove the front badge.

a. Unscrew the 3 retaining nuts -Arrow A- securing the front emblem to the hood, and disengage the 2 retaining clips -Arrow B- of the front emblem.
Recommended tools: 10mm socket, interior trim removal tool
Torque: 5±1N m

b. Remove the front badge ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the front badge with the corresponding position, attach it, and press it down firmly.

© 2026, All rights reserved

RIGHT REAR LETTER EMBLEM

REMOVAL PROCEDURE

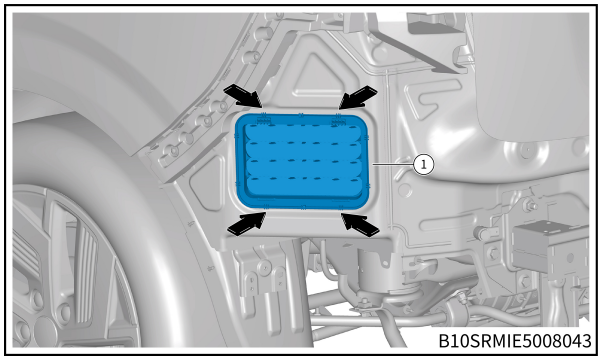
1. Remove the right rear emblem.

   a. Release the fixing adhesive securing the right rear emblem to the liftgate assembly, and remove the right rear emblem ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the right rear emblem with the corresponding position, apply it, and press it down firmly.

© 2026, All rights reserved



SIDE PANEL VENT FRAME

NOTE

This section describes the removal and installation of the left side panel ventilation grille. The removal and installation of the right side panel ventilation grille can generally be performed by referring to the left side.

REMOVAL PROCEDURE

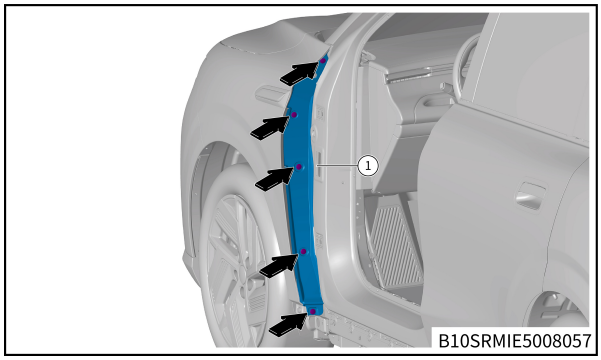
1. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
2. Remove the side panel ventilation frame.

a. Release the 4 retaining clips of the side panel ventilation grille -arrow-, and remove the side panel ventilation grille ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT FENDER LINER ASSEMBLY

NOTE

This section describes the removal and installation of the left fender liner assembly, and the removal and installation of the right fender liner assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the left side skirt panel assembly.
   See:Left side skirt assembly (page 5295)
3. Remove the left fender liner assembly.

a. Release the 5 retaining clips -arrows- of the left fender liner assembly, and remove the left fender liner assembly ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clips or retaining clips are damaged, they must be replaced with new double-sided clips or retaining clips.

© 2026, All rights reserved

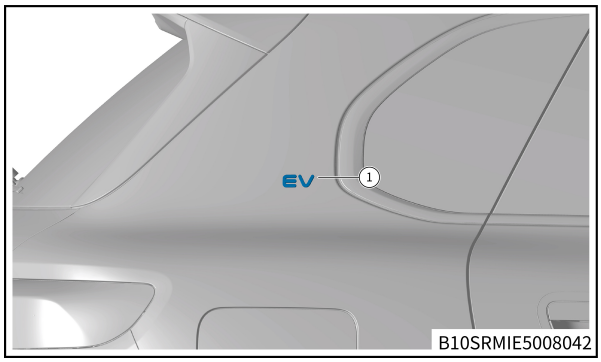
CENTER AND REAR EMBLEMS

REMOVAL PROCEDURE

1. Remove the center and rear letter emblems.

a. Release the fixing adhesive between the center and rear badges and the liftgate assembly, and remove the center and rear badges ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the center and rear emblems with the corresponding positions and attach them, then press down firmly until fully adhered.

© 2026, All rights reserved

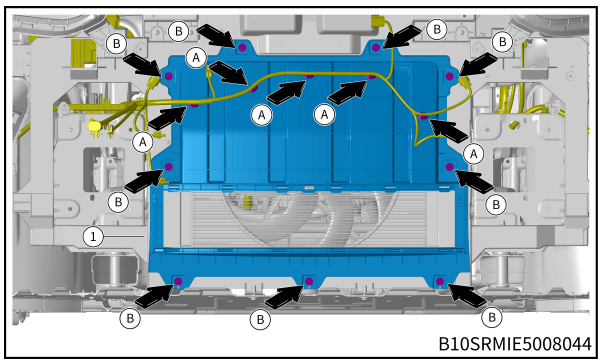
EV BADGE

REMOVAL PROCEDURE

1. Remove the EV badge.

a. Detach the adhesive securing the EV badge to the left side outer panel, and remove the EV badge ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Wipe the bonding area with alcohol and wipe it dry with a non-woven cloth.
   b. Align the center and rear emblems with the corresponding positions and attach them, then press down firmly until fully adhered.

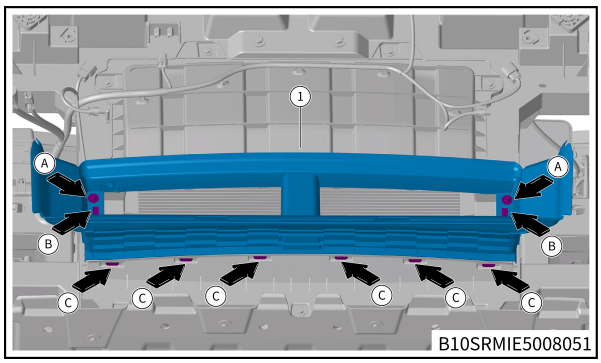
AIR GUIDE COVER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the hood latch mounting bracket.
   See:Hood latch mounting bracket (page 6360)
5. Remove the front bumper reinforcement assembly.
   See:Front bumper beam assembly (page 6344)
6. Remove the ambient temperature sensor assembly.
   See:Outdoor temperature sensor assembly (page 5166)
7. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5344)
8. Remove the air guide cover.

a. Disconnect the 5 retaining clips of the engine compartment wiring harness - Arrow A -.
Recommended tool: Clip remover
b. Unscrew the 9 fixing bolts of the air guide cover -arrow B-, and remove the air guide cover ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

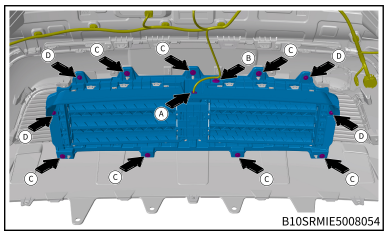
HOUSING

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5344)
5. Remove the ambient temperature sensor assembly.
   See:Outdoor temperature sensor assembly (page 5166)
6. Remove the cover.

a. Unscrew the 2 fixing screws connecting the cover and the air guide cover -Arrow A-, and disengage the 2 fixing clips connecting the cover and the air guide cover -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Release the 6 retaining clips connecting the cover to the air guide cover -Arrow C-, and remove the cover ①.
   Recommended tool: Clip remover

SETUP

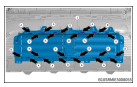


1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

ACTIVE GRILLE SHUTTER ASSEMBLY

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page)
4. Remove the active grille assembly.

a. Disconnect 1 connector -arrow A- between the front bumper wiring harness and the active grille shutter assembly, and release 1 retaining clip -arrow B- of the front bumper wiring harness.
Recommended tool: Clip remover

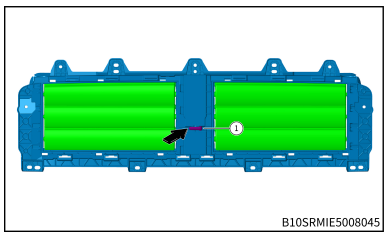
b. Unscrew the 7 fixing bolts connecting the active grille shutter assembly to the front bumper assembly - Arrow C -.
Recommended tool: 10mm socket
Torque: 5±1N m

c. Unscrew the 4 mounting screws connecting the active grille shutter assembly to the front bumper assembly - arrow D -.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

d. Release the 22 retaining clips -Arrow A-, -Arrow B- between the active grille shutter assembly and the lower front bumper grille.
Recommended tool: Clip remover

e. Remove the active grille assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. Tighten the fixing bolt to the specified torque.

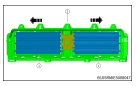
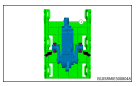
ACTUATOR MOTOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page)
4. Remove the active grille assembly.
   See:Active Grille Shutter Assembly (page 5344)
5. Remove the cover.
   See:Housing (page 5343)
6. Remove the actuator motor.



a. Remove the motor retaining pin ①-arrow-.



d. Unscrew the 8 fixing screws -arrow- securing the left/ right pressure rod to the active grille shutter housing and the front bumper assembly, and remove the left/ right pressure rod ①.
Recommended tool: Phillips screwdriver

© 2026, All rights reserved

Torque: 1.5±0.4N m

d. Remove the left/ right driven vane ① in the direction of the arrow, and remove the active grille shutter housing ②.

d. Release the 2 retaining clips -arrow- between the actuator motor and the linkage, and remove the motor ①.

SETUP

1. The installation procedure is performed in reverse order.

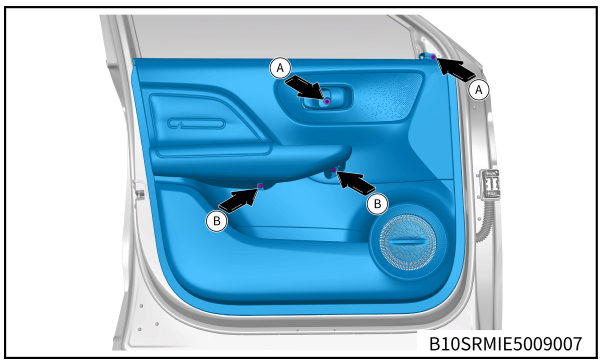
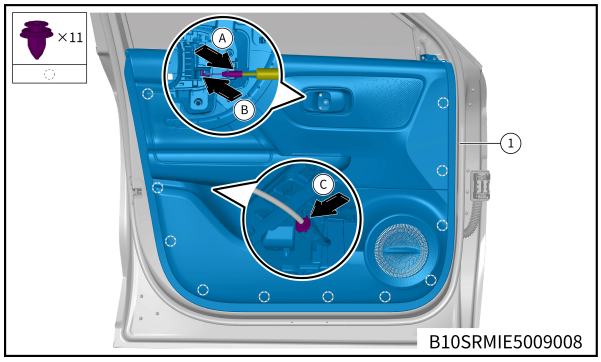
7.8.6 SERVICE AND REPAIR GUIDANCE



FRONT LEFT DOOR TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the front left door trim panel assembly, and the removal and installation of the front right door trim panel assembly can generally follow the same procedures as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door switch panel assembly.
   See:Front left door switch panel assembly (page 5356)
4. Remove the front left door pull cup cover.
   See:Front left door inner handle recess cover (page 5355)
5. Remove the left front door inner triangular trim panel assembly.
   See:Front left door inner sail panel assembly (page 5354)
6. Remove the front left door interior trim panel assembly.

a. Unscrew the 2 fixing screws -arrow- of the front left door trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.8±0.5N m

b. Release the 11 retaining clips of the front left door trim panel assembly.
Recommended tool: Interior trim removal tool
c. Disconnect the connection between the front left inner door handle cable and the inner door handle -Arrow A-, -Arrow B-.
d. Disconnect the 1 connector - arrow C - between the left front door wiring harness and the left front door trim panel wiring harness, and remove the left front door interior trim panel assembly ①.

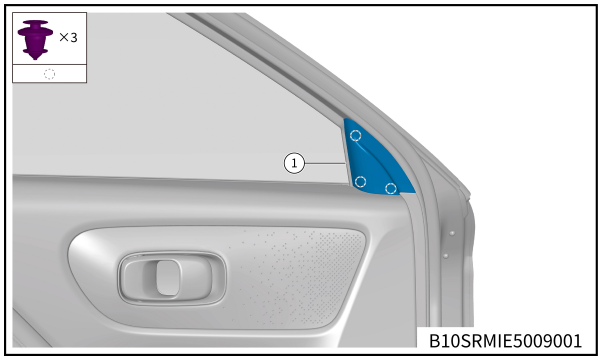
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



FRONT LEFT DOOR INNER SAIL PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left front door inner triangular panel assembly. The removal and installation of the right front door inner triangular panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Open the front left door.
2. Remove the left front door inner triangular trim panel assembly.

a. Disengage the 3 retaining clips of the left front door inner triangular trim panel assembly, and remove the left front door inner triangular trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

FRONT LEFT DOOR INNER HANDLE RECESS COVER

NOTE

This section describes the removal and installation of the front left door handle box plug, and the removal and installation of the front right door handle box plug can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the front left door.
2. Remove the front left door pull cup cover.

a. Detach the left front door handle box cover at the arrow, and remove the left front door handle box cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

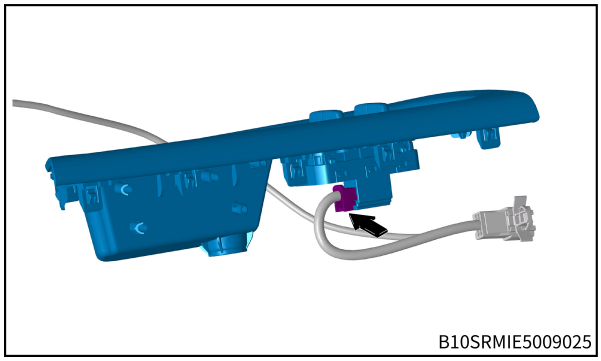
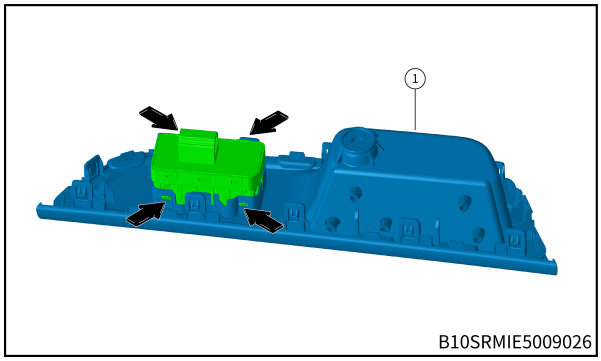
FRONT LEFT DOOR SWITCH PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the front left door switch panel assembly, and the removal and installation of the front right door switch panel assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door switch panel assembly.

a. Release the 11 retaining clips - arrow - of the front left door switch panel assembly, and remove the front left door switch panel with the driver's window control switch ①.
Recommended tool: Interior trim removal tool

b. Disconnect the 1 connector -arrow- of the driver's window control switch.

c. Release the 4 retaining clips -arrow- of the driver's power window control switch, and remove the front left door switch panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT FRONT DOOR HANDLE BOX SCREW RUBBER PAD

NOTE

This section describes the removal and installation of the rubber pad for the screw of the front left door handle box. The removal and installation of the rubber pad for the screw of the front right door handle box can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the front left door.
2. Remove the rubber pad of the screw on the front left door handle box.

a. Detach the left front door handle box screw rubber pad from the -arrow-, and remove the left front door handle box screw rubber pad ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

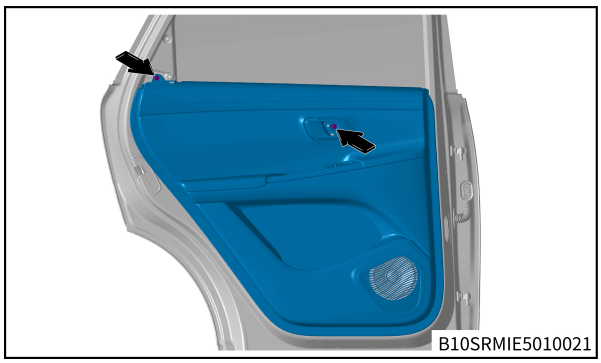
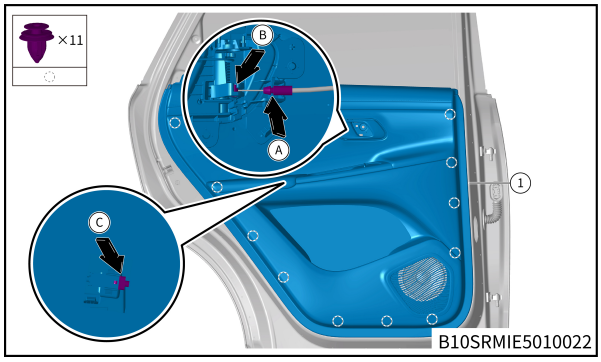
7.9.6 SERVICE AND REPAIR GUIDANCE



REAR LEFT DOOR TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the left rear door trim panel assembly, and the removal and installation of the right rear door trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door switch panel assembly.
   See:Rear left door switch panel assembly (page 5366)
4. Remove the rear left door handle recess plug.
   See:Rear left door handle box cover (page 5367)
5. Remove the inner triangular trim panel assembly of the left rear door.
   See:Left rear door inner quarter trim panel assembly (page 5365)
6. Remove the rear left door interior trim panel assembly.

a. Unscrew the 2 fixing screws -arrow- of the left rear door interior trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.8±0.5N m

b. Release the 11 retaining clips of the left rear door interior trim panel assembly.
Recommended tool: Interior trim removal tool
c. Disconnect the left rear inner door handle cable from the inner door handle -Arrow A-, -Arrow B-.
d. Disconnect the 1 connector between the left rear door wiring harness and the left rear door trim panel wiring harness - arrow C -, and remove the left rear door interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

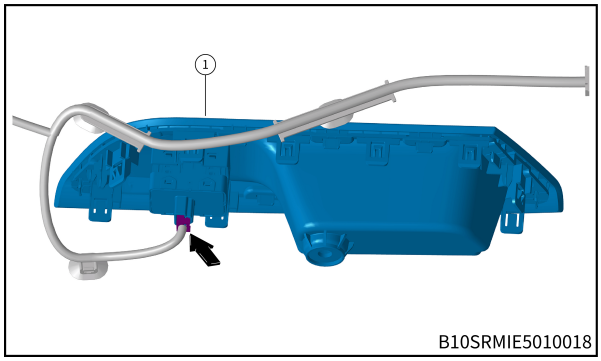
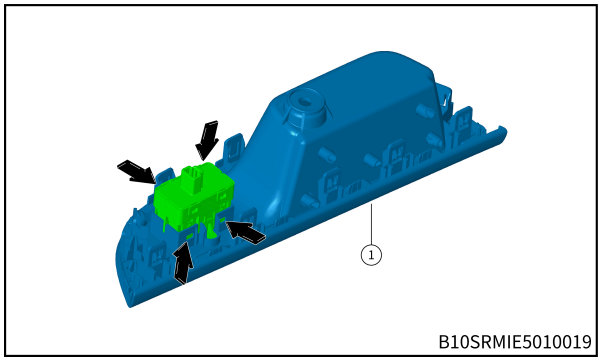
REAR LEFT DOOR SWITCH PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the rear left door switch panel assembly. The removal and installation of the rear right door switch panel assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door switch panel assembly.

a. Release the 11 retaining clips - arrow - of the rear left door switch panel assembly, and remove the rear left door switch panel with single door window switch assembly ①.
Recommended tool: Interior trim removal tool

b. Disconnect 1 connector of the single door window control switch -arrow-.

c. Release the 4 retaining clips -arrow- of the single door window control switch, and remove the left rear door switch panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

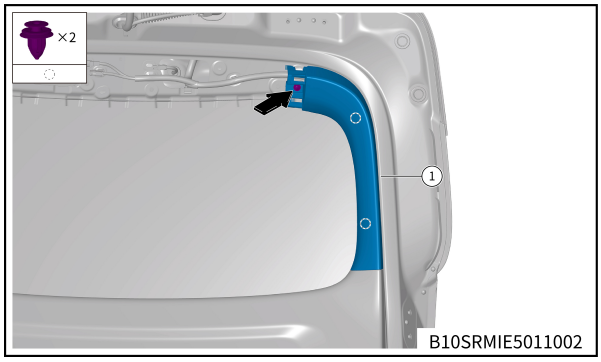
7.10.6 SERVICE AND REPAIR GUIDANCE



LEFT LIFTGATE INTERIOR TRIM PANEL ASSEMBLY

NOTE

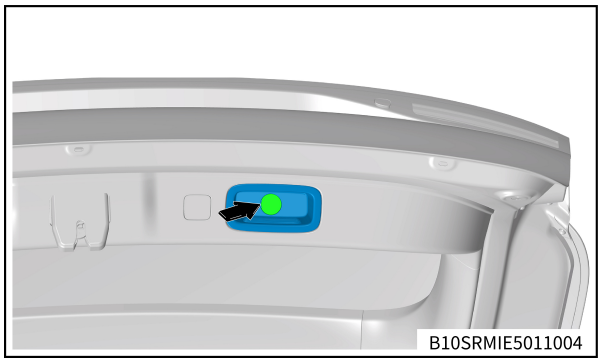
This section describes the removal and installation of the tailgate left interior trim panel assembly, and the removal and installation of the tailgate right interior trim panel assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
3. Remove the liftgate left interior trim panel assembly.

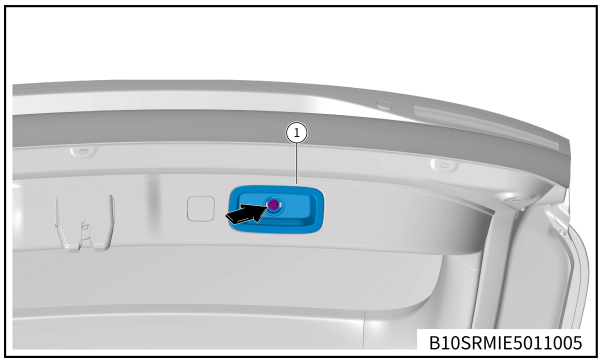
a. Unscrew 1 fixing screw -arrow- on the left interior trim panel assembly of the liftgate.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m
b. Release the 2 retaining clips of the liftgate left interior trim panel assembly, and remove the liftgate left interior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



TAILGATE HANDLE ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the liftgate handle assembly.

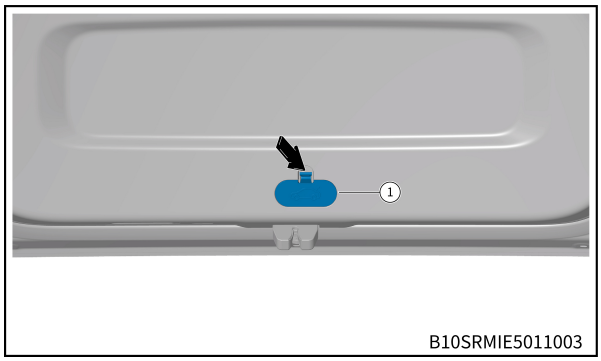
a. Release the 1 retaining clip of the glove box cover -arrow-.
Recommended tool: Flathead screwdriver

b. Unscrew 1 fixing bolt -arrow- of the liftgate handle assembly, and remove the liftgate handle assembly ①.
Recommended tool: 8mm socket
Torque: 3.5±1.5N • m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



ESCAPE COVER

NOTE

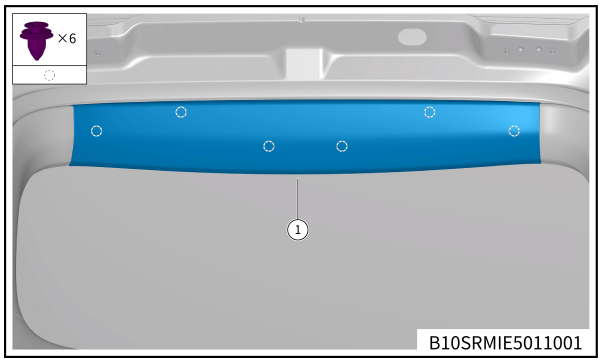
If the liftgate cannot be opened, fold down the second-row seatbacks, remove the escape cover from the inside, and release the liftgate latch.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the escape cover.

a. Release the 1 retaining clip of the escape cover -arrow-, and remove the escape cover ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

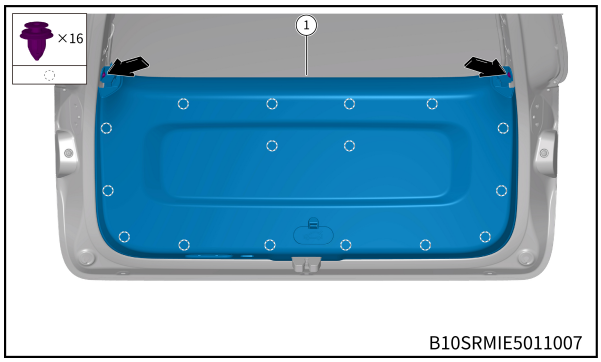
LIFTGATE UPPER INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the upper interior trim panel assembly of the liftgate.

a. Release the 6 retaining clips of the liftgate upper interior trim panel assembly, and remove the liftgate upper interior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

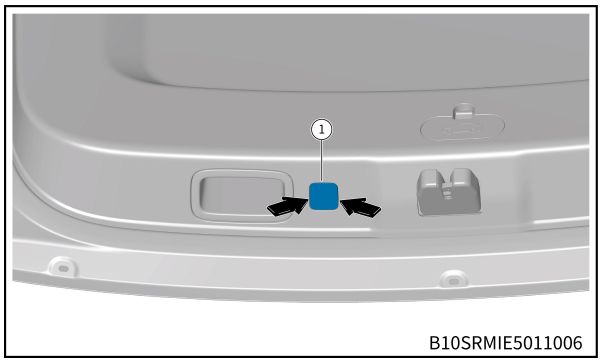
TAILGATE LOWER INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5375)
6. Remove the power liftgate switch.
   See:Power trunk lid switch (page 8634)
7. Remove the lower interior trim panel assembly of the liftgate.

a. Unscrew the 2 fixing screws of the liftgate upper interior trim panel assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m
b. Release the 16 retaining clips of the liftgate lower interior trim panel assembly, and remove the liftgate lower interior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

WINDOW REGULATOR SWITCH BLANKING CAP

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the power window switch cover.

a. Release the 2 retaining clips -arrow- of the window regulator switch blanking cover, and remove the window regulator switch blanking cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

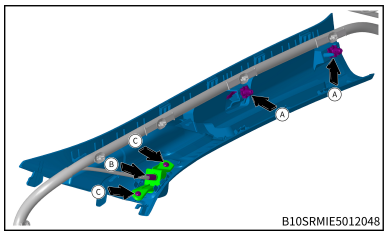
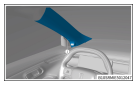
7.11.6 SERVICE AND REPAIR GUIDANCE



LEFT A-PILLAR UPPER INTERIOR TRIM PANEL ASSEMBLY

NOTE

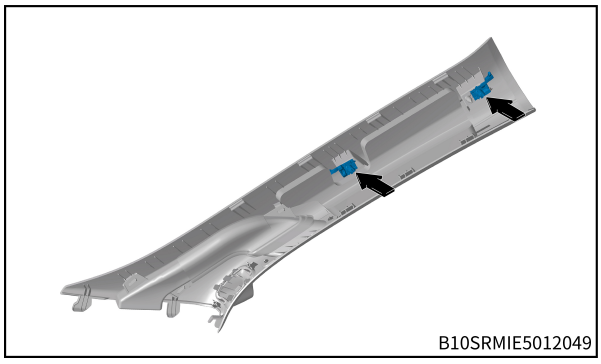
This section describes the removal and installation of the left A-pillar upper interior trim panel assembly, and the removal and installation of the right A-pillar upper interior trim panel assembly can generally refer to the left side.



REMOVAL PROCEDURE

1. Remove the left A-pillar upper interior trim panel assembly.

a. Release the 2 retaining clips of the left A-pillar upper interior trim panel assembly -arrow A-.
Recommended tool: Interior trim removal tool



b. Disconnect the 1 connector of the DMS camera assembly -arrow B-, and unscrew the 2 fixing screws of the DMS camera assembly -arrow C-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

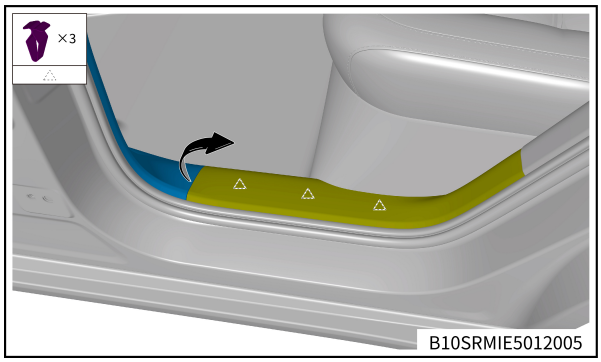
c. Remove the left A-pillar upper interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

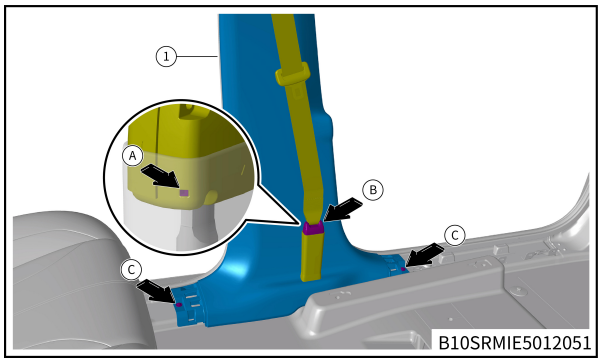
a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



LEFT B-PILLAR LOWER INTERIOR TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the left lower B-pillar interior trim panel assembly, and the removal and installation of the right lower B-pillar interior trim panel assembly can generally be performed by referring to the left side.

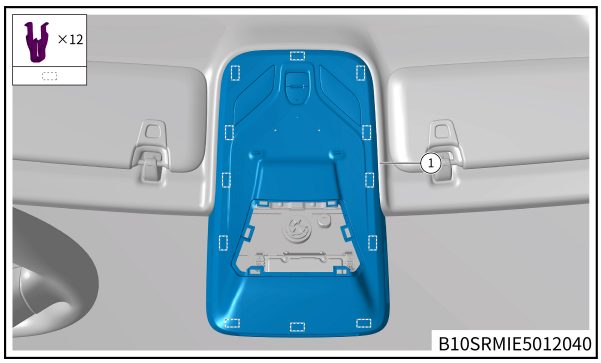
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the left B-pillar lower interior trim panel assembly.

a. Disengage the 3 retaining clips of the left rear door sill trim, and lift up the left rear door sill trim in the direction of the -arrow-.
Recommended tool: Interior trim removal tool

b. Adjust the front driver's seat to the foremost position.
c. Press the release buckle -arrow A- of the front left seat belt assembly to disconnect 1 fixing buckle -arrow B- of the front left seat belt assembly.
d. Unscrew the 2 retaining screws -arrow C- of the lower left B-pillar interior trim panel assembly.
Recommended tool: T25 Torx wrench
Torque: 2±0.2N m
e. Release the 6 retaining clips of the left lower B-pillar interior trim panel assembly, and remove the left lower B-pillar interior trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

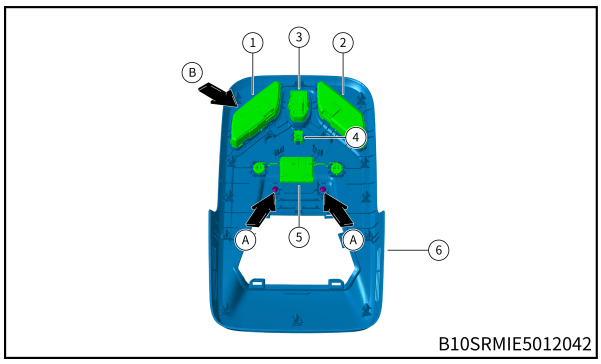
MONOCULAR UPPER COVER ASSEMBLY

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5390)
4. Remove the interior rearview mirror assembly.
   See:Interior rearview mirror assembly (page 5287)
5. Remove the blind cover.
   See:Plug cover (page 5391)
6. Remove the monocular upper cover assembly.

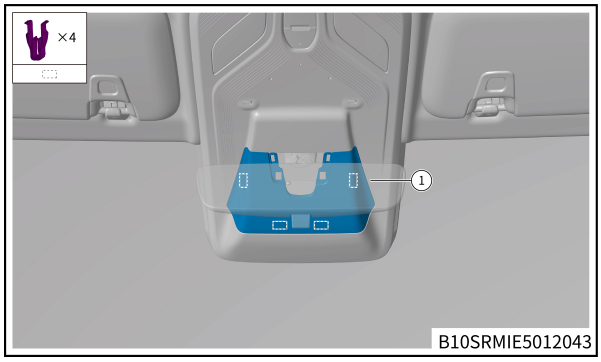
a. Release the 12 retaining clips of the mono upper cover assembly, and remove the mono upper cover assembly with accessory ①.
Recommended tool: Interior trim removal tool

b. Disconnect 1 connector of the front left dome lamp - arrow A -, and disconnect 1 connector of the front right dome lamp - arrow B -.
c. Disconnect 1 connector -Arrow C- from the overhead switch assembly, and disconnect 1 connector -Arrow D- from the single microphone assembly.

d. Unscrew the 2 fixing screws of the anti-theft alarm control unit -arrow A-.
Recommended tool: Phillips screwdriver
Torque: 1.2±0.2N m
e. Release the 16 retaining clips for the front left dome lamp ①, front right dome lamp ②, overhead switch assembly ③, single microphone assembly ④, and anti-theft alarm controller ⑤ - Arrow B.
Recommended tool: Interior trim removal tool
f. Remove the monocular upper cover assembly ⑥.

© 2026, All rights reserved

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

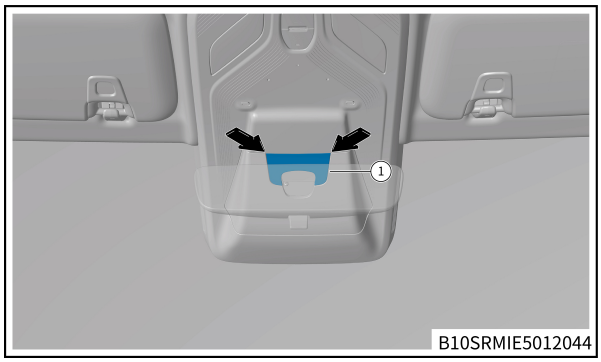
MONOCULAR LOWER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Remove the blind cover.
   See:Plug cover (page 5391)
2. Remove the monocular lower cover assembly.

a. Release the 4 retaining clips of the monocular lower cover assembly, and remove the monocular lower cover assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

PLUG COVER

REMOVAL PROCEDURE

1. Remove the blind cover.

a. Release the 2 retaining clips of the cover -arrow-, and remove the cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

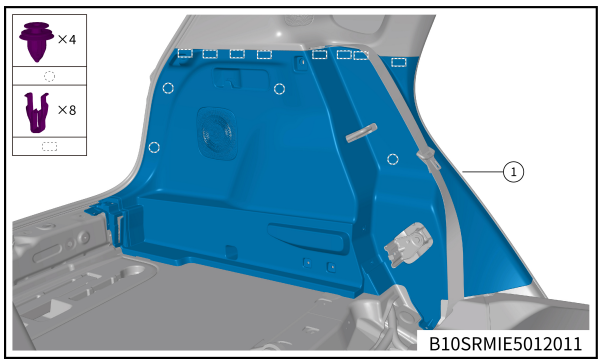
LEFT LOWER C-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the left C-pillar lower trim panel assembly, and the removal and installation of the right C-pillar lower trim panel assembly can generally refer to the left side.

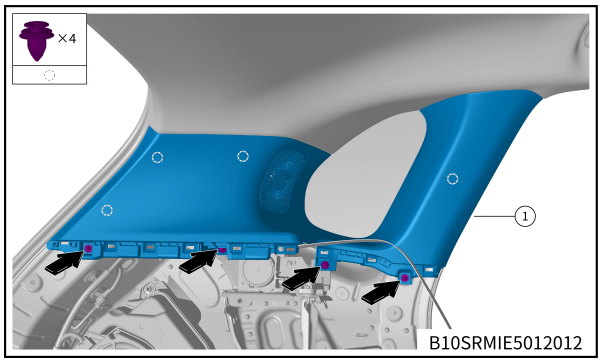
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
4. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
5. Remove the luggage compartment partition assembly.
   See:Trunk partition assembly (page 5399)
6. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5405)
7. Remove the left C-pillar lower interior trim panel assembly.

a. Unscrew the 3 fixing screws of the left C-pillar lower interior trim panel assembly -arrow A-.
   Recommended tool: T25 Torx wrench
   Torque: 2±0.2N m
b. Unscrew the 3 fixing bolts -arrow B- of the lower left C-pillar interior trim panel assembly.
   Recommended tool: 10mm socket
   Torque: 5±1N m

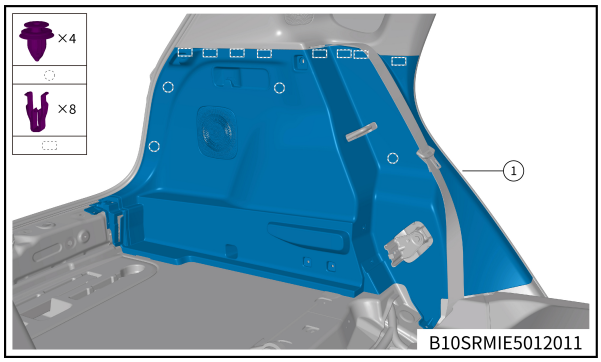
c. Release the 4 retaining clips on the lower left C-pillar interior trim panel assembly, and release the 8 double-sided clips on the lower left C-pillar interior trim panel assembly.
   Recommended tool: Interior trim removal tool
d. Remove the lower left C-pillar interior trim panel assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



LUGGAGE COMPARTMENT PARTITION

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page)
3. Remove the second-row seat assembly.
   See:Second row seat assembly (page)
4. Remove the trunk partition.

a. Unscrew the 4 fixing screws of the luggage compartment cover -arrow A-, and disengage the 2 fixing clips of the left luggage compartment cover -arrow B-.
Recommended tools: Phillips screwdriver, interior trim removal tool
Torque: 2±0.2N m

c. Unscrew the 4 retaining bolts for the luggage compartment cover -arrow-, and remove the luggage compartment cover ①.
Recommended tool: 10mm socket
Torque: 2±0.2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT UPPER C-PILLAR INTERIOR TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the left upper C-pillar interior trim panel assembly, and the removal and installation of the right upper C-pillar interior trim panel assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the left C-pillar upper interior trim panel assembly.

a. Unscrew the 4 fixing screws -arrow- of the left C-pillar upper interior trim panel assembly, and disengage the 4 fixing clips of the left C-pillar upper interior trim panel assembly.
   Recommended tools: T25 Torx wrench, interior trim removal tools
   Torque: 2±0.2N m
b. Remove the left C-pillar upper interior trim panel assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT C-PILLAR CENTER BRACKET

NOTE

This section describes the removal and installation of the left C-pillar center bracket, and the removal and installation of the right C-pillar center bracket can generally follow the procedure for the left side.

REMOVAL PROCEDURE

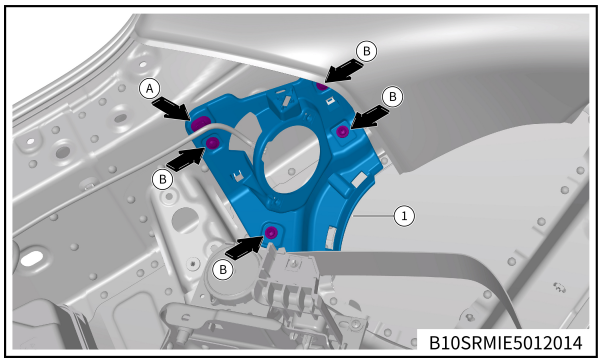
1. Remove the left C-pillar upper interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
2. Remove the left C-pillar middle bracket.

a. Unscrew the 2 fixing screws -arrow- of the left C-pillar middle bracket, and remove the left C-pillar middle bracket ①.
Recommended tool: T25 Torx wrench
Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT ROOF BRACKET

NOTE

This section describes the removal and installation of the left roof bracket, and the removal and installation of the right roof bracket can generally refer to the left side.

REMOVAL PROCEDURE

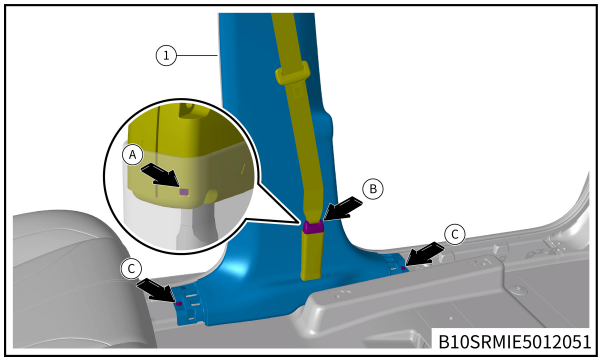
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
4. Remove the midrange speaker assembly (D-pillar).
   See:Midrange speaker assembly (D-pillar) (page 9473)
5. Remove the left roof bracket.

a. Unclip 1 retaining clip of the floor wiring harness - arrow A -, and unscrew the 4 fixing screws of the left roof bracket - arrow B -.
Recommended tools: T25 Torx wrench, trim clip remover
Torque: 2±0.2N m
b. Remove the left roof bracket ①.

SETUP

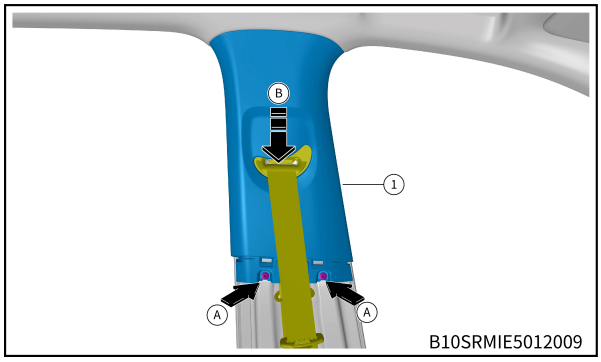
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT B-PILLAR UPPER INTERIOR TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the left B-pillar upper interior trim panel assembly, and the removal and installation of the right B-pillar upper interior trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
4. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
5. Remove the left B-pillar upper interior trim panel assembly.

a. Adjust the front driver's seat to the foremost position.
b. Press the release buckle -arrow A- of the front left seat belt assembly to disconnect 1 fixing buckle -arrow B- of the front left seat belt assembly.

c. Disengage the 2 retaining clips -arrow A- of the left B-pillar upper interior trim panel assembly, and remove the left B-pillar upper interior trim panel assembly ① in the direction of -arrow B-.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT A-PILLAR LOWER INTERIOR TRIM PANEL ASSEMBLY

NOTE

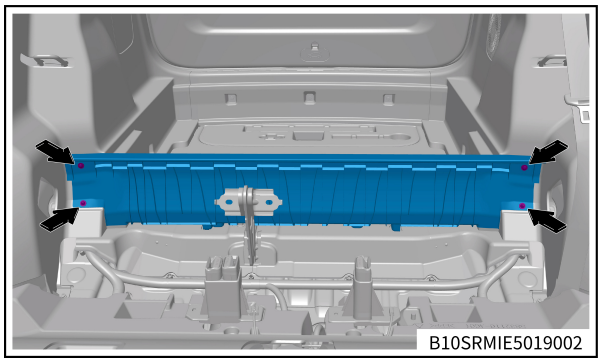
This section describes the removal and installation of the left lower A-pillar interior trim panel assembly, and the removal and installation of the right lower A-pillar interior trim panel assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the lower left A-pillar interior trim panel assembly.

a. Unscrew the 1 retaining screw -arrow- of the left lower A-pillar interior trim panel assembly, and disengage the 6 retaining clips of the left lower A-pillar interior trim panel assembly.
Recommended tools: T25 Torx wrench, interior trim removal tools
Torque: 2±0.2N m
b. Remove the left A-pillar lower interior trim panel assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

TRUNK PARTITION ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page)
2. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page)
3. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
4. Remove the luggage compartment partition assembly.

a. Unscrew the 4 fixing screws of the luggage compartment cover assembly -arrow-.
Recommended tool: T25 Torx wrench
Torque: 1.5±0.2N m

b. Unscrew the 4 fixing bolts -arrow- of the luggage compartment cover assembly, and remove the luggage compartment cover assembly ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

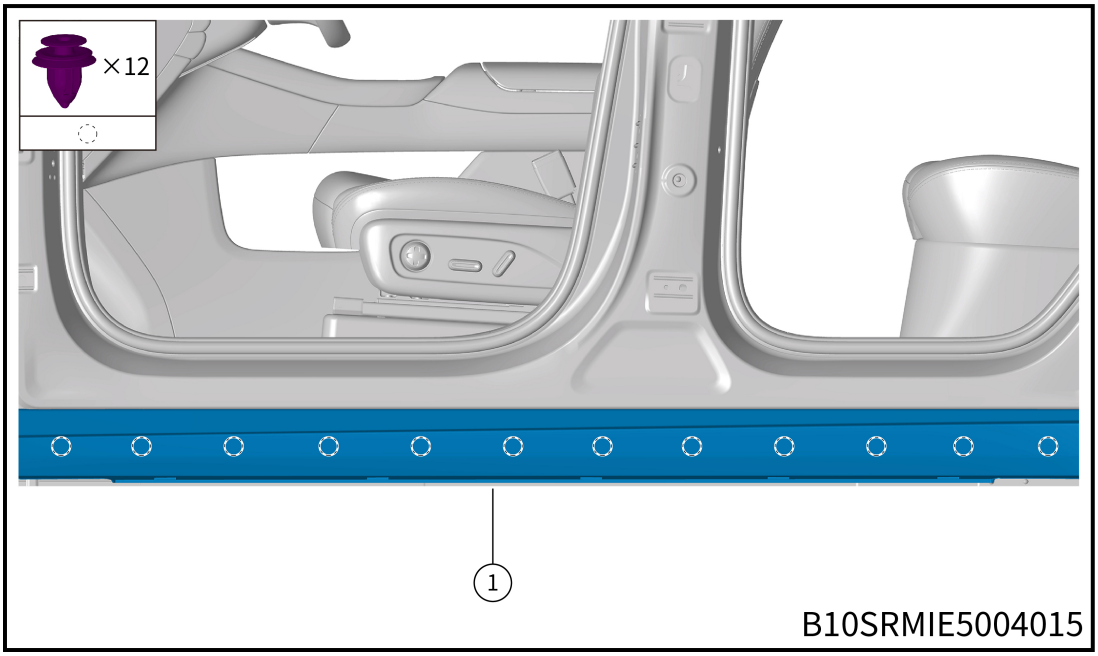
7.12 DOOR SILL INTERIOR TRIM SYSTEM

7.12.1 PRECAUTIONS



PRECAUTIONS

1. When removing the interior trim panel, a specialized removal wedge must be used to avoid damaging the trim surface with other tools.
2. After removing the interior trim panel, check whether the retaining clips on the inner trim panel are damaged, and replace them if necessary.

7.12.6 SERVICE AND REPAIR GUIDANCE

LIFTGATE SILL INTERIOR TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
2. Remove the liftgate sill trim panel assembly.

a. Unscrew the 3 fixing bolts of the liftgate sill interior trim panel assembly - arrow -.
Recommended tool: 10mm socket
Torque: 5±1N m
b. Release the 6 retaining clips of the liftgate sill trim assembly, and remove the liftgate sill trim assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

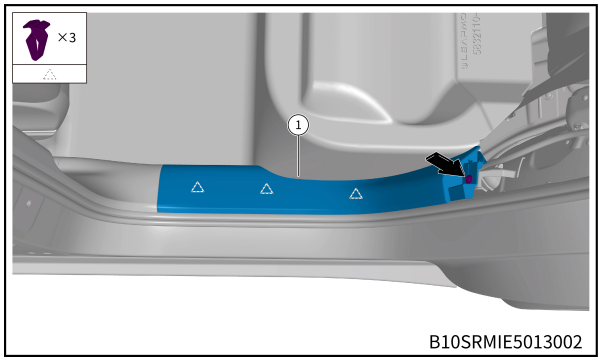
REAR LEFT SILL TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the rear left door sill trim panel assembly, and the removal and installation of the rear right door sill trim panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6327)
2. Remove the rear left sill interior trim panel assembly.

a. Disengage the 2 retaining clips of the lower left C-pillar trim panel assembly -Arrow A-, and pull off the lower left C-pillar trim panel assembly in the direction of -Arrow B-.
Recommended tool: Interior trim removal tool

b. Unscrew 1 retaining screw -arrow- of the left rear door sill trim panel assembly.
Recommended tool: T25 Torx wrench
Torque: 2±0.2N m

c. Disengage the 3 retaining clips of the left rear door sill trim panel assembly, and remove the left rear door sill trim panel assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

REAR LEFT SILL BRACKET

NOTE

This section describes the removal and installation of the rear left door sill bracket, and the removal and installation of the rear right door sill bracket can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6327)
4. Remove the rear seat cushion EPP assembly.
   See:Rear seat cushion EPP assembly (page 5546)
5. Remove the rear left sill interior trim panel assembly.
   See:Rear left sill trim panel assembly (page 5406)
6. Remove the rear left sill bracket.

a. Unclip the 3 retaining clips of the floor wiring harness -arrow A-, and unscrew the 1 plastic nut of the left rear sill bracket -arrow B-.
b. Unscrew the 2 mounting screws -arrow C- of the left rear rocker panel bracket, and remove the left rear rocker panel bracket ①.
Recommended tool: Phillips screwdriver
Torque: 2±0.2N m

SETUP

1. The installation procedure is performed in reverse order.

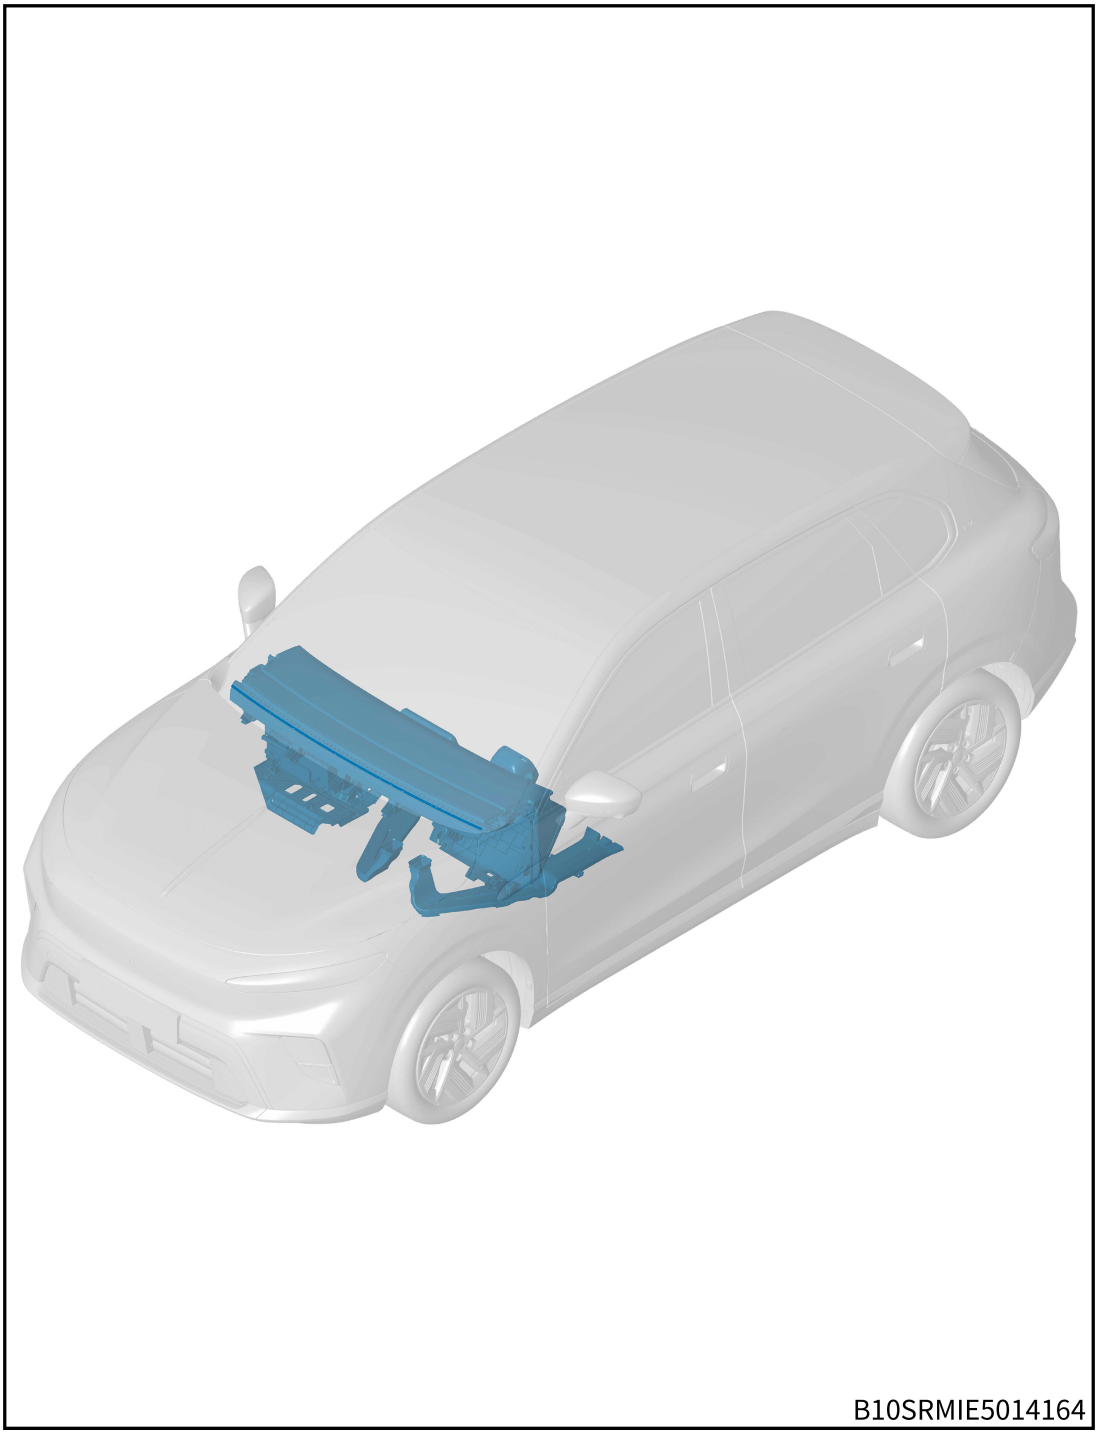
7.13 INSTRUMENT PANEL AND ACCESSORIES SYSTEM

7.13.1 PRECAUTIONS



PRECAUTIONS

1. When repairing the instrument panel, whether on the vehicle or on a workbench, a ground wire connected to the vehicle body should be attached to discharge static charges into the ground.
2. Storage of components: Spare components for the instrument panel are stored in nickel-plated packaging bags, and should be removed during installation, not in advance. When removing them, do not touch the conductive contacts.
3. After removing the instrument panel, cover it with a protective cover to prevent it from being scratched.
4. When repairing or removing the airbag, the airbag must always be placed facing upwards.
5. When replacing any airbag component, perform a self-diagnostic operation to thoroughly check whether the airbag system is functioning properly.
6. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

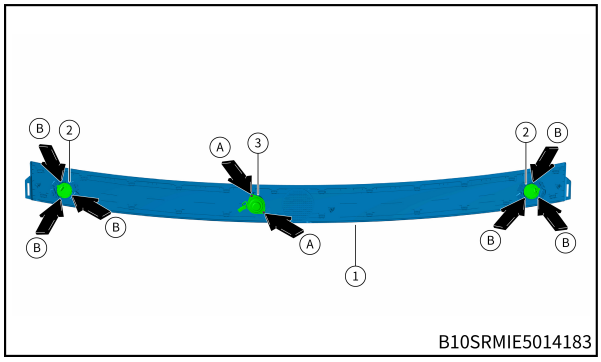
7.13.6 SERVICE AND REPAIR GUIDANCE



SPEAKER COVER ASSEMBLY

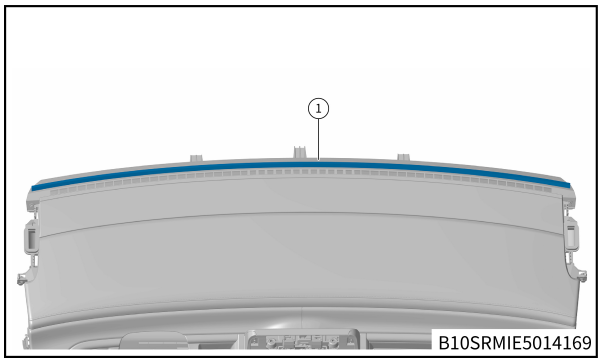
REMOVAL PROCEDURE

1. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
2. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
3. Remove the speaker cover assembly.

a. Release the 24 double-sided clips of the speaker cover assembly.
   Recommended tool: Interior trim removal tool
b. Disconnect the 3 fixing connectors -arrow- of the speaker cover assembly, and remove the speaker cover assembly with the speaker assembly ①.

c. Unscrew the 2 mounting screws connecting the speaker to the speaker cover assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Release the 6 clips -Arrow B- connecting the tweeter assembly to the speaker cover assembly.
   Recommended tool: Interior trim removal tool
e. Remove the speaker cover assembly ①, tweeter assembly ②, and speaker ③.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

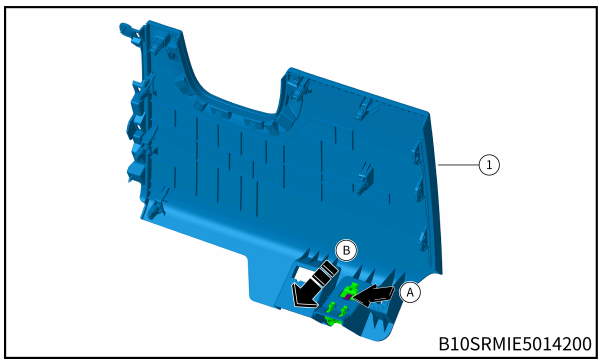
LOWER LEFT INSTRUMENT PANEL TRIM ASSEMBLY

REMOVAL PROCEDURE



1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
2. Remove the trunk lamp.
   See:Trunk light (page 9453)
3. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
5. Remove the left trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
6. Remove the instrument panel lower left trim panel assembly.

a. Unscrew 1 fixing bolt from the lower left trim panel assembly of the instrument panel -Arrow A-, and disconnect the front cover lock cable from the front cover handle assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Release the 2 retaining clips -arrow C- of the diagnostic tester connector, and pull the diagnostic tester connector away.

c. Unscrew the 5 retaining screws of the lower left instrument panel trim assembly -arrow-, and disengage the 7 retaining clips of the lower left instrument panel trim assembly.
   Recommended tools: Phillips screwdriver, interior trim removal tool
   Torque: 1.5±0.4N m
d. Remove the lower left instrument panel trim panel with the hood release handle assembly ①.

e. Press 1 retaining clip -Arrow A- of the hood release handle assembly, and detach the hood release handle assembly in the direction of -Arrow B-.
f. Remove the lower left instrument panel trim panel assembly ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

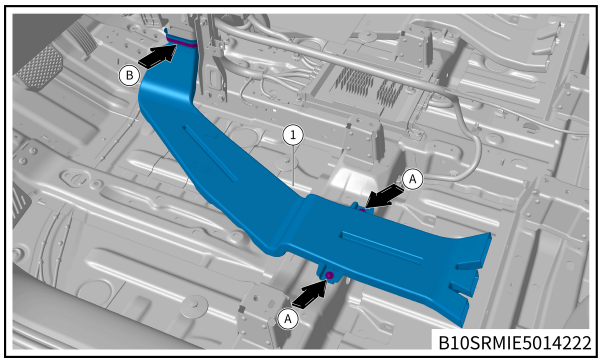
REAR LEFT FOOTWELL AIR DUCT

NOTE



This section describes the removal and installation of the left rear footwell air duct. The removal and installation of the right rear footwell air duct can generally be performed by referring to the left side.

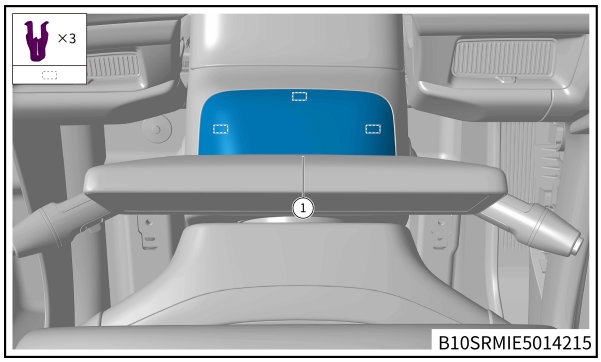
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
5. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
6. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
7. Remove the rear left footwell air duct.

a. Lift up the front left part of the driver's carpet ①.

b. Unscrew the 2 fixing screws of the left rear footwell air duct -arrow A-, and disconnect the left rear footwell air duct from the evaporator assembly -arrow B-.
Recommended tool: Phillips screwdriver
Torque: 2±0.5N m
c. Remove the rear left footwell air duct ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

INSTRUMENT PANEL CENTER AIR OUTLET PANEL ASSEMBLY

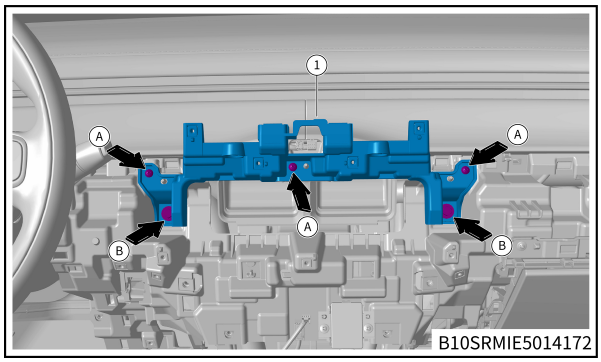
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
7. Remove the center display screen.
   See:Central control display (page 8534)
8. Remove the front storage box mat.
   See:Front storage box mat (page 5441)
9. Remove the instrument panel center air outlet panel assembly.

a. Disconnect the 1 fixing connector -arrow A- of the instrument panel center air outlet panel assembly.
b. Unscrew the 8 fixing screws of the instrument panel center air outlet panel assembly -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

b. Release the 14 double-sided clips of the instrument panel center air outlet panel assembly, and remove the instrument panel center air outlet panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

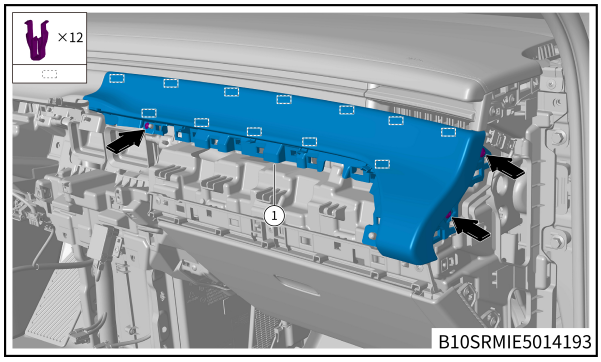
SCREEN MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
2. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
3. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page)
4. Remove the screen mounting bracket assembly.

a. Unscrew the 3 fixing screws of the display mounting bracket assembly - arrow A -.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
b. Unscrew the 2 fixing bolts -Arrow B- of the screen mounting bracket assembly, and remove the screen mounting bracket assembly ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP



1. The installation procedure is performed in reverse order.

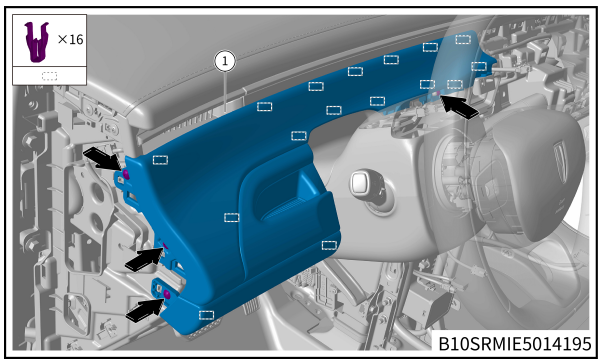
RIGHT INSTRUMENT PANEL TRIM COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page)
7. Remove the screen mounting bracket assembly.
   See:Screen mounting bracket assembly (page)
8. Remove the right side instrument panel trim cover assembly.

a. Unscrew the 3 fixing screws -arrow- of the left instrument panel trim cover assembly, and disengage the 12 double-sided clips of the left instrument panel trim cover assembly.
Recommended tools: Phillips screwdriver, interior trim removal tool
Torque: 1.5±0.4N m
b. Remove the instrument panel left trim cover assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

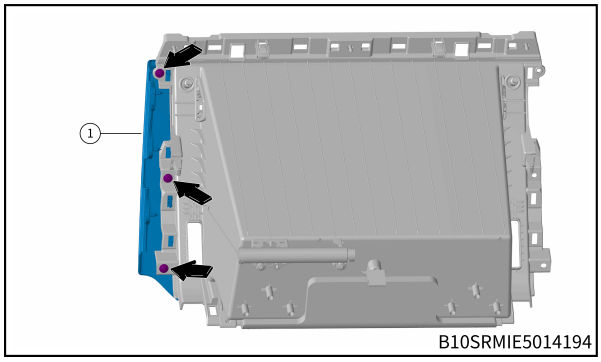
INSTRUMENT PANEL CENTER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
7. Remove the screen mounting bracket assembly.
   See:Screen mounting bracket assembly (page 5423)
8. Remove the trim panel assembly.

a. Unscrew the 4 fixing screws of the trim panel assembly -arrows-, and disengage the 16 double-sided clips of the trim panel assembly.
Recommended tools: Phillips screwdriver, interior trim removal tool
Torque: 1.5±0.4N m
b. Remove the trim panel assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

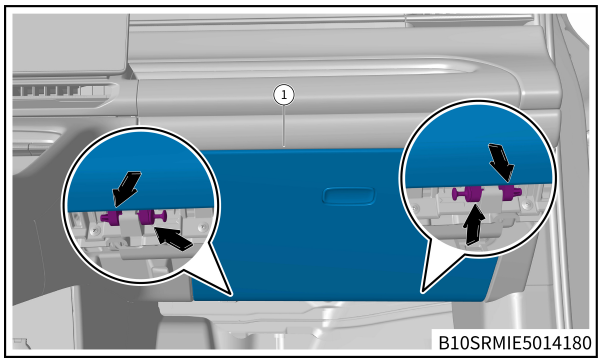
RIGHT INSTRUMENT PANEL TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
2. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
5. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
6. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
7. Remove the right side trim panel assembly of the instrument panel.
   See:Right instrument panel trim panel assembly (page 5426)
8. Remove the outer cover of the glove box.
   See:Glove box outer cover (page 5427)
9. Remove the glove box bin assembly.
   See:Glove box bin assembly (page 5428)
10. Remove the right side trim panel assembly of the instrument panel.

a. Unscrew the 3 retaining screws -arrow- of the right side instrument panel trim assembly, and remove the right side instrument panel trim assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

GLOVE BOX OUTER COVER

REMOVAL PROCEDURE

1. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
2. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
3. Remove the glove box cover assembly.

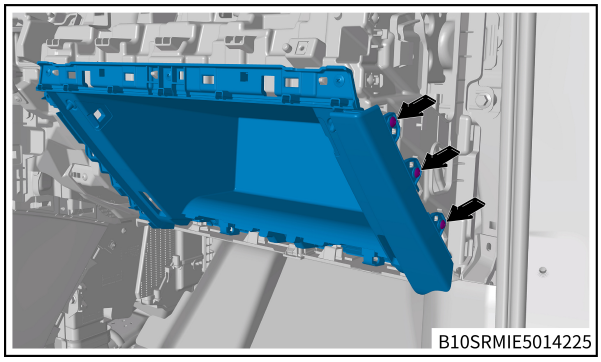
a. Detach the 2 retaining pins at the bottom of the glove box cover assembly -arrow-, and open the glove box cover assembly.

b. Disconnect the glove box cover assembly from the air damper cable -arrow-, and remove the glove box cover assembly ①.

ATTENTION

After disconnecting the air damper cable, a flathead screwdriver can be used to secure the cable for installation.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

GLOVE BOX BIN ASSEMBLY

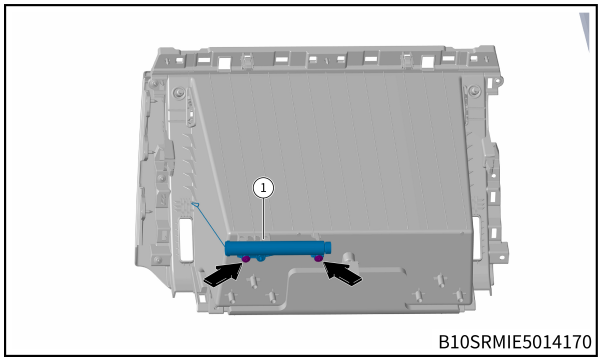
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
7. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
8. Remove the right side trim panel assembly of the instrument panel.
   See:Right instrument panel trim panel assembly (page 5426)
9. Remove the outer cover of the glove box.
   See:Glove box outer cover (page 5427)
10. Remove the glove box bin assembly.

a. Unscrew the 3 fixing screws on the side of the glove box bin assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

c. Unscrew the 8 fixing screws - arrows - of the glove box bin assembly, and disengage the 4 retaining clips of the glove box bin assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
d. Remove the glove box bin assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

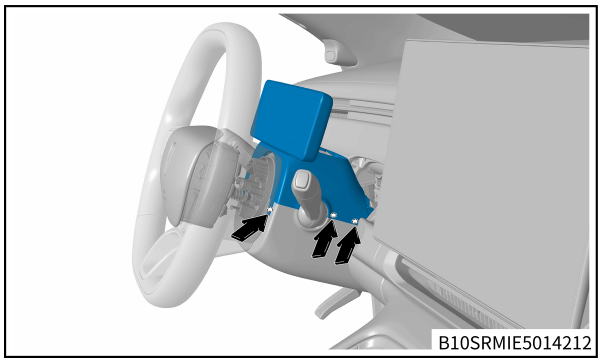
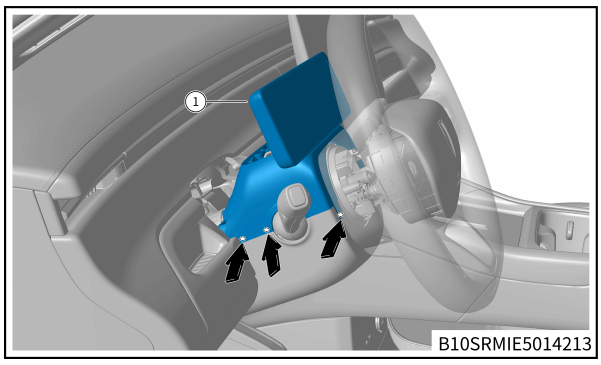
STEERING COLUMN UPPER COVER ASSEMBLY

REMOVAL PROCEDURE

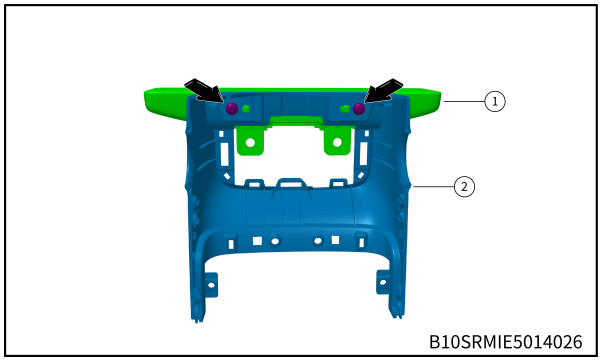


1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the combination instrument cover.
   See:Combination instrument cover (page 5420)
4. Remove the steering column upper shroud assembly.



a. Release the 6 retaining clips - arrows - between the cargo cover and the upper steering column shroud assembly, and remove the cargo cover.
Recommended tool: Interior trim removal tool

b. Unscrew the 2 fixing bolts of the instrument display -Arrow A-, disconnect the 2 connectors of the instrument display -Arrow B-, -Arrow C-.
Recommended tool: 7mm socket
Torque: 5±1N m



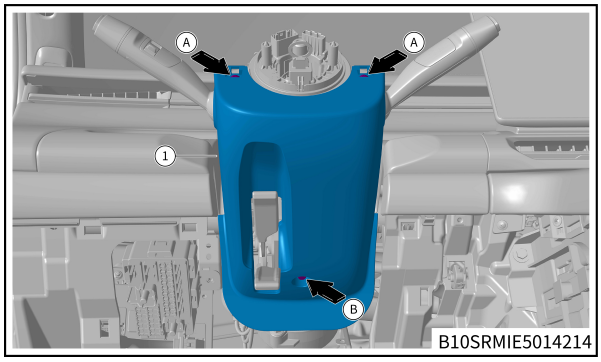
c. Release the 3 retaining clips on the right side of the steering column upper shroud assembly -arrow-.
Recommended tool: Interior trim removal tool

c. Release the 3 retaining clips on the left side of the upper steering column shroud assembly -arrow B-, and remove the upper steering column shroud assembly with instrument display ①.
Recommended tool: Interior trim removal tool

© 2026, All rights reserved

c. Unscrew the 2 fixing screws -arrow- of the instrument display screen, and remove the instrument display screen ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
d. Remove the steering column upper cover assembly ②.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

STEERING COLUMN LOWER COVER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the left trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
5. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
6. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
7. Remove the steering wheel assembly.
   See:Steering wheel assembly (page 6233)
8. Remove the lower steering column cover assembly.

a. Unscrew the 2 fixing screws -arrow A- of the steering column lower cover assembly and the combination switch.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Unscrew the 1 retaining bolt -arrow B- between the lower steering column cover assembly and the steering column, and remove the lower steering column cover assembly ①.
   Recommended tool: 10mm socket
   Torque: 3.5±0.5N m

SETUP

1. The installation procedure is performed in reverse order.

INSTRUMENT PANEL LEFT END COVER ASSEMBLY

NOTE

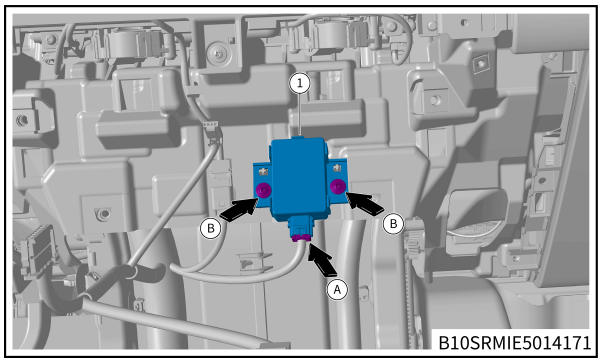
This section describes the removal and installation of the instrument panel left end cover assembly, and the removal and installation of the instrument panel right end cover assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the instrument panel left end cover assembly.

a. Release the 7 retaining clips of the instrument panel left end cover assembly, and remove the instrument panel left end cover assembly ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

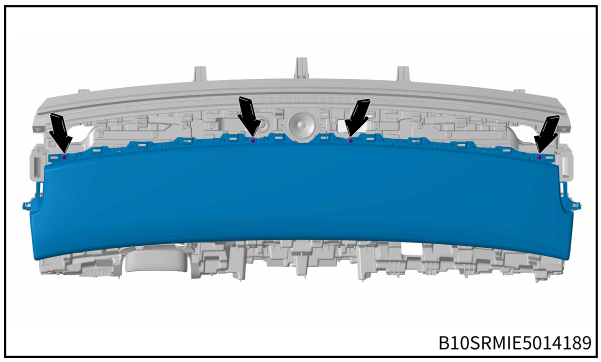
FILTER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the filter assembly.

a. Disconnect 1 connector of the filter assembly -arrow A-, unscrew 2 fixing screws of the filter assembly -arrow B-, and remove the filter assembly ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is performed in reverse order.

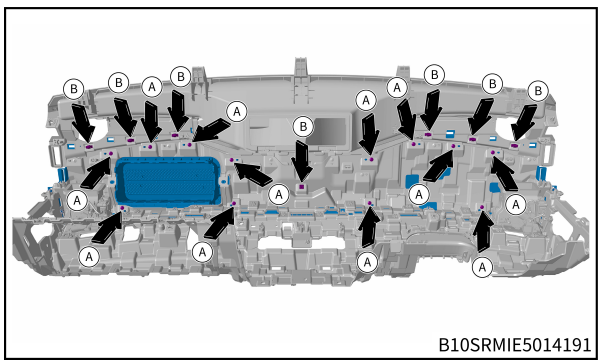
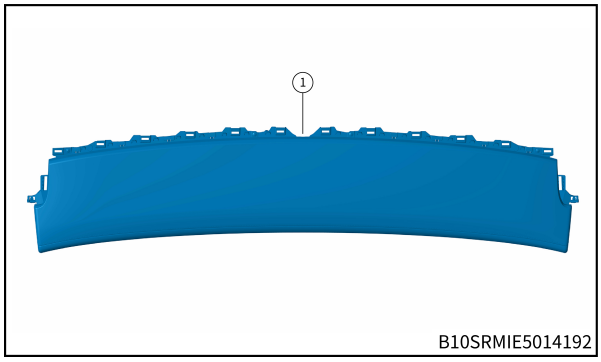
INSTRUMENT PANEL UPPER TRIM ASSEMBLY

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.

a. Unscrew the 4 fixing screws - arrows - connecting the instrument panel upper trim assembly to the front defroster upper body assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m



b. Unscrew the 6 mounting screws - arrows - connecting the instrument panel upper trim assembly to the instrument panel main frame assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

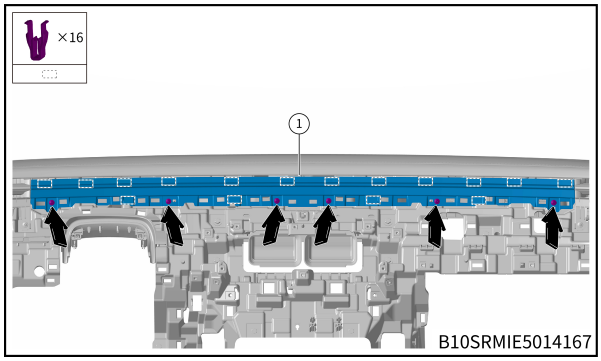
c. Unscrew the 12 fixing screws -arrow A- connecting the instrument panel upper trim assembly to the instrument panel main frame assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

d. Release the 7 clips of the instrument panel upper trim assembly -Arrow B-.
Recommended tool: Interior trim removal tool

© 2026, All rights reserved

e. Remove the instrument panel upper trim assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
7. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5442)
8. Remove the air vent panel.

a. Unscrew the 6 fixing screws -arrow- of the air outlet panel, and disengage the 16 double-sided clips of the air outlet panel.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the air outlet panel ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

LEFT AIR OUTLET ASSEMBLY

NOTE

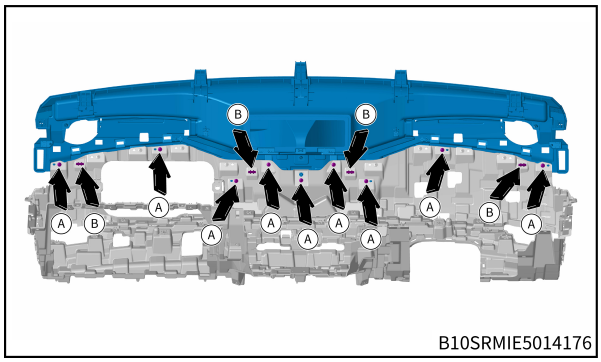
This section describes the removal and installation of the left air outlet assembly, and the removal and installation of the right air outlet assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
8. Remove the left air outlet assembly.

a. Disconnect the 1 fixing connector -arrow A- between the left air outlet assembly and the instrument wire harness assembly.
Recommended tool: Interior trim removal tool
b. Unscrew the 4 retaining screws -arrow B- on the left air outlet panel, and remove the left air outlet assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

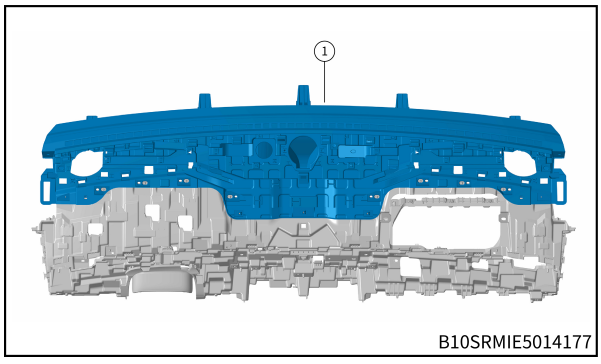
FRONT DEFROSTER UPPER BODY ASSEMBLY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the windshield sponge.
   See:Windshield foam (page)
6. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
7. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
8. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
9. Remove the front defroster upper body assembly.

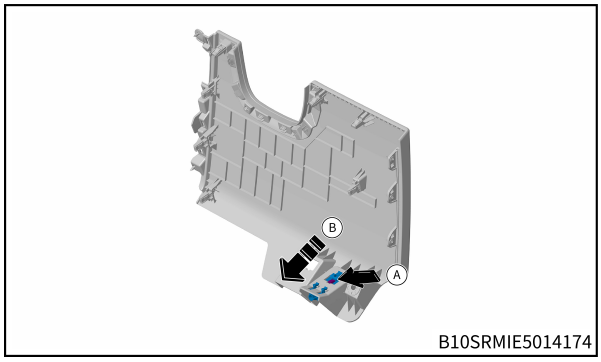
B10SRMIE5014176

a. Unscrew the 9 mounting screws between the front defroster upper body assembly and the instrument panel main frame assembly - Arrow A -.
Recommended tool: Phillips screwdriver
-Arrow B-Torque: 1.5±0.4N m
b. Release the 4 retaining clips of the front defroster upper body assembly - Arrow B -.
Recommended tool: Interior trim removal tool

B10SRMIE5014177

c. Remove the front defroster upper body assembly ①

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

HOOD RELEASE HANDLE ASSEMBLY

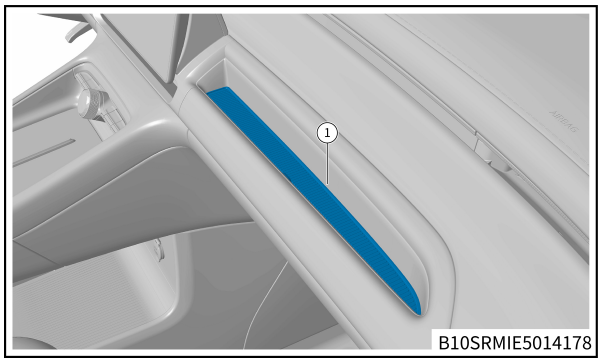
REMOVAL PROCEDURE

1. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
2. Remove the right trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
3. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
5. Remove the front hood release handle assembly.

a. Press 1 retaining clip -Arrow A- of the hood release handle assembly, and detach the hood release handle assembly in the direction of -Arrow B-.

b. Remove the front compartment cover handle assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the front hood release handle assembly to ensure it functions normally.

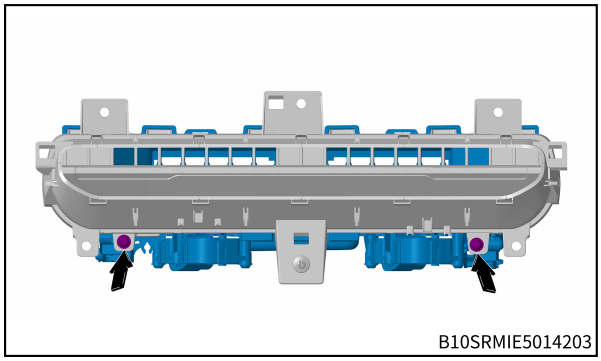
CENTER AIR OUTLET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
7. Remove the center display screen.
   See:Central control display (page 8534)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
9. Remove the center air outlet assembly.

a. Unscrew the 5 fixing screws -arrows- of the center air outlet assembly, and remove the center air outlet assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET HOUSING ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
7. Remove the center display screen.
   See:Central control display (page 8534)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
9. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5442)
10. Remove the center air outlet wiring harness assembly.
    See:Center air outlet wiring harness assembly (page 5446)
11. Remove the center air outlet housing assembly.

a. Unscrew the 2 fixing screws of the center air outlet housing assembly -arrow-.
Recommended tool: T20 Torx wrench
Torque: 1.5±0.4N m

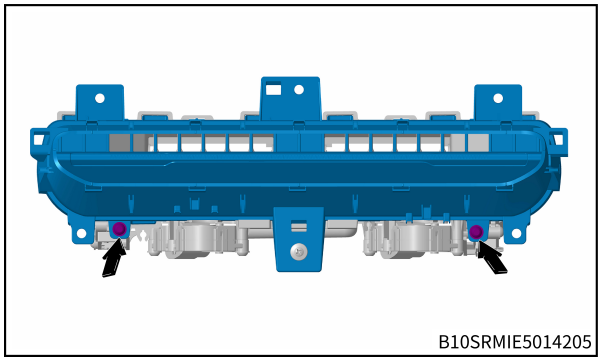
b. Unscrew the 3 fixing screws of the center air outlet housing assembly -arrow A-.
Recommended tool: T20 Torx wrench
Torque: 1.5±0.4N m

c. Release the 8 retaining clips -arrow B- of the center air outlet housing assembly, and remove the center air outlet housing assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved



a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
7. Remove the center display screen.
   See:Central control display (page 8534)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
9. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5442)
10. Remove the center air outlet panel.

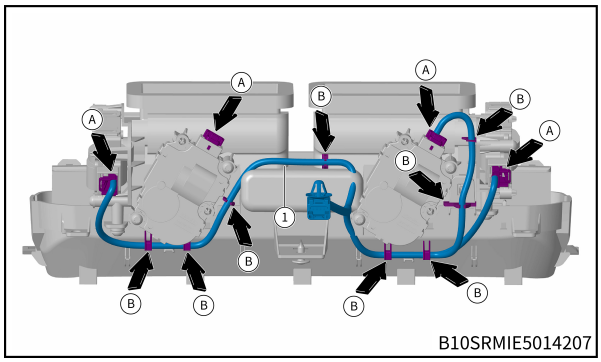
B10SRMIE5014205

a. Unscrew the 2 fixing screws of the center air outlet panel -arrow-.
   Recommended tool: T25 Torx wrench
   Torque: 1.5±0.4N m

B10SRMIE5014206

b. Unscrew the 3 retaining screws of the center air outlet panel -Arrow A-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m
c. Disengage the 8 retaining clips -Arrow B- of the center air outlet panel, and remove the center air outlet panel ①.
   Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
7. Remove the center display screen.
   See:Central control display (page 8534)
8. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
9. Remove the center air outlet wiring harness assembly.

a. Disconnect the 4 connectors of the air outlet motor -arrow A-.
b. Release the 8 retaining clips of the center air outlet wiring harness assembly -Arrow B-, and remove the center air outlet wiring harness assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER AIR OUTLET MOTOR

NOTE

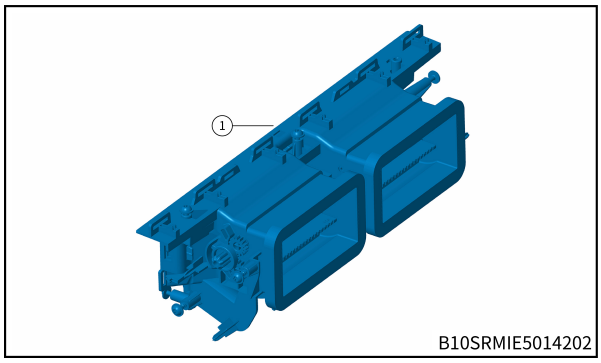
This section describes the removal and installation of the center air outlet motors for certain parts. The removal and installation of the center air outlet motors for other parts can generally be performed with reference to this document.

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
2. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
5. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
6. Remove the center display screen.
   See:Central control display (page 8534)
7. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
8. Remove the center air outlet motor.

a. Disconnect 1 connector of the center air outlet motor -arrow A-.
b. Unscrew the 2 fixing screws -arrow B- and remove the center air outlet motor ①.
Recommended tool: T20 Torx wrench
Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

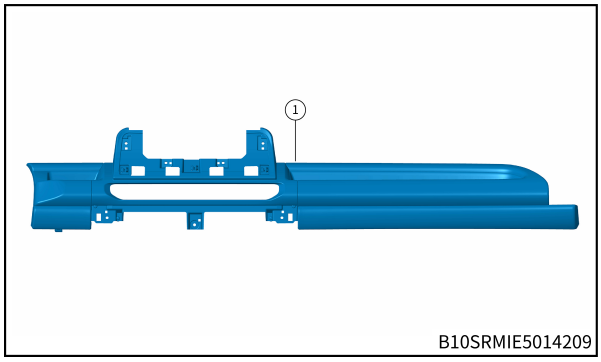
CENTER AIR OUTLET MECHANISM ASSEMBLY

REMOVAL PROCEDURE

1. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
2. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
3. Remove the instrument panel left/right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
5. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
6. Remove the center display screen.
   See:Central control display (page 8534)
7. Remove the instrument panel center air outlet panel assembly.
   See:Instrument panel center air outlet panel assembly (page 5422)
8. Remove the center air outlet assembly.
   See:Center air outlet assembly (page 5442)
9. Remove the center air outlet panel.
   See:Center air outlet panel (page 5445)
10. Remove the center air outlet wiring harness assembly.
    See:Center air outlet wiring harness assembly (page 5446)
11. Remove the center air outlet motor.
    See:Center air outlet motor (page 5447)
12. Remove the center air outlet mechanism assembly.

a. Remove the center air outlet mechanism assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

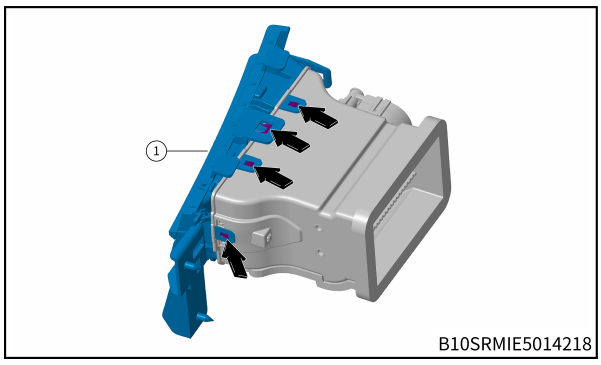
LEFT AIR OUTLET PANEL

NOTE

This section describes the removal and installation of the left air outlet panel. The removal and installation of the right air outlet panel can generally follow the same procedure as the left side.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5438)
9. Remove the left air outlet panel.

B10SRMIE5014217

a. Unscrew 1 retaining screw -arrow A- of the left air outlet panel, and disengage the 3 retaining clips -arrow B- of the left air outlet panel.
Recommended tool: T20 Torx wrench
Torque: 1.5±0.4N m

B10SRMIE5014218

b. Release the 4 retaining clips -arrows- of the center A/C vent panel, and remove the left A/C vent panel ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT AIR OUTLET MOTOR

NOTE

This section describes the removal and installation of the left air outlet motor; the removal and installation of the right air outlet motor can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5438)
9. Remove the left air outlet motor.

B10SRMIE5014216

a. Disconnect the 1 connector of the left air outlet motor -arrow A-, and unscrew the 2 fixing screws of the left air outlet motor -arrow B-.
   Recommended tool: T20 Torx wrench
   Torque: 1.5±0.4N m
b. Remove the left air outlet motor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT AIR OUTLET WIRING HARNESS ASSEMBLY

NOTE

This section describes the removal and installation of the left air outlet wiring harness assembly. The removal and installation of the right air outlet wiring harness assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5438)
9. Remove the left air outlet wiring harness assembly.

a. Disconnect the 2 connectors of the left air outlet wiring harness assembly -arrow-, and remove the left air outlet wiring harness assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LEFT AIR OUTLET MECHANISM ASSEMBLY

NOTE

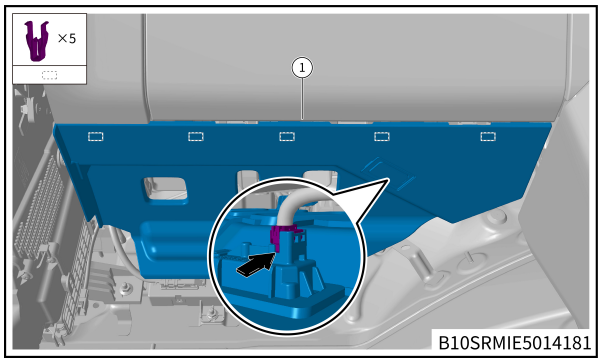
This section describes the removal and installation of the left air outlet mechanism assembly, and the removal and installation of the right air outlet mechanism assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left/right defrost air duct.
   See:Left defrost duct (page 5457)
7. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
8. Remove the left air outlet assembly.
   See:Left air outlet assembly (page 5438)
9. Remove the left air outlet wiring harness assembly.
   See:Left air outlet wiring harness assembly (page 5453)
10. Remove the left air outlet motor.
    See:Left air outlet motor (page 5452)
11. Remove the left air outlet panel.
    See:Left air outlet panel (page 5450)
12. Remove the left air outlet mechanism assembly.

a. Remove the left air outlet mechanism assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

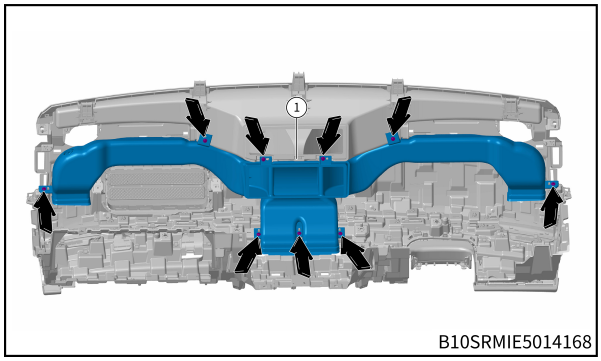
GLOVE BOX LOWER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the center console right extension panel assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the glove box lower cover assembly.

a. Release the 5 double-sided clips of the glove box lower trim panel assembly, and disconnect the 1 connector of the luggage compartment lamp -arrow-.
   Recommended tool: Interior trim removal tool
b. Remove the glove box lower cover assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

FACE AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel and accessories assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.

a. Unscrew the 9 mounting screws -arrow- of the face-level air duct assembly, and remove the face-level air duct assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

LEFT DEFROST DUCT

NOTE

This section describes the removal and installation of the left defroster duct, and the removal and installation of the right defroster duct can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the instrument panel and accessories assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the face air duct assembly.
   See:Face air duct assembly (page 5456)
6. Remove the left defroster air duct.

a. Unscrew the 2 fixing screws of the left defroster duct -arrow-, and remove the left defroster duct ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Screws should be placed in a box to avoid loss.

LEFT GLOVE BOX LOCK ROD SLEEVE

NOTE

This section describes the removal and installation of the left glove box lock rod sleeve, and the removal and installation of the right glove box lock rod sleeve can generally refer to the left side.

REMOVAL PROCEDURE

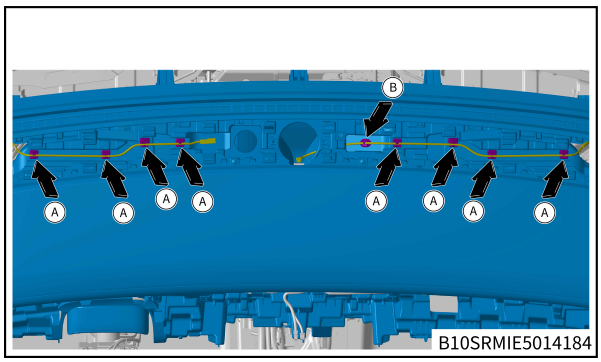
1. Open the glove box cover assembly.
2. Remove the left glove box lock rod sleeve.

a. Release the 3 retaining clips -arrow- of the left glove box lock rod cover, and remove the left glove box lock rod cover ①.
Recommended tool: Interior trim removal tool

SETUP

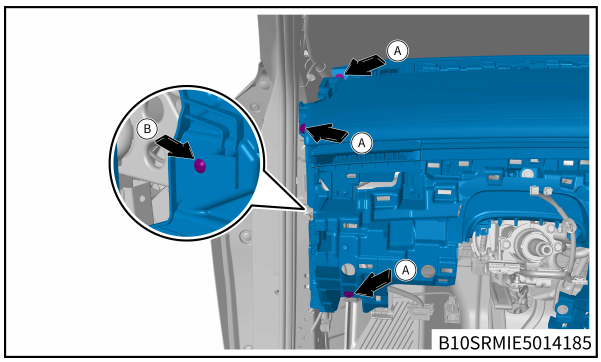
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



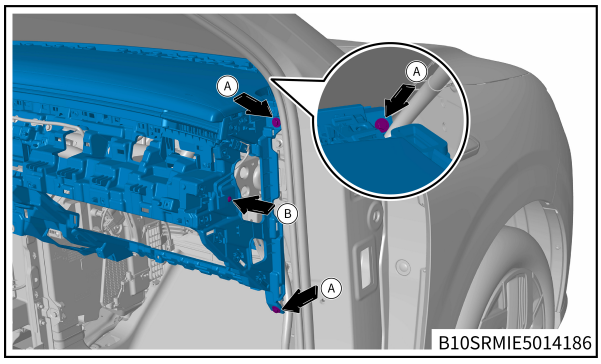
INSTRUMENT PANEL BODY AND ACCESSORIES ASSEMBLY

REMOVAL PROCEDURE

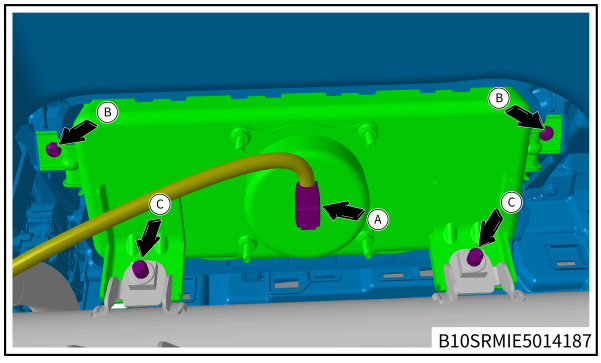


1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the center console and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the combination instrument cover.
   See:Combination instrument cover (page 5420)
5. Remove the lower steering column cover assembly.
   See:Steering Column Lower Cover Assembly (page 5432)
6. Remove the combination switch.
   See:Combination switch (page 8635)
7. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
8. Remove the speaker cover assembly.
   See:Speaker cover assembly (page 5415)
9. Remove the midrange speaker assembly.
   See:Midrange Speaker Assembly (Instrument Panel) (page 9472)
10. Remove the instrument panel left/right end cover assembly.
    See:Instrument Panel Left End Cover Assembly (page 5433)
11. Remove the glove box lower cover assembly.
    See:Glove box lower trim panel assembly (page 5455)
12. Remove the front hood release handle assembly.
    See:Hood release handle assembly (page 5440)
13. Remove the instrument panel lower left trim panel assembly.
    See:Lower left instrument panel trim assembly (page 5417)
14. Remove the screen trim cover assembly.
    See:Screen trim cover assembly (page 5421)
15. Remove the center display screen.
    See:Central control display (page 8534)
16. Remove the instrument panel center air outlet panel assembly.
    See:Instrument panel center air outlet panel assembly (page 5422)
17. Remove the outer cover of the glove box.
    See:Glove box outer cover (page 5427)
18. Remove the glove box bin assembly.
    See:Glove box bin assembly (page 5428)
19. Remove the screen mounting bracket assembly.
    See:Screen mounting bracket assembly (page 5423)
20. Remove the right side instrument panel trim cover assembly.
    See:Right instrument panel trim cover assembly (page 5424)
21. Remove the air vent panel.
    See:Air outlet panel (page 5437)
22. Remove the left air duct temperature sensor.
    See:Duct temperature sensor (Left footwell air duct) (page 5187)

© 2026, All rights reserved

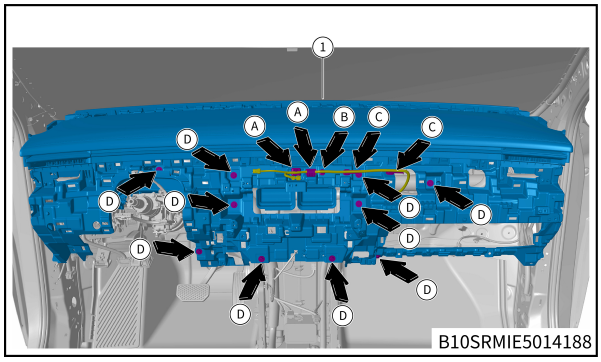


23. Remove the right air duct temperature sensor.
    See:Air duct temperature sensor (right face-level air duct) (page 5181)
24. Remove the filter assembly.
    See:Filter Assembly (page 5434)
25. Remove the instrument panel body and accessory assembly.



a. Release the 9 retaining clips of the instrument panel wiring harness -arrow A-, -arrow B-, and move the instrument panel wiring harness away.
Recommended tools: 10mm socket, clip remover
Torque: 5±0.5N m

b. Unscrew the 3 mounting bolts on the left side of the instrument panel body and accessories assembly -Arrow A-, and unscrew the 1 mounting screw of the instrument panel body and accessories assembly -Arrow B-.
Recommended tools: 10mm socket, Phillips screwdriver
-Arrow A- Torque: 5±0.5N m
-Arrow B-Torque: 1.5±0.4N m



c. Unscrew the 3 mounting bolts on the right side of the instrument panel body and accessories assembly -Arrow A-, and unscrew the 1 mounting screw of the instrument panel body and accessories assembly -Arrow B-.
Recommended tools: 10mm socket, Phillips screwdriver
-Arrow A- Torque: 5±0.5N m
-Arrow B-Torque: 1.5±0.4N m

d. Disconnect the 1 connector -arrow A- between the instrument panel wiring harness and the front passenger airbag assembly.
Recommended tool: Clip remover
e. Unscrew the 2 mounting screws -arrow B- and the bolt -arrow C- of the front passenger airbag assembly.
Recommended tools: 13mm socket, Phillips screwdriver
-Arrow B-Torque: 1.5±0.4N m
- Arrow C - Torque: 23±2N m

© 2026, All rights reserved

f. Release the 5 retaining clips connecting the instrument panel wire harness to the instrument panel body and accessory assembly -Arrow A-, -Arrow B-, -Arrow C-.
Recommended tool: Clip remover
g. Unscrew the 10 mounting bolts of the instrument panel body and accessory assembly - Arrow D -.
Recommended tool: 10mm socket
Torque: 5±1N m
h. Remove the instrument panel body and accessory assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.
   d. After installation, test the relevant electrical components to ensure they function properly.

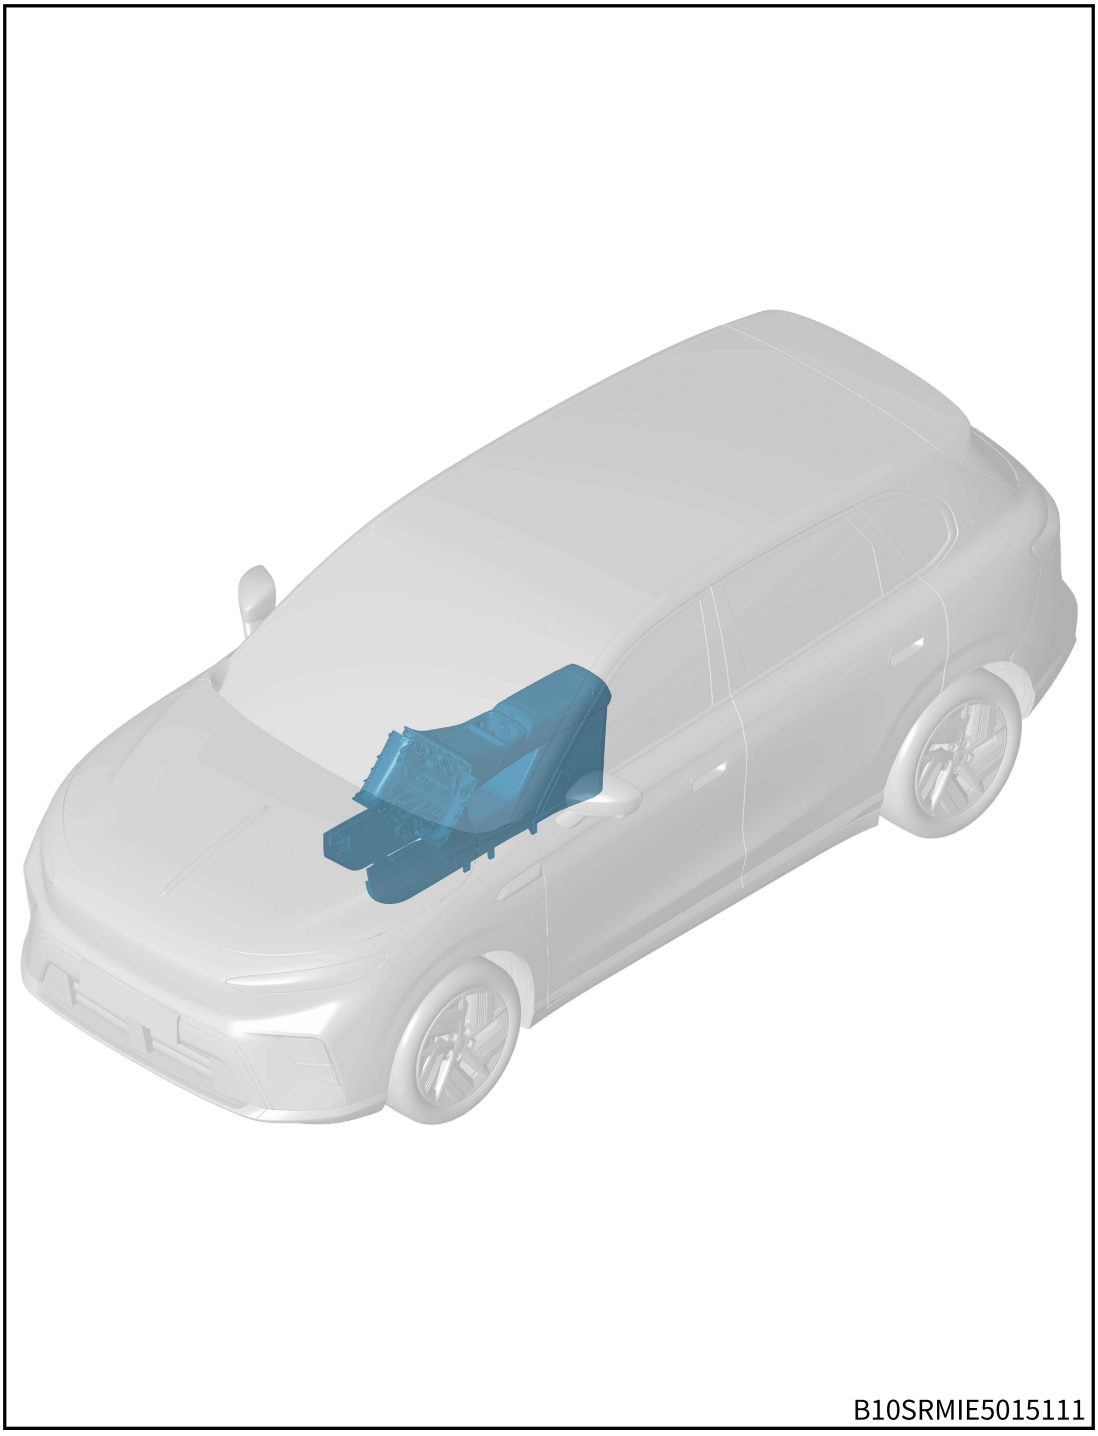
7.14 CENTER CONSOLE AND ACCESSORY SYSTEM

7.14.1 PRECAUTIONS



PRECAUTIONS

1. When repairing the center console, whether on the vehicle or on the workbench, a grounding wire should be connected to the vehicle body to discharge static charges to the ground.
2. Storage of components: Spare components for the center console are stored in nickel-plated packaging bags, and should be removed during installation, not in advance, and do not touch the conductive contacts when removing them.
3. After removing the center console, cover it with a protective cover to prevent the instrument panel from being scratched.
4. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

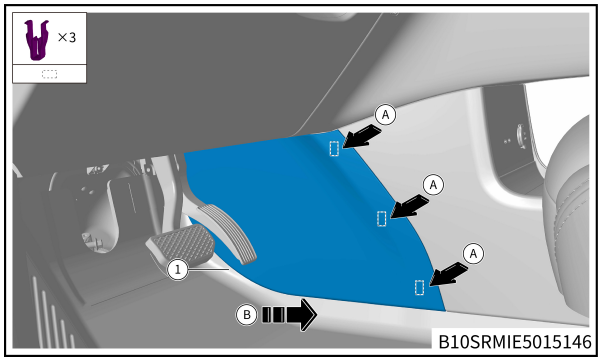
7.14.6 SERVICE AND REPAIR GUIDANCE



LEFT EXTENSION PLATE ASSEMBLY OF THE AUXILIARY INSTRUMENT PANEL

NOTE

This section describes the removal and installation of the center console left extension panel assembly, and the removal and installation of the center console right extension panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

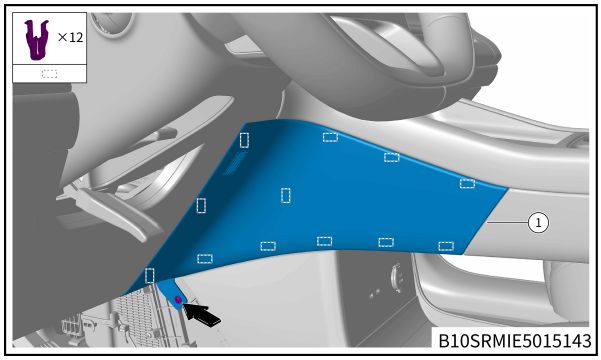
1. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
2. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
3. Remove the left extension plate assembly of the auxiliary instrument panel.

a. Release the 3 double-sided clips of the center console left extension panel assembly - Arrow A -, and remove the center console left extension panel assembly ① in the direction of - Arrow B -.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



CENTER CONSOLE LEFT TRIM PANEL ASSEMBLY

NOTE

This section describes the removal and installation of the center console left trim panel assembly, and the removal and installation of the center console right trim panel assembly can generally be performed by referring to the left side.

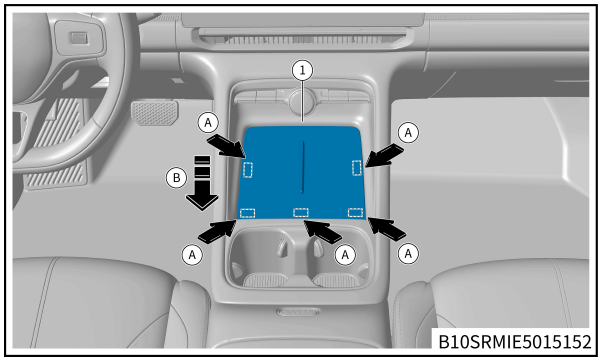
REMOVAL PROCEDURE

1. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
2. Remove the left trim panel assembly of the center console.

a. Unscrew the 2 retaining screws -arrow- of the center console left trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

b. Release the 12 double-sided clips on the center console left side trim panel assembly, and remove the center console left side trim panel assembly ①.
Recommended tool: Interior trim removal tool

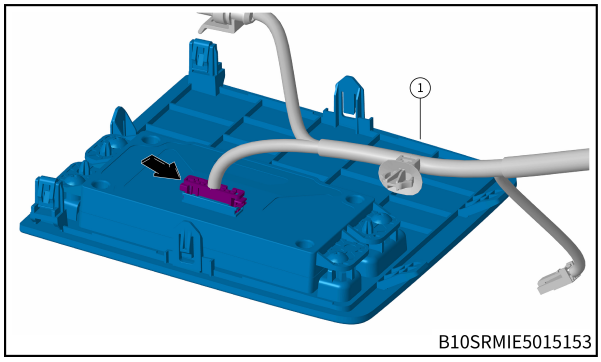
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

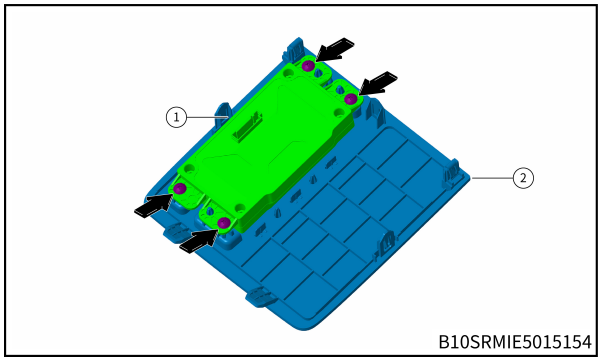
© 2026, All rights reserved

WIRELESS CHARGING PAD ASSEMBLY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the wireless charging pad assembly.



B10SRMIE5015152

a. Release the 5 retaining clips of the wireless charging pad assembly -Arrow A-, and remove the wireless charging pad assembly and accessory ① in the direction of -Arrow B-.
   Recommended tool: Interior trim removal tool

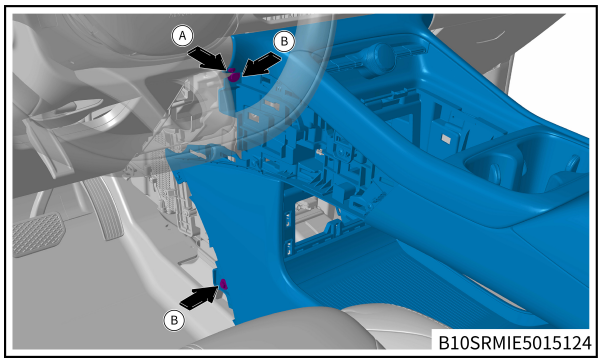
B10SRMIE5015153

b. Disconnect the connector -arrow- of the wireless charging module assembly, and remove the wireless charging pad assembly and accessories ①.

B10SRMIE5015154

c. Unscrew the 4 fixing screws -arrow- of the wireless charging module assembly, and separate the wireless charging pad assembly ① from the wireless charging module assembly ②.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Remove the wireless charging pad assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

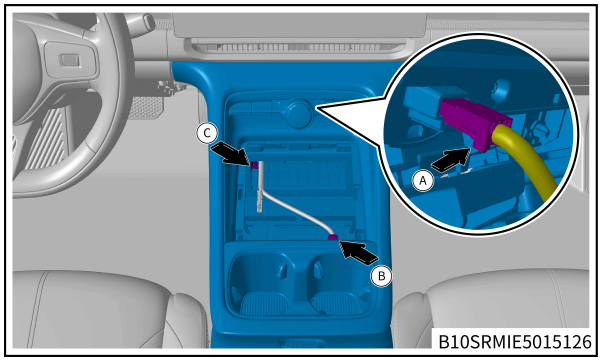
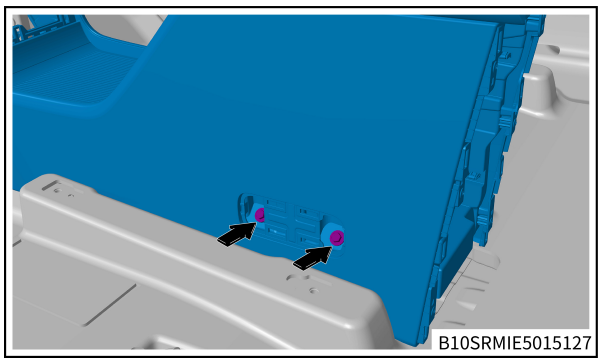
CENTER CONSOLE BODY AND ACCESSORY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right extension panel assembly of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the USB mounting plate.
   See:USB Mounting Plate (page 5474)
5. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5470)
6. Remove the left/right instrument panel trim cover.
   See:Instrument trim cover (page 5501)
7. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
8. Remove the rear panel assembly of the center console.
   See:Center console rear panel assembly (page 5476)
9. Remove the sub-instrument panel body and accessory assembly.

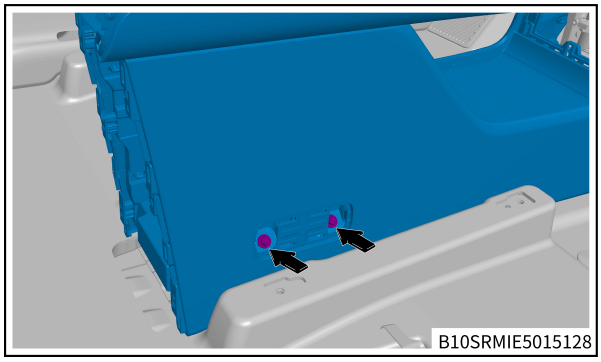


a. Unscrew the 1 retaining screw on the left side of the center console body and accessory assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Unscrew the 2 mounting bolts on the left side of the center console body and accessory assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m



c. Unscrew 1 fixing screw on the right side of the center console body and accessory assembly - arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
d. Unscrew the 2 fixing bolts on the right side of the center console body and accessory assembly -arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m

© 2026, All rights reserved

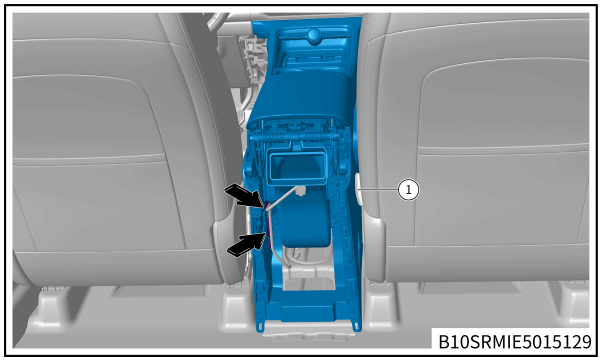


e. Disconnect 1 connector between the center console switch and the instrument panel harness - Arrow A -.
f. Disconnect 1 connector -arrow B- of the low-frequency antenna integrated in the vehicle interior for IMMO.
g. Disconnect the 1 clip - Arrow C - between the center console body and accessories assembly and the instrument panel wiring harness.
Recommended tool: Clip remover

g. Unscrew the 2 fixing screws -arrow- connecting the left side of the center console body and accessory assembly to the center console rear mounting bracket assembly.
Recommended tool: 10mm socket
Torque: 5±1N m

NOTE

When removing and installing the bolts on the left and right sides at the rear of the center console body and accessory assembly, adjust the driver and front passenger seats to the foremost position.



h. Unscrew the 2 fixing screws -arrow- on the right side of the center console body and accessories assembly that connect to the center console rear mounting bracket assembly.
Recommended tool: 10mm socket
Torque: 5±1N m

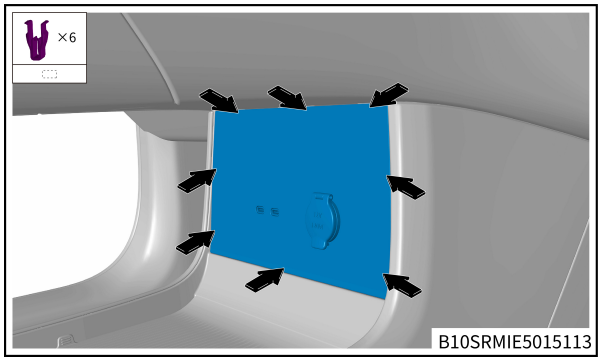
NOTE

When removing and installing the bolts on the left and right sides at the rear of the center console body and accessory assembly, adjust the driver and front passenger seats to the foremost position.

© 2026, All rights reserved

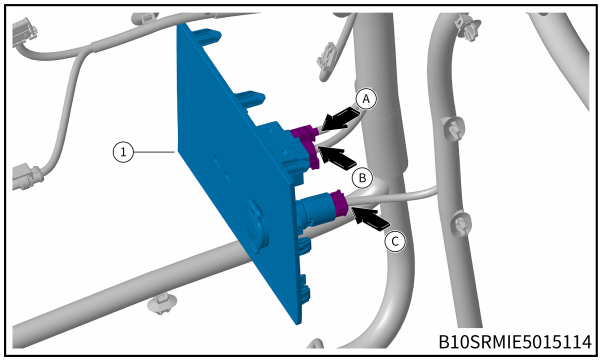
i. Release the 2 retaining clips -arrow- connecting the instrument panel harness to the center console body and accessory assembly.
Recommended tool: Clip remover
j. Remove the center console body and accessory assembly ①.

SETUP



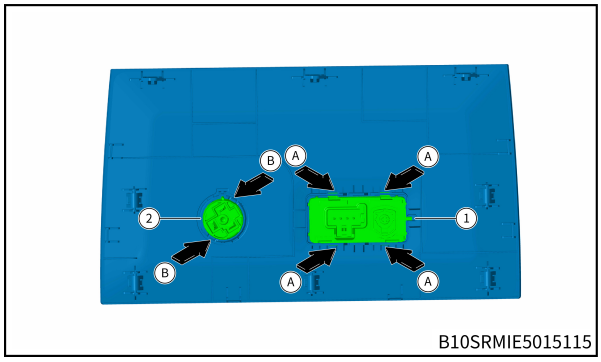
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

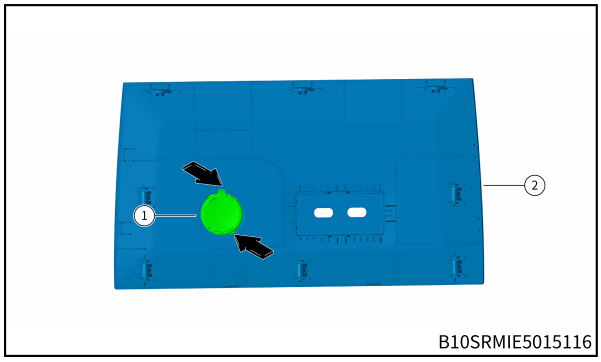


USB MOUNTING PLATE

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the USB mounting plate.



a. Release the 8 retaining clips of the USB mounting plate -arrow-, and remove the USB mounting plate and accessory assembly ①.
Recommended tool: Interior trim removal tool

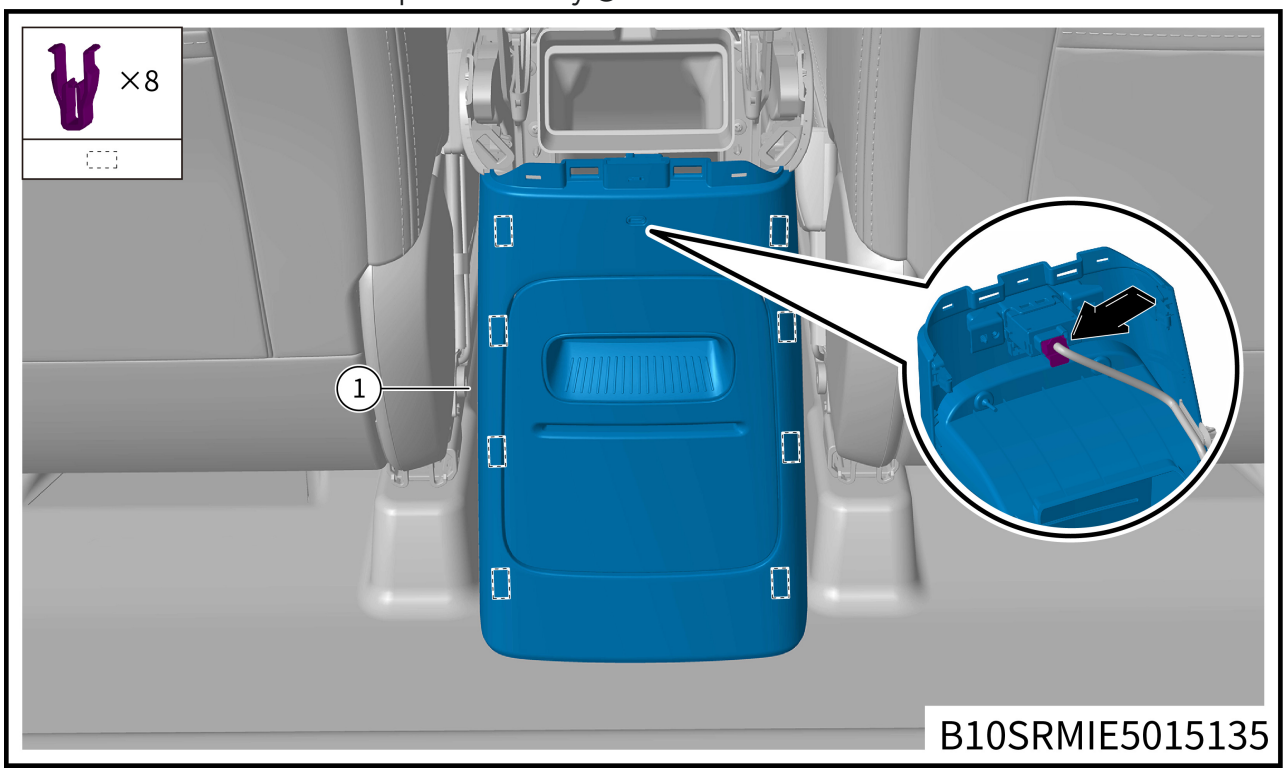
b. Disconnect the 2 connectors of the front USB -arrow A-, -arrow B-, disconnect the 1 connector of the backup power supply -arrow C-, and remove the USB fixing plate and accessory assembly ①.

c. Press the 4 retaining clips of the front USB -arrow A-, and remove the front USB ①.
d. Release the 2 retaining clips of the backup power supply -Arrow B-, and remove the backup power supply ②.

e. Press the 2 retaining clips -arrow- of the auxiliary power supply bracket, and remove the auxiliary power supply bracket ①.
f. .Remove the USB retaining plate ②.

© 2026, All rights reserved

SETUP



1. After installation, check whether all retaining clips are properly installed.

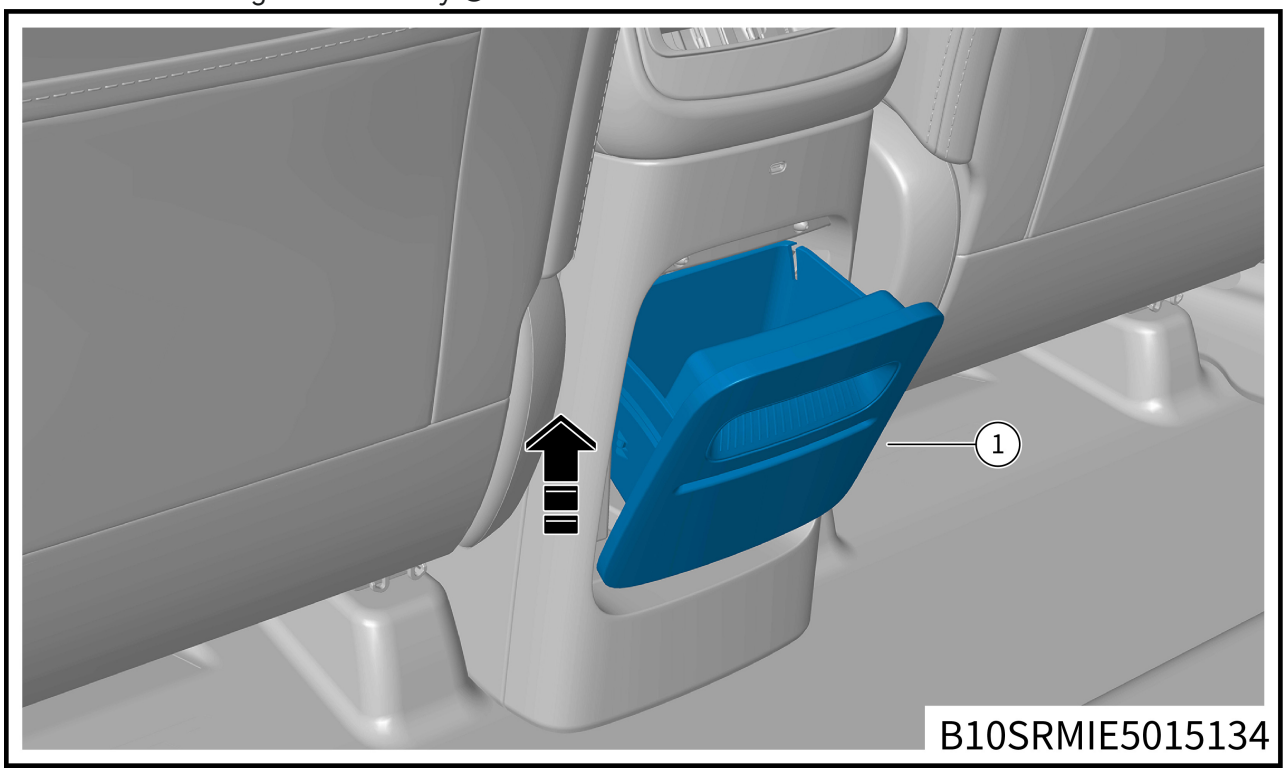
© 2026, All rights reserved

CENTER CONSOLE REAR PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
4. Remove the rear panel assembly of the center console.
   a. Release the 8 double-sided clips of the center console rear panel assembly, and disconnect the 1 connector for the rear USB charging from the instrument wiring harness -arrow-.
   Recommended tool: Interior trim removal tool
   b. Remove the center console rear panel assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

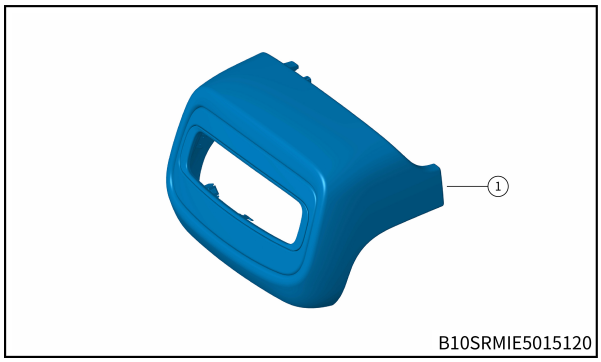
© 2026, All rights reserved

CENTER CONSOLE REAR STORAGE BOX ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear storage box assembly of the center console.
   a. Open the rear storage box assembly behind the center console.
   b. Detach the rear center console storage box assembly in the direction of the arrow, and remove the rear center console storage box assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

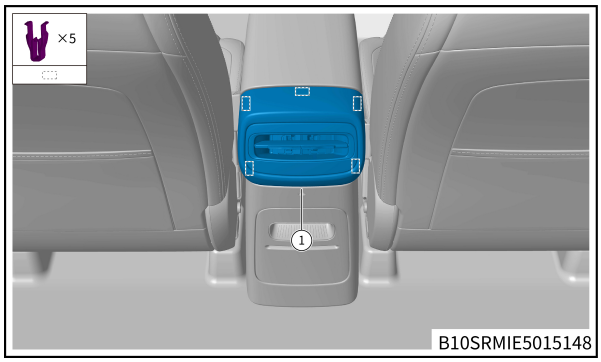
AIR OUTLET PANEL

REMOVAL PROCEDURE

1. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
2. Remove the center console air outlet housing assembly.
   See:Center Console Air Outlet Housing Assembly (page 5480)
3. Remove the air vent panel.

a. Remove the air outlet panel ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

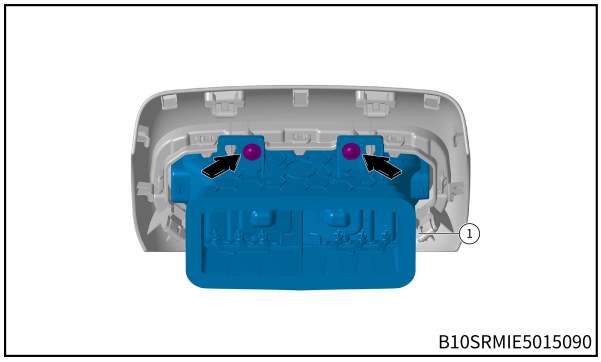
PASSENGER INSTRUMENT PANEL AIR OUTLET ASSEMBLY

REMOVAL PROCEDURE

1. Remove the passenger side air outlet assembly.

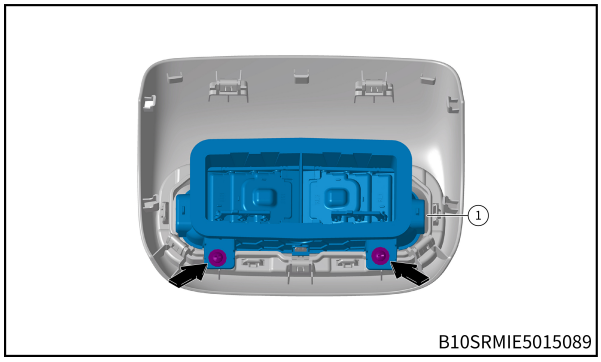
   a. Release the 5 retaining clips of the center console air outlet assembly, and remove the center console air outlet assembly ①.
   Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



CENTER CONSOLE AIR OUTLET HOUSING ASSEMBLY

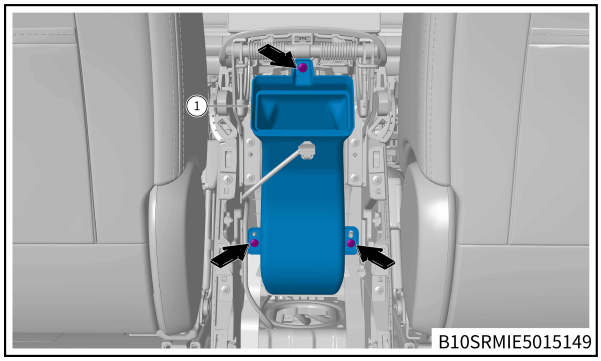
REMOVAL PROCEDURE

1. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
2. Remove the center console air outlet housing assembly.

a. Unscrew the 2 fixing screws of the center console air outlet housing assembly -arrow-.
Recommended tool: Phillips screwdriver

b. Unscrew the 2 fixing screws -arrow- of the center console air outlet housing assembly, and remove the center console air outlet housing assembly ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

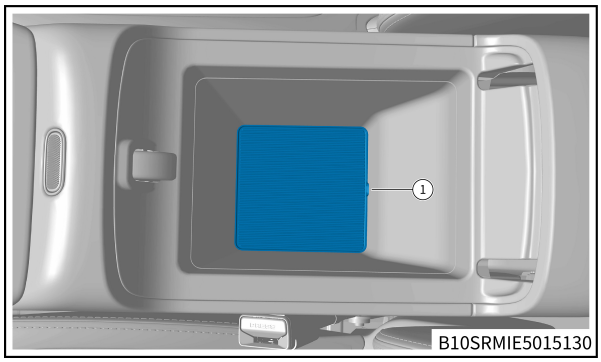
REAR FACE-LEVEL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
4. Remove the rear panel assembly of the center console.
   See:Rear face-level air duct assembly (page 5481)
5. Remove the rear face air duct assembly.

a. Unscrew the 3 fixing screws -arrow- of the rear face-blowing rear air duct assembly, and remove the rear face-blowing rear air duct assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

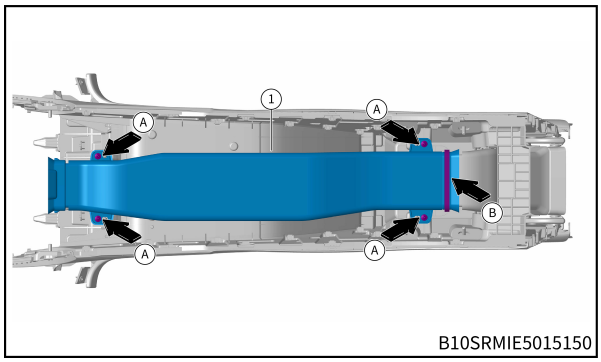
CENTER CONSOLE ARMREST PAD

REMOVAL PROCEDURE

1. Remove the center console armrest pad.

a. Open the center console armrest assembly.
b. Remove the center console armrest pad ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

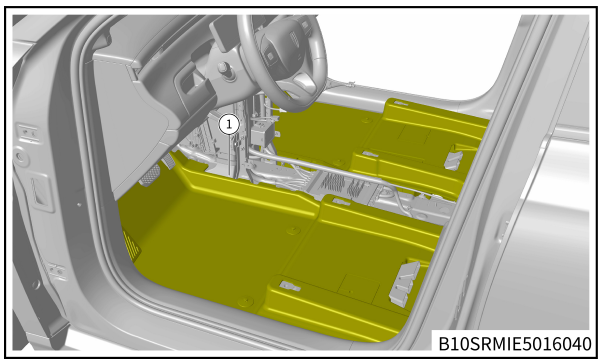
REAR FRONT FACE-LEVEL AIR DUCT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the rear front face air duct assembly.

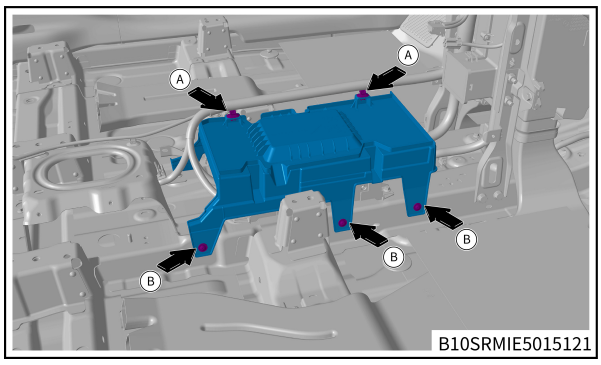
a. Unscrew the 4 fixing screws of the rear front face-level air duct assembly -Arrow A-, and disconnect the 1 connecting clip between the rear front face-level air duct assembly and the rear face-level rear air duct assembly -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the rear front face air duct assembly ①.

SETUP



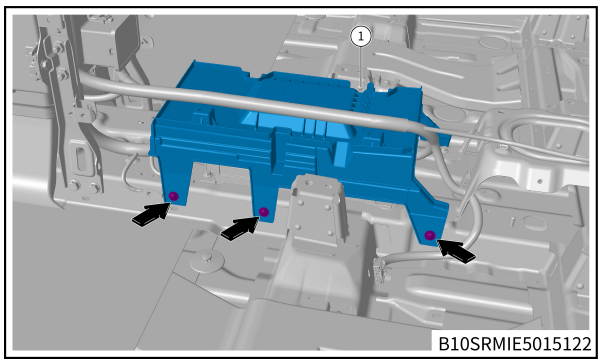
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



WATERPROOF COVER

REMOVAL PROCEDURE



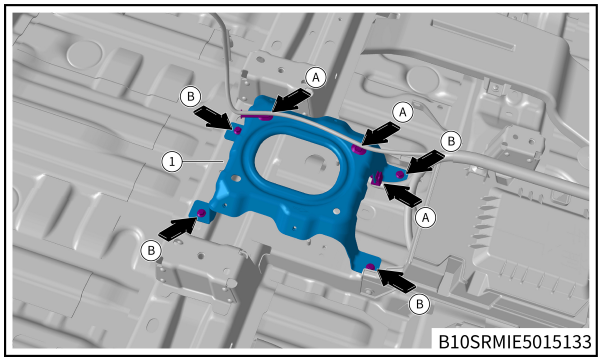
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the left/right front seat assembly.
   See:Front left seat assembly (page 6267)
5. Remove the rear front face air duct assembly.
   See:Rear Front Face-Level Air Duct Assembly (page 5483)
6. Remove the waterproof cover.

a. Lift the front part of the carpet assembly ①.

b. Release the 2 retaining clips connecting the instrument panel wiring harness to the waterproof cover - arrow A -.
c. Unscrew the 3 fixing screws on the right side of the waterproof cover -arrow B-.
Recommended tool: Phillips screwdriver
Torque: 2±0.5N m

b. Unscrew the 3 fixing screws on the left side of the waterproof cover -arrow-, and remove the waterproof cover ①.
Recommended tool: Phillips screwdriver
Torque: 2±0.5N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

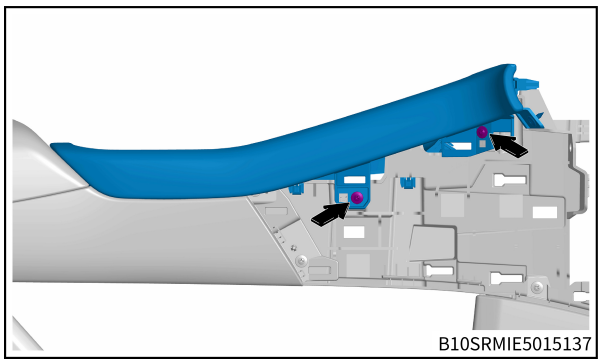
CENTER CONSOLE REAR MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the rear front face air duct assembly.
   See:Rear Front Face-Level Air Duct Assembly (page 5483)
5. After removing the center console, install the rear mounting bracket assembly.

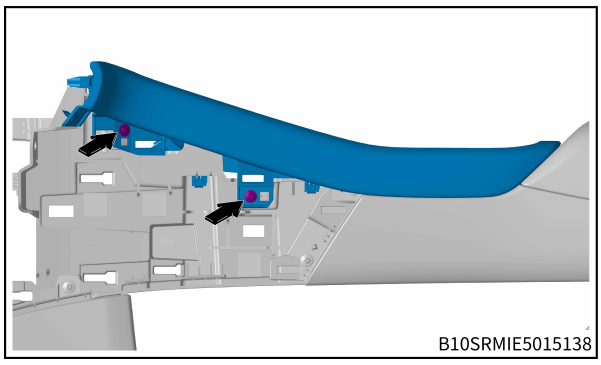
a. Release the 3 retaining clips - Arrow A - connecting the instrument panel wiring harness to the rear mounting bracket assembly of the center console, and move the wiring harness aside.
   Recommended tool: Clip remover
b. Unscrew the 4 mounting bolts -Arrow B- of the center console rear mounting bracket assembly, and remove the center console rear mounting bracket assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP



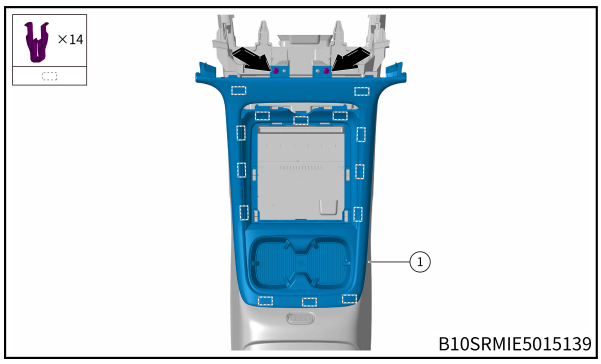
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



PASSENGER INSTRUMENT PANEL FRONT UPPER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
4. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5470)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
6. Remove the center console front upper trim panel assembly.

a. Unscrew the 2 fixing screws on the left side of the front upper trim panel assembly of the center console -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

b. Unscrew the 2 fixing screws -arrow- on the right side of the center console front upper trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

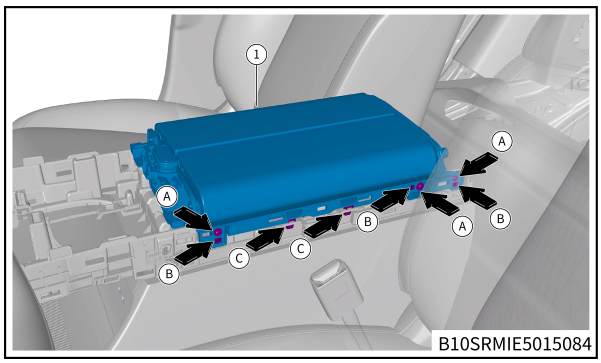
c. Unscrew the 2 fixing screws -arrow- of the center console front upper trim panel assembly, and disengage the 14 double-sided clips of the center console front upper trim panel assembly.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

d. Remove the front upper trim panel assembly ① of the center console.

SETUP

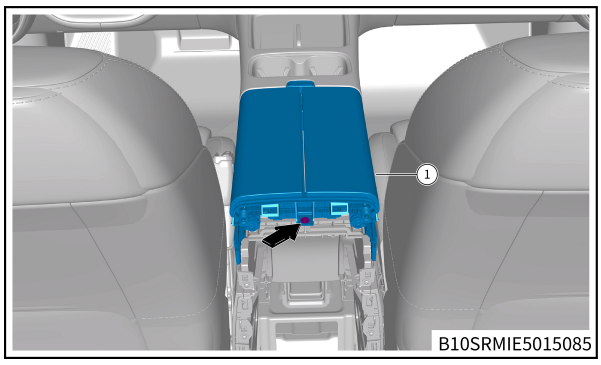
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



CENTER CONSOLE ARMREST ASSEMBLY

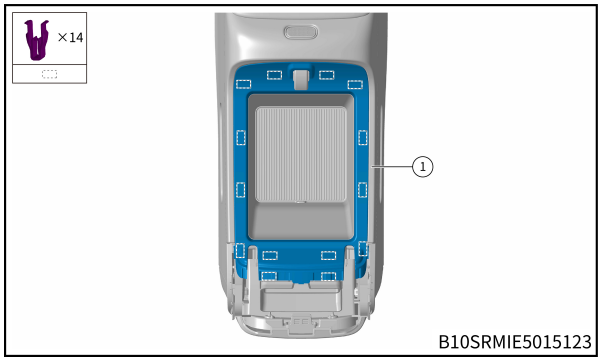
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
4. Remove the rear panel assembly of the center console.
   See:Center console rear panel assembly (page 5476)
5. Remove the rear face air duct assembly.
   See:Rear face-level air duct assembly (page 5481)
6. Remove the center console armrest assembly.

a. Unscrew the 7 fixing screws -arrow- connecting the center console armrest assembly to the center console frame assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

c. Press the arrow button to open the center console armrest assembly ①.
d. Remove the center console armrest assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

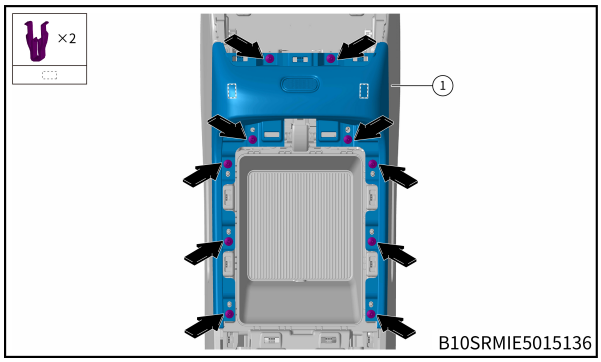
ARMREST FRAME

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the passenger side air outlet assembly.
   See:Passenger instrument panel air outlet assembly (page 5479)
3. Remove the armrest frame.

a. Open the center console armrest assembly.
b. Release the 14 double-sided clips on the armrest frame, and remove the armrest frame ①.
   Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

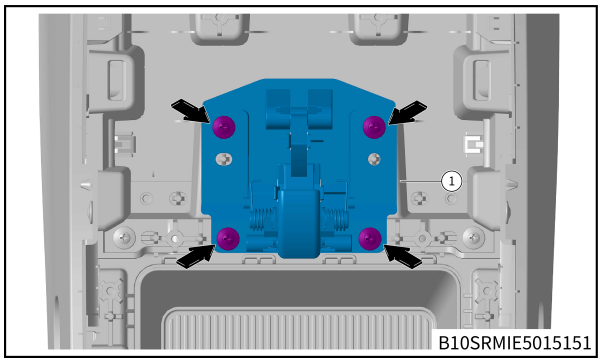
CENTER CONSOLE REAR UPPER TRIM PANEL ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
4. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5470)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
6. Remove the armrest frame.
   See:Armrest frame (page 5489)
7. Remove the rear upper trim panel assembly of the center console.

a. Unscrew the 10 mounting screws -arrow- of the center console rear upper trim panel assembly, and disengage the 2 double-sided clips of the center console rear upper trim panel assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the center console rear upper trim panel assembly and accessories ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

LOCK MECHANISM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the lock mechanism.

a. Unscrew the 4 fixing screws -arrow- connecting the lock mechanism to the upper body assembly on the center console.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
b. Remove the lock mechanism ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE LEFT CENTER TRIM ASSEMBLY

NOTE

This section describes the removal and installation of the left center trim panel assembly of the center console. The removal and installation of the right center trim panel assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the left center trim panel assembly of the center console.

a. Unscrew the 7 mounting bolts of the left center trim panel assembly of the center console -arrow-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Release the 8 double-sided clips of the center console lower left trim panel assembly, and remove the center console left center trim panel assembly ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

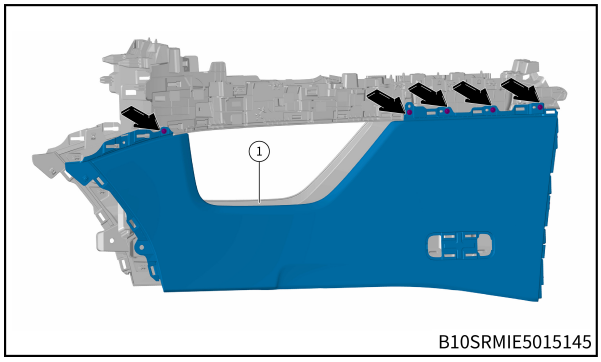
CENTER CONSOLE LOWER LEFT TRIM PANEL ASSEMBLY

NOTE



This section describes the removal and installation of the lower left trim panel assembly of the center console, and the removal and installation of the lower right trim panel assembly of the center console can generally follow the left side procedure.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the center console left center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5492)
8. Remove the lower left trim panel assembly of the center console.

a. Unscrew the 3 fixing bolts at the rear end of the center console lower left trim panel assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

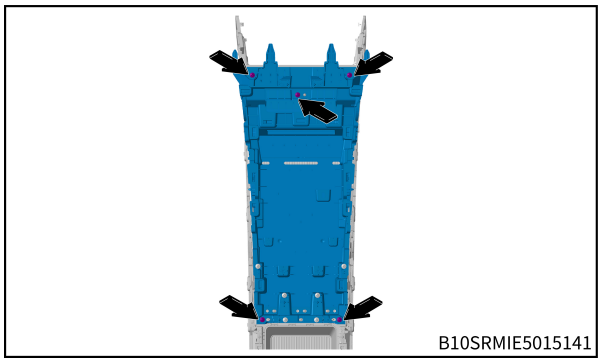
b. Unscrew the 5 fixing screws -arrow- of the lower left trim panel assembly of the center console, and disengage the 21 double-sided clips of the lower left trim panel assembly of the center console.
Recommended tools: Phillips screwdriver, interior trim removal tool
Torque: 1.5±0.4N m

c. Remove the lower left trim panel assembly ① of the center console.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved



a. After installation, check whether all retaining clips are properly installed.
b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

CENTER CONSOLE UPPER BODY ASSEMBLY

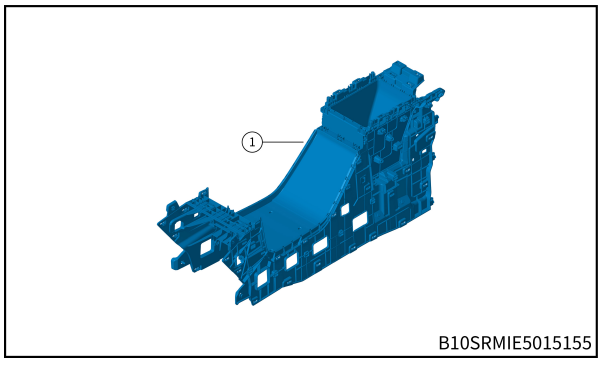
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the left/right center console center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5492)
8. Remove the lock mechanism.
   See:Lock mechanism (page 5491)
9. Remove the center console upper body assembly.

a. Unscrew the 5 fixing bolts of the upper body assembly on the center console -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

b. Remove the upper body assembly ① on the center console.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

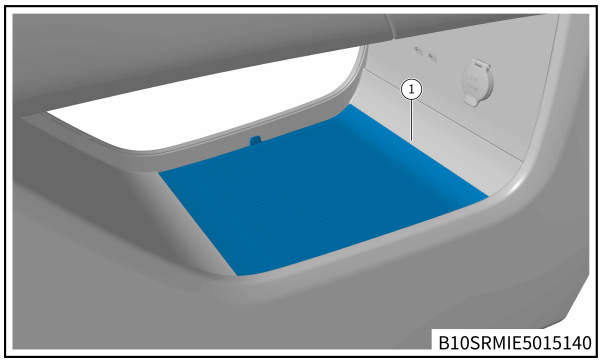
CENTER CONSOLE FRAME ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the left/right center console center trim panel assembly.
   See:Center Console Left Center Trim Assembly (page 5492)
8. Remove the center console upper body assembly.
   See:Center Console Upper Body Assembly (page 5495)
9. Remove the left/right lower trim panel assembly of the center console.
   See:Center Console Lower Left Trim Panel Assembly (page 5493)
10. Remove the rear front face air duct assembly.
    See:Rear Front Face-Level Air Duct Assembly (page 5483)
11. Remove the rear face air duct assembly.
    See:Rear face-level air duct assembly (page 5481)
12. Remove the center console armrest assembly.
    See:Center console armrest assembly (page 5488)
13. Remove the front storage box mat on the center console.
    See:Center Console Front Storage Box Mat (page 5497)
14. Remove the center console armrest pad.
    See:Center console armrest pad (page 5482)
15. Remove the center console upper body assembly.

a. Remove the center console frame assembly ①

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

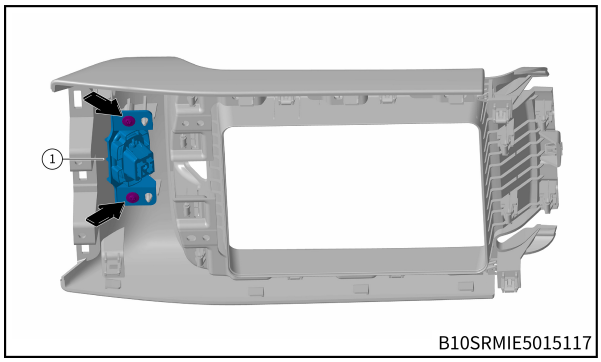
CUP HOLDER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the integrated IMMO low-frequency antenna inside the vehicle.
   See:In-vehicle integrated IMMO low-frequency antenna (page 9628)
6. Remove the cup holder assembly.

a. Unscrew the 4 fixing screws -arrow- of the cup holder assembly, and remove the cup holder assembly ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

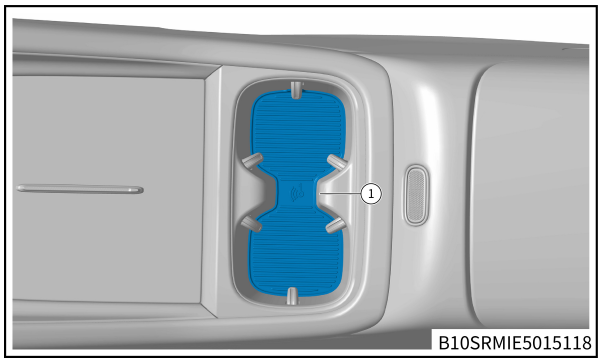
BUTTON

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the armrest frame.
   See:Armrest frame (page 5489)
6. Remove the rear upper trim panel assembly of the center console.
   See:Center Console Rear Upper Trim Panel Assembly (page 5490)
7. Remove the button.

a. Unscrew the 2 fixing screws of the button -arrow-, and remove the button ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. After installation, check whether the relevant electrical components can function properly.

INSTRUMENT TRIM COVER

NOTE

This section describes the removal and installation of the left instrument panel trim cover, and the removal and installation of the right instrument panel trim cover can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the instrument panel trim cover.

a. Release the 6 clips -arrow- of the instrument panel trim cover, and remove the instrument panel trim cover ①.

SETUP

1. The installation procedure is performed in reverse order.

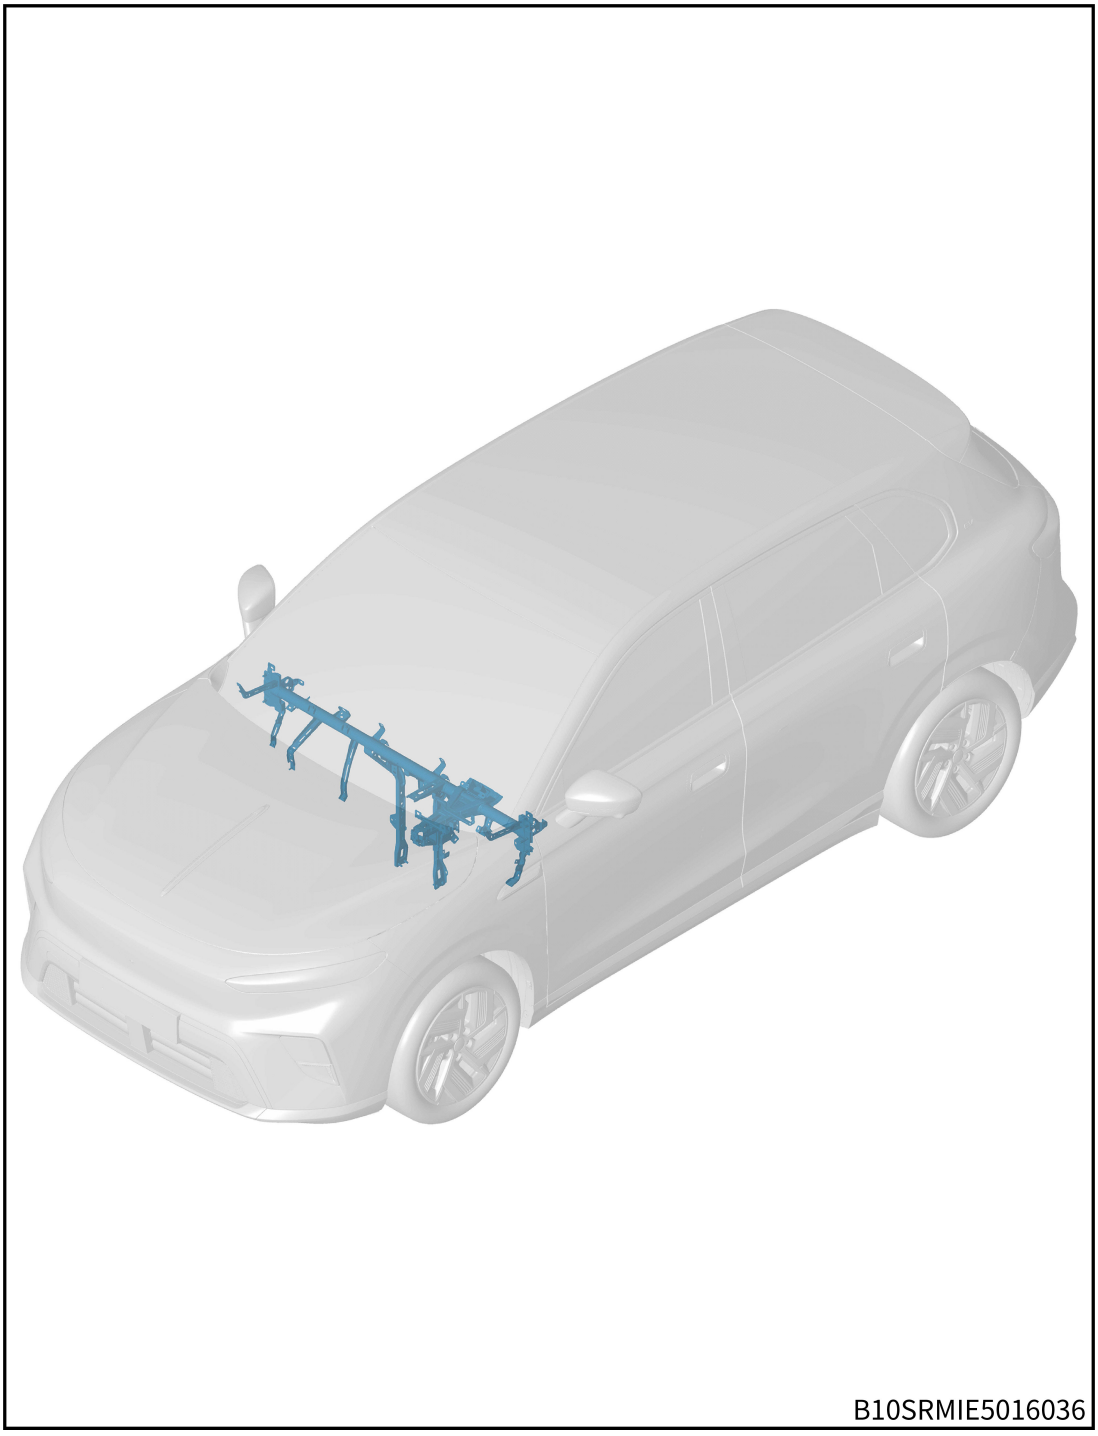
7.15 INSTRUMENT PANEL CROSSBEAM SYSTEM

7.15.1 PRECAUTIONS



PRECAUTIONS

1. When repairing the instrument panel, whether on the vehicle or on a workbench, a ground wire connected to the vehicle body should be attached to discharge static charges into the ground.
2. Storage of components: Spare components for the instrument panel are stored in nickel-plated packaging bags, and should be removed during installation, not in advance. When removing them, do not touch the conductive contacts.
3. After removing the instrument panel, cover it with a protective cover to prevent it from being scratched.
4. When repairing or removing the airbag, the airbag must always be placed facing upwards.
5. When replacing any airbag component, perform a self-diagnostic operation to thoroughly check whether the airbag system is functioning properly.
6. When repairing or removing trim parts, check whether the retaining clips are damaged, and replace them if necessary.

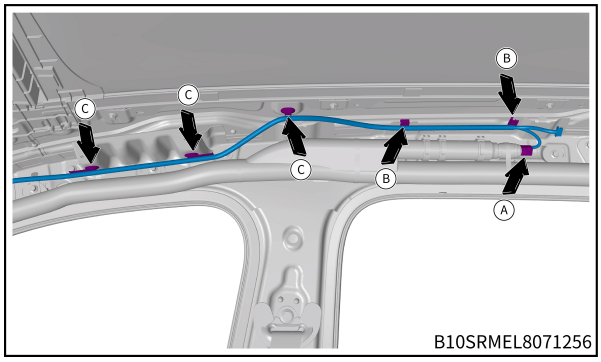
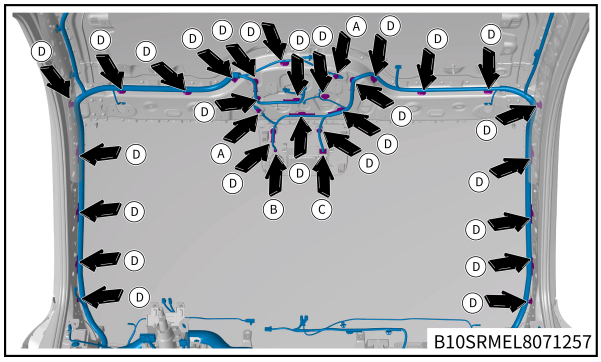
7.15.6 SERVICE AND REPAIR GUIDANCE

INSTRUMENT PANEL CROSS CAR BEAM ASSEMBLY



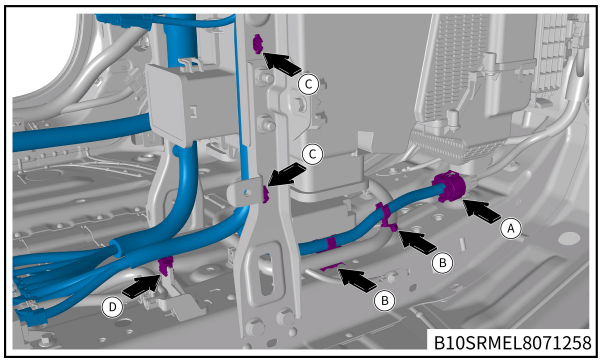
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the mechanical steering column with intermediate shaft assembly.
   See:Electric Power Steering Column with Intermediate Shaft Assembly (page 3081)
4. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
5. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
6. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
7. Remove the 4G integrated antenna assembly.
   See:4G Integrated Antenna Assembly (page 9638)
8. Remove the telematics control unit.
   See:Telematics Control Unit (page 8541)
9. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5311)
10. Remove the front wiper motor and linkage assembly.
    See:Front wiper motor and linkage assembly (page 9492)
11. Remove the left/right front seat assembly.
    See:Front left seat assembly (page 6267)
12. Remove the headliner assembly.
    See:Headliner assembly (Panoramic roof) (page 5528)
13. Remove the left/right lower bracket of the instrument panel crossmember.
    See:Lower left bracket of instrument panel cross car beam (page 5512)
14. Remove the combination switch assembly.
    See:Combination switch (page 8635)
15. Remove the instrument panel crossbeam assembly.

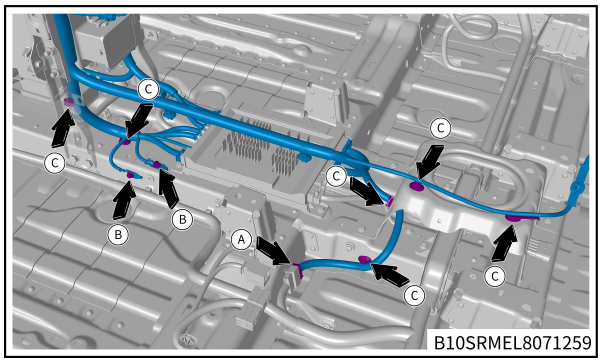


a. Disconnect the 2 connectors - Arrow A - between the instrument panel wiring harness and the liftgate wiring harness, and release the connector retaining clips.
   Recommended tool: Clip remover
b. Disconnect the 1 connector between the instrument panel wiring harness and the left side curtain airbag -Arrow B-, and release the 13 retaining clips of the instrument panel wiring harness -Arrow C-.
   Recommended tool: Clip remover

© 2026, All rights reserved

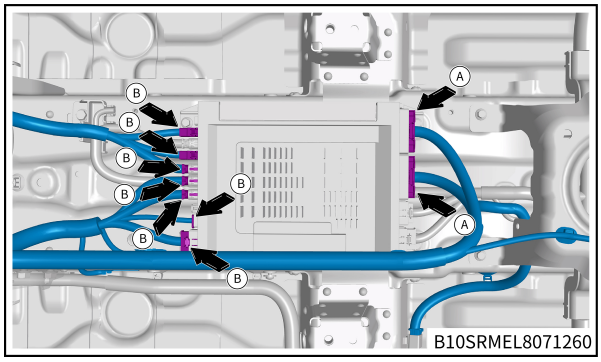


c. Disconnect the 1 connector between the instrument panel wiring harness and the right curtain airbag -Arrow A-, and detach the 5 retaining clips securing the instrument panel wiring harness to the vehicle body -Arrow B-, -Arrow C-.
Recommended tool: Clip remover

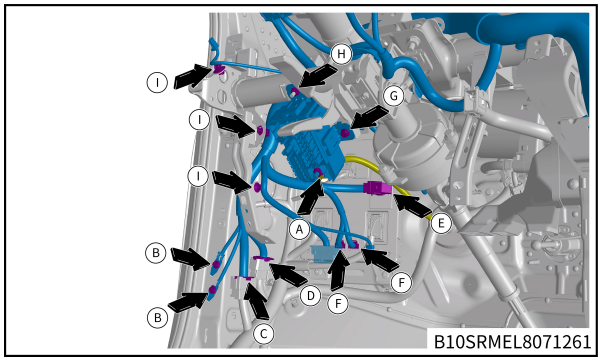


d. Unscrew the 2 fixing bolts of the ground wire for the instrument panel wiring harness -Arrow A-, and disconnect the 1 connector between the instrument panel wiring harness and the rain and light sensor -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

e. Disconnect the 1 connector -arrow C- between the instrument panel harness and the forward-facing monocular camera assembly, and release the 26 retaining clips -arrow D- of the instrument panel harness.
Recommended tool: Clip remover



f. Disconnect the 1 connector between the instrument wire harness and the engine compartment wire harness -Arrow A-, and release the 5 retaining clips of the instrument wire harness -Arrow B-, -Arrow C-, -Arrow D-.
Recommended tool: Clip remover



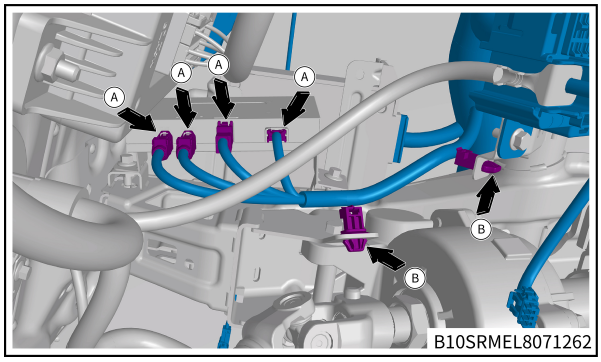
g. Disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow A-, and unscrew the 2 fixing bolts of the ground wire of the instrument wiring harness -Arrow B-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

h. Disconnect the 6 retaining clips of the instrument wiring harness - arrow C -.
Recommended tool: Clip remover

© 2026, All rights reserved

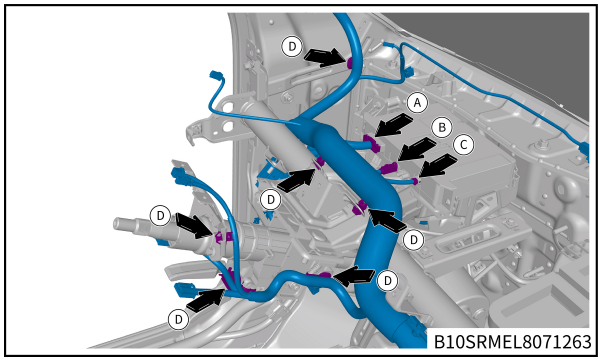
i. Disconnect the 9 connectors between the instrument panel wiring harness and the multi-domain fusion controller - Arrow A -, - Arrow B -.

j. Unscrew the 1 fixing nut connecting the engine compartment wiring harness to the instrument wiring harness fuse box -Arrow A-, and move the engine compartment wiring harness aside.
Recommended tool: 10mm socket
Torque: 15±1.5N m



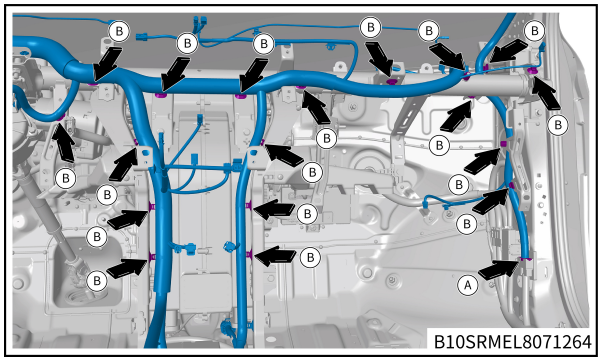
k. Unscrew the 2 fixing bolts for the ground wire of the instrument wiring harness -arrow B-, and disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -arrow C-.
Recommended tool: 8mm socket
Torque: 9±1N m

l. Disconnect the 1 connector -Arrow D- between the instrument panel wiring harness and the engine compartment wiring harness, and disconnect the 3 connectors -Arrow E- and -Arrow F- between the instrument panel wiring harness and the main zone controller.

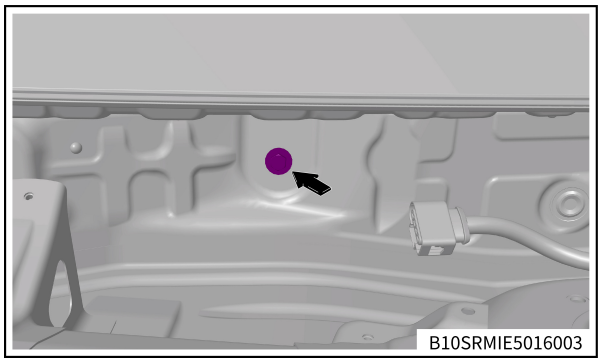


m. Unscrew 1 mounting bolt -arrow G- of the instrument wire harness fuse box, and unscrew 1 mounting nut -arrow H- of the instrument wire harness fuse box.
Recommended tools: 10mm socket, clip remover
-Arrow G-Torque: 9±1N m
-Arrow H- Torque: 9±1 N m

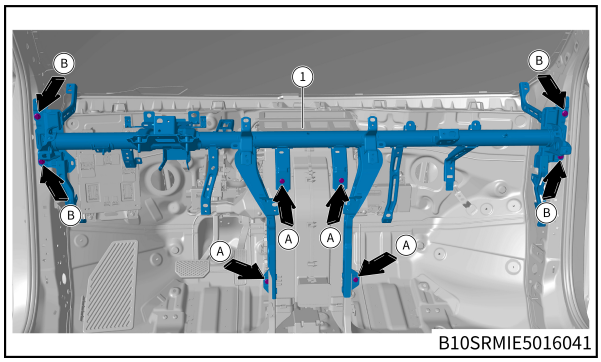
n. Release the 3 retaining clips of the instrument panel wiring harness -arrow I-.
Recommended tool: Clip remover



© 2026, All rights reserved



o. Disconnect the 4 connectors between the instrument wiring harness and the DAB head unit assembly -arrow A-, and release the 2 retaining clips of the instrument wiring harness -arrow B-.
Recommended tool: Clip remover



p. Disconnect the 3 connectors between the instrument panel wiring harness and the telematics host -Arrow A-, -Arrow B-, -Arrow C-, and release the 6 retaining clips of the instrument panel wiring harness -Arrow D-.
Recommended tool: Clip remover

q. Disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow A-, and release the 18 retaining clips of the instrument wiring harness -Arrow C-.
Recommended tool: Clip remover

r. Unscrew the 1 fixing bolt -arrow- connecting the instrument panel cross car beam assembly to the dash panel assembly.
Recommended tool: 13mm socket
Torque: 23±2N m

s. Unscrew the 4 mounting bolts -Arrow A- connecting the instrument panel crossmember assembly to the housing and evaporator assembly.
Recommended tools: 10mm socket, 8mm socket
—Arrow A-Torque: 6±1N m
—Arrow B-Torque: 6±1N m

t. Unscrew the 4 mounting bolts -Arrow B- connecting the instrument panel cross car beam assembly to the vehicle body, and

© 2026, All rights reserved

remove the instrument panel cross car beam assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   c. After installation, check whether the relevant electrical components can function properly.

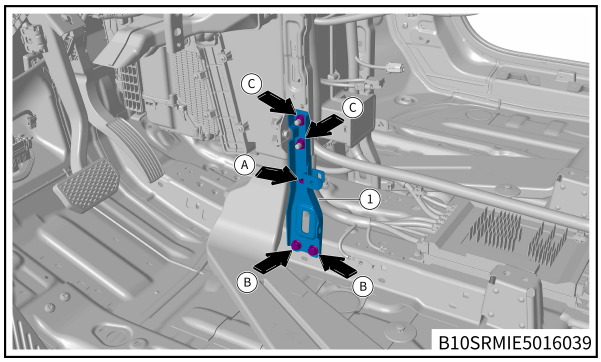
LOWER LEFT BRACKET OF INSTRUMENT PANEL CROSS CAR BEAM

NOTE



This section describes the removal and installation of the lower left bracket of the instrument panel crossbeam; the removal and installation of the lower right bracket of the instrument panel crossbeam can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
5. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
6. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
7. Remove the lower left bracket of the instrument panel crossbeam.

a. Lift up the front left part of the carpet assembly ①.

b. Release 1 retaining clip of the instrument panel wiring harness - arrow A -, and unscrew 2 retaining bolts of the lower left bracket of the instrument panel crossmember - arrow B -.
   Recommended tools: 13mm socket, clip remover
   Torque: 23±2N m
c. Unscrew the 2 fixing nuts of the lower left bracket of the instrument panel crossbeam -arrow C-, and remove the lower left bracket of the instrument panel crossbeam ①.
   Recommended tool: 13mm socket
   Torque: 23±2N m

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. Tighten the bolts/nuts to the specified torque.

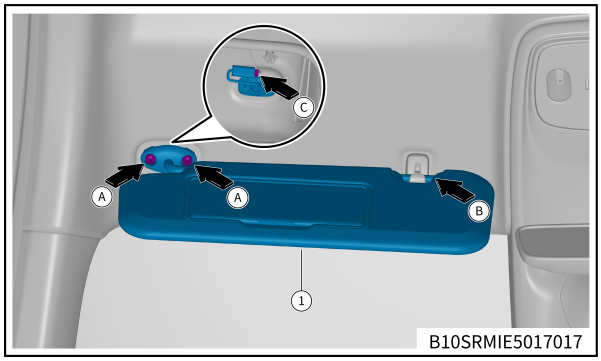
7.16.6 SERVICE AND REPAIR GUIDANCE



LEFT SUN VISOR ASSEMBLY

NOTE

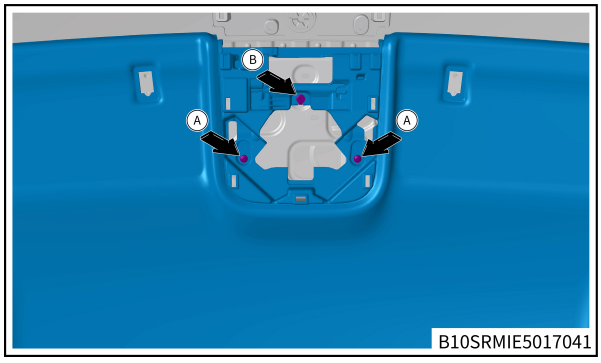
This section describes the removal and installation of the left sun visor assembly; the removal and installation of the right sun visor assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the cover of mounting base A.
   See:Fixed seat A cover (page 5531)
4. Remove the left sun visor assembly.

a. Fold down the left sun visor and unscrew the 2 mounting screws of the left sun visor assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 5±1N m
b. Release the 1 retaining clip -arrow B- between the left sun visor assembly and retainer B, and remove the left sun visor assembly ①.
c. Disconnect 1 connector of the left sun visor assembly -arrow C-, and remove the left sun visor assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

HEADLINER ASSEMBLY (FULL BLACKOUT HEADLINER)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
4. Remove the left/right upper B-pillar interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
5. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
6. Remove the left/right mounting bracket B.
   See:Mount B (page 5527)
7. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5522)
8. Remove the rear roof left/right grab handle mounting bracket assembly.
   See:Rear roof left grab handle mounting bracket assembly (page 5526)
9. Remove the front passenger's folding roof handle assembly.
   See:Front passenger folding roof handle assembly (page 5525)
10. Remove the monocular upper cover assembly.
    See:Monocular upper cover assembly (page 5388)
11. Remove the headliner assembly.

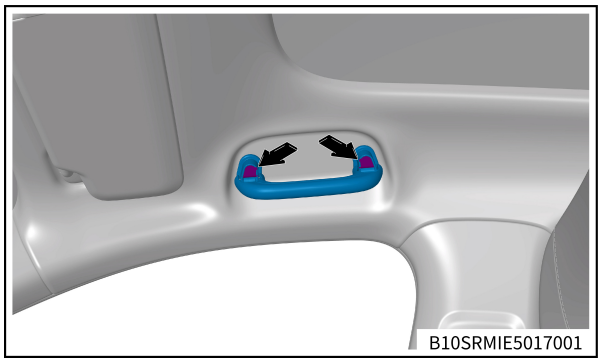
a. Unscrew the 2 mounting bolts of the headliner assembly -arrow A-, and disengage the 1 retaining clip of the headliner assembly -arrow B-.
Recommended tool: Phillips screwdriver
Torque: 5±1N m

b. Release the 2 retaining clips of the headliner assembly, release the 2 hook-and-loop fasteners of the headliner assembly -arrow-, and remove the headliner assembly ①.

SETUP

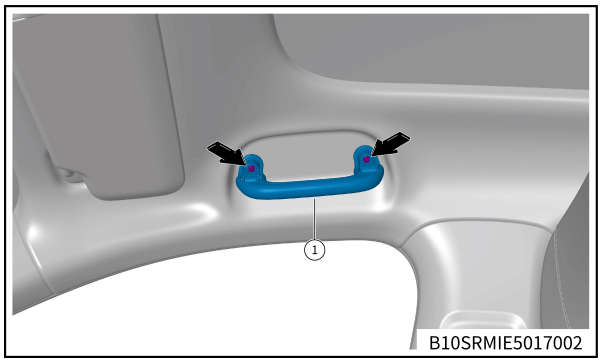
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



FRONT PASSENGER FOLDING ROOF HANDLE ASSEMBLY

REMOVAL PROCEDURE

1. Remove the front passenger's folding roof handle assembly.

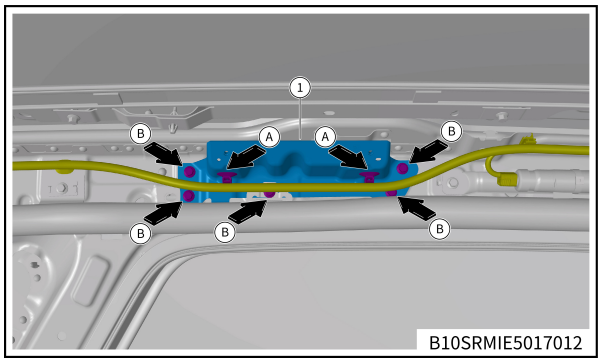
a. Release the 2 retaining clips - arrow - of the bolt cover for the front passenger folding roof handle assembly, and open the bolt cover.

b. Unscrew the 2 mounting bolts -arrow- of the front passenger folding roof grab handle assembly, and remove the front passenger folding roof grab handle assembly ①.
Recommended tool: T25 Torx wrench
Torque: 3±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



REAR ROOF LEFT GRAB HANDLE MOUNTING BRACKET ASSEMBLY

NOTE

This section describes the removal and installation of the rear roof left grab handle mounting bracket assembly, and the removal and installation of the rear roof right grab handle mounting bracket assembly can generally follow the procedures for the left side.

REMOVAL PROCEDURE

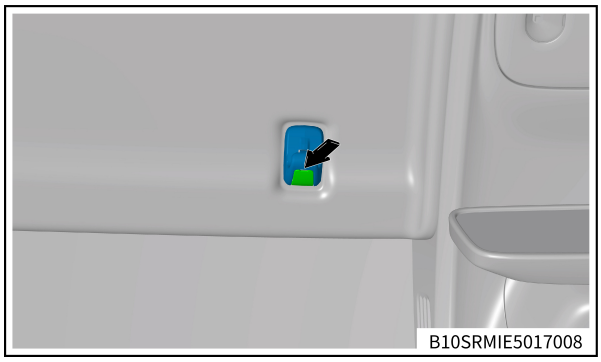
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page 5523)
4. Remove the rear roof left grab handle mounting bracket assembly.

a. Release the 2 retaining clips -arrow A- of the instrument panel wiring harness, and move the instrument panel wiring harness aside.
   Recommended tool: Clip remover
b. Unscrew the 5 fixing bolts -Arrow B- of the rear roof left handle mounting bracket assembly, and remove the rear roof left handle mounting bracket assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

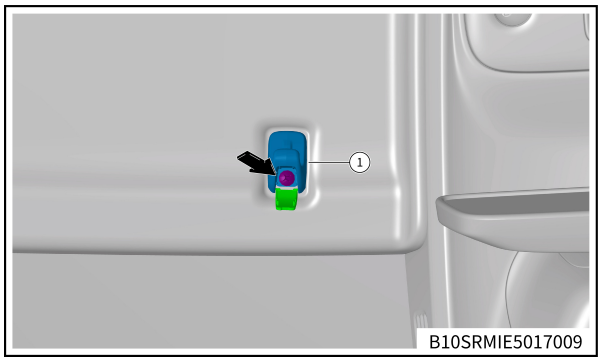
1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolt to the specified torque.

© 2026, All rights reserved



MOUNT B

NOTE



This section describes the removal and installation of the left fixed seat B. The removal and installation of the right fixed seat B can generally refer to the left side.

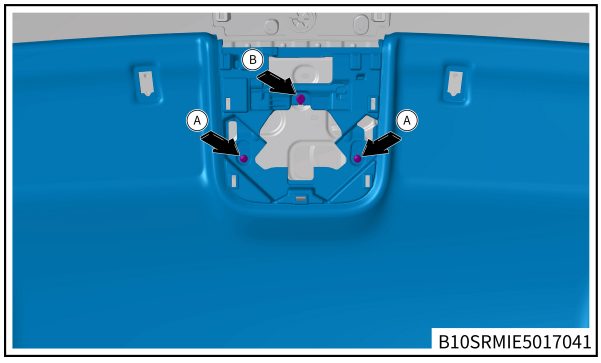
REMOVAL PROCEDURE

1. Remove mounting bracket B.

a. Flip down the left sun visor, release 1 retaining clip -arrow- of the mounting bracket B screw cover, and open the mounting bracket B screw cover.

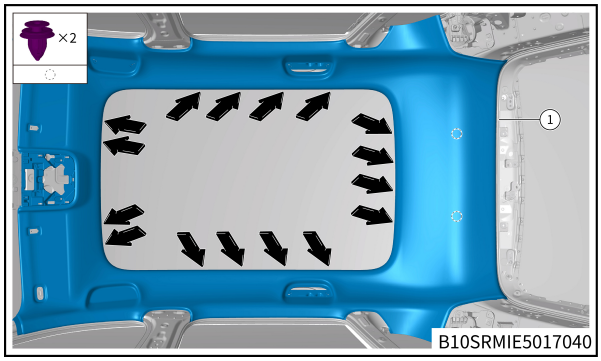
b. Unscrew the 1 fixing screw -arrow- of mounting bracket B, and remove mounting bracket B ①.
Recommended tool: Phillips screwdriver
Torque: 5±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



HEADLINER ASSEMBLY (PANORAMIC ROOF)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
4. Remove the left/right upper B-pillar interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
5. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
6. Remove the left/right mounting bracket B.
   See:Mount B (page 5527)
7. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5522)
8. Remove the rear roof left/right grab handle mounting bracket assembly.
   See:Rear roof left grab handle mounting bracket assembly (page 5526)
9. Remove the front passenger's folding roof handle assembly.
   See:Front passenger folding roof handle assembly (page 5525)
10. Remove the monocular upper cover assembly.
    See:Monocular upper cover assembly (page 5388)
11. Remove the headliner assembly.

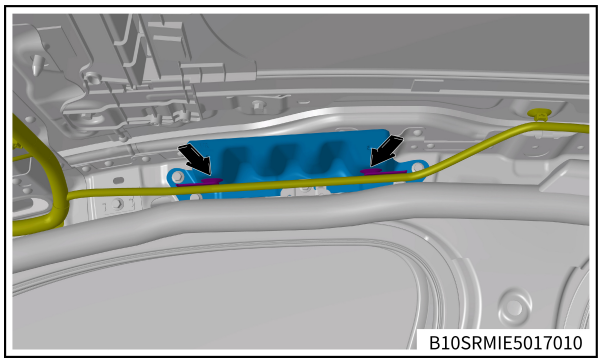
a. Unscrew the 2 fixing screws -Arrow A- of the headliner assembly, and disengage the 1 retaining clip -Arrow B- of the headliner assembly.
Recommended tool: Phillips screwdriver
Torque: 5±1N m

b. Release the 2 retaining clips of the headliner assembly, release the 15 hook-and-loop fasteners -arrow- of the headliner assembly, and remove the headliner assembly ①.

SETUP

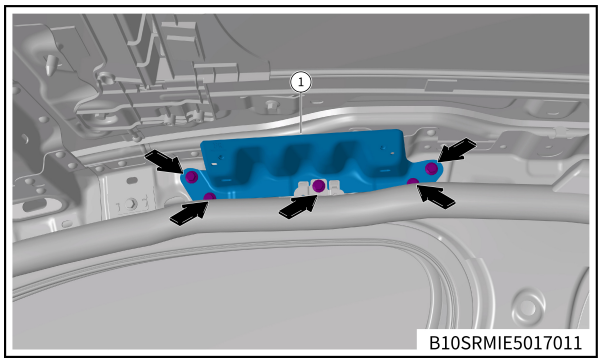
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved



FRONT PASSENGER HEADLINER GRAB HANDLE MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page 5523)
4. Remove the front passenger roof grab handle mounting bracket assembly.

a. Release the 2 retaining clips -arrow- of the instrument panel wiring harness, and move the instrument panel wiring harness aside.
Recommended tool: Clip remover

b. Unscrew the 5 fixing bolts -arrow- of the front passenger roof grab handle mounting bracket assembly, and remove the front passenger roof grab handle mounting bracket assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolt to the specified torque.

FIXED SEAT A COVER

NOTE

This section describes the removal and installation of the left fixed seat A cover, and the removal and installation of the right fixed seat A cover can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the cover of mounting base A.

a. Flip down the left sun visor, release the 4 retaining clips of the mounting bracket A cover -arrow-, and remove the mounting bracket A cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

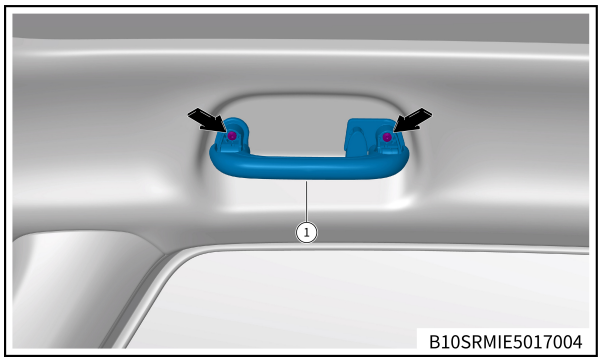
REAR FOLDING ROOF LEFT HANDLE ASSEMBLY

NOTE



This section describes the removal and installation of the left handle assembly for the rear folding roof, and the removal and installation of the right handle assembly for the rear folding roof can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the left handle assembly of the rear folding roof.

a. Release the 2 retaining clips (- arrow -) of the bolt cover for the rear folding roof left handle assembly, and open the bolt cover.

b. Unscrew the 2 mounting bolts -arrow- of the rear folding roof left handle assembly, and remove the rear folding roof left handle assembly ①.
Recommended tool: T25 Torx wrench
Torque: 3±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

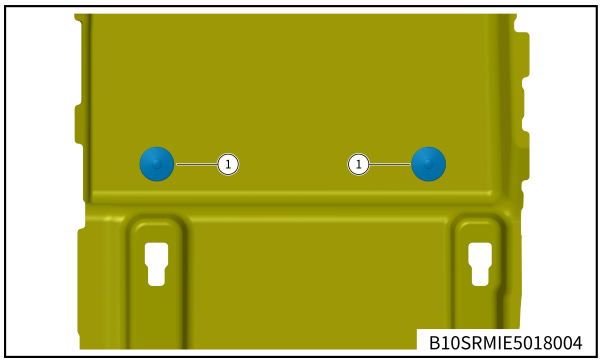
FLOOR MAT CLIP

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
5. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
6. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
7. Remove the floor mat clip.

a. Lift up the front left part of the driver's carpet ①.

b. Disengage the 2 retaining clips of the floor mat clip -arrow-.
Recommended tool: Flathead screwdriver

c. Remove the floor mat clip ①.

REAR SEAT CUSHION EPP ASSEMBLY

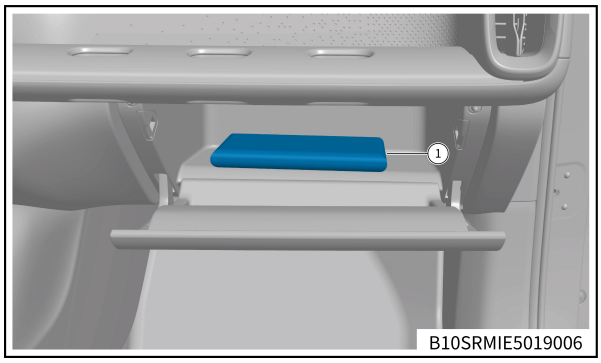
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page)
4. Remove the left/right rear door sill trim panel assembly.
   See:Rear left sill trim panel assembly (page 5406)
5. Remove the fixing clips at the front of the rear seat cushion.
   See:Rear seat cushion front fixing bracket (page)
6. Remove the rear seat cushion EPP assembly.

a. Lift the rear part of the driver's floor carpet ①.

b. Unscrew 1 fixing nut of the DCDC positive wire harness assembly - Arrow A -, and move aside the DCDC wire harness assembly and the rear seat belt buckle.
Recommended tool: 13mm socket
Torque: 15±1N m
c. Unscrew the 4 fixing bolts -Arrow B- of the rear seat cushion EPP assembly, and remove the rear seat cushion EPP assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, test the relevant electrical components to ensure they function properly.

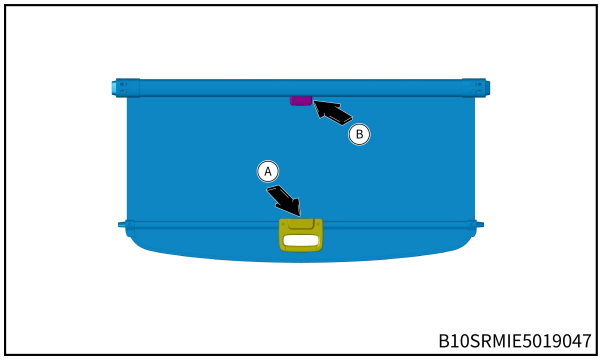
CARGO COVER ASSEMBLY

REMOVAL PROCEDURE

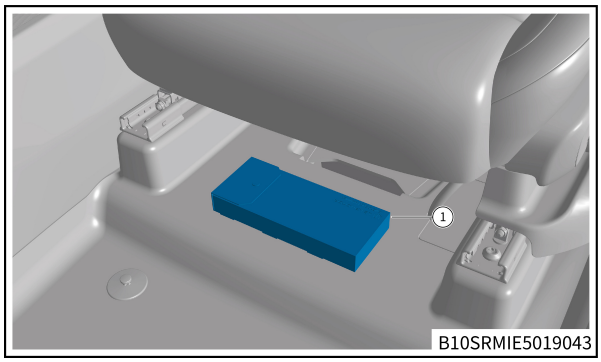


1. Open the liftgate assembly.
2. Remove the cargo cover assembly.

a. Release the retaining clip of the cargo cover assembly -Arrow A-, and retract the cargo cover.
b. Detach both ends of the cargo cover assembly from the vehicle body in the direction of arrow B, and remove the cargo cover assembly ①.

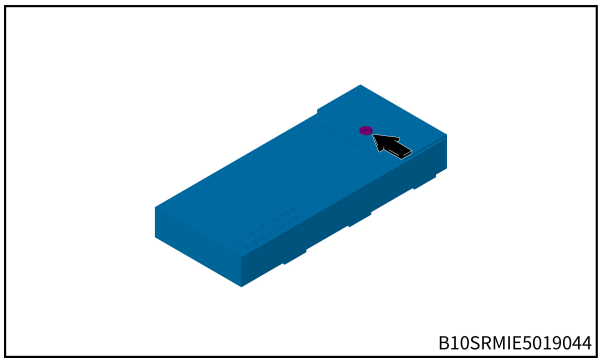
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:



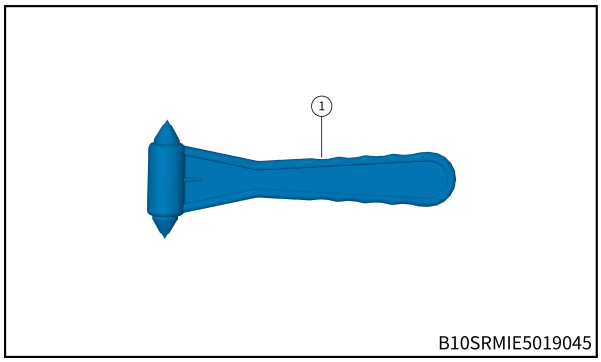
a. Release the retaining clip of the cargo cover assembly -Arrow A-, and retract the cargo cover.
b. When installing the cargo cover, ensure it is securely installed to prevent injury to occupants in the event of an emergency.
c. The removed cargo cover must be stored properly to avoid injuring occupants in the event of an emergency.
d. Do not place any items on the cargo cover to avoid damaging it and injuring occupants in the event of an emergency.
e. When retracting the cargo cover fabric, ensure it is fully retracted. Insert the fixing slot of the cargo cover fabric - arrow A - into the fixing clip of the cargo cover - arrow B - to avoid damaging the cargo cover and causing abnormal noises while driving.

© 2026, All rights reserved



EMERGENCY HAMMER

REMOVAL PROCEDURE



1. Remove the emergency hammer.

a. Open the left front door assembly, and remove the emergency hammer ① under the left front seat.

b. Release the retaining clip of the packaging box -arrow- and open the emergency hammer packaging box.

b. Remove the emergency hammer ①.

SETUP

1. The installation procedure is performed in reverse order.

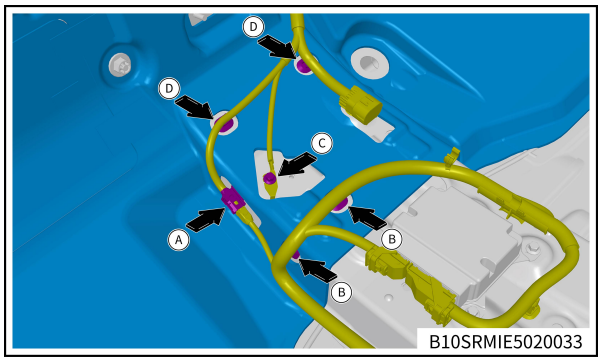
INNER DASH PANEL SOUND INSULATION PAD

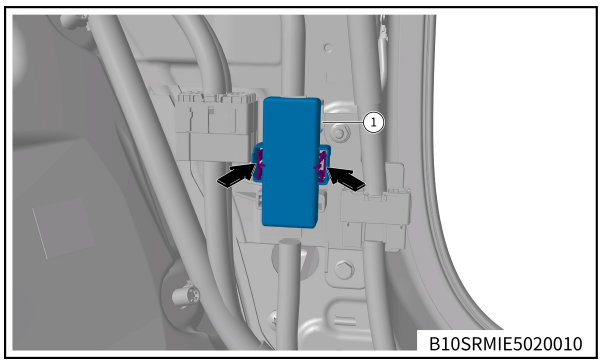
REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
5. After removing the center console, install the rear mounting bracket assembly.
   See:Center console rear mounting bracket assembly (page 5485)
6. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
7. Remove the automatic HVAC assembly.
   See:Automatic HVAC Assembly (page 5188)
8. Remove the thermal management controller.
   See:Thermal Management Controller (page 5170)
9. Remove the brake pedal assembly.
   See:Brake Pedal Assembly (page 3201)
10. Remove the electronic accelerator pedal assembly.
    See:Electronic Accelerator Pedal Assembly (page 3196)
11. Remove the electronic accelerator pedal mounting bracket.
    See:Electronic accelerator pedal mounting bracket (page 3200)
12. Remove the left/right lower A-pillar interior trim panel assembly.
    See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
13. Remove the main zone controller.
    See:Master Zone Controller (page 6640)
14. Remove the multi-domain fusion controller.
    See:Multi-domain fusion controller (page 8537)
15. Remove the electric power steering column with intermediate shaft assembly.
    See:Electric Power Steering Column with Intermediate Shaft Assembly (page 3081)
16. Remove the inner dash panel sound insulation pad.

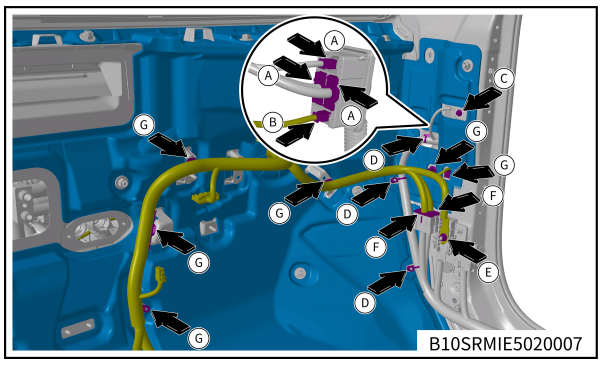
a. Disconnect the 4 connectors between the floor wiring harness and the front left door wiring harness -Arrow A-, and unscrew the 1 fixing bolt of the floor wiring harness ground wire -Arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the 1 connector between the floor wiring harness and the engine compartment wiring harness -arrow C-, and release the 3 retaining clips of the floor wiring harness -arrow D-.
   Recommended tool: Clip remover

© 2026, All rights reserved



c. Release the 2 retaining clips of the engine compartment wiring harness -arrow E-.
Recommended tool: Clip remover

B10SRMIE5020033



d. Disconnect the 1 connector between the engine compartment wiring harness and the floor wiring harness -arrow A-, release the 2 retaining clips of the floor wiring harness -arrow B-, and release the connector retaining clip.
Recommended tool: Clip remover

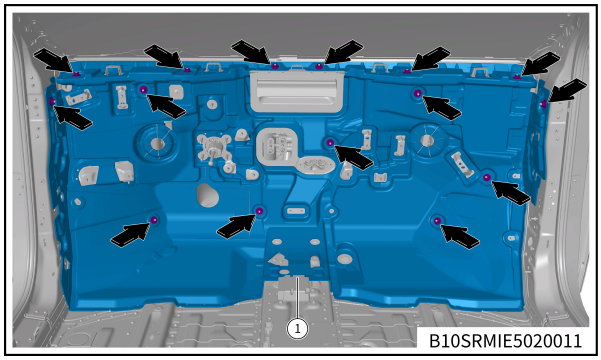
e. Unscrew the 1 fixing bolt of the engine compartment wiring harness ground wire -Arrow C-, and unclip the 2 fixing clips of the engine compartment wiring harness -Arrow D-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

B10SRMIE5020010

f. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.

B10SRMIE5020007

g. Disconnect the 3 connectors between the floor wire harness and the right front door wire harness -arrow A-, and disconnect the 1 connector between the engine compartment wire harness and the floor wire harness -arrow B-.



h. Unscrew the 1 mounting bolt of the floor wire harness ground wire -Arrow C-, and release the 3 retaining clips of the floor wire harness -Arrow D-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

i. Unscrew the 1 fixing nut connecting the engine compartment wiring harness and the floor wiring harness - arrow E -, and disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness - arrow F -.
Recommended tool: 13mm socket

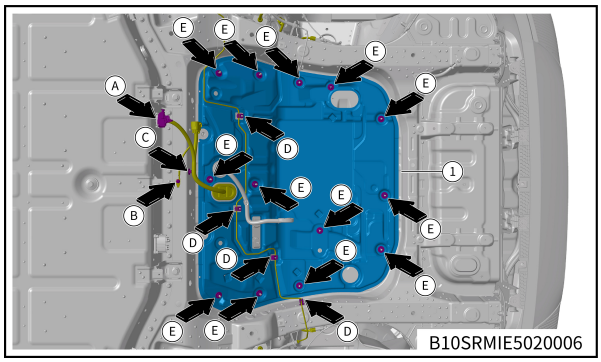
© 2026, All rights reserved

Torque: 15±1.5N m

j. Disconnect the 6 retaining clips of the engine compartment wiring harness - arrow G -.
Recommended tool: Clip remover

k. Unscrew the 15 plastic nuts -arrow- of the front dash inner sound insulation pad, and remove the front dash inner sound insulation pad ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

REAR FLOOR OUTER SOUND INSULATION PAD

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear subframe assembly.
   See:Rear subframe assembly (page 2920)
4. Remove the outer sound insulation pad of the rear floor.

a. Disconnect 1 connector between the floor wiring harness and the battery pack -arrow A-, and unscrew 1 fixing bolt of the floor wiring harness ground wire harness -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Release 1 retaining clip of the floor wire harness -Arrow C-, and release 4 single-groove tube clamps of the right rear No. 2 brake hard pipe assembly -Arrow D-.
   Recommended tool: Clip remover
c. Unscrew the 13 plastic nuts of the outer rear floor sound insulation pad - Arrow E -, and remove the outer rear floor sound insulation pad ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

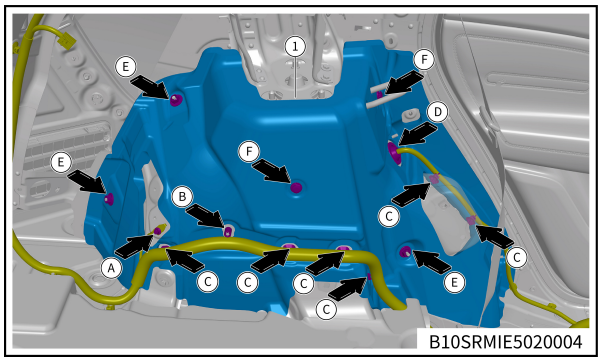
LEFT REAR INNER WHEELHOUSE SOUND INSULATION PAD

NOTE



This section describes the removal and installation of the rear left inner wheelhouse sound insulation pad, and the removal and installation of the rear right inner wheelhouse sound insulation pad can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the rear left sill bracket.
   See:Rear left sill bracket (page 5407)
5. Remove the left mounting bracket assembly of the rear seatback.
   See:Rear seat backrest left mounting bracket assembly (page)
6. Remove the subwoofer assembly.
   See:Subwoofer Assembly (page 9478)
7. Remove the left rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
8. Remove the rear left inner wheelhouse soundproofing pad.

a. Disconnect the 1 connector -arrow A- between the floor wiring harness assembly and the drive brake motor, and release the 2 retaining clips -arrow B- of the floor wiring harness assembly.
b. Disconnect the 1 connector between the floor wiring harness assembly and the rear left intelligent wheel speed sensor -arrow C-, and release the 3 retaining clips of the floor wiring harness assembly -arrow D-.
Recommended tool: Clip remover

c. Unscrew the 1 mounting bolt of the floor wiring harness ground wire -Arrow A-, and release the 7 retaining clips of the floor wiring harness assembly -Arrow B-, -Arrow C-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m
d. Disconnect 1 grommet of the floor wiring harness assembly -Arrow D-, and move the floor wiring harness assembly aside.

© 2026, All rights reserved

e. Unscrew the 3 plastic nuts of the left rear inner wheelhouse sound insulation pad -Arrow E-, and release the 2 retaining clips of the left rear inner wheelhouse sound insulation pad -Arrow F-.
Recommended tool: Clip remover
f. Remove the left rear inner wheelhouse sound insulator ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

LEFT SOUND ABSORBER

NOTE

This section describes the removal and installation of the sound-absorbing cotton on the left side, and the removal and installation of the sound-absorbing cotton on the right side can generally follow the procedure for the left side.

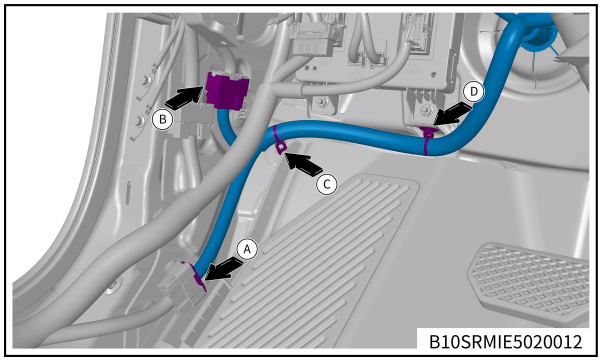
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the subwoofer assembly.
   See:Subwoofer Assembly (page 9478)
5. Remove the left sound insulation cotton.

a. Remove the left sound absorber ①.

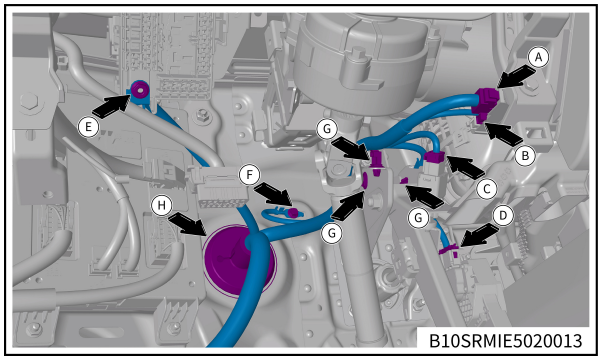
SETUP

1. The installation procedure is performed in reverse order.



© 2026, All rights reserved

DASH PANEL OUTER HEAT SHIELD



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. After removing the center console, install the rear mounting bracket assembly.
   See:Center console rear mounting bracket assembly (page 5485)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
7. Remove the left/right front seat assembly.
   See:Front left seat assembly (page 6267)
8. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
9. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
10. Remove the front compartment storage box assembly.
    See:Front compartment storage box assembly (page 5302)
11. Remove the cowl panel grille assembly.
    See:Cowl Grille Assembly (page 5311)
12. Remove the battery assembly.
    See:Battery Assembly (page 9594)
13. Remove the battery tray.
    See:Battery tray (page 9595)
14. Remove the super integrated module.
    See:Super Integrated Module (page 5226)
15. Remove the interior condenser liquid outlet pipe.
    See:Interior condenser liquid outlet pipe (page 5165)
16. Remove the interior condenser inlet pipe.

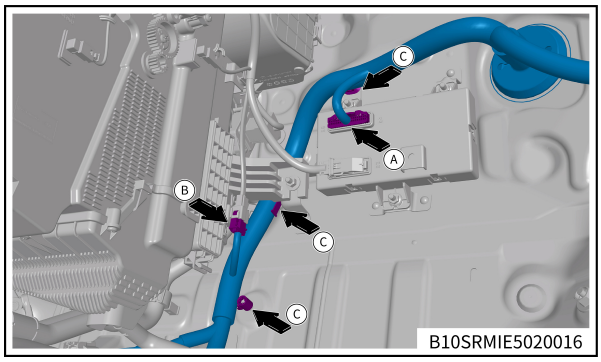
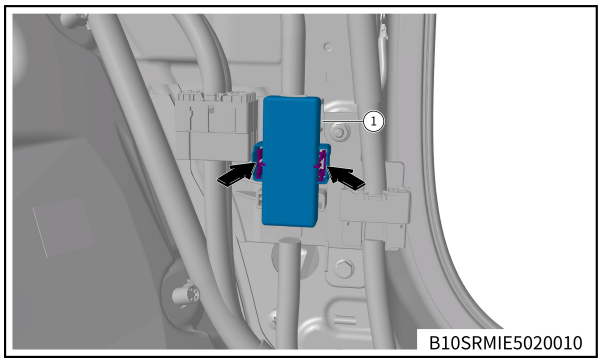
a. Disconnect 1 connector between the engine compartment harness and the floor harness -arrow A-, disconnect 1 connector between the engine compartment harness and the instrument panel harness -arrow B-, and release the connector retaining clips.
b. Release the 2 retaining clips of the engine compartment wiring harness -Arrow C-, -Arrow D-.
Recommended tool: Clip remover



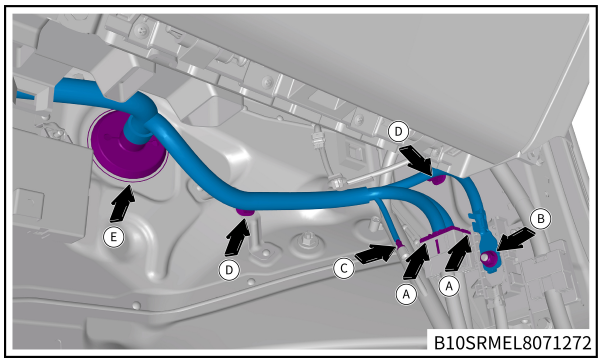
c. Disconnect the 2 connectors, -Arrow A- and -Arrow B-, between the engine compartment wiring harness and the electric steering column with intermediate shaft assembly, and disconnect the 1 connector, -Arrow C-, between the engine compartment wiring harness and the brake light switch.
d. Disconnect the 1 connector between the engine compartment wiring harness and the electronic accelerator pedal - arrow D -, and unscrew the 1 fixing nut between the engine compartment wiring harness and the instrument wiring harness fuse box - arrow E -.
Recommended tool: 13mm socket
Torque: 15±1.5N m
e. Unscrew 1 fixing bolt for the ground wire of the engine compartment wiring harness -Arrow F-, and unclip 3 fixing clips of the engine compartment wiring harness -Arrow G-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m
f. Detach 1 grommet of the engine compartment wiring harness -arrow H-, and feed out the left engine compartment wiring harness.

g. Unscrew the 1 fixing bolt for the ground wire of the engine compartment wiring harness -Arrow A-, and disconnect the 1 connector between the engine compartment wiring harness and the instrument panel wiring harness -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m



© 2026, All rights reserved

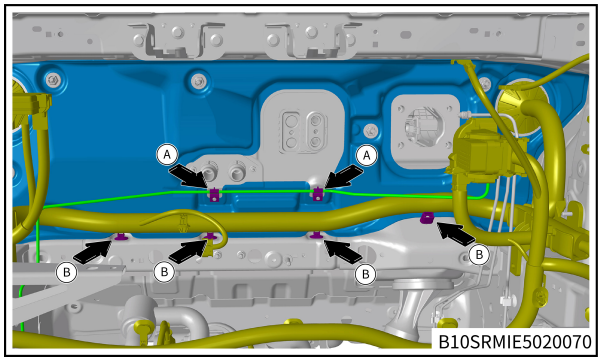
h. Disconnect the 1 connector between the engine compartment harness and the floor harness -Arrow C-, and release the 2 retaining clips of the engine compartment harness -Arrow D-.
Recommended tool: Clip remover



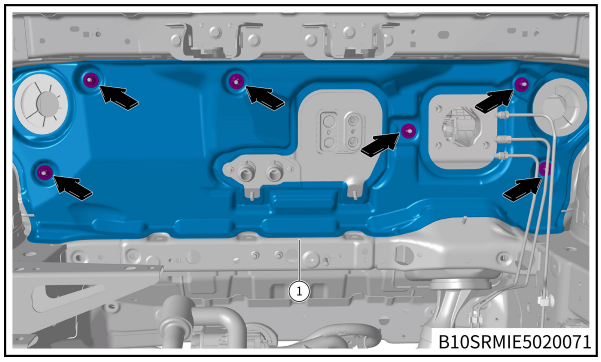
i. Disconnect 1 connector between the engine compartment wiring harness and the thermal management controller -Arrow A-, and disconnect 1 connector between the engine compartment wiring harness and the HVAC wiring harness -Arrow B-.

j. Unclip the 3 retaining clips of the engine compartment wiring harness - Arrow C -.
Recommended tool: Clip remover

k. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.



l. Disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness - arrow A -, and unscrew the 1 fixing nut securing the engine compartment wiring harness to the floor wiring harness - arrow B -.
Recommended tool: 13mm socket
Torque: 15±1.5N m



m. Disconnect the 1 fixing connector of the rear washer line - arrow C -, and detach the 2 fixing clips of the engine compartment wiring harness - arrow D -.
Recommended tool: Clip remover

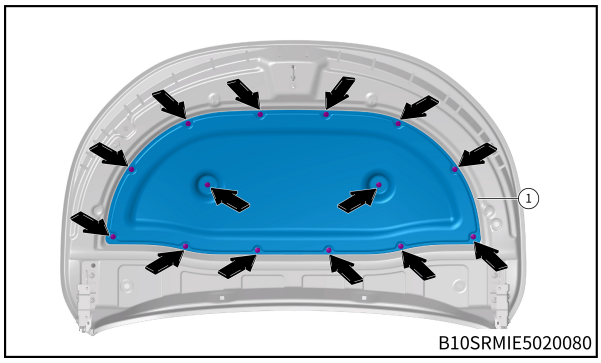
n. Disconnect 1 rubber grommet of the engine compartment wiring harness - Arrow E -, and route out the right engine compartment wiring harness.

© 2026, All rights reserved

o. Release the 2 retaining clamps for the brake lines - arrow A -, and release the 4 retaining clips for the engine compartment wiring harness - arrow B -.
Recommended tool: Clip remover

p. Release the 6 retaining clips -arrow- of the outer dash panel heat insulator, and remove the outer dash panel heat insulator ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT HOOD INSULATION PAD

REMOVAL PROCEDURE

1. Open the hood.
2. Remove the front hood insulation pad.

a. Release the 14 retaining clips -arrow- of the front bonnet insulation pad, and remove the front bonnet insulation pad ①.

SETUP

1. The installation procedure is performed in reverse order.

7.20 STEERING WHEEL AND AIRBAG SYSTEM

7.20.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

WARNING

- During maintenance or replacement, improper or incorrect operations may cause unintended airbag deployment, resulting in personal injury or vehicle damage. Meanwhile, improper maintenance may also lead to airbag failure. Therefore, only professionally trained technicians are qualified to service and replace the airbag system.
- Except for the operations described in this manual, it is prohibited to use electrical equipment to operate any circuit of the airbag system. The airbag system circuits can be identified by the yellow wiring harness or connectors.

ATTENTION

- Faults in the airbag system are difficult to diagnose, and the diagnostic trouble codes stored in the memory by the self-diagnostic system are an important source of information for troubleshooting. Therefore, before inspecting and troubleshooting the airbag system, the diagnostic trouble codes must be read before disconnecting the negative battery cable.
- The inspection must be performed after the vehicle is powered off and the negative battery terminal has been disconnected for 90s or longer. Because the airbag control unit has a backup power supply, performing the inspection within 90s after disconnecting the battery terminal may cause the airbag to deploy accidentally.

NOTE

The backup power supply in the airbag control unit is provided to ensure the airbag system remains functional after the power output from the vehicle battery and alternator is cut off. It consists of a power control circuit and several capacitors.

1. Both the airbag and its connectors are equipped with a shorting bar (copper spring clip) mechanism to prevent inadvertent airbag deployment. Its function is to automatically short the two lead terminals of the plug or socket on the side adjacent to the airbag igniter when the connector is disconnected. This structure prevents the ignition circuit from being closed by static electricity or inadvertent energization, thereby avoiding accidental airbag deployment.
2. The airbag system has stringent requirements for its components, all of which are single-use components. Damaged airbag-related components must never be repaired and reused. Airbag-related components include the driver airbag assembly, front passenger airbag assembly, seat belt pretensioner, airbag control module assembly, etc.
3. After the vehicle is involved in a collision and the airbag has been deployed, the airbag assembly must be replaced immediately.
4. Unauthorized modification of the following equipment may affect the airbag system.

© 2026, All rights reserved

- Install devices such as mobile two-way radio communication devices, cassette tape players, or small record players;
- Modify the suspension system, modify the front-end structure;
- Install grille protection devices (push bars, kangaroo bars, etc.) or attach other equipment to the front end.

5. The airbag is a precision component. Therefore, when disconnecting or connecting the airbag connector, the airbag must be secured first; otherwise, the airbag function may fail.
6. Do not modify, disassemble, strike, or open any components during maintenance, such as the steering wheel, driver airbag cover, front passenger airbag, or airbag control module; otherwise, it will result in sudden airbag deployment or system failure.
7. When removing or handling the airbag assembly, the airbag trim cover side must face upward. Do not stack the airbag assemblies on top of each other to prevent accidental airbag deployment, which could cause serious accidents.

© 2026, All rights reserved

7.20.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Steering wheel operating instructions:

- The steering wheel heating switch is located on the operation page of the central display. By tapping the steering wheel heating switch on the operation interface, you can turn the steering wheel heating on or off.

Working principle of steering wheel heating:

- The steering wheel is heated by supplying power to the heating wires in the heating pad located between the leather cover and the foam. The heating pad is positioned at the steering wheel rim, allowing you to feel the heat in the grip area during heating.

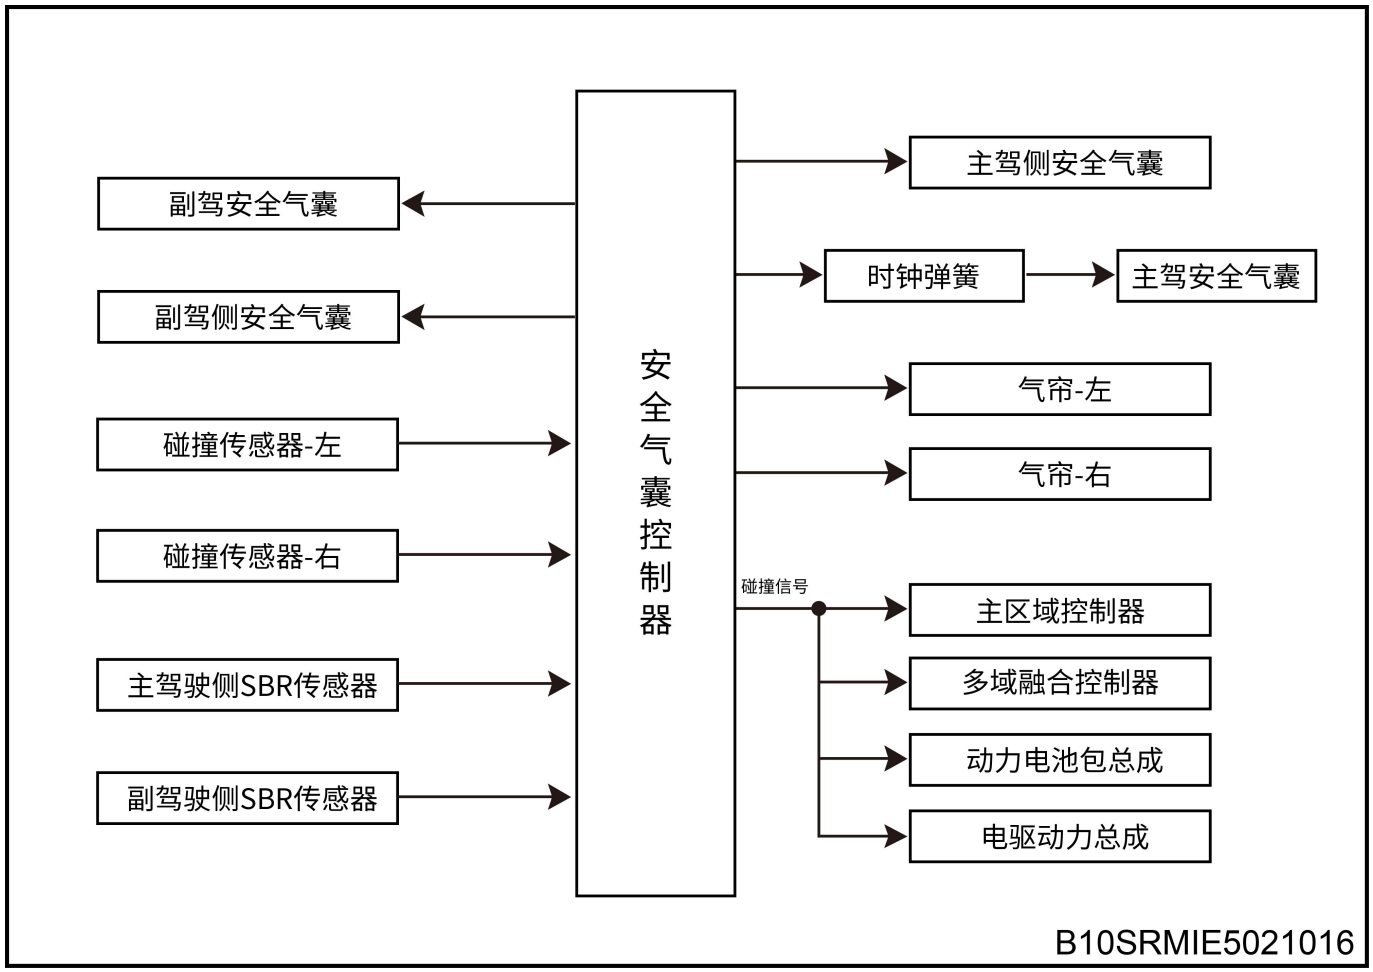
Airbag System Overview

- The vehicle airbag system is an important supplemental protective system, in the event of a severe collision with an obstacle, the airbags will rapidly deploy to form a gas-filled cushion or activate the pretensioners to tighten the seat belts, so that when the occupants move due to inertia, it reduces the impact on them and absorbs collision energy, thereby mitigating the severity of injuries to the driver and passengers.
- If the severity of a collision is below the specified threshold, the airbag will not deploy.
- When a severe collision occurs and the impact severity exceeds the specified threshold, the airbag electronic control unit will quickly activate the ignition circuit of the corresponding airbag to ignite the inflator. The inflator generates a large amount of gas to rapidly inflate and expand the airbag.
- Upon impact, the airbag automatically deflates immediately, without obstructing the escape of vehicle occupants or affecting the visibility of others. A backup power supply is installed inside the airbag control unit to ensure that the propellant in the airbag can still be ignited at the moment of a collision even if the power supply is cut off. Additionally, the crash trigger device continuously and automatically monitors the system to ensure that the entire system is in a ready state at all times.

ATTENTION

- After the airbag is deployed, the inflator becomes hot. Please do not touch the inflator immediately.
- The inflated airbag will deflate quickly to avoid obstructing visibility.
- After the airbag is deployed, you may see a smoke-like substance, which is actually powder on the airbag surface and is harmless to the human body. However, if it gets into your eyes or onto your skin, wash it off immediately.
- Once an airbag has been deployed, it will not deploy again.
- After airbag deployment, the airbag control unit and related parts must be replaced promptly and cannot be reused.

Airbag system composition



1. Left and right impact sensors;
2. Airbag control unit;
3. Driver airbag assembly;
4. Front passenger airbag assembly;
5. Left and right side airbag assemblies;
6. Left and right side curtain airbag assembly;
7. Driver and front passenger weight sensors.

© 2026, All rights reserved

Working principle:

- The airbag control unit determines whether to deploy the airbags and cut off the high voltage of the power battery by receiving the crash acceleration detected by the crash sensors.
- In the event of a frontal collision, the crash sensors and airbag control unit will detect the collision signal and issue a command to deploy the frontal airbags and seat belts. Similarly, when the side of the vehicle is struck by another vehicle, the crash sensors and airbag control unit will detect the collision signal and then issue a command to deploy the side airbags and side curtain airbags.
- The airbags and seat belts will only be deployed when the impact speed of a frontal or side collision exceeds the specified speed.

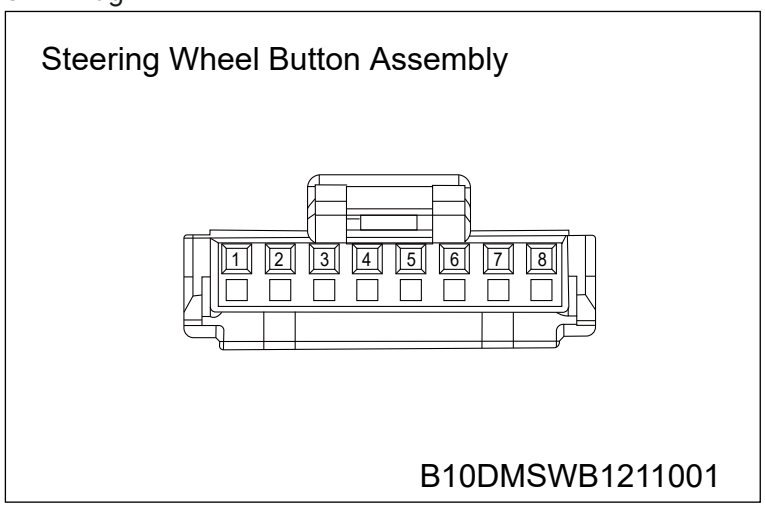
7.20.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-SWB

By using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the SWB data list, the function of reading switch and sensor values can be performed without removing any parts by reading the data list displayed on the diagnostic tool. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION - SWB

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the steering wheel buttons.	
	A Check the steering wheel buttons for any foreign objects causing jamming or damage.
Yes 》》》 Remove foreign objects or replace the steering wheel button assembly.	
No 》》》 Go to step 3.	
Step 3 Check the power and ground of the steering wheel button assembly.	
	A Check whether the power ground of the steering wheel b utton assembly is normal.
No 》》》 Go to Step 9.	
Yes 》》》 Go to step 4.	
Step 4 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the combination switch and the multi-domain fusion controller.	
EL091-2 Combination Switch  B10DMSWB1211010 EL215-4 Multi-Domain Fusion Controller  B10DMSWB1211011	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL091-2 of the combination switch. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of harness connector EL091-2 of the combination switch and terminal 4 of harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 9 of harness connector EL091-2 of the combination switch and terminal 3 of harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the CAN harness between the combination switch and the steering wheel button assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL091-2 of the combination switch. C Disconnect the wiring harness connector of the steering wheel switch assembly. D Use a multimeter, select the resistance range, and measure the resistance between the terminal of the combination switch EL091-2 (device side) and the terminal of the combination switch (where the combination switch connects to the steering wheel button assembly) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.

	No 》 》 》 Replace the combination switch.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

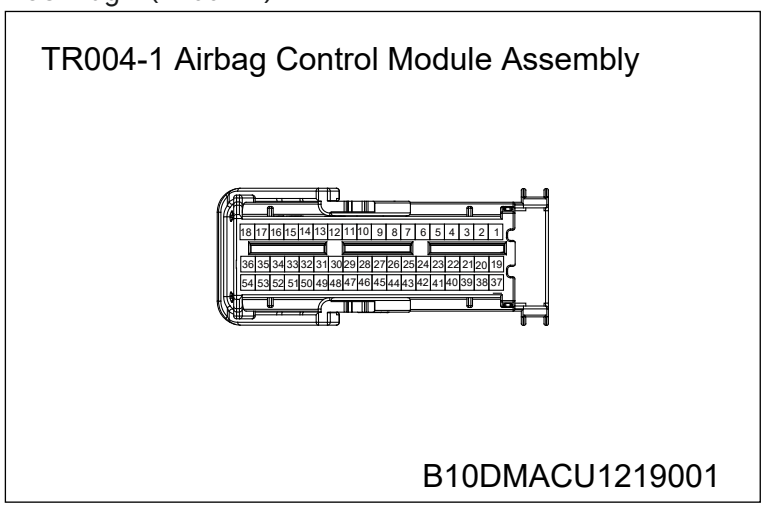
DIAGNOSTIC INSTRUCTIONS-ACU

Using a diagnostic tool, fault codes can be read via the vehicle's OBD diagnostic connector. By utilizing the ACU data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-ACU

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC: U132287-ACU

Fault code	Description
U132287	ECall Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

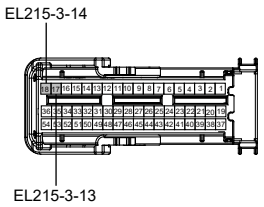
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

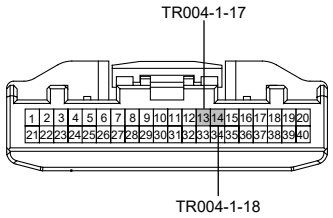
Step 2 Check the fault codes of the telematics host.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the telematics host, and record them.
C Check for relevant fault codes.

Yes》》》 Prioritize the repair of faults related to the telematics host.

No》》》
Go to step 3.



Step 3 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.

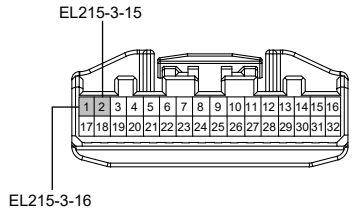
TR004-1 Airbag Control Module Assembly

B10DMACU1219098

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219099

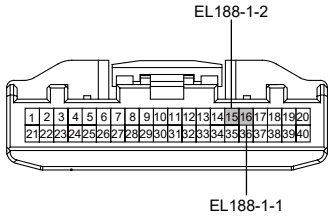
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the ACAN harness between the multi-domain fusion controller and the connected vehicle host.



© 2026, All rights reserved

EL188-1 Telematics Main Unit

B10DMACU1219117

EL215-3 Multi-Domain Fusion Controller

B10DMACU1219118

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 2 of wiring harness connector EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the power ground circuit of the telematics host.

A Check whether the power ground circuit of the connected vehicle host is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

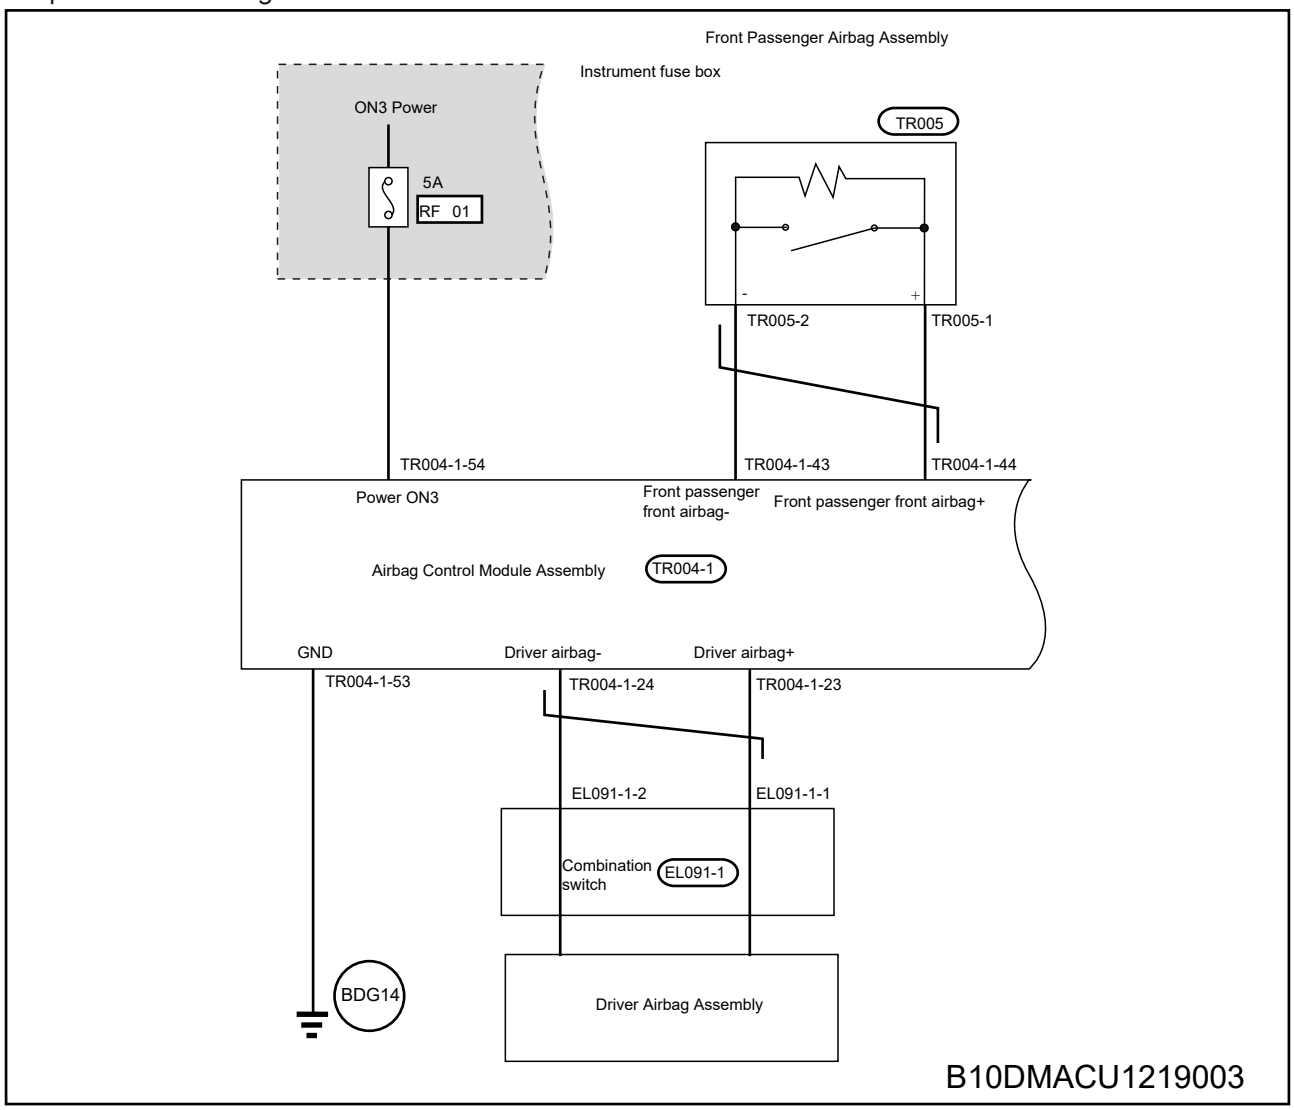
Yes 》》》 System normal.

No 》》》
Go to step 7.

Step 7 Replacement of airbag control module assembly

A Replacement of airbag control module assembly.
B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

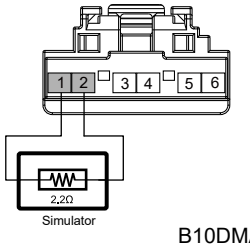
DTC: B00011A-ACU

Fault code	Description
B00011A	Driver front airbag stage 1 circuit resistance below lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

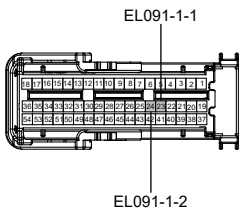
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

EL091-1 Combination Switch

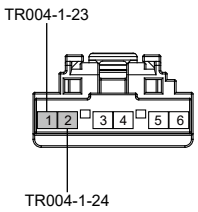
B10DMACU1219006



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness connec tor EL091-1.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 5.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

B10DMACU1219007

EL091-1 Combination Switch

B10DMACU1219008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL091-1 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 24 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 2 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

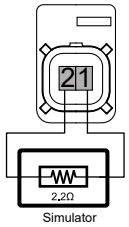
DTC: B00201A-ACU

Fault code	Description
B00201A	Driver side airbag circuit resistance below lower limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

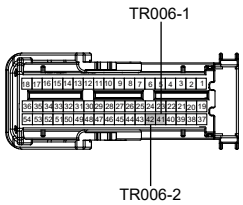
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR006 Front Left Airbag Assembly

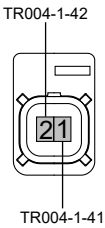
B10DMACU1219034



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector TR006 of the front left airbag assembly.
C Connect the simulator to the wiring harness connector of the front left airbag assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front left airbag a ssembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219035

TR006 Front Left Airbag Assembly

B10DMACU1219036

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR006 of the fro nt left airbag assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 41 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR006 of the front left airbag assem bly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 42 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR006 of the f ront left airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

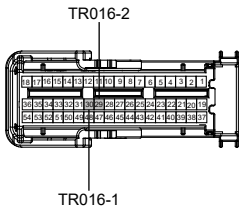
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

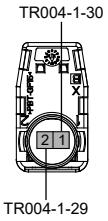
B10DMACU1219015



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

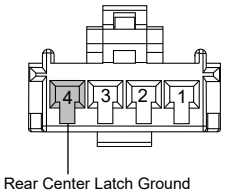
Step 2 Check the wiring harness connecting the airbag control module assembly and the rear dual latch ass embly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219062

TR050 Rear Dual Latch Assembly

B10DMACU1219063



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 49 of harness con nector TR004-1 for the airbag control module assembly and terminal 3 of harness connector TR050 for the rear dual buc kle assembly is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Inspect the circuit of the second row center seat belt buckle switch for possible short circuits, ope n circuits, and poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear dual latch assembly.

TR050 Rear Dual Latch Assembly

B10DMACU1219064

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 4 of the wire harness co nnector TR050 of the rear dual latch assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

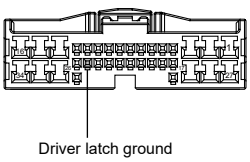
TR004-1 Airbag Control Module Assembly

B10DMACU1219052

TR035 Front left seat connector

B10DMACU1219053



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 of the front left seat.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 32 of the airbag contro l module assembly harness connector TR004-1 and terminal 24 of the left front seat harness connector TR035 to check i f it is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the driver's side seat belt buckle assembly (front left seat connect or).

TR035 Front left seat connector

B10DMACU1219054

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C. Use a multimeter, set it to the resistance range, and meas ure the resistance value between terminal 25 of the harness connector TR035 of the left front seat connector and the b ody ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver side seat belt buckle assembly and the left front seat connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 of the front left seat connector. C Disconnect the wiring harness connector of the driver's side seat belt buckle assembly. D Use a multimeter, select the resistance range, and measure the resistance between the harness connector terminal of the left front seat connector (component side) and the harness connector terminal of the driver side seat belt buckle assembly to check if it is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

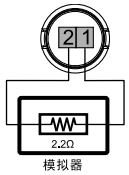
Fault code	Description
B002109	Driver Side Curtain Airbag Circuit in Series with Other Circuits Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

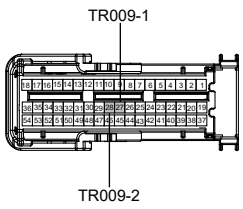
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR009 左侧安全气帘总成

B10DMACU1219041



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the left side curtain airbag assembly harness connector TR009.
C Connect the simulator to the left side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219042

TR009 Left Side Curtain Airbag Assembly

B10DMACU1219043

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR009 of the left side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 27 of the harness connector TR004-1 of the airbag control module assembly and terminal 1 of the harness connector TR009 of the left side curtain airbag assembly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 28 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR009 of the left side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

TR009 Left Side Curtain Airbag Assembly

B10DMACU1219043

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR009 of the left side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 27 of the harness connector TR004-1 of the airbag control module assembly and terminal 1 of the harness connector TR009 of the left side curtain airbag assembly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 28 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR009 of the left side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

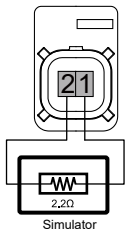
DTC: B002809-ACU

Fault code	Description
B002809	Passenger side airbag circuit in series with other circuits fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

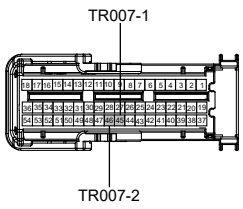
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR007 Front right airbag assembly

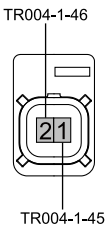
B10DMACU1219037



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front right airbag assembly wire harness c onnector TR007.
C Connect the simulator to the front right airbag assembly wire harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front right airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219038

TR007　前排右侧安全气囊总成

B10DMACU1219039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR007 of the front righ t airbag assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 45 of harness connector TR004-1 of the airbag control module assembly and termin al 1 of harness connector TR007 of the front right airbag as sembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 46 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 2 of the harness connector TR007 of the front right airbag assembly to check whether the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

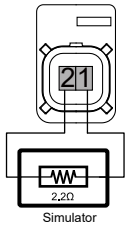
DTC: B002009-ACU

Fault code	Description
B002009	Driver side airbag circuit in series with another circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

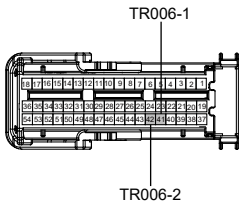
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR006 Front Left Airbag Assembly

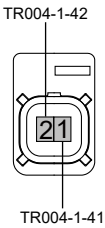
B10DMACU1219034



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector TR006 of the front left airbag assembly.
C Connect the simulator to the wiring harness connector of the front left airbag assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front left airbag a ssembly.

TR004-1 Airbag Control Module Assembly

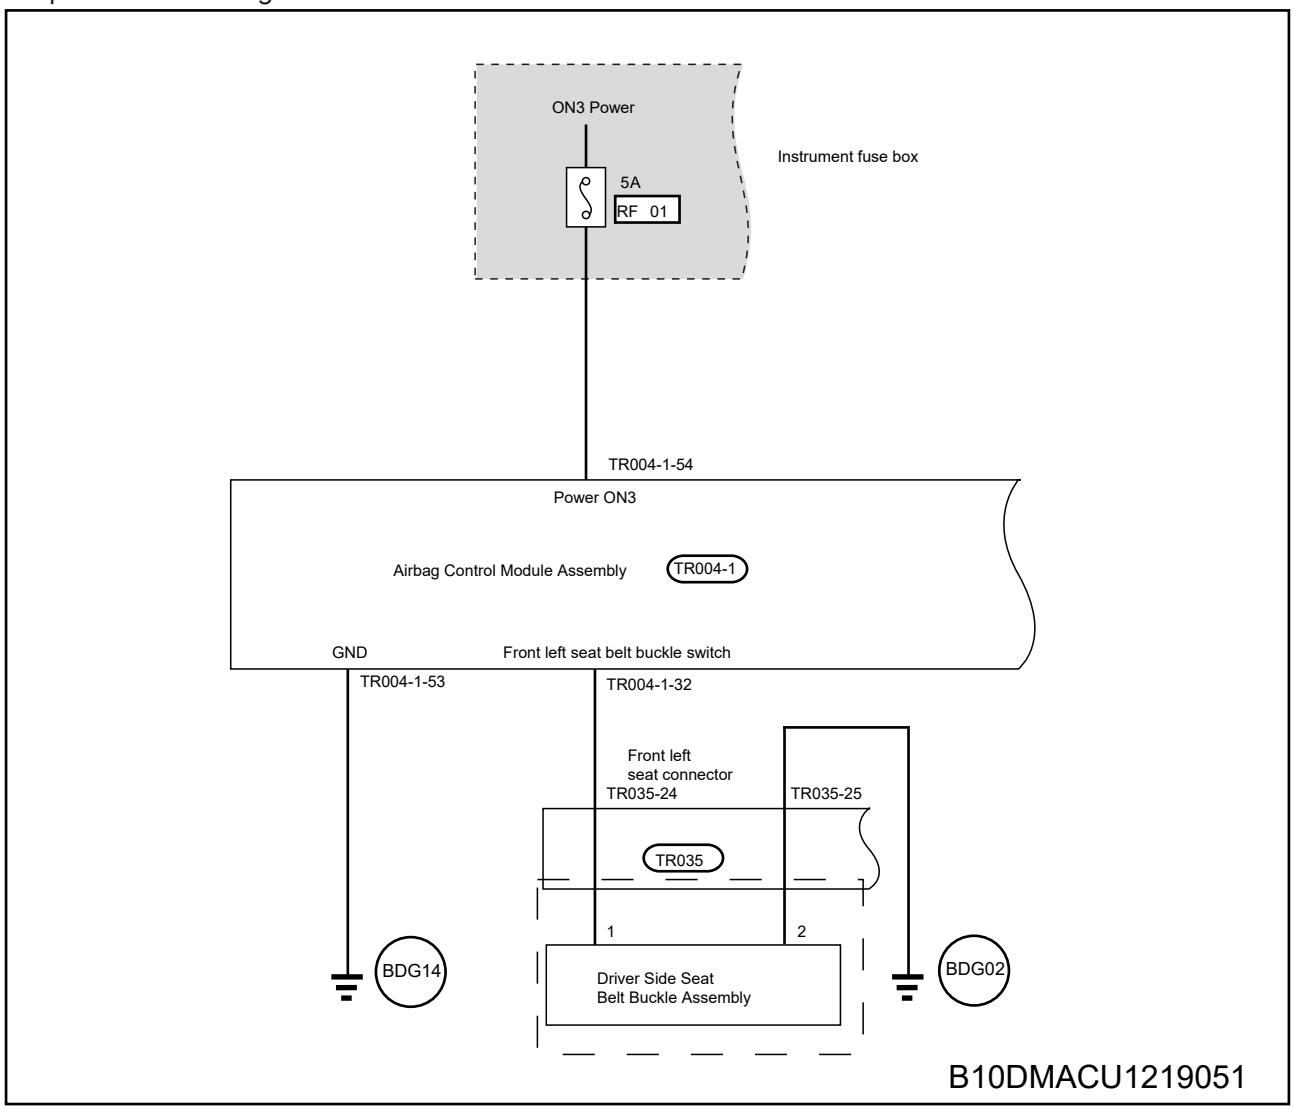
B10DMACU1219035

TR006 Front Left Airbag Assembly

B10DMACU1219036

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR006 of the fro nt left airbag assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 41 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR006 of the front left airbag assem bly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 42 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR006 of the f ront left airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved



No 》》》 Inspect the wiring of the front left airbag assembly for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front left airbag assembly.	
	A Replace the front left airbag assembly. B After replacing the front left airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

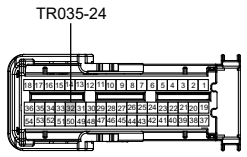
DTC: B005013-ACU

Fault code	Description
B005013	Driver seat belt buckle switch open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

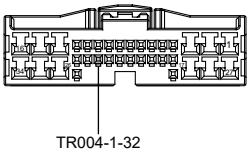
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



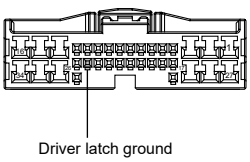
Step 2 Check the wiring harness connecting the airbag control module assembly and the left front seat con nector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219052

TR035 Front left seat connector

B10DMACU1219053



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 of the front left seat.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 32 of the airbag contro l module assembly harness connector TR004-1 and terminal 24 of the left front seat harness connector TR035 to check i f it is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the driver's side seat belt buckle assembly (front left seat connect or).

TR035 Front left seat connector

B10DMACU1219054

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C. Use a multimeter, set it to the resistance range, and meas ure the resistance value between terminal 25 of the harness connector TR035 of the left front seat connector and the b ody ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the driver side seat belt buckle assembly and the left front seat connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 of the front left seat connector. C Disconnect the wiring harness connector of the driver's side seat belt buckle assembly. D Use a multimeter, select the resistance range, and measure the resistance between the harness connector terminal of the left front seat connector (component side) and the harness connector terminal of the driver side seat belt buckle assembly to check if it is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the driver's side seat belt buckle assembly.	
	A Replace the driver's side seat belt buckle assembly. B After replacing the driver side seat belt buckle assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

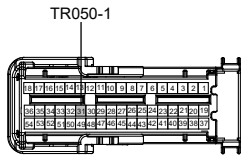
DTC: B005556-ACU

Fault code	Description
B005556	Invalid configuration of the seat belt buckle for the right rear passeng er

1. Simplified Circuit Diagram

2. Diagnostic Steps

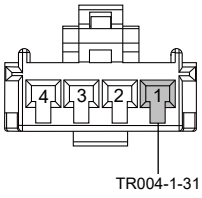
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



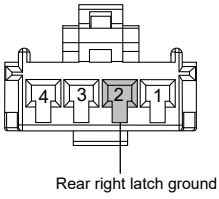
Step 2 Check the wiring harness connecting the airbag control module assembly and the rear dual latch ass embly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219059

TR050 Rear Dual Latch Assembly

B10DMACU1219060



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
D. Use a multimeter set to the resistance range to measure t he resistance between terminal 31 of harness connector TR 004-1 of the airbag control module assembly and terminal 1 of harness connector TR050 of the rear dual buckle assem bly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Inspect the wiring of the right second-row seat belt buckle switch for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the rear dual latch assembly.

TR050 Rear Dual Latch Assembly

B10DMACU1219061

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR050 of the re ar dual latch assembly.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the rear dual latch assembly harness connector TR050 and the vehicle body gr ound to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear dual latch assembly.	
	A Replace the rear dual latch assembly. B After replacing the rear dual latch assembly, is the fault cl eared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

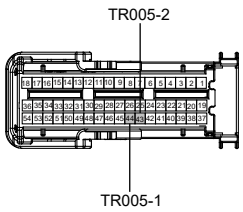
Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR005 Front Passenger Airbag Assembly

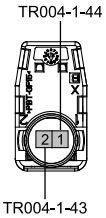
B10DMACU1219009



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger airbag assembly wire harness connector TR005.
C Connect the simulator to the front passenger airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219010

TR005 副驾驶员安全气囊总成

B10DMACU1219011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR005 of the front passenger airbag assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 44 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR005 of the front passenger airbag assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 43 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR005 of the front passenger airbag assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Test using the simulator.	
TR007 Front right airbag assembly  B10DMACU1219037	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the front right airbag assembly wire harness c onnector TR007. C Connect the simulator to the front right airbag assembly wire harness connector. Simulator resistance: 2.2Ω D. Connect the negative terminal of the battery to power on the vehicle. E Connect the diagnostic tool to the OBD port. F Clear fault codes. G Read the fault codes again. H Check whether the same fault code is displayed.
	No》》》 Go to step 4.
	Yes》》》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the front right airbag assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219038	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector TR007 of the front righ t airbag assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 45 of harness connector TR004-1 of the airbag control module assembly and termin al 1 of harness connector TR007 of the front right airbag as sembly to check if it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 46 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 2 of the harness connector TR007 of the front right airbag assembly to check whether the resistance value is no rmal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

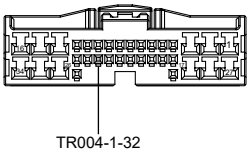
Yes 》 》 》
Go to step 2.



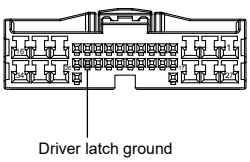
Step 2 Check the wiring harness connecting the airbag control module assembly and the left front seat con nector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219052

TR035 Front left seat connector

B10DMACU1219053



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR035 of the front left seat.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 32 of the airbag contro l module assembly harness connector TR004-1 and terminal 24 of the left front seat harness connector TR035 to check i f it is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the driver's side seat belt buckle assembly (front left seat connect or).

TR035 Front left seat connector

B10DMACU1219054

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C. Use a multimeter, set it to the resistance range, and meas ure the resistance value between terminal 25 of the harness connector TR035 of the left front seat connector and the b ody ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

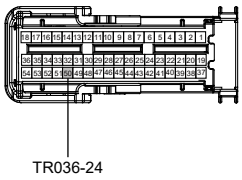
DTC: B005256-ACU

Fault code	Description
B005256	Invalid Configuration of Front Passenger Seat Belt Buckle Switch

1. Simplified Circuit Diagram

2. Diagnostic Steps

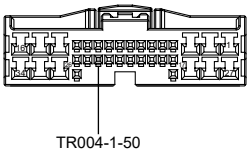
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



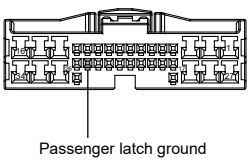
Step 2 Check the wiring harness connecting the airbag control module assembly and the right front seat co nnector.

TR004-1 Airbag Control Module Assembly

B10DMACU1219048

TR036 Front right seat connector

B10DMACU1219049



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the right front seat harness connector TR036.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 50 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 24 of harness connector TR036 of the right front seat co nnector to check if the resistance is normal.
Resistance standard value: Less than 1Ω
E Check whether the resistance value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the front passenger side seat belt buckle assembly (right front sea t connector).

TR036 Front right seat connector

B10DMACU1219050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR036 of the front righ t seat connector.
C Use a multimeter, select the resistance range, and measur e the resistance between terminal 25 of the right front seat harness connector TR036 and the body ground to check if i t is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 4.
Step 4 Check the wiring harness between the front passenger side seat belt buckle assembly and the right front seat connector.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front right seat connector. C Disconnect the wiring harness connector of the front passenger side seat belt buckle assembly. D Use a multimeter, set it to the resistance range, and measure whether the resistance between the harness connector terminal of the right front seat connector (component side) and the harness connector terminal of the passenger-side seat belt buckle assembly is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the front passenger side seat belt buckle assembly.	
	A Replace the front passenger side seat belt buckle assembly. B After replacing the front passenger side seat belt buckle assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.	

© 2026, All rights reserved

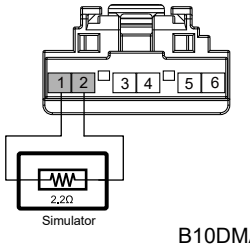
DTC: B000111-ACU

Fault code	Description
B000111	Driver Front Airbag Stage 1 Circuit Short to Ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

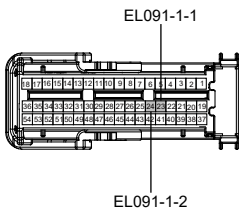
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

EL091-1 Combination Switch

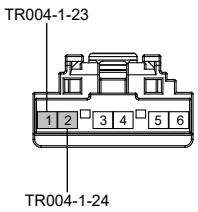
B10DMACU1219006



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness connec tor EL091-1.
C Connect the simulator to the combination switch harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 5.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the combination switc h.

TR004-1 Airbag Control Module Assembly

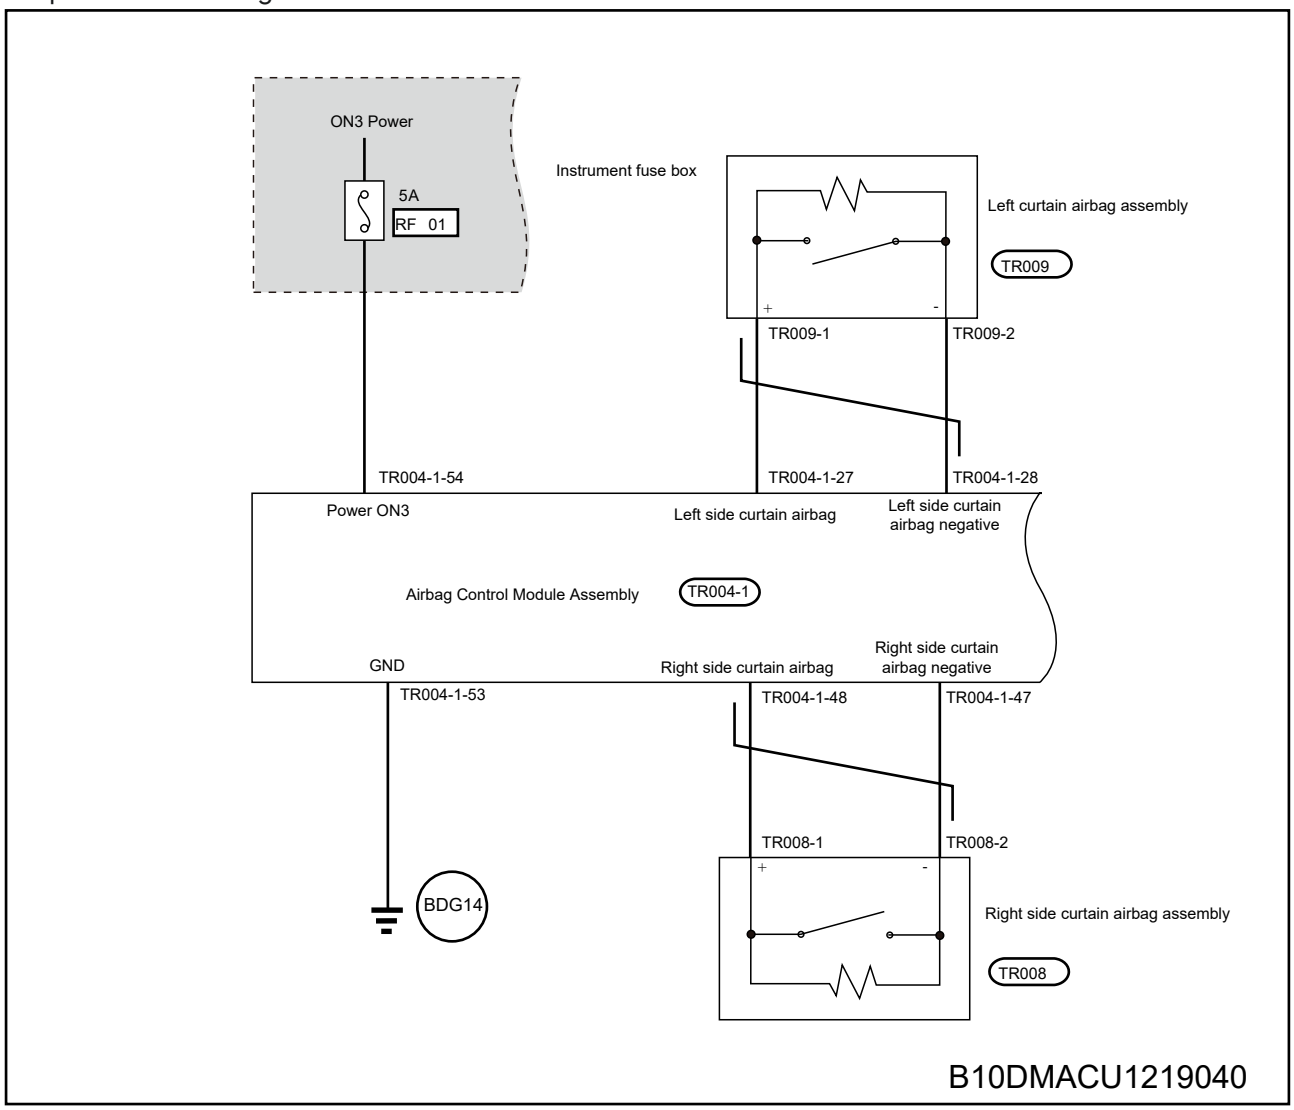
B10DMACU1219007

EL091-1 Combination Switch

B10DMACU1219008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL091-1 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 24 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 2 of harness connector EL091-1 of the combination swit ch to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved



No 》》》 Inspect the wiring between the airbag control module assembly and the combination switch for possible short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Check the wiring between the combination switch and the driver airbag assembly.	
	A Check the wiring between the combination switch and the driver airbag assembly for short or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 5.	
Step 5 Replace the driver airbag assembly.	
	A Replace the driver's airbag assembly. B After replacing the driver airbag assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

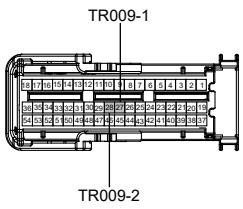
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR009 左侧安全气帘总成

B10DMACU1219041



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the left side curtain airbag assembly harness connector TR009.
C Connect the simulator to the left side curtain airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the airbag control module assembly and the left side curtain airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219042

TR009 Left Side Curtain Airbag Assembly

B10DMACU1219043

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR009 of the left side curtain airbag assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 27 of the harness connector TR004-1 of the airbag control module assembly and terminal 1 of the harness connector TR009 of the left side curtain airbag assembly to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 28 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR009 of the left side curtain airbag assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: B00914A-ACU

Fault code	Description
B00914A	Left side impact sensor parameter error

1. Simplified Circuit Diagram

2. Diagnostic Steps

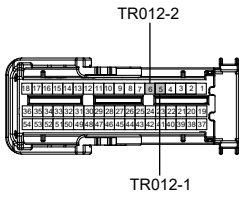
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

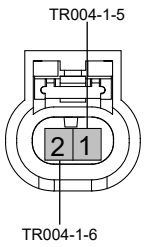
Step 2 Check the wiring harness of the left impact sensor assembly for interference.



A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes 》 》 》 Remove the source of interference.

No 》 》 》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes 》 》 》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

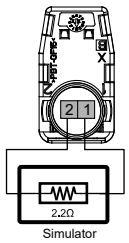
DTC: B007509-ACU

Fault code	Description
B007509	Second Row Right Seat Belt Pretensioner Circuit in Series with Other Circuits Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

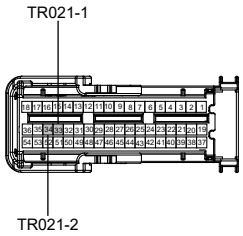
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

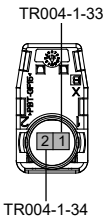
B10DMACU1219032



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

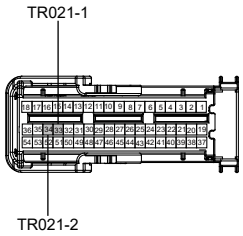
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

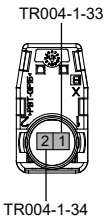
B10DMACU1219032



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness of the front left collision sensor assembly for interference.

A Check the wiring harness of the front left collision sensor assembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

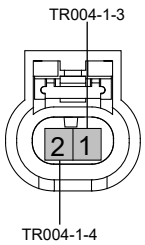
No》》》
Go to step 3.



Step 3 Check the connecting wiring harness between the airbag control module assembly and the front left collision sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219068

TR010 Front left crash sensor assembly

B10DMACU1219069

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR010 of the left front impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR010 of the left front impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 4 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR010 of the left front impact sensor assembly is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the left front collision sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the front left crash sensor assembly.

A Replace the front left impact sensor assembly.

© 2026, All rights reserved

	B After replacing the front left collision sensor assembly, is t he fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

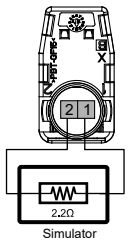
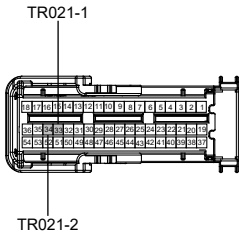
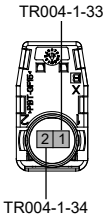
DTC: B007512-ACU

Fault code	Description
B007512	Second row right seat belt pretensioner short to power







1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Test using the simulator.	
TR021 Seat Belt Pretensioner - Rear Right  B10DMACU1219032	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the seat belt pretensioner - rear right harness connector TR021. C Connect the simulator to the seat belt pretensioner-rear right harness connector. Simulator resistance: 2.2Ω D. Connect the negative terminal of the battery to power on the vehicle. E Connect the diagnostic tool to the OBD port. F Clear fault codes. G Read the fault codes again. H Check whether the same fault code is displayed.
	No》》》 Go to step 4.
	Yes》》》 Go to step 3.
Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219065 TR021 Seat Belt Pretensioner - Rear Right  B10DMACU1219066	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector TR021 of the rear right seat belt pretensioner. D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.

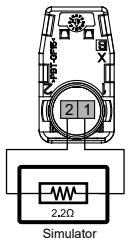
DTC: B00751A-ACU

Fault code	Description
B00751A	Second row right seat belt pretensioner circuit resistance below lowe r limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

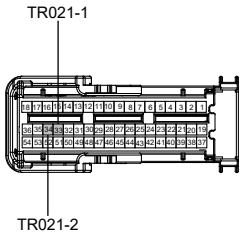
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

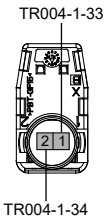
B10DMACU1219032



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

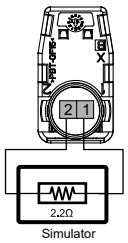
DTC: B007909-ACU

Fault code	Description
B007909	Driver lap belt pretensioner in series with other circuits fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

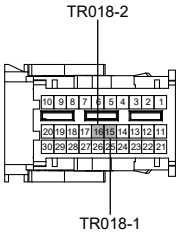
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR018 Front Left Seat Belt Lap Pretensioner Assembly

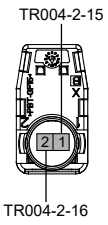
B10DMACU1219022



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front left seat belt lap pretensioner assembly harness connector TR018.
C Connect the simulator to the harness connector of the front left seat belt lap pretensioner assembly.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front left seat belt lap pretensioner assembly.

TR004-2 Airbag Control Module Assembly

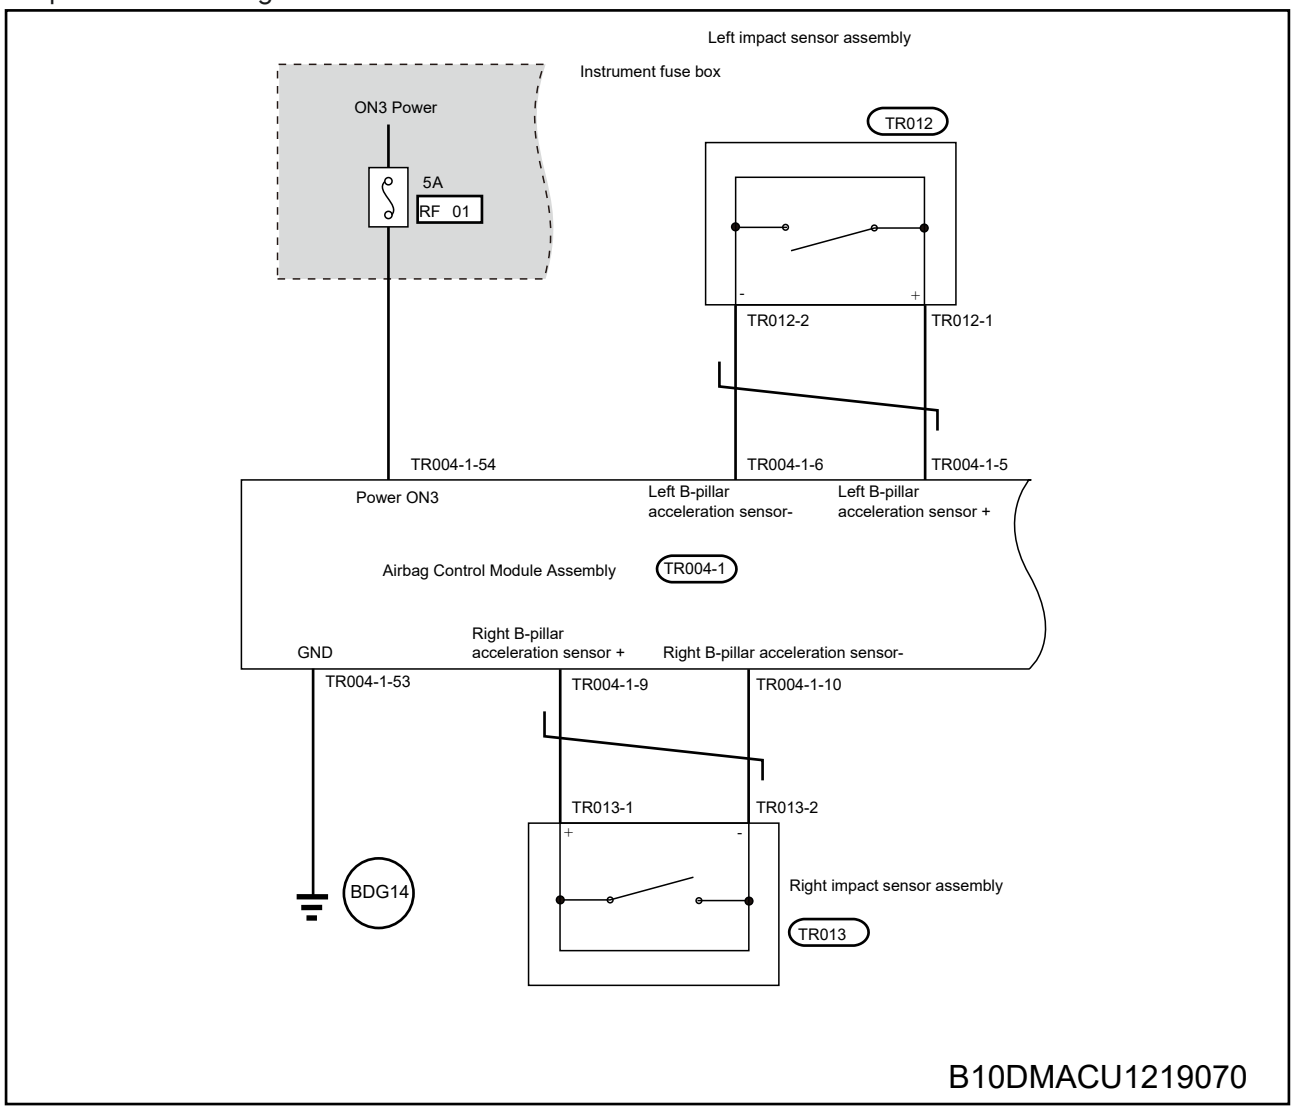
B10DMACU1219023

TR018 Front Left Seat Belt Lap Pretensioner Assembly

B10DMACU1219024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly.
C Disconnect the harness connector TR018 of the front left seat belt waist pretensioner assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 15 of harness connector TR004-2 of the airbag control module assembly and terminal 1 of harness connector TR018 of the front left seat belt lap pretensioner assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the harness connector TR004-2 of the airbag control module assembly and terminal 2 of the harness connector TR018 of the front left seat belt lap pretensioner assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved



No 》》》 Inspect the wiring of the front left seat belt lap pretensioner assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front left seat belt lap pretensioner assembly.	
	A Replace the front left seat belt lap pretensioner assembly. B After replacing the front left seat belt lap pretensioner assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B009149-ACU

Fault code	Description
B009149	Left side impact sensor fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

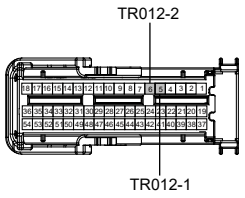
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

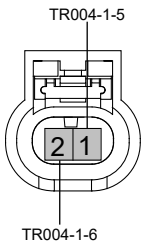
Step 2 Check the wiring harness of the left impact sensor assembly for interference.



A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219071

TR012 Left Crash Sensor Assembly

B10DMACU1219072

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR012 of the left side i mpact sensor assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the left impact sensor assembly.

A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

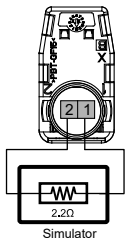
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

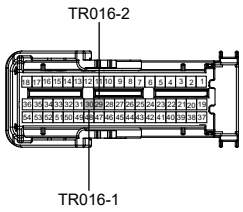
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR016 Seat Belt Pretensioning - Driver

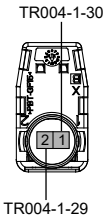
B10DMACU1219015



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the driver's seat belt pretensioner harness con nector TR016.
C Connect the simulator to the driver seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly to the driver seat belt pret ensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219016

TR016 Seat Belt Pretensioning - Driver

B10DMACU1219017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR016 of the driver's s eat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 29 of the harnes s connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR016 of the driver seat belt pretensioner is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 30 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 1 of harness connector TR016 of the driver seat belt pre tensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

Yes》》》
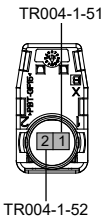
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219019

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR017 of the front passenger seat belt pretensioner.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 51 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR017 of the front passenger seat belt pretensioner is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 52 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wiring harness connector TR017 of the front passenger seat belt pretensioner to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

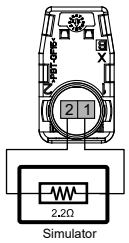
DTC: B007211-ACU

Fault code	Description
B007211	Front passenger seat belt pretensioner short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

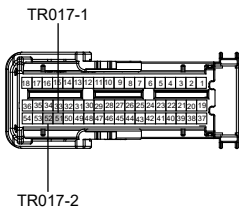
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR017 Seat Belt Pretensioning - Front Passenger

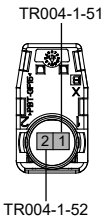
B10DMACU1219018



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the front passenger seat belt pretensioner wiring harness connector TR017.
C Connect the simulator to the front passenger seat belt pretensioner harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the front passenger seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219019

TR017 Seat Belt Pretensioning - Front Passenger

B10DMACU1219020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR017 of the front passenger seat belt pretensioner.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 51 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR017 of the front passenger seat belt pretensioner is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 52 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wiring harness connector TR017 of the front passenger seat belt pretensioner to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

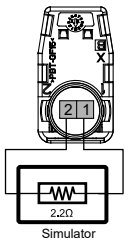
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

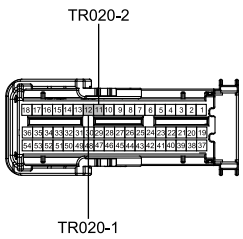
TR020 Seat Belt Pretensioning - Rear Left

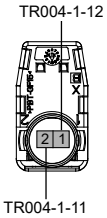
B10DMACU1219029



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rear left seat belt pretensioner harness co nnector TR020.
C Connect the simulator to the seat belt pretensioner - left rear harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the rear left seat belt pr etensioner.

TR004-1 安全气囊控制模块总成

B10DMACU1219030

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219031

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Disconnect the harness connector TR020 of the rear left seat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 2 of the harness connector TR020 of the seat belt pre tensioner - left rear to check whether the resistance value i s normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the airbag control module assembly harness connector TR004-1 and terminal 1 of the seat belt pretensioner - rear left harness connector TR020 to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

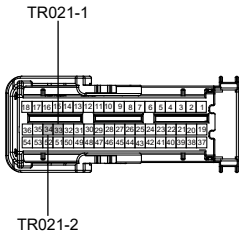
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

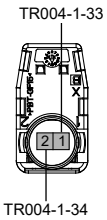
B10DMACU1219032



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the left impact sensor assembly for interference.	
	A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219071 TR012 Left Crash Sensor Assembly  B10DMACU1219072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector TR012 of the left side i mpact sensor assembly. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal. Resistance standard value: Less than 1Ω E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the left impact sensor assembly.	
	A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

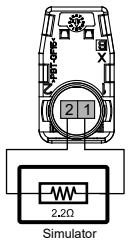
DTC: B00751B-ACU

Fault code	Description
B00751B	Second row right seat belt pretensioner circuit resistance above lowe r limit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

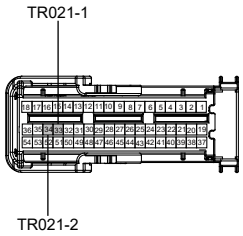
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR021 Seat Belt Pretensioner - Rear Right

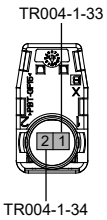
B10DMACU1219032



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the seat belt pretensioner - rear right harness connector TR021.
C Connect the simulator to the seat belt pretensioner-rear right harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the right rear seat belt pretensioner.

TR004-1 Airbag Control Module Assembly

B10DMACU1219065

TR021 Seat Belt Pretensioner - Rear Right

B10DMACU1219066

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector TR021 of the rear right seat belt pretensioner.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of harness connector TR004-1 of the airbag control module assembly and terminal 1 of harness connector TR021 of the seat belt pretensioner - rear right to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 34 of harness connector TR004-1 for the airbag control module assembly and terminal 2 of harness connector TR021 for the right rear seat belt pretensioner to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

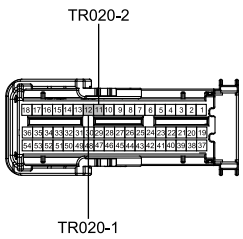
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR020 Seat Belt Pretensioning - Rear Left

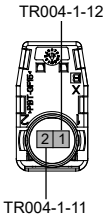
B10DMACU1219029



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rear left seat belt pretensioner harness co nnector TR020.
C Connect the simulator to the seat belt pretensioner - left rear harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the airbag control module assembly and the rear left seat belt pr etensioner.

TR004-1 安全气囊控制模块总成

B10DMACU1219030

TR020 Seat Belt Pretensioning - Rear Left

B10DMACU1219031

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Disconnect the harness connector TR020 of the rear left seat belt pretensioner.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 2 of the harness connector TR020 of the seat belt pre tensioner - left rear to check whether the resistance value i s normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the airbag control module assembly harness connector TR004-1 and terminal 1 of the seat belt pretensioner - rear left harness connector TR020 to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the left pressure sensor assembly for interference.	
	A Check the wiring harness of the left pressure sensor assembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the airbag control module assembly and the left side pressure sensor assembly.	
TR004-2 Airbag Control Module Assembly  B10DMACU1219078 TR014 Left Pressure Sensor Assembly  B10DMACU1219079	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly. C Disconnect the wiring harness connector TR014 of the left pressure sensor assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the harness connector TR004-2 of the airbag control module assembly and terminal 1 of the harness connector TR014 of the left pressure sensor assembly to check if it is normal. Resistance standard value: Less than 1Ω E. Use a multimeter set to the resistance range to measure the resistance between terminal 13 of harness connector TR004-2 of the airbag control module assembly and terminal 2 of harness connector TR014 of the left pressure sensor assembly to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the left pressure sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the left pressure sensor assembly.	
	A Replace the left pressure sensor assembly. B Has the fault been cleared after replacing the left pressure sensor assembly?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

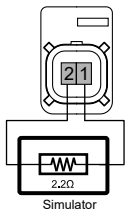
DTC: B10051B-ACU

Fault code	Description
B10051B	Far-side airbag resistance too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

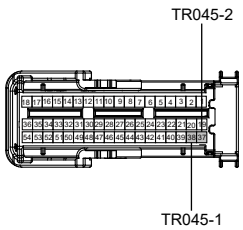
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

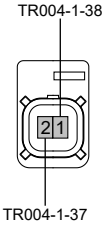
B10DMACU1219113



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

Fault code	Description
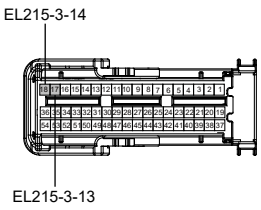
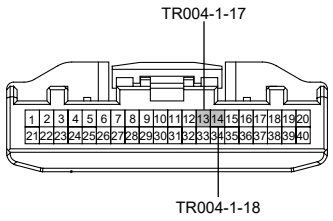
B00DF1E	Passenger airbag disable switch signal range invalid





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the center display assembly.	
	A Check whether the central control display assembly operates normally.
	No 》 》 》 Troubleshoot the central control display malfunction.
	Yes 》 》 》 Go to step 3.
Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

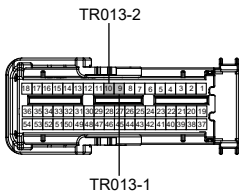
Yes》》》
Go to step 2.

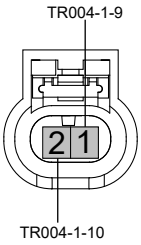
Step 2 Check the wiring harness of the right impact sensor assembly for interference.



A Check the wiring harness of the right side impact sensor assembly for interference from added or modified wiring.

Yes》》》 Remove the source of interference.

No》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the right side impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219073

TR013 Right Crash Sensor Assembly

B10DMACU1219074

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR013 of the right side impact sensor assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 2 of the wire harness connector TR013 of the right impact sensor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Inspect the wiring of the right side impact sensor assembly for potential short circuits, open circuits, or poor connections; replace the wiring harness if necessary.

Yes》》》
Go to step 4.

Step 4 Replace the right impact sensor assembly.

A Replace the right impact sensor assembly.

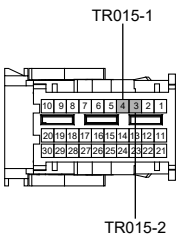
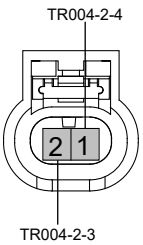
DTC: B009849-ACU

Fault code	Description
B009849	Right pressure sensor fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness of the right pressure sensor assembly for interference.	
	A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.
	Yes》》》 Remove the source of interference.
	No》》》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.	
TR004-2 Airbag Control Module Assembly  B10DMACU1219080 TR015 Right Pressure Sensor Assembly  B10DMACU1219087	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly. C Disconnect the harness connector TR015 of the right pressure sensor assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes》》》 Go to step 4.
Step 4 Replace the right pressure sensor assembly.	
	A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

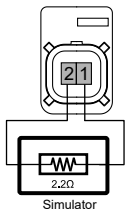
DTC: B10051A-ACU

Fault code	Description
B10051A	Far-side airbag resistance too low

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

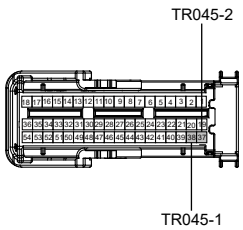
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

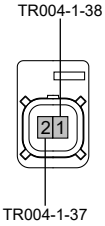
B10DMACU1219113



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Inspect the wiring of the far-side airbag assembly for possible short circuits, open circuits, and po or connections; replace the wiring harness if necessary.	
Yes 》》》 Go to step 4.	
Step 4 Replace the far-side airbag assembly.	
	A Replace the far-side airbag assembly. B After replacing the far-side airbag assembly, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

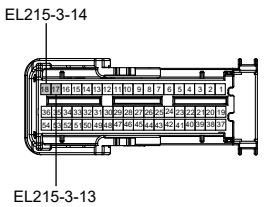
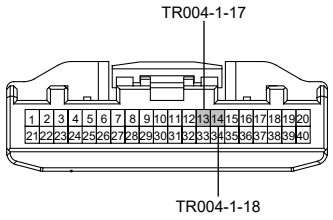
DTC: B00DF56-ACU

Fault code	Description
B00DF56	Invalid PADS switch signal data with the central control panel





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

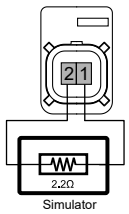
DTC: B100511-ACU

Fault code	Description
B100511	(FSA: Far Side Airbag) Far-side airbag short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

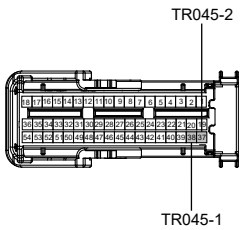
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

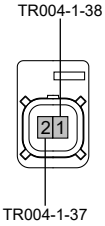
B10DMACU1219113



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

	No 》 》 》 Troubleshoot the central control display malfunction.
	Yes 》 》 》 Go to step 3.
Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

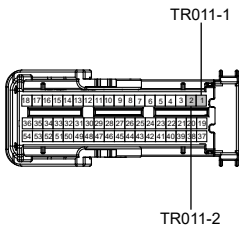
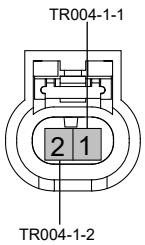
DTC: B009512-ACU

Fault code	Description
B009512	Right early impact sensor short to power





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the front right crash sensor assembly for interference.	
	A Check the wiring harness of the right front crash sensor assembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219075 TR011 Front right crash sensor assembly  B10DMACU1219076	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wire harness connector TR011 of the right front crash sensor assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR011 of the right front impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E. Use a multimeter set to the resistance range, and measure the resistance between terminal 2 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sensor assembly to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right impact sensor assembly.	
	A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

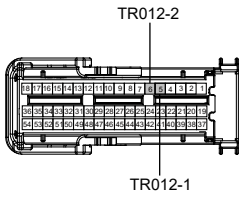
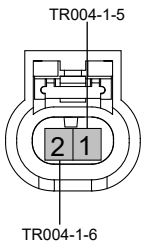
DTC: B009156-ACU

Fault code	Description
B009156	Left side impact sensor configuration error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the left impact sensor assembly for interference.	
	A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219071 TR012 Left Crash Sensor Assembly  B10DMACU1219072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector TR012 of the left side i mpact sensor assembly. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal. Resistance standard value: Less than 1Ω E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the left impact sensor assembly.	
	A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

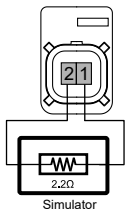
DTC: B100512-ACU

Fault code	Description
B100512	Far-side airbag short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

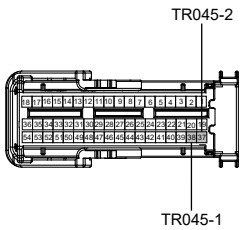
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

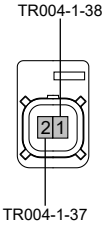
B10DMACU1219113



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

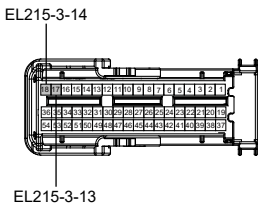
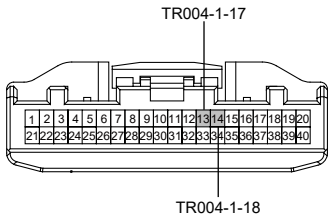
DTC: B00DF13-ACU

Fault code	Description
B00DF13	Passenger airbag disable switch open circuit





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the center display assembly.	
	A Check whether the central control display assembly operates normally.
	No 》 》 》 Troubleshoot the central control display malfunction.
	Yes 》 》 》 Go to step 3.
Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

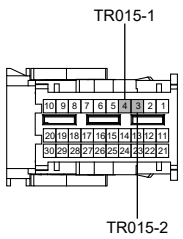
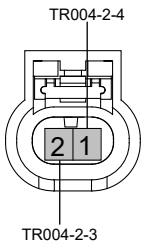
DTC: B009811-ACU

Fault code	Description
B009811	Right pressure sensor short to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness of the right pressure sensor assembly for interference.	
	A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.
	Yes》》》 Remove the source of interference.
	No》》》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.	
TR004-2 Airbag Control Module Assembly  B10DMACU1219080 TR015 Right Pressure Sensor Assembly  B10DMACU1219087	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly. C Disconnect the harness connector TR015 of the right pressure sensor assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes》》》 Go to step 4.
Step 4 Replace the right pressure sensor assembly.	
	A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

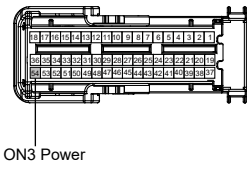
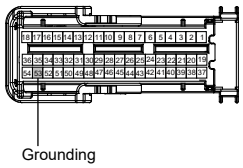
DTC: B100049-ACU

Fault code	Description
B100049	ECU internal error



1. Simplified Circuit Diagram



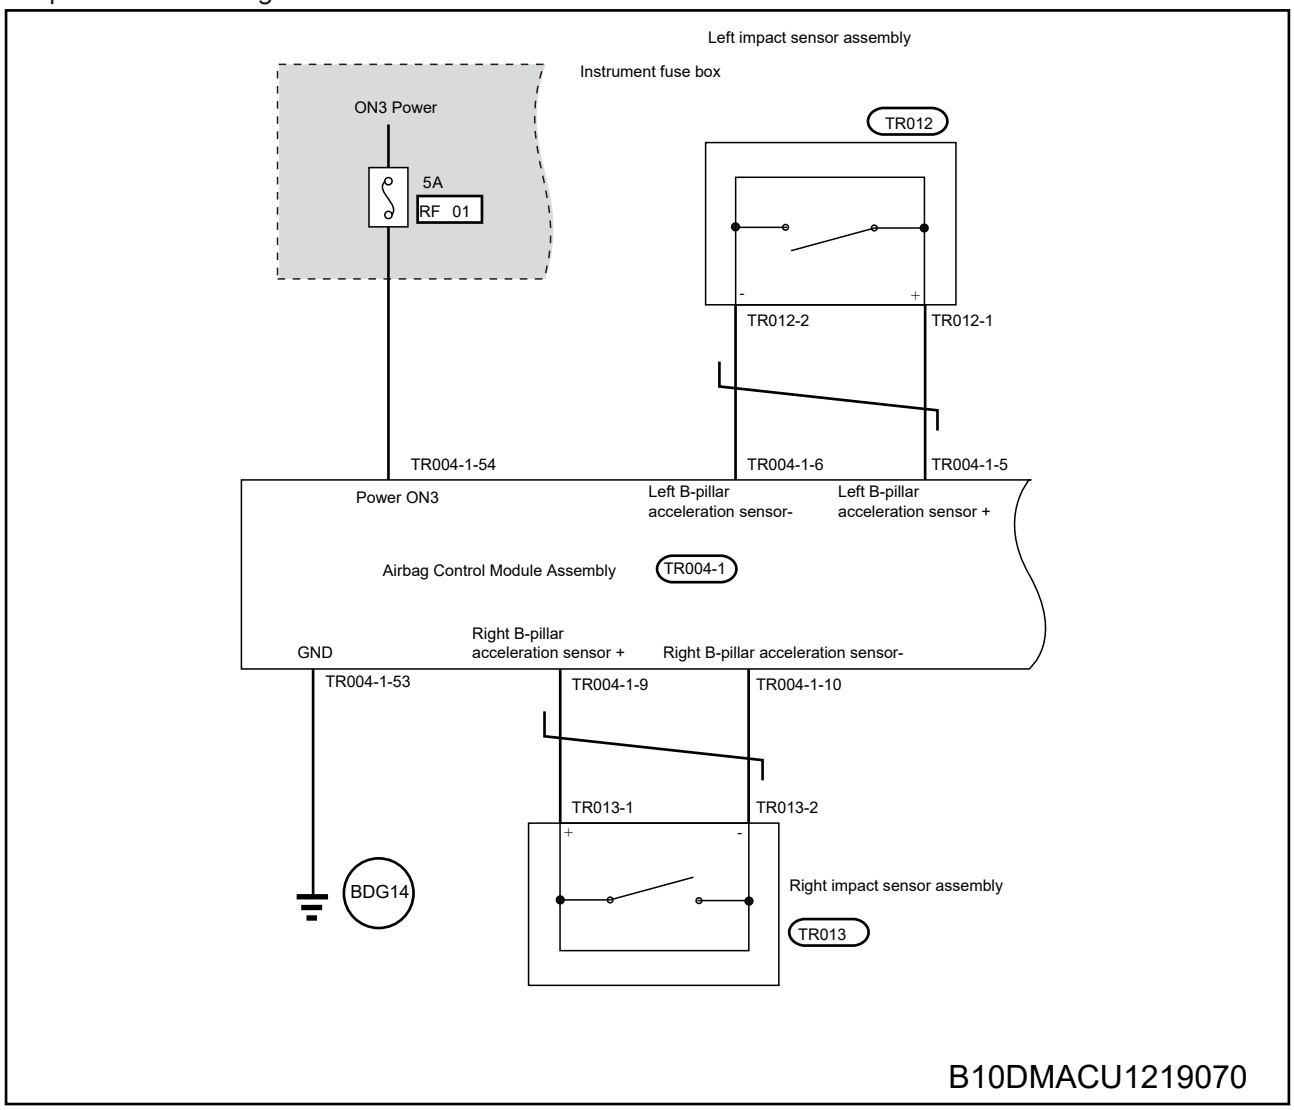
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

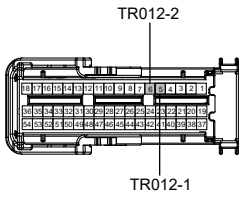


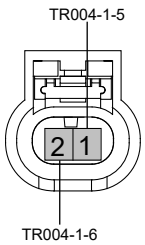
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009186-ACU

Fault code	Description
B009186	Left side impact sensor communication error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the left impact sensor assembly for interference.	
	A Check the wiring harness of the left side impact sensor as sembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the airbag control module assembly and the left impact sensor as sembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219071 TR012 Left Crash Sensor Assembly  B10DMACU1219072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector TR012 of the left side i mpact sensor assembly. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 5 of the airbag control module assembly wire harness connector TR004-1 and ter minal 1 of the left impact sensor assembly wire harness con nector TR012 to check if it is normal. Resistance standard value: Less than 1Ω E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of the wire harness c onnector TR004-1 of the airbag control module assembly a nd terminal 2 of the wire harness connector TR012 of the le ft impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the left impact sensor assembly for possible short circuits, open circuits, or p oor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the left impact sensor assembly.	
	A Replace the left crash sensor assembly.

© 2026, All rights reserved

	B After replacing the left impact sensor assembly, is the faul t cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

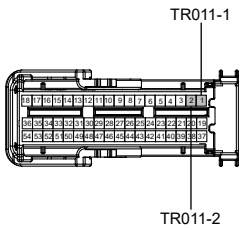
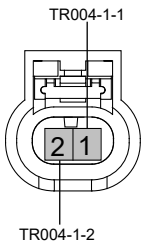
DTC: B009509-ACU

Fault code	Description
B009509	Right Early Crash Sensor Series Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the front right crash sensor assembly for interference.	
	A Check the wiring harness of the right front crash sensor assembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219075 TR011 Front right crash sensor assembly  B10DMACU1219076	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wire harness connector TR011 of the right front crash sensor assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR011 of the right front impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E. Use a multimeter set to the resistance range, and measure the resistance between terminal 2 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sensor assembly to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right impact sensor assembly.	
	A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B009511-ACU

Fault code	Description
B009511	Right early collision sensor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

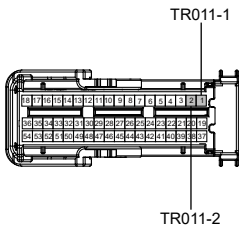
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

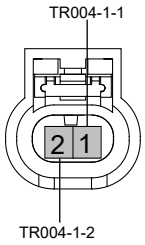
Step 2 Check the wiring harness of the front right crash sensor assembly for interference.



A Check the wiring harness of the right front crash sensor assembly for interference from added or modified wiring.

Yes 》 》 》 Remove the source of interference.

No 》 》 》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219075

TR011 Front right crash sensor assembly

B10DMACU1219076

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wire harness connector TR011 of the right front crash sensor assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR011 of the right front impact sensor assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
E. Use a multimeter set to the resistance range, and measure the resistance between terminal 2 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sensor assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》 》 》
Go to step 4.

Step 4 Replace the front right impact sensor assembly.

A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

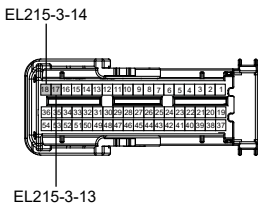
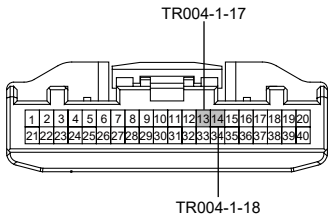
DTC: B00DF09-ACU

Fault code	Description
B00DF09	Passenger airbag deactivation switch in series





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the center display assembly.	
	A Check whether the central control display assembly operates normally.
	No》》》 Troubleshoot the central control display malfunction.
	Yes》》》 Go to step 3.
Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

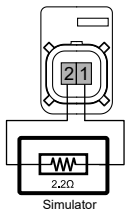
DTC: B100556-ACU

Fault code	Description
B100556	Invalid Far-Side Airbag Configuration

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

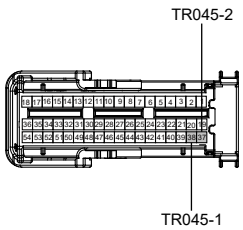
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Test using the simulator.

TR045 Far-Side Airbag Assembly

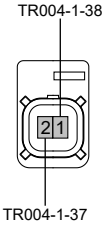
B10DMACU1219113



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
C Connect the simulator to the far-side airbag assembly wiring harness connector.
Simulator resistance: 2.2Ω
D. Connect the negative terminal of the battery to power on the vehicle.
E Connect the diagnostic tool to the OBD port.
F Clear fault codes.
G Read the fault codes again.
H Check whether the same fault code is displayed.

No》》》 Go to step 4.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness connecting the airbag control module assembly and the far-side airbag assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219114

TR045 Far-Side Airbag Assembly

B10DMACU1219115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector TR045 of the far-side airbag assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 37 of the harness connector TR004-1 of the airbag control module assembly and terminal 2 of the harness connector TR045 of the far-side airbag assembly to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 38 of harness connector TR004-1 on the Airbag Control Module Assembly and terminal 1 of harness connector TR045 on the Remote Airbag Assembly to check if the value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness of the right pressure sensor assembly for interference.	
	A Check the wiring harness of the right pressure sensor assembly for interference from added or modified wiring.
	Yes》》》 Remove the source of interference.
	No》》》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right side pressure sensor assembly.	
TR004-2 Airbag Control Module Assembly  B10DMACU1219080 TR015 Right Pressure Sensor Assembly  B10DMACU1219087	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector TR004-2 of the airbag control module assembly. C Disconnect the harness connector TR015 of the right pressure sensor assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR004-2 of the airbag control module assembly and terminal 1 of the wire harness connector TR015 of the right pressure sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector TR004-2 for the airbag control module assembly and terminal 2 of harness connector TR015 for the right pressure sensor assembly to check whether it is normal Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Inspect the wiring of the right pressure sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes》》》 Go to step 4.
Step 4 Replace the right pressure sensor assembly.	
	A Replace the right pressure sensor assembly.

© 2026, All rights reserved

	B After replacing the right pressure sensor assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

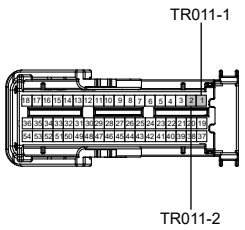
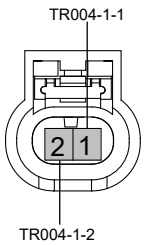
DTC: B009513-ACU

Fault code	Description
B009513	Open circuit in right early crash sensor





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness of the front right crash sensor assembly for interference.	
	A Check the wiring harness of the right front crash sensor assembly for interference from added or modified wiring.
	Yes 》 》 》 Remove the source of interference.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness connecting the airbag control module assembly and the right front impact sensor assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219075 TR011 Front right crash sensor assembly  B10DMACU1219076	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wire harness connector TR011 of the right front crash sensor assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 1 of the wire harness connector TR011 of the right front impact sensor assembly to check if the resistance value is normal. Resistance standard value: Less than 1Ω E. Use a multimeter set to the resistance range, and measure the resistance between terminal 2 of harness connector TR004-1 of the airbag control module assembly and terminal 2 of harness connector TR011 of the right front impact sensor assembly to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Inspect the wiring of the right front impact sensor assembly for potential short circuits, open circuits, and poor connections; replace the wiring harness if necessary.	
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right impact sensor assembly.	
	A Replace the front right crash sensor assembly.

© 2026, All rights reserved

	B After replacing the right front impact sensor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

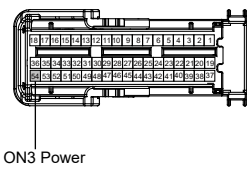
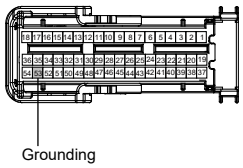
DTC: B104317-ACU

Fault code	Description
B104317	Supply voltage exceeds upper limit



1. Simplified Circuit Diagram



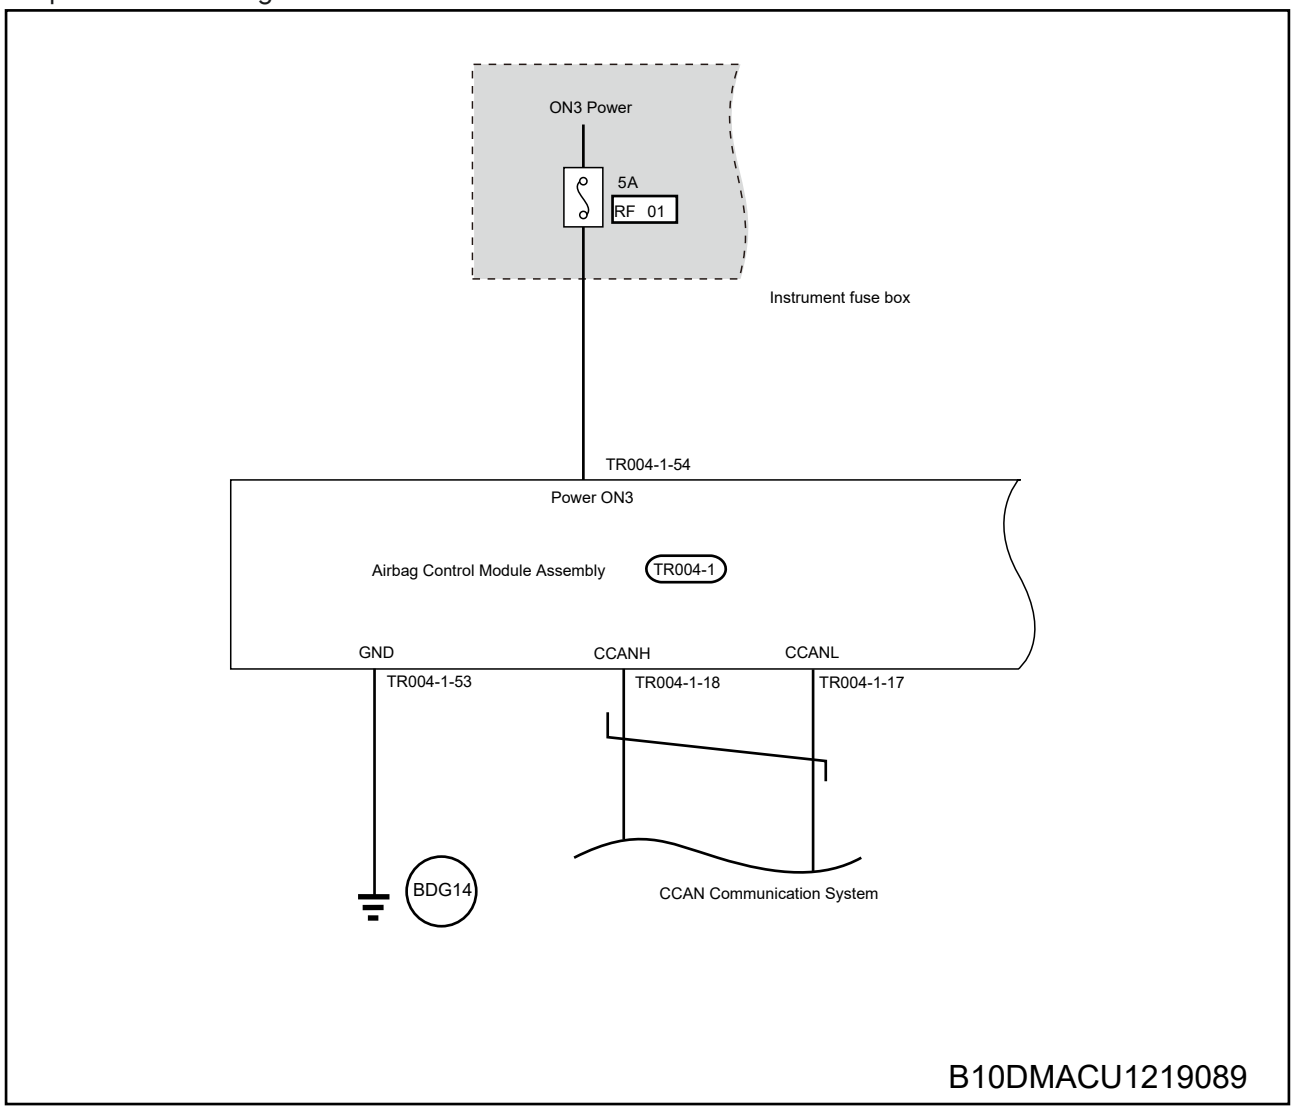
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved



No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

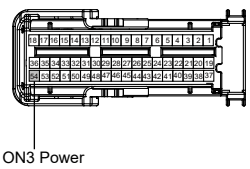
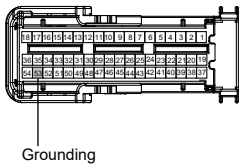
DTC: U1222FE-ACU

Fault code	Description
U1222FE	CAN Transceiver Error



1. Simplified Circuit Diagram



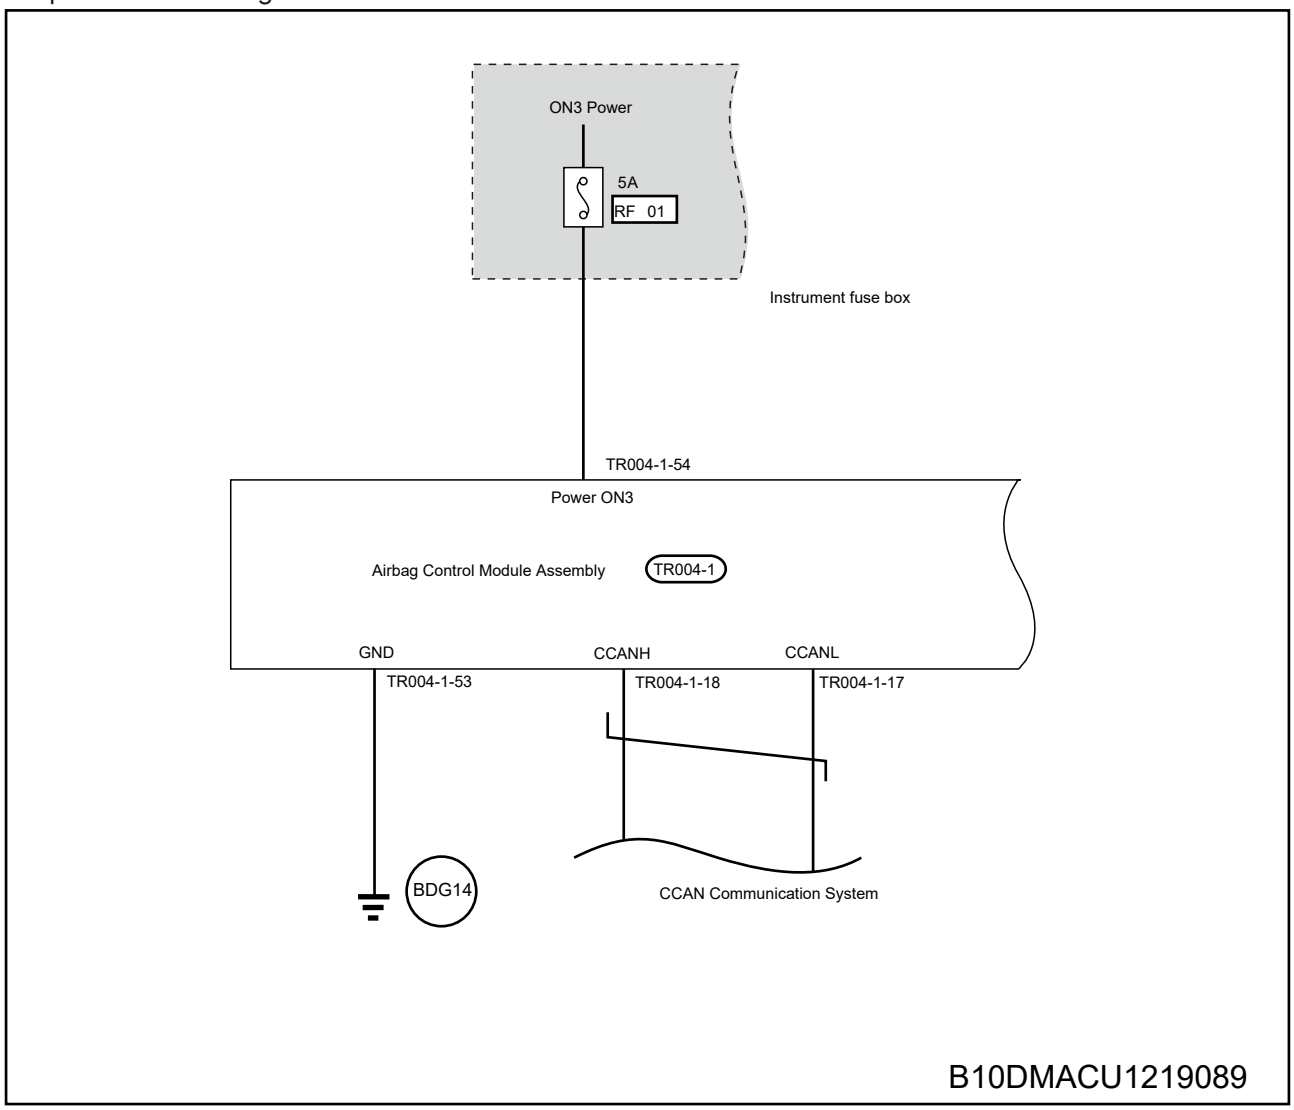
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 54 of the harness connecto r TR004-1 of the airbag control module assembly and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved



No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B103955-ACU

Fault code	Description
B103955	Invalid Configuration of Front Passenger Detection Switch

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the front right seat connector and the main zone controller.	
	A Check whether the wiring harness between the front right seat connector and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the communication wiring harness between the multi-domain fusion controller and the main zone controller.	
	A Check whether the communication harness between the multi-domain fusion controller and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the communication wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
	A Check whether the communication harness between the airbag control module assembly and the multi-domain fusion controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the front passenger detection switch.	
	A Replace the front passenger detection switch. B After replacing the front passenger detection switch, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly.

© 2026, All rights reserved

	B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U131E87-ACU

Fault code	Description
U131E87	Loss of Communication with ACC

1. Simplified Circuit Diagram

2. Diagnostic Steps

CAUTION

This diagnostic procedure uses vehicles without electric sunshades as an example, and vehicles equip ped with electric sunshades should refer to this procedure.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port.

© 2026, All rights reserved

	B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the communication wiring harness between the front monocular camera assembly and the for ward collision avoidance radar.	
	A Check whether the communication harness between the f ront monocular camera assembly and the forward collision avoidance radar is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Check the communication wiring harness between the airbag control module assembly and the forw ard-facing monocular camera assembly.	
	A Check whether the communication wiring harness betwe en the airbag control module assembly and the forward-fac ing monocular camera assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground of the forward collision warning radar.	
	A Check whether the power ground of the forward collision avoidance radar is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?

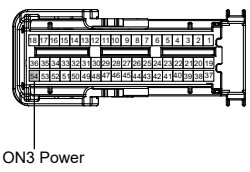
© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.	

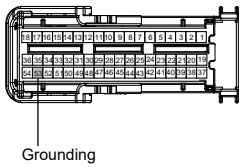
© 2026, All rights reserved

DTC: U1221FE-ACU

Fault code	Description
U1221FE	AUTOSAR Development Error Tracker Failure



1. Simplified Circuit Diagram



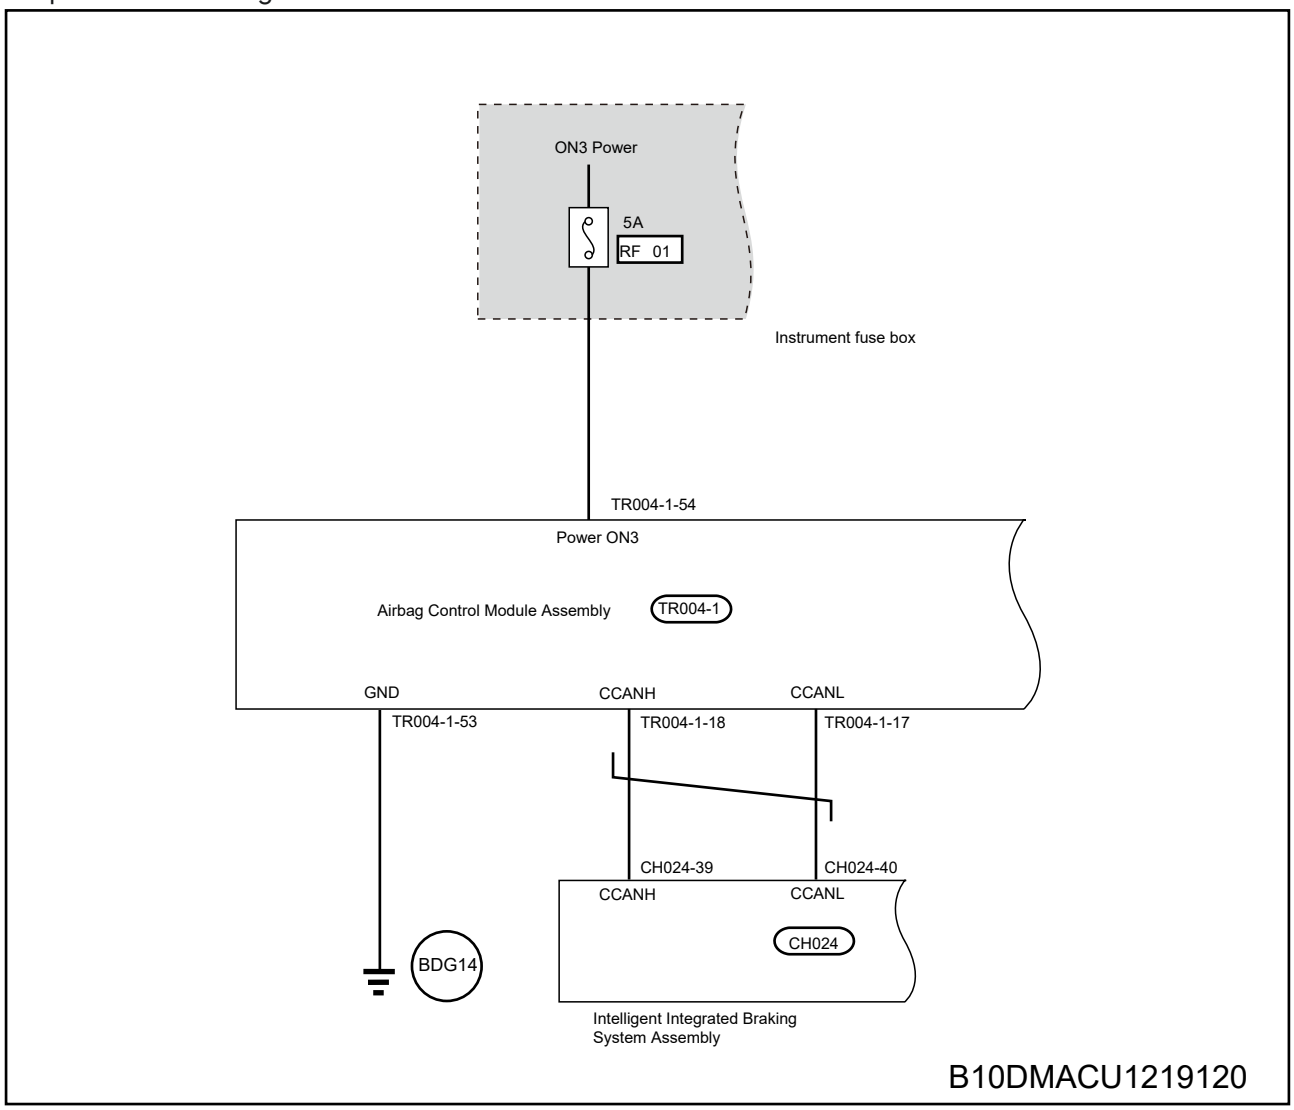
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 54 of the harness connecto r TR004-1 of the airbag control module assembly and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved



No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

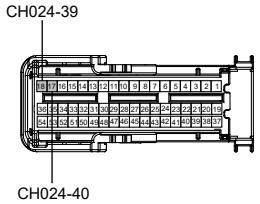
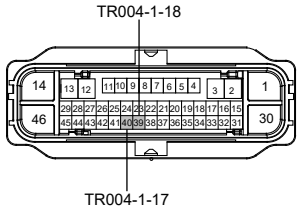
DTC: U132687-ACU

Fault code	Description
U132687	Communication lost with EPB





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219121 CH024 Intelligent Integrated Brake System Assembly  B10DMACU1219122	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector CH024 of the in telligent integrated brake system assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 39 of the harness connector CH024 of the intelligent i ntegrated braking system assembly to check if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 17 of the airbag control mo dule assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harne ss connector CH024 to check if the resistance value is norm al. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

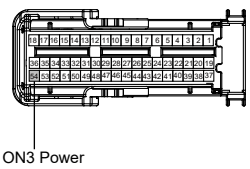
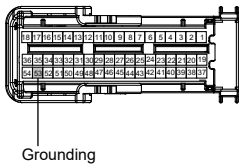
DTC: B104900-ACU

Fault code	Description
B104900	The safety transistor fault SF1B is classified as an internal fault.



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

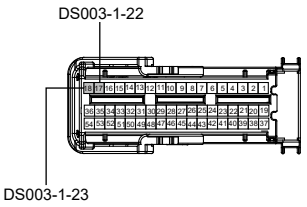
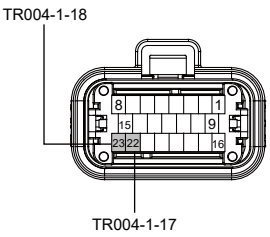
DTC: U132783-ACU

Fault code	Description
U132783	CheckSum Error in communication signal with VCU B7





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the controller assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219134 DS003-1 Controller Assembly  B10DMACU1219135	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector DS003-1 of the controller assembly. D Use a multimeter set to the resistance range to measure the resistance between terminal 18 of harness connector TR004-1 on the airbag control module assembly and terminal 23 of harness connector DS003-1 on the controller assembly to check if the value is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 22 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》

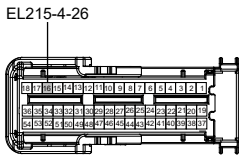
DTC: B103714-ACU

Fault code	Description
B103714	Crash output short to ground or open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

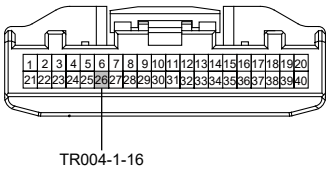
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



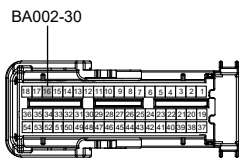
Step 2 Check the wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219091

EL215-4 Multi-Domain Fusion Controller

B10DMACU1219092



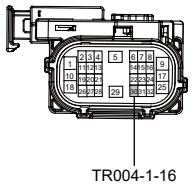
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 26 of harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》 》 》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》 》 》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the power battery pack assembly.

TR004-1 Airbag Control Module Assembly



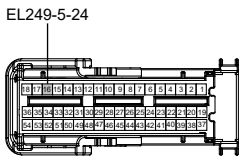
B10DMACU1219081

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 30 of the wiring harness connector BA002 of the power battery pack assembly to check whether it is normal.

© 2026, All rights reserved

BA002 Power Battery Pack Assembly

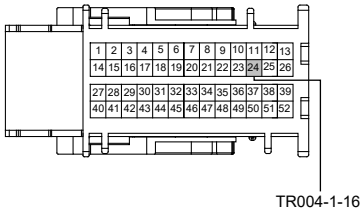
B10DMACU1219082



Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 4.



Step 4 Check the wiring harness between the airbag control module assembly and the main zone controller.

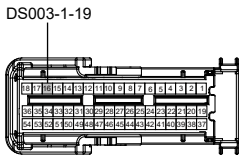
TR004-1 Airbag Control Module Assembly

B10DMACU1219083

EL249-5 Main Zone Controller

B10DMACU1219084

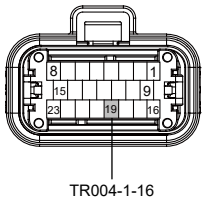
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D Using a multimeter, select the resistance range and meas ure whether the resistance value between terminal 16 of th e wire harness connector TR004-1 of the airbag control mo dule assembly and terminal 24 of the wire harness connect or EL249-5 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.



No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 5.

Step 5 Check the wiring harness between the airbag control module assembly and the controller assembly.



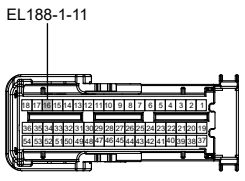
© 2026, All rights reserved

TR004-1 Airbag Control Module Assembly

B10DMACU1219085

DS003-1 Controller Assembly

B10DMACU1219086



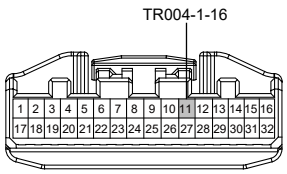
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 19 of harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 6.

Step 6 Check the wiring harness connecting the airbag control module assembly and the telematics control unit.

TR004-1 Airbag Control Module Assembly

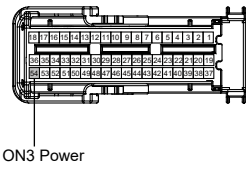


B10DMACU1219012

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D. Use a multimeter, set it to the resistance range, and measure whether the resistance between terminal 16 of the harness connector TR004-1 of the airbag control module assembly and terminal 11 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

EL188-1 Telematics Main Unit



B10DMACU1219013

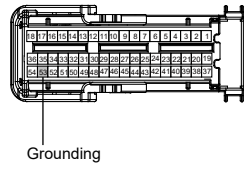
No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 7.

Step 7 Check the power supply harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219004



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 8.

Step 8 Check the ground wire harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 10.	
Step 10 Diagnosis complete.

B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

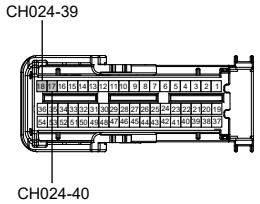
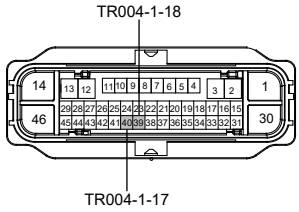
DTC: U132587-ACU

Fault code	Description
U132587	Communication lost with ESC/OneBox





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219121 CH024 Intelligent Integrated Brake System Assembly  B10DMACU1219122	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector CH024 of the in telligent integrated brake system assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 39 of the harness connector CH024 of the intelligent i ntegrated braking system assembly to check if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 17 of the airbag control mo dule assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harne ss connector CH024 to check if the resistance value is norm al. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

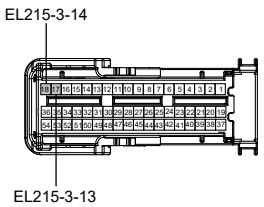
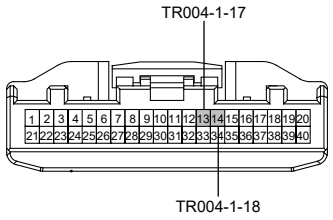
DTC: U130687-ACU

Fault code	Description
U130687	Loss of communication with BCM





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

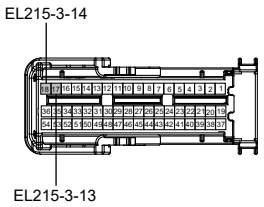
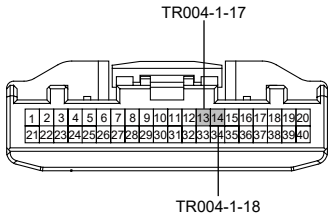
DTC: B203C92-ACU

Fault code	Description
B203C92	Inertial Sensor Internal Error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the fault codes of the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the Multi-Domain Fusion Controller, and record them. C Check for relevant fault codes.
Yes 》 》 》 Prioritize the repair of faults related to the multi-domain fusion controller.	
	No 》 》 》 Go to step 3.
Step 3 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

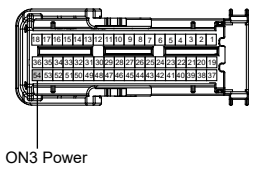
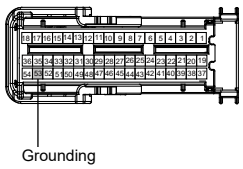
DTC: B105000-ACU

Fault code	Description
B105000	No functions are configured for EOLP



1. Simplified Circuit Diagram



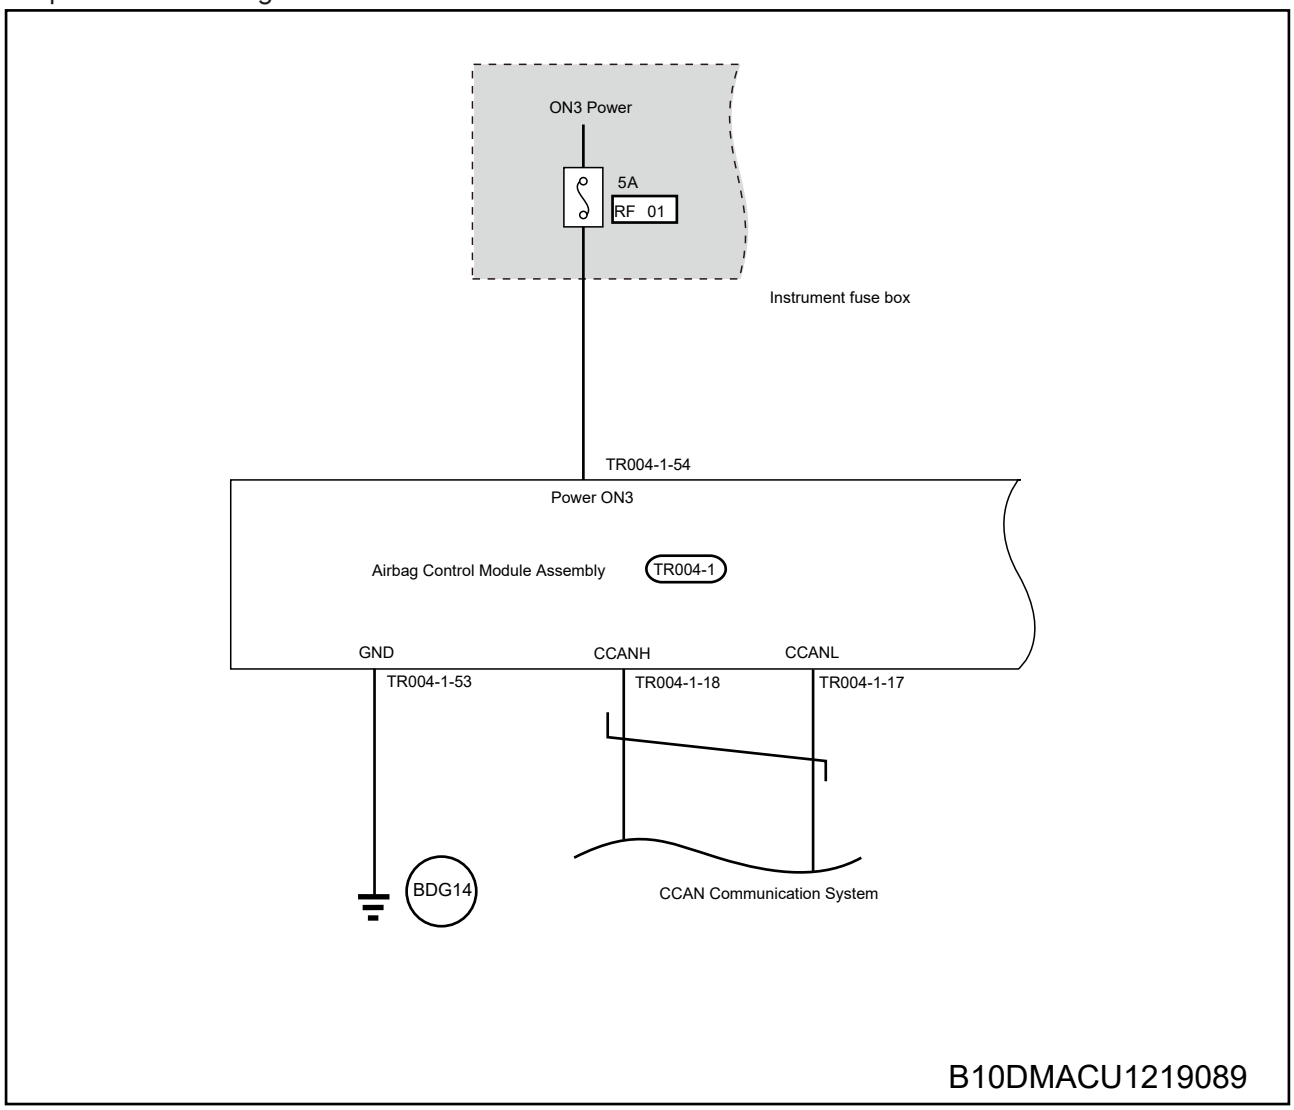
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Reconfigure the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Reconfigure the airbag control module assembly according to the diagnostic tool prompts. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the ground wire harness of the airbag control module assembly.	

© 2026, All rights reserved



TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

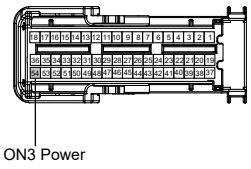
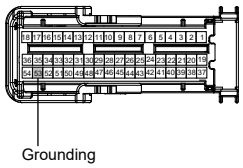
DTC: B105500-ACU

Fault code	Description
B105500	Forward Collision



1. Simplified Circuit Diagram



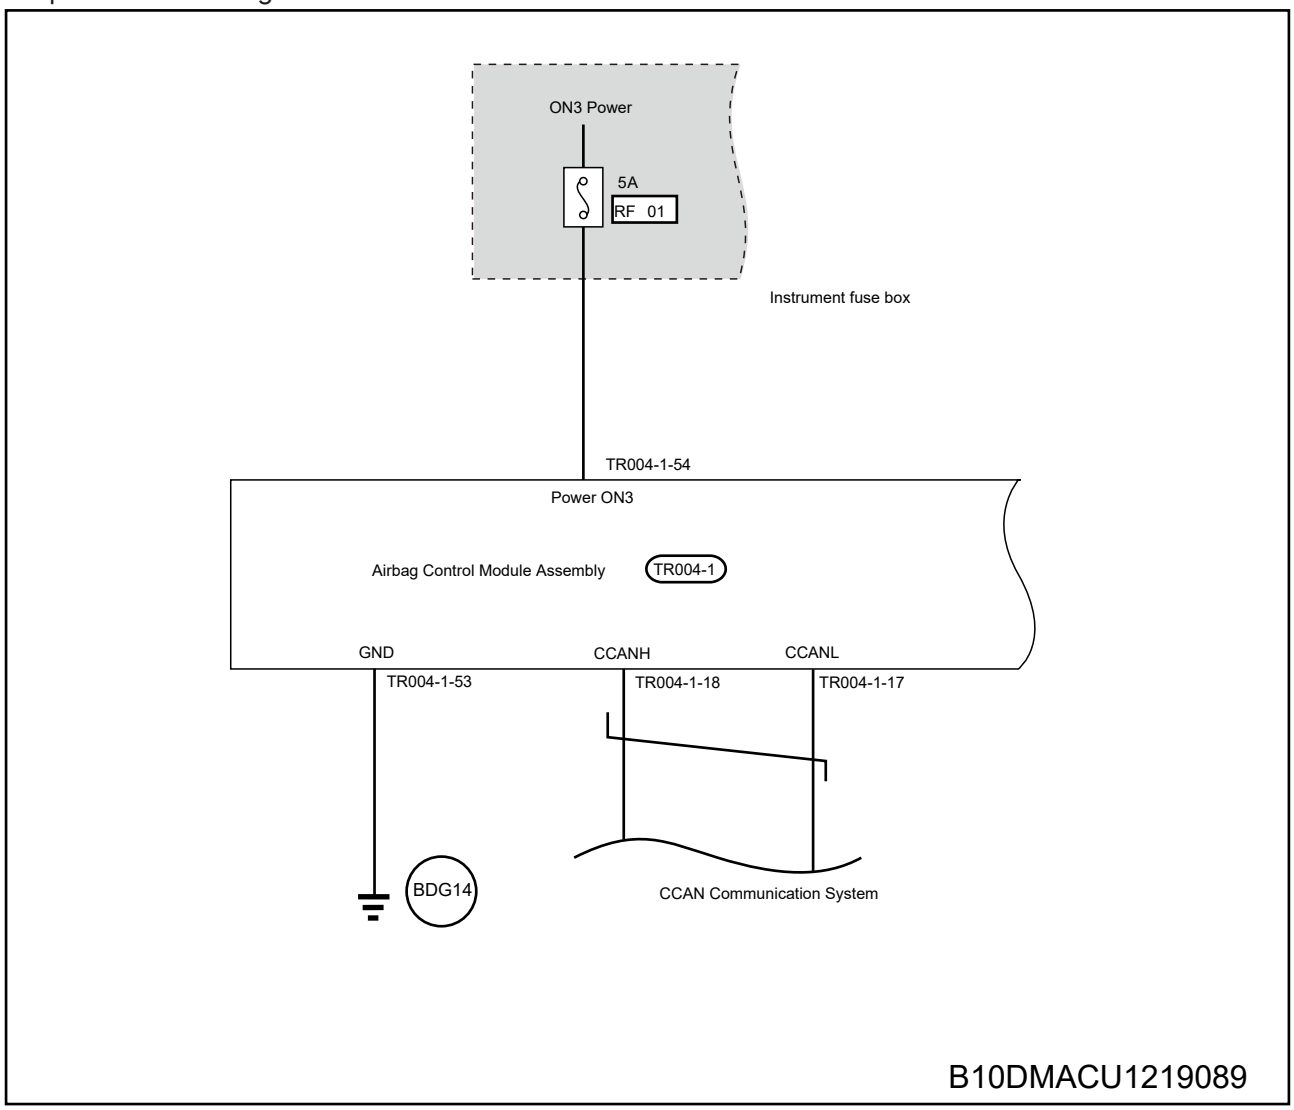
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved



No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

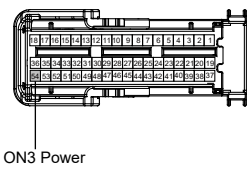
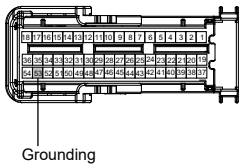
DTC: B105100-ACU

Fault code	Description
B105100	Collision Record Lock



1. Simplified Circuit Diagram



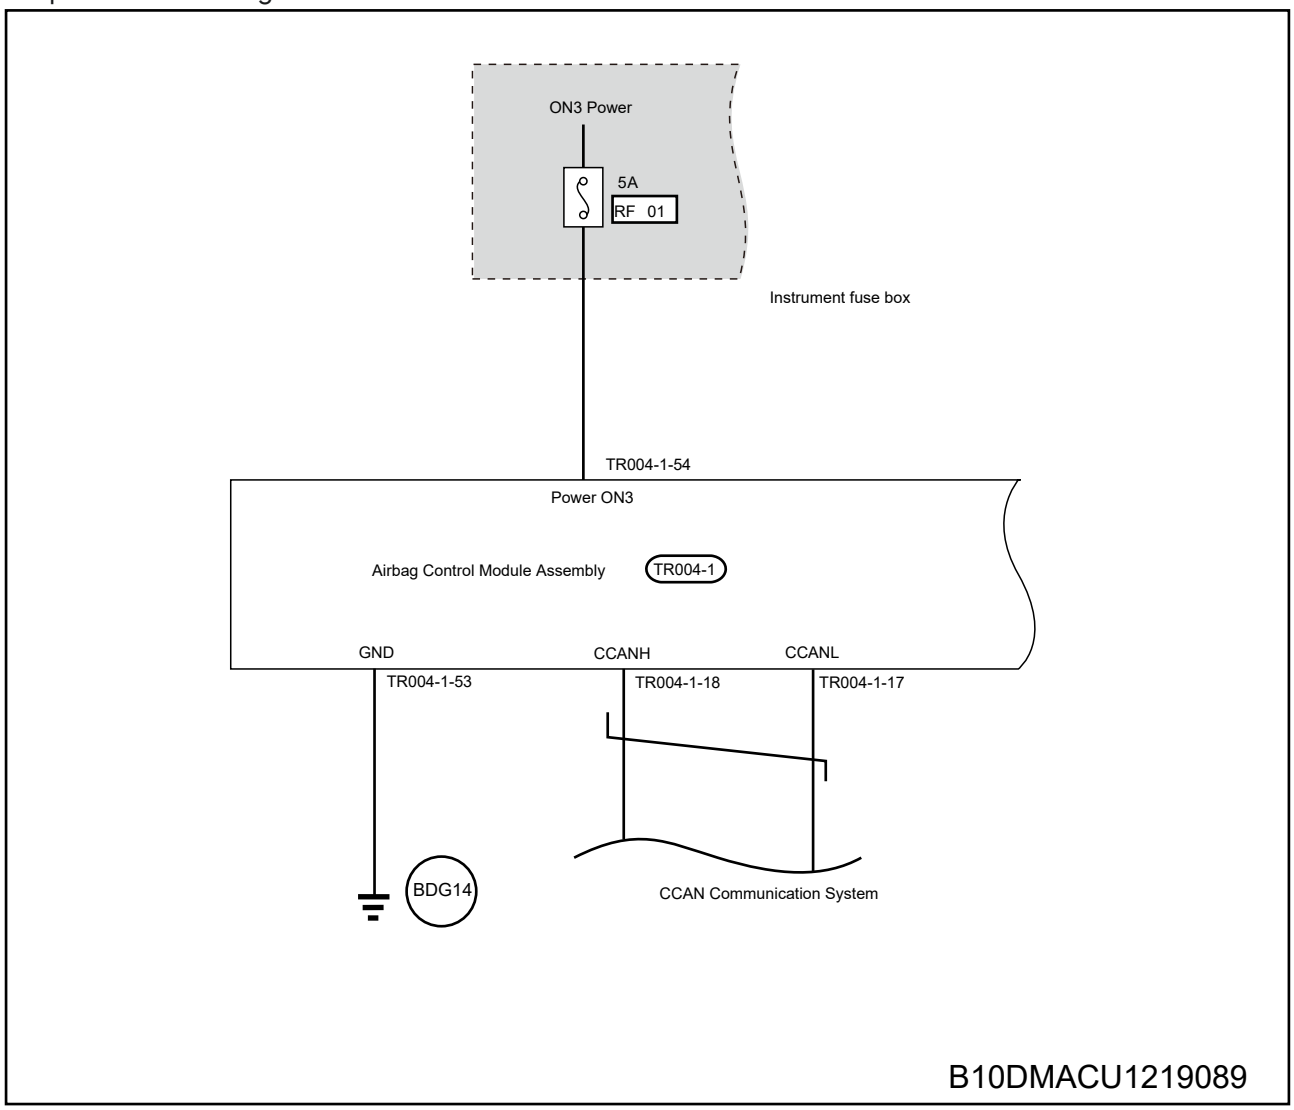
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved



No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

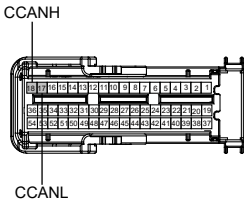
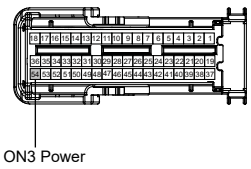
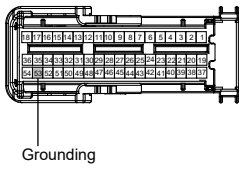
DTC: U007388-ACU

Fault code	Description
U007388	CAN1 Bus Off



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the airbag control module assembly is normal.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219093	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 18 and body ground, and between terminal 17 and body ground, respectively, at harn ess connector TR004-1 of the airbag control module assem bly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A

© 2026, All rights reserved

	C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Check the ground wire harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly.

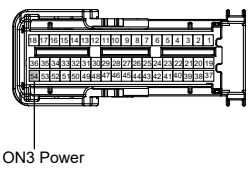
© 2026, All rights reserved

	B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

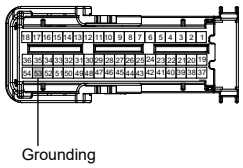
© 2026, All rights reserved

DTC: B105600-ACU

Fault code	Description
B105600	Rear-end collision



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the airbag control module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the airbag control module assembly fuse RF01. Fuse specification: RF01 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the airbag control module assembly.	
TR004-1 Airbag Control Module Assembly  ON3 Power B10DMACU1219004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

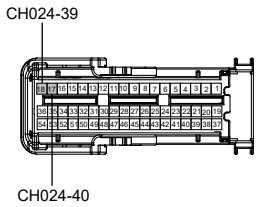
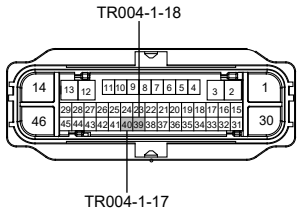
DTC: B203A00-ACU

Fault code	Description
B203A00	Angular velocity exceeds the defined range





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the intelligent integrated brake system assembly fault code.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the Intellige nt Integrated Brake System Assembly and record them. C Check for relevant fault codes.
Yes 》 》 》 Prioritize repair of faults related to the Intelligent Integrated Brake System assembly.	
	No 》 》 》 Go to step 3.
Step 3 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219121 CH024 Intelligent Integrated Brake System Assembly  B10DMACU1219122	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector CH024 of the in telligent integrated brake system assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 39 of the harness connector CH024 of the intelligent i ntegrated braking system assembly to check if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 17 of the airbag control mo dule assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harne ss connector CH024 to check if the resistance value is norm al. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

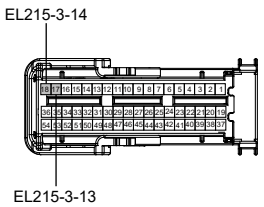
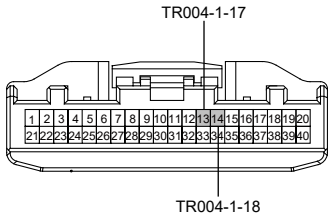
DTC: U130683-ACU

Fault code	Description
U130683	BCM Signal Checksum Error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain f usion controller.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219098 EL215-3 Multi-Domain Fusion Controller  B10DMACU1219099	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connect or TR004-1 of the airbag control module assembly and ter minal 14 of harness connector EL215-3 of the multi-domai n fusion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of the harness conn ector TR004-1 of the airbag control module assembly and t erminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance v alue is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

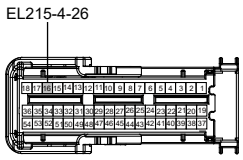
DTC: B103712-ACU

Fault code	Description
B103712	Crash output short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

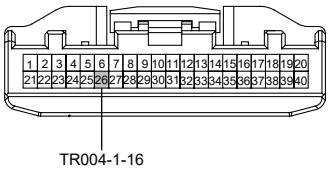
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



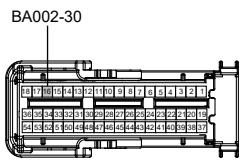
Step 2 Check the wiring harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMACU1219091

EL215-4 Multi-Domain Fusion Controller

B10DMACU1219092



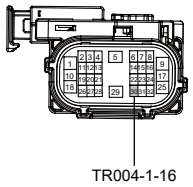
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 26 of harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》 》 》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》 》 》
Go to step 3.

Step 3 Check the connecting wiring harness between the airbag control module assembly and the power battery pack assembly.

TR004-1 Airbag Control Module Assembly



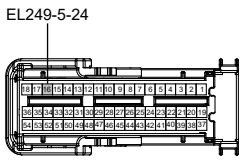
B10DMACU1219081

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the wiring harness connector TR004-1 of the airbag control module assembly and terminal 30 of the wiring harness connector BA002 of the power battery pack assembly to check whether it is normal.

© 2026, All rights reserved

BA002 Power Battery Pack Assembly

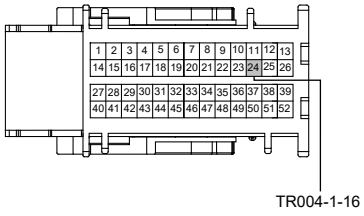
B10DMACU1219082



Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 4.



Step 4 Check the wiring harness between the airbag control module assembly and the main zone controller.

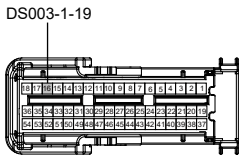
TR004-1 Airbag Control Module Assembly

B10DMACU1219083

EL249-5 Main Zone Controller

B10DMACU1219084

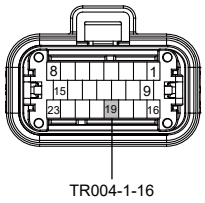
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D Using a multimeter, select the resistance range and meas ure whether the resistance value between terminal 16 of th e wire harness connector TR004-1 of the airbag control mo dule assembly and terminal 24 of the wire harness connect or EL249-5 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.



No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; rep lace the wiring harness if necessary.

Yes 》》》
Go to step 5.

Step 5 Check the wiring harness between the airbag control module assembly and the controller assembly.



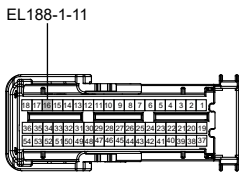
© 2026, All rights reserved

TR004-1 Airbag Control Module Assembly

B10DMACU1219085

DS003-1 Controller Assembly

B10DMACU1219086



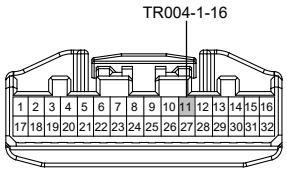
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of harness connector TR004-1 of the airbag control module assembly and terminal 19 of harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 6.

Step 6 Check the wiring harness connecting the airbag control module assembly and the telematics control unit.

TR004-1 Airbag Control Module Assembly

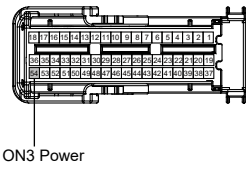


B10DMACU1219012

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D. Use a multimeter, set it to the resistance range, and measure whether the resistance between terminal 16 of the harness connector TR004-1 of the airbag control module assembly and terminal 11 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

EL188-1 Telematics Main Unit



B10DMACU1219013

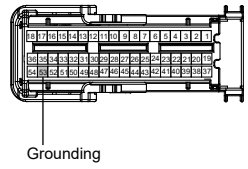
No 》》》 Inspect the crash signal circuit for possible short circuits, open circuits, and poor connections; replace the wiring harness if necessary.

Yes 》》》
Go to step 7.

Step 7 Check the power supply harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219004



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 54 of the harness connector TR004-1 of the airbag control module assembly and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 8.

Step 8 Check the ground wire harness of the airbag control module assembly.

TR004-1 Airbag Control Module Assembly

B10DMACU1219005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Use a multimeter, select the resistance range, and measure the resistance between terminal 53 of the harness connector TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to Step 9.	
Step 9 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 10.	
Step 10 Diagnosis complete.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the airbag control module assembly and the smart integrated braki ng system assembly.	
TR004-1 Airbag Control Module Assembly  B10DMACU1219121 CH024 Intelligent Integrated Brake System Assembly  B10DMACU1219122	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector CH024 of the in telligent integrated brake system assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor TR004-1 of the airbag control module assembly and ter minal 39 of the harness connector CH024 of the intelligent i ntegrated braking system assembly to check if it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 17 of the airbag control mo dule assembly harness connector TR004-1 and terminal 40 of the intelligent integrated braking system assembly harne ss connector CH024 to check if the resistance value is norm al. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

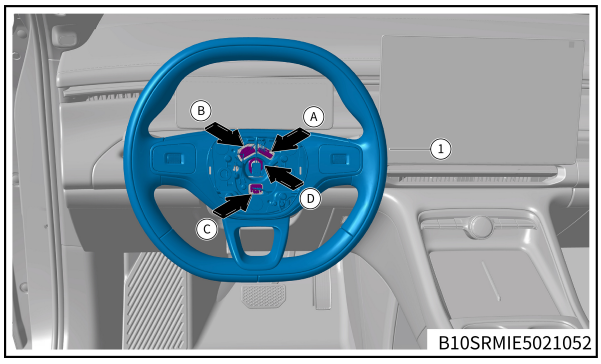
7.20.7 MAINTENANCE TOOLS

GENERAL TOOLS

Serial No.	Tool name	Tool Outline Drawing	Description
1	Socket wrench		Removal and installation of fi xing bolts/nuts
2	Interior trim removal tools		Remove interior trim clips
3	Screwdriver		Removal and installation of t he fixing screw



© 2026, All rights reserved

7.20.8 SERVICE AND REPAIR GUIDANCE

STEERING WHEEL ASSEMBLY

REMOVAL PROCEDURE

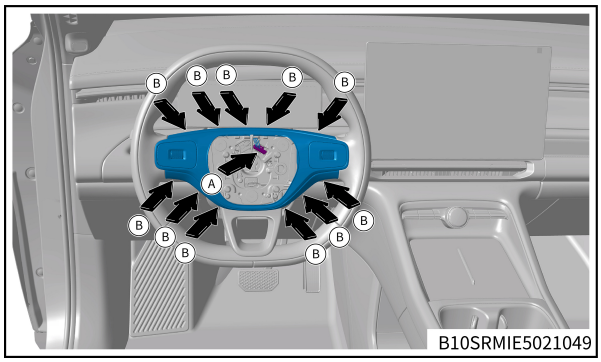
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6237)
4. Remove the steering wheel assembly.

a. Disconnect 1 connector of the steering wheel switch assembly harness - arrow A -, disconnect 1 connector of the driver airbag harness - arrow B -, and disconnect 1 connector of the steering wheel assembly harness - arrow C -.
b. Unscrew the 1 fixing nut -arrow D- of the steering wheel assembly, and remove the steering wheel assembly ①.
Recommended tool: 21mm socket
Torque: 50±5N m

> **NOTE**
>
> Before removal, make alignment marks between the steering wheel and the steering column to facilitate installation.

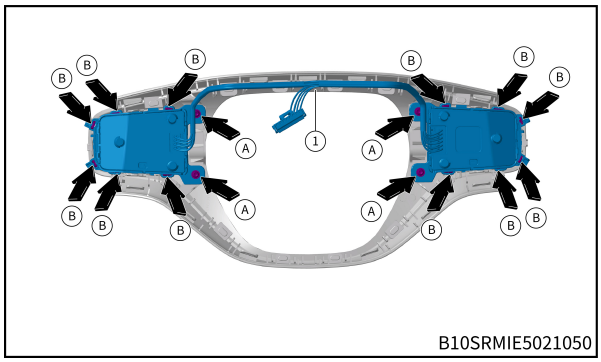
> **ATTENTION**
>
> After removal, do not rotate the clock spring.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, check whether the clock spring is in the correct position.
   b. Install the steering wheel assembly according to the marks made during removal.

© 2026, All rights reserved



STEERING WHEEL BUTTON ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6237)
4. Remove the steering wheel button assembly.

a. Disconnect the 1 connector of the steering wheel button assembly -arrow A-, and release the 11 retaining clips of the steering wheel button assembly -arrow B-.
Recommended tool: Interior trim removal tool
b. Remove the steering wheel button and steering wheel V-shaped trim assembly ①.

c. Unscrew the 4 mounting screws -Arrow A- of the steering wheel button assembly, and release the 12 retaining clips -Arrow B- of the steering wheel button assembly.
Recommended tool: T10 Torx wrench
d. Remove the steering wheel button assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the controller requires following these steps to ensure software version compatibility:
      - Record the old version: Before disassembly, read and record the software version number of the old controller.
      - Check for new version: After installing the new controller, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the new controller software must first be updated to the old version or a higher version before being put into use.

   b. After installation, perform the following operations on the steering wheel button assembly:
      - Write the VIN to the new steering wheel button assembly-Diagnostic tool operation: Select corresponding vehicle model-System diagnostics-Steering wheel controller (SWB)-Data writing-Write VIN.

   c. Check whether the steering wheel button assembly is functioning properly.

© 2026, All rights reserved

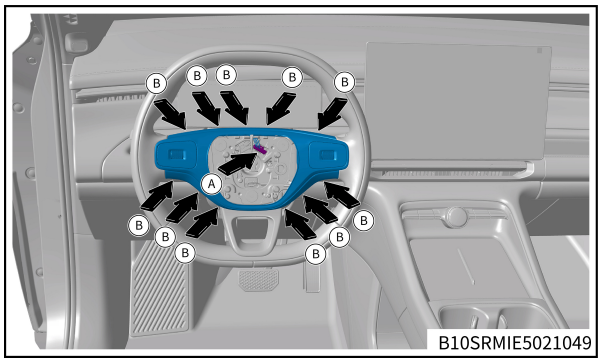
STEERING WHEEL MAIN BODY ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the steering wheel assembly.
   See:Steering wheel assembly (page 6233)
4. Remove the steering wheel button assembly.
   See:Steering wheel button assembly (page 6234)
5. Remove the steering wheel main body assembly.

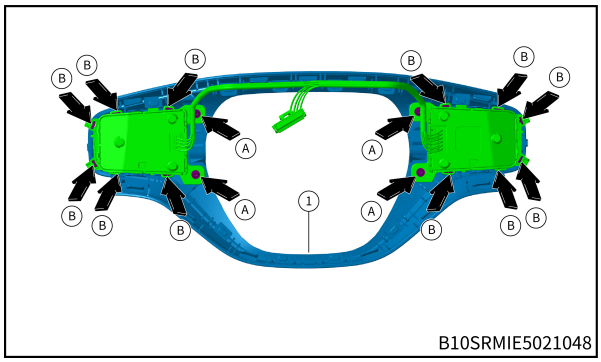
a. Remove the steering wheel main body assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, check whether the clock spring is in the correct position.
   b. Install the steering wheel assembly according to the marks made during removal.

© 2026, All rights reserved



STEERING WHEEL BUTTON TRIM

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the driver airbag assembly.
   See:Driver airbag assembly (page 6237)
4. Remove the steering wheel button trim.

a. Disconnect the 1 connector -Arrow A- of the steering wheel button assembly, and release the 13 retaining clips -Arrow B- of the steering wheel button assembly.
   Recommended tool: Interior trim removal tool
b. Remove the steering wheel buttons along with the steering wheel button trim ①.

c. Unscrew the 4 mounting screws -Arrow A- of the steering wheel button assembly, and release the 12 retaining clips -Arrow B- of the steering wheel button assembly.
   Recommended tool: T10 Torx wrench
d. Remove the steering wheel button trim ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check whether the steering wheel button assembly is functioning properly.

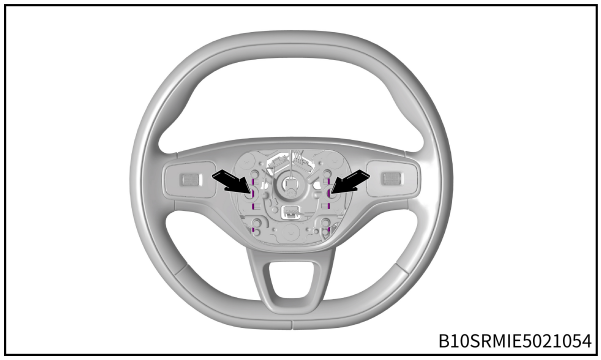
DRIVER AIRBAG ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

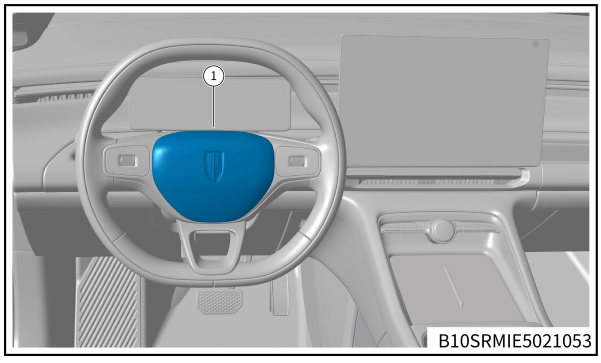
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

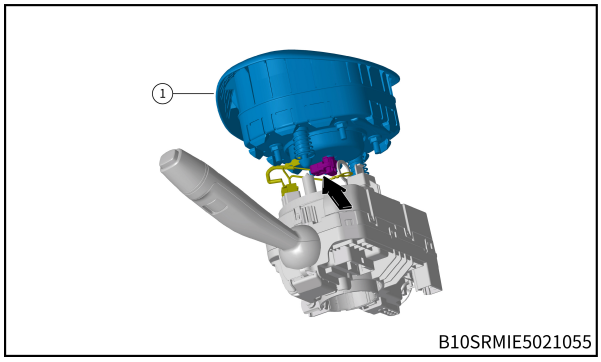
After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.



3. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
4. Remove the driver airbag assembly.

WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。



a. Detach the 2 retaining clips -arrows- of the driver airbag assembly from the bottom of the steering wheel assembly.
Recommended tool: Flathead screwdriver

b. Disconnect the driver airbag assembly ①.

© 2026, All rights reserved

c. Disconnect 1 connector -arrow- of the driver airbag assembly, and remove the driver airbag assembly ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:

ATTENTION

- Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.
- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- Ensure the airbag is fully installed in place. After installation, check whether the airbag fits evenly at the interface with the steering wheel assembly, and if it does not fit evenly, reinstall it.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

© 2026, All rights reserved

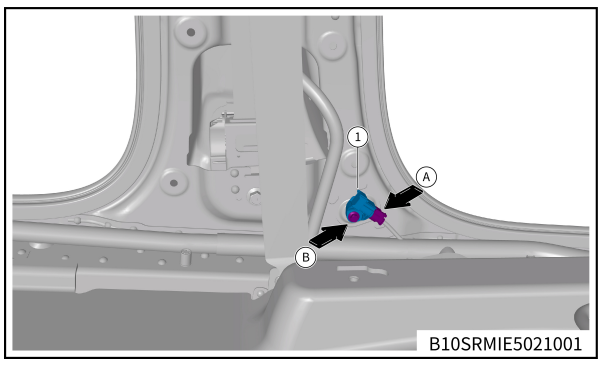
CRASH SENSOR ASSEMBLY

NOTE

- This section describes the removal and installation of the left side impact sensor assembly. The removal and installation of the right side impact sensor assembly can generally follow the procedure for the left side.
- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
4. Remove the crash sensor assembly.

WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。

a. Disconnect 1 connector of the crash sensor assembly - Arrow A -, and unscrew 1 mounting bolt of the crash sensor - Arrow B -.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Remove the collision sensor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

© 2026, All rights reserved

- Check whether the airbag malfunction indicator is illuminated, and if so, troubleshoot the fault.

© 2026, All rights reserved

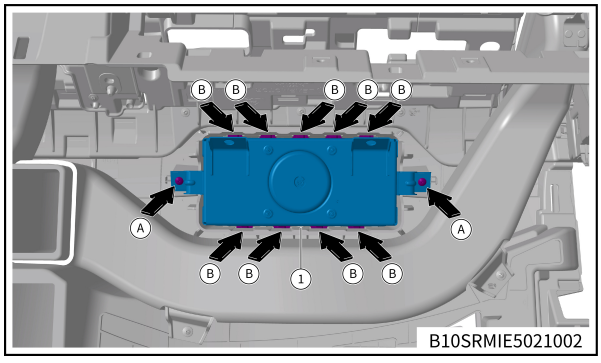
FRONT PASSENGER AIRBAG ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page)
4. Remove the front passenger airbag assembly.

WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。

a. Unscrew the 2 fixing screws of the front passenger airbag assembly -arrow A-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Detach the 9 retaining clips -arrow B- of the front passenger airbag assembly, and remove the front passenger airbag assembly ①.

SETUP

1. Perform the installation procedure in reverse order, and note the following:

ATTENTION

- Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.

© 2026, All rights reserved

- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

© 2026, All rights reserved

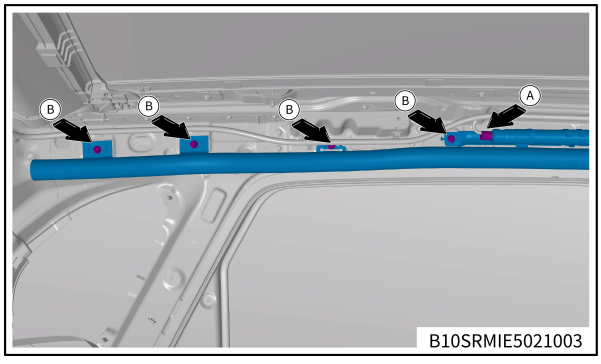
LEFT SIDE CURTAIN AIRBAG ASSEMBLY

NOTE

- This section describes the removal and installation of the left curtain airbag assembly, and the removal and installation of the right curtain airbag assembly can generally be performed by referring to the left side.
- Static electricity can cause the curtain airbag to deploy accidentally. Before performing maintenance on the protection system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the side curtain airbag and may result in injury to the driver.

REMOVAL PROCEDURE

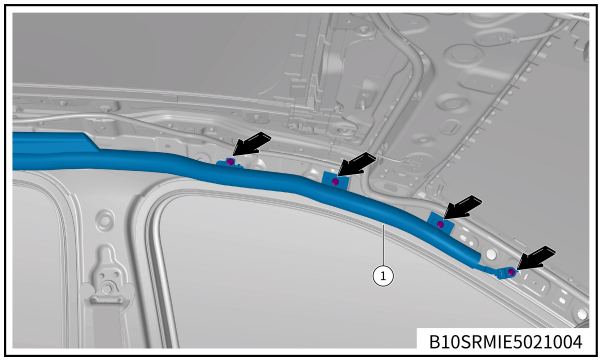
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the headliner assembly.
   See:Headliner assembly (full blackout headliner) (page)
4. Remove the left curtain airbag.



WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)"

a. Disconnect the 1 connector of the left curtain airbag assembly -arrow A-, and unscrew the 4 mounting bolts of the left curtain airbag assembly -arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

© 2026, All rights reserved

b. Unscrew the 4 mounting bolts -arrow- of the left curtain airbag assembly, and remove the left curtain airbag assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

- If handled improperly, the new curtain airbag assembly may deploy unexpectedly, causing personal injury. Therefore, when handling it, the deployment direction of the curtain airbag should face upward to minimize potential injury.
- Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
- It is strictly forbidden to use a multimeter to measure airbag resistance.

© 2026, All rights reserved

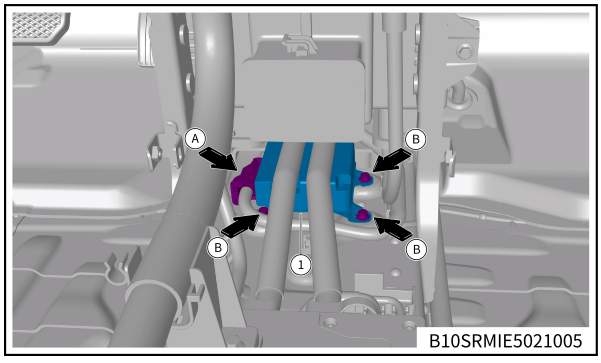
AIRBAG CONTROL MODULE ASSEMBLY

NOTE

- Static electricity can cause the airbag to deploy accidentally. Before performing maintenance on the protective system, static electricity must be discharged. You can discharge static electricity by briefly touching the vehicle body.
- Note: Failure to follow the instructions will affect the normal operation of the airbag system and may cause injury to the driver.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the rear front face air duct assembly.
   See:Rear Front Face-Level Air Duct Assembly (page 5483)
4. Remove the airbag control module assembly.

WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。

a. Disconnect the 1 connector of the airbag control module assembly -arrow A-, and unscrew the 3 fixing bolts of the airbag control module assembly -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Remove the airbag control module assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The mounting surface of the airbag control module assembly must be free of any debris to ensure the airbag control module assembly is seated securely. Orient the connector port of the airbag control module assembly to the right, ensure that the arrow on the airbag control module assembly label points toward the front of the vehicle, and align the three mounting holes of the airbag control module assembly with the threaded holes on the airbag control module assembly bracket.

© 2026, All rights reserved

b. The airbag control module assembly must be handled with care, avoid dropping the airbag control module assembly from a height, if the airbag control module assembly is accidentally dropped from a height, the airbag control module assembly must be replaced, and it is prohibited to install a potentially damaged airbag control module assembly on the vehicle.
c. Ensure all relevant connectors are securely connected and all wiring harnesses are free from damage.
d. After replacing the module, the module must be matched.
e. Replacing the controller requires following these steps to ensure software version compatibility:
   - Record the old version: Before disassembly, read and record the software version number of the old controller.
   - Check for new version: After installing the new controller, first read its software version number.

   Version Comparison and Processing:
   - If the new version ≥ the old version, the replacement process will be completed normally.
   - If the new version < the old version, the new controller software must first be updated to the old version or a higher version before being put into use.
f. After installation, perform the following operations on the Airbag Control Module:
   - Write the VIN to the new airbag control module. Diagnostic tool operation: ACU - Data Write - VIN.
   - Write the end-of-line configuration to the new airbag control module. The diagnostic tool operation is: ACU-End-of-line configuration-Vehicle model configuration.
   - Calibrate the new airbag control module. Diagnostic tool operation: ACU-Routine Control-IMU Calibration.

     NOTE

     Before starting this step, ensure that the vehicle has undergone a four-wheel alignment or is parked on a level surface.

   - After locking the vehicle, re-enter READY mode and wait for the self-check to complete. If the airbag warning light does not remain illuminated, the procedure is complete.

7.21 SEAT BELT SYSTEM

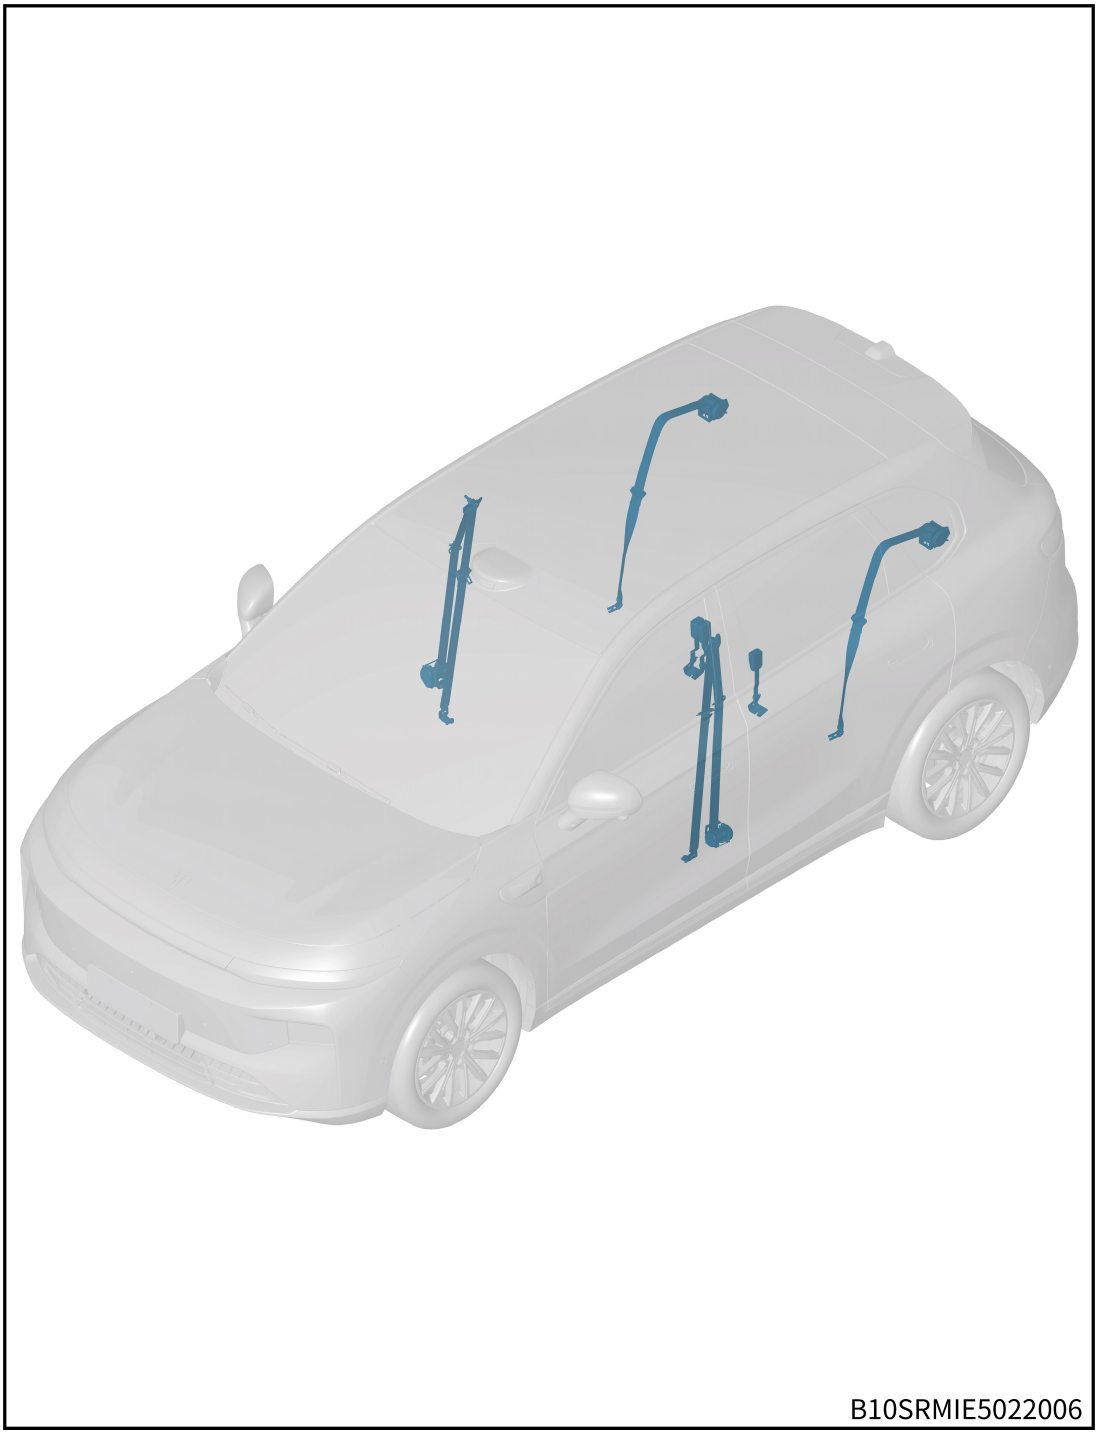
7.21.1 PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. When removing and installing the seat belt assembly, avoid bumping the retractor.
2. After installation, check that the retractor function is normal.
3. If the seat belt is damaged, frayed, or the buckle malfunctions, it should be replaced immediately.
4. If the vehicle has been involved in a collision and the seat belt has sustained impact forces, it must be replaced immediately, even if no damage is found.
5. Do not insert any foreign objects into the seat belt buckle, and do not modify or remove the seat belt.
6. When the seat belt is dirty, clean it with a neutral detergent. Do not use corrosive agents, dyes, or dry cleaning agents, otherwise the strength of the seat belt will be severely affected.
7. If the seat belt is damaged, frayed, or stretched and deformed due to chemical action or sun exposure, it must be replaced.
8. If the metal connecting parts of the seat belt are bent, deformed, or corroded, the seat belt must be replaced.
9. Retractor performance requirements: It shall retract smoothly at the installation angle and automatically retract to its original position.
10. Latch performance requirements: The process of inserting the latch bolt and opening the latch must provide a distinct tactile feedback of proper engagement; the latch must not open on its own, and the assembly must not fail.

© 2026, All rights reserved

7.21.2 STRUCTURE AND PRINCIPLE INTRODUCTION



STRUCTURE AND PRINCIPLE INTRODUCTION

1. The seat belt system includes the front left and right seat belt assemblies, the second row left and right seat belt assemblies, the second row center seat belt assembly, and the SBR sensor. The SBR sensor is used to detect whether an occupant is present in the occupant seat. Under the following conditions, the seat belt can keep the passenger in the passenger compartment and gradually reduce the impact force:
   a. Frontal impact collision.
   b. Rear impact collision.
   c. Side impact collision.
   d. Rollover collision.
2. Seat belt reminder control description:
   a. When the vehicle is in motion, if the driver or front passenger is not wearing a seat belt, the corresponding seat belt reminder indicator in the combination instrument will illuminate accompanied by a warning chime. The indicator and warning chime will turn off and stop simultaneously once the seat belt is fastened.

7.21.7 SERVICE AND REPAIR GUIDANCE

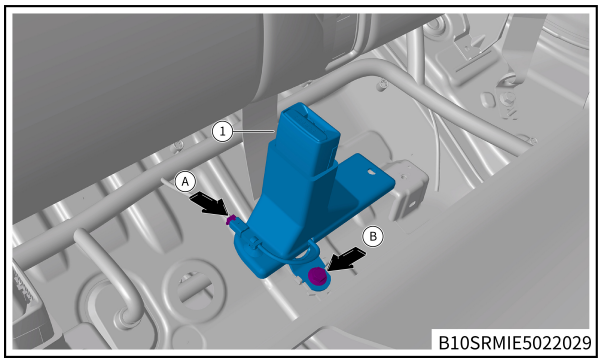
REAR SEAT BELT DUAL BUCKLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page)
4. Remove the rear seat belt dual buckle assembly.

a. Disconnect the 1 connector between the rear seat belt dual buckle assembly and the floor wiring harness -Arrow A-.
b. Unscrew the 1 fixing bolt -Arrow B- of the rear seat belt dual buckle assembly, and remove the rear seat belt dual buckle assembly ①.
   Recommended tool: 14mm socket
   Torque: 50±5N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

REAR SEAT BELT SINGLE BUCKLE ASSEMBLY

REMOVAL PROCEDURE

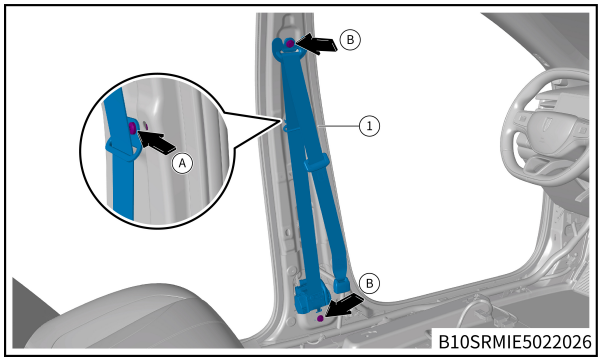
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page)
4. Remove the rear seat belt single buckle assembly.

a. Disconnect the 1 connector - Arrow A - between the rear seat belt single buckle assembly and the floor wiring harness.
b. Unscrew the 1 fixing bolt -arrow B- of the rear seat belt single buckle assembly, and remove the rear seat belt single buckle assembly ①.
   Recommended tool: 14mm socket
   Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



FRONT LEFT SEAT BELT ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat belt assembly, and the removal and installation of the front right seat belt assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

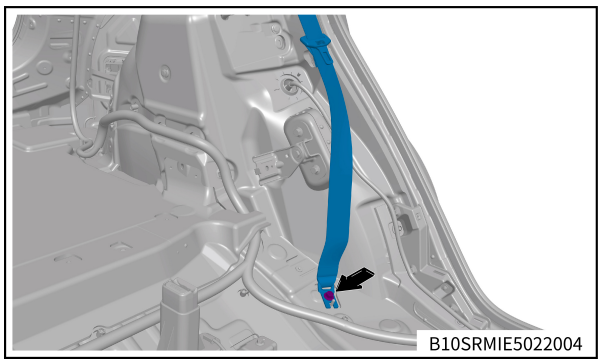
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the B-pillar upper interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
4. Remove the lower B-pillar interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
5. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
6. Remove the front left seat belt assembly.

a. Unscrew the 1 fixing bolt of the front left seat belt guide hook -arrow A-.
   Recommended tool: T30 Torx socket wrench
   Torque: 9±1N m
b. Unscrew the 2 fixing bolts of the front left seat belt assembly -arrow B-.
   Recommended tool: 14mm socket
   Torque: 50±5N m
c. Remove the front left seat belt assembly ①.

SETUP

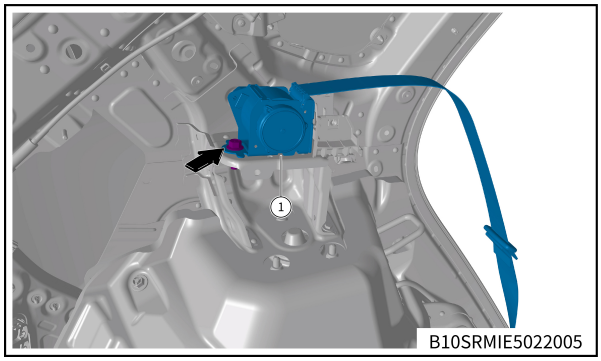
1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



REAR LEFT AND RIGHT SEAT BELT ASSEMBLIES

NOTE



This section describes the removal and installation of the rear left seat belt assembly, and the removal and installation of the rear right seat belt assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
5. Remove the rear seat cushion EPP assembly.
   See:Rear seat cushion EPP assembly (page 5546)
6. Remove the seat belt assemblies on both sides of the rear seats.

a. Unscrew 1 mounting bolt -arrow- of the seat belt assemblies on both rear sides.
Recommended tool: 14mm socket
Torque: 50±5N m

b. Unscrew the 1 fixing bolt -arrow- of both rear seat belt assemblies, and remove both rear seat belt assemblies ①.
Recommended tool: 14mm socket
Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

FRONT LEFT SEAT BELT LAP PRETENSIONER ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat belt lap pretensioner assembly, while the removal and installation of the front right seat belt lap pretensioner assembly can generally follow the procedures for the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the left A-pillar lower trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the left B-pillar lower trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
5. Remove the front left seat belt lap pretensioner assembly.

a. Disconnect the 1 connector -arrow A- of the front left seat belt lap pretensioner assembly.
b. Unscrew 1 fixing nut -arrow B- of the front left seat belt lap pretensioner assembly, and remove the front left seat belt lap pretensioner assembly ①.
Recommended tool: 15mm socket
Torque: 9±1N m

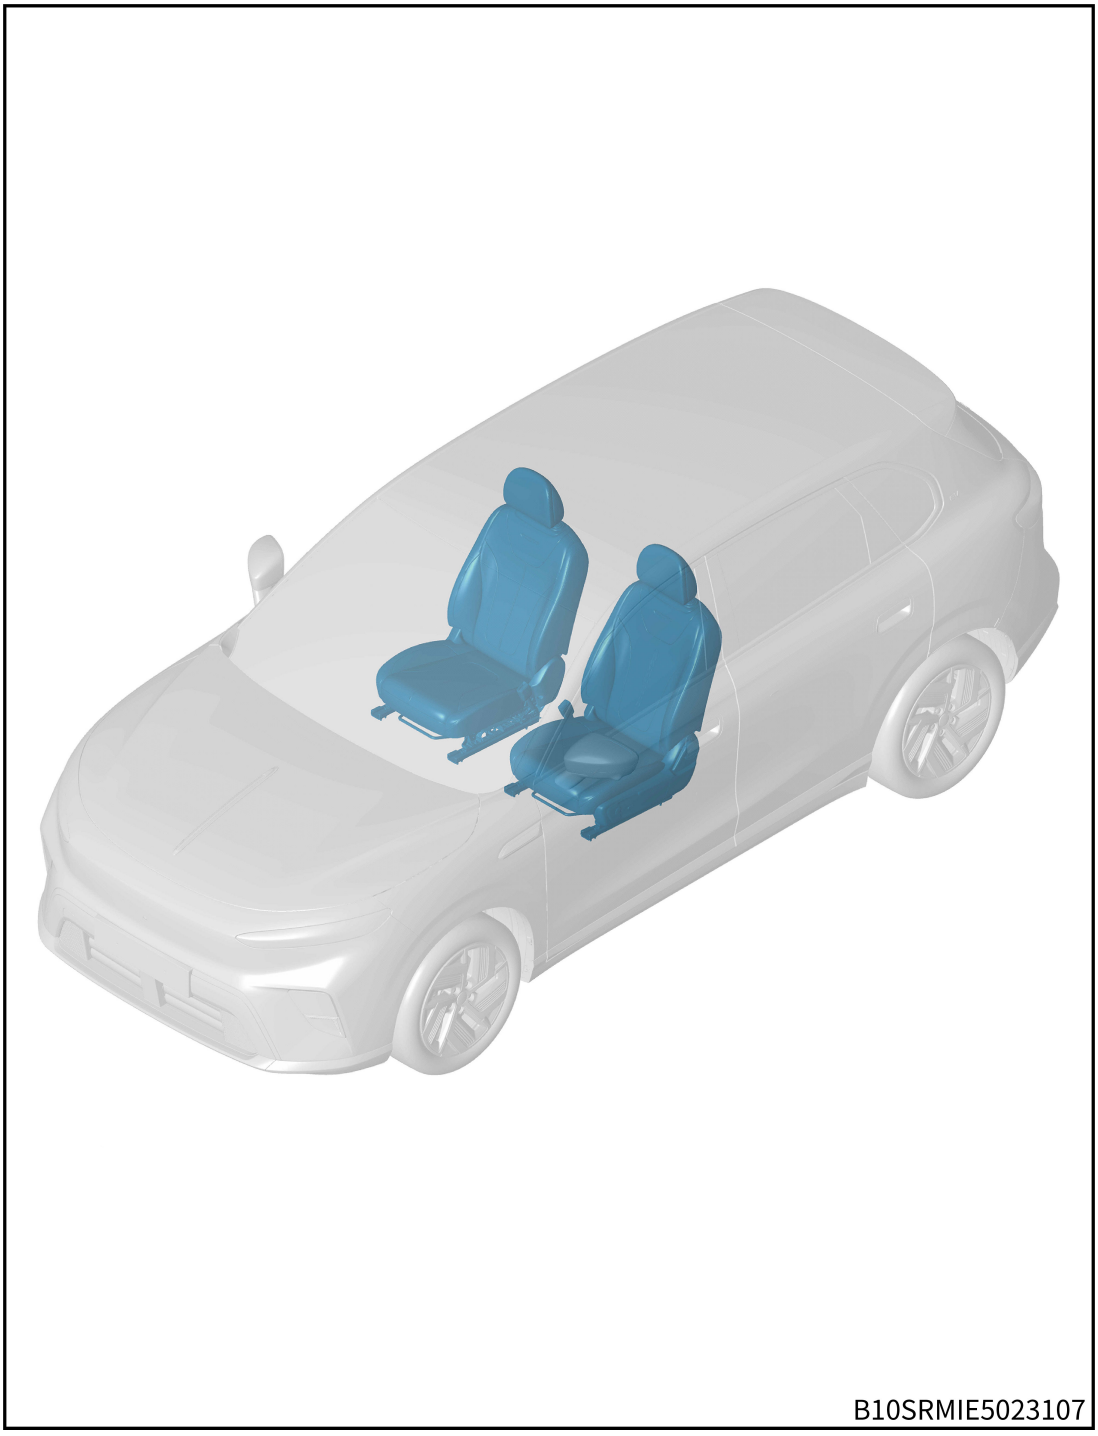
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

7.22 FRONT SEATS AND ACCESSORY SYSTEM

7.22.1 PRECAUTIONS



PRECAUTIONS

1. The silicone material is soft: Please avoid contact with sharp objects to prevent it from being cut or punctured.
2. When cleaning, avoid using abrasive or hard cleaning tools (such as scouring pads, brass wire brushes, etc.).
3. Avoid prolonged contact between silicone leather and organic solvents such as gasoline, sewing machine oil, and kerosene.
4. When using alcohol or flammable cleaners, keep away from any ignition sources; wear protective gloves and ensure cleaning is performed in a well-ventilated area.
5. When cleaning with agents other than water, avoid leaving cleaning agent residue on the surface, as the residue may affect the service life and should be removed as soon as possible.
6. When using cleaning agents, please use a colorfast towel, cotton cloth, or sponge for cleaning.
7. Before removing the seat, be sure to protect the vehicle body by laying protective pads to prevent scratching the vehicle body during the removal or extraction of the seat.
8. After removing the seat, do not move the seat track to avoid installation difficulties.
9. During installation, align the seat locating pins with the body locating holes, and then insert the seat fixing bolts.

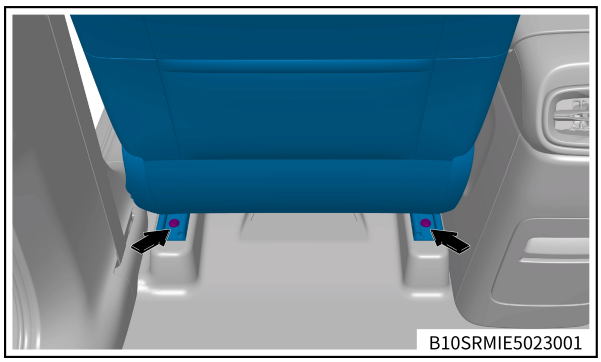
7.22.6 SERVICE AND REPAIR GUIDANCE

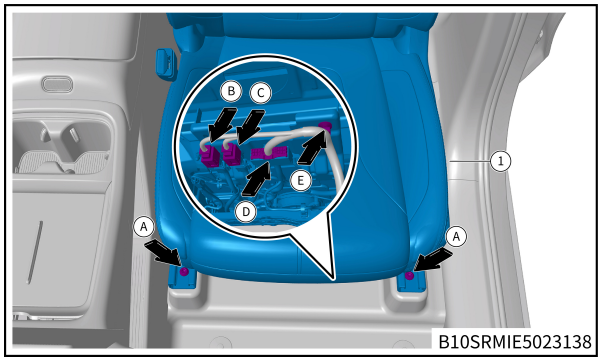


FRONT LEFT SEAT ASSEMBLY

NOTE

This section describes the removal and installation of the left front seat assembly. The removal and installation of the right front seat assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE



1. Remove the front left seat assembly.

a. Slide the seat to the foremost position, and unscrew the 2 fixing bolts at the rear of the seat -arrow-.
Recommended tool: T45 Torx key
Torque: 50±5N m

ATTENTION

When removing the seat bolts, do not power off the vehicle; otherwise, the fore-and-aft position of the seat cannot be adjusted, which may prevent the removal of the seat mounting bolts.

b. Adjust the seat to a position that allows the removal of the fixing bolts at the front end of the seat assembly.
c. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
d. Disconnect the battery negative terminal. See:Battery Disconnection Operation (page)
e. Unscrew the 2 fixing bolts at the front of the left front seat assembly -Arrow A-.
Recommended tool: T45 Torx key
Torque: 50±5N m
f. Disconnect the 3 connectors -arrow B-, -arrow C-, -arrow D- between the floor wire harness and the left front seat assembly, and release the 1 retaining clip -arrow E- of the floor wire harness.
Recommended tool: Clip remover

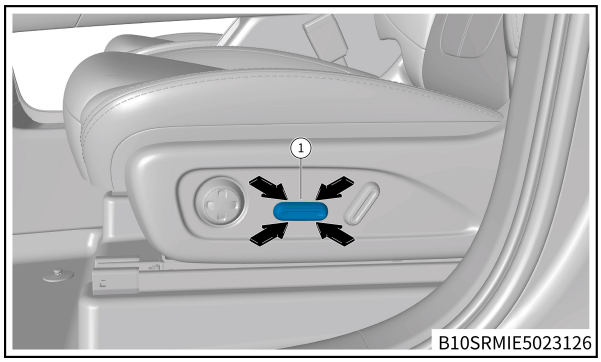
© 2026, All rights reserved

g. Remove the front left seat assembly ①.

> **ATTENTION**
>
> When removing the seat bolts, do not power off the vehicle; otherwise, the fore-and-aft position of the seat cannot be adjusted, which may prevent the removal of the seat mounting bolts.

> **ATTENTION**
>
> After all seat bolts are completely removed, promptly power off the vehicle, and then disconnect the wiring harness connector.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the driver's seat learning must be performed. The diagnostic tool operation is as follows: SCU - Routine Control - Start Driver Seat Calibration.
   b. First connect the wiring harness connector, then power on the vehicle, otherwise the fore-and-aft position of the seat cannot be adjusted, which may prevent the installation of the rear fixing bolts.
   c. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   d. Tighten the fixing bolt to the specified torque.

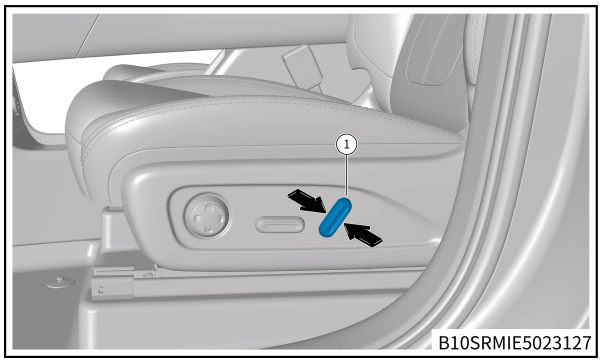
FRONT LEFT SEAT ADJUSTMENT SWITCH BUTTON 1

REMOVAL PROCEDURE

1. Remove the front left seat adjustment switch button 1.

a. Release the 4 retaining clips -arrow- of the front left seat adjustment switch button 1, and remove the front left seat adjustment switch button 1 ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

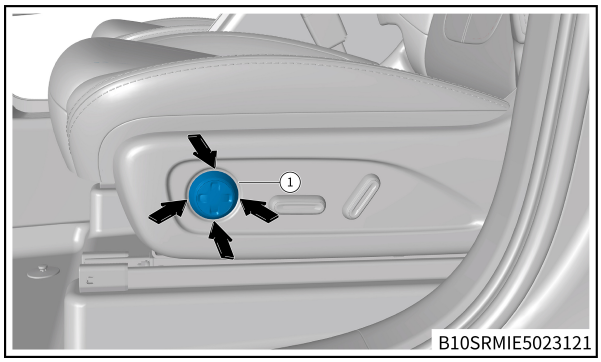
FRONT LEFT SEAT ADJUSTMENT SWITCH BUTTON 2

REMOVAL PROCEDURE

1. Remove the front left seat adjustment switch button 2.

a. Release the 2 retaining clips -arrow- of the front left seat adjustment switch button 2, and remove the front left seat adjustment switch button 2 ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LUMBAR SUPPORT SWITCH BUTTON

REMOVAL PROCEDURE

1. Remove the lumbar support switch button.

a. Release the 4 retaining clips -arrow- of the lumbar support switch button, and remove the lumbar support switch button ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

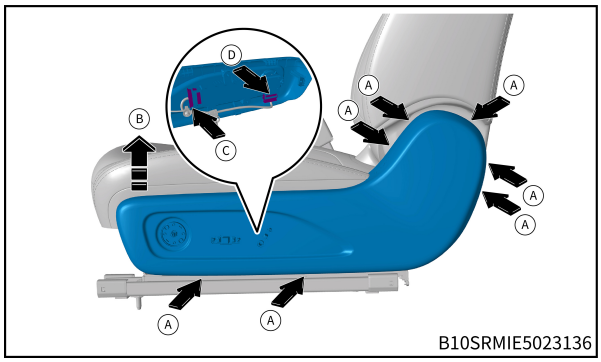
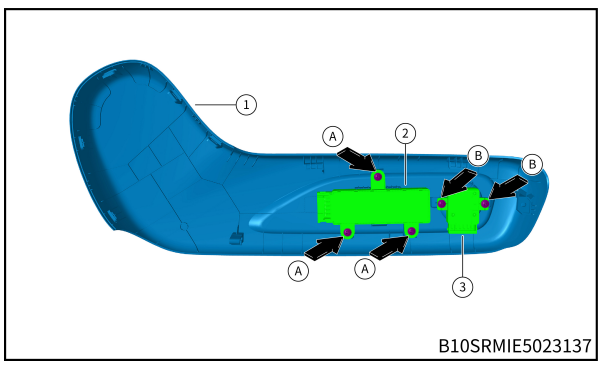
FRONT LEFT SEAT OUTER COVER

NOTE



This section describes the removal and installation of the outer cover of the front left seat, and the removal and installation of the outer cover of the front right seat can generally refer to the left side.

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left seat adjustment switch button 1.
   See:Front left seat adjustment switch button 1 (page 6269)
4. Remove the front left seat adjustment switch button 2.
   See:Front left seat adjustment switch button 2 (page 6270)
5. Remove the outer trim cover of the left front seat.

a. Unscrew the 1 fixing screw -arrow- inside the outer trim cover of the front left seat.
Recommended tool: Phillips screwdriver

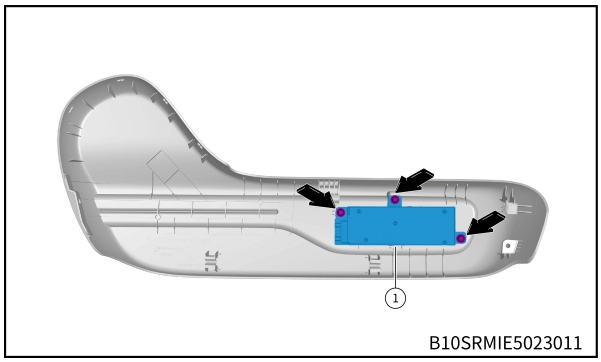
b. Release the 7 retaining clips -Arrow A- of the outer trim cover of the front left seat, and detach the outer trim cover of the front left seat in the direction of -Arrow B-.
Recommended tool: Interior trim removal tool
c. Disconnect 1 connector between the seat wiring harness and the front left seat switch module assembly - arrow C -.
d. Disconnect the 1 connector between the seat wiring harness and the lumbar support switch module -arrow D-.

e. Unscrew the 3 fixing screws between the left front seat switch module assembly and the left front seat outer cover - arrow A -.
f. Unscrew the 2 fixing screws between the lumbar support switch module and the left front seat outer cover -Arrow B-.
Recommended tool: Phillips screwdriver

© 2026, All rights reserved

g. Remove the front left seat outer cover ①, front left seat switch module assembly ②, and lumbar support switch module ③.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

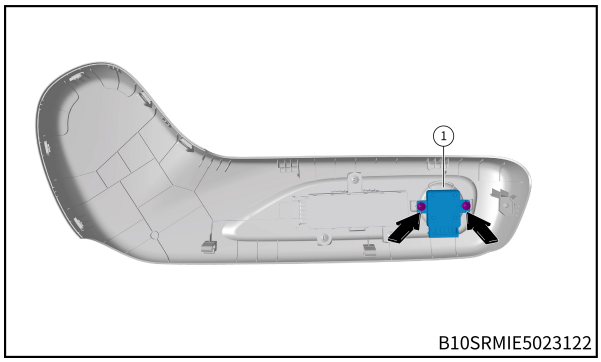
FRONT LEFT SEAT SWITCH MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover (page 6272)
4. Remove the front left seat switch module assembly.

a. Unscrew the 3 fixing screws -arrow- between the front left seat switch module assembly and the front left seat outer cover, and remove the front left seat switch module assembly ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

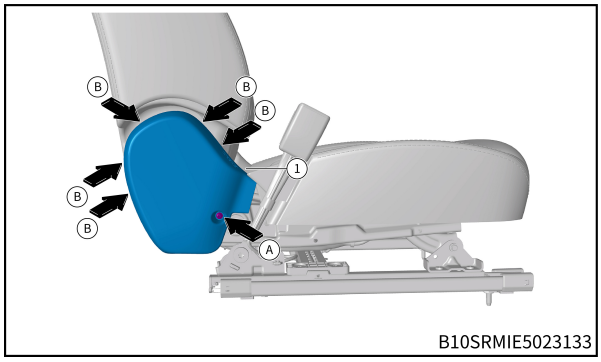
LUMBAR SUPPORT SWITCH MODULE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover (page 6272)
4. Remove the lumbar support switch module.

a. Unscrew the 2 fixing screws -arrow- between the lumbar support switch module and the left front seat outer cover, and remove the lumbar support switch module ①.
Recommended tool: Phillips screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT LEFT SEAT INNER COVER

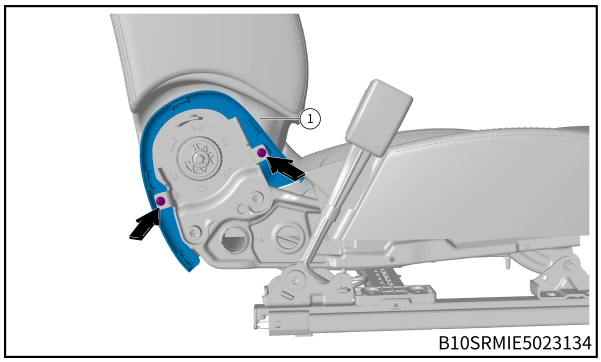
REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the inner cover of the front left seat.

B10SRMIE5023133

a. Unscrew the 1 fixing screw -arrow A- of the front left seat inner trim cover, and disengage the 5 retaining clips -arrow B- of the front left seat inner trim cover.
   Recommended tool: Phillips screwdriver
b. Remove the inner cover ① of the front left seat.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

FRONT LEFT SEAT INNER TRIM COVER

REMOVAL PROCEDURE

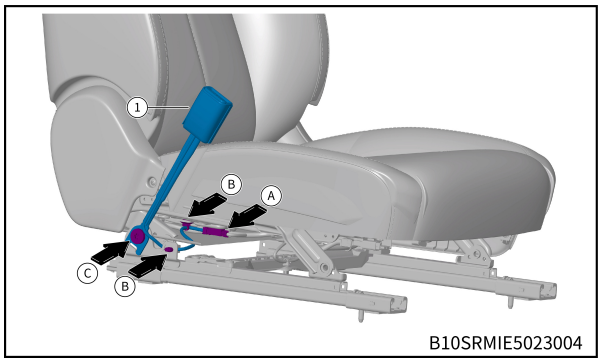
1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the inner cover of the front left seat.
   See:Front left seat inner cover (page 6276)
3. Remove the inner trim cover on the inner side of the front left seat.

a. Unscrew the 2 fixing screws -arrow- of the inner trim cover on the inner side of the front left seat, and remove the front left seat inner trim cover ①.
Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT SEAT BELT BUCKLE ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat belt buckle assembly, and the removal and installation of the front right seat belt buckle assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
4. Remove the driver's front seat belt buckle assembly.

a. Disconnect 1 connector -arrow A- of the front seat belt buckle assembly, and release the connector retaining clip.
b. Disconnect the 2 retaining clips -arrow B- of the seat belt buckle wiring harness, and unscrew the 1 fixing bolt -arrow C- of the front seat belt buckle assembly.
   Recommended tool: T50 Torx wrench
   Torque: 50±5N m
c. Remove the front seat belt buckle assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   b. Tighten the fixing bolt to the specified torque.

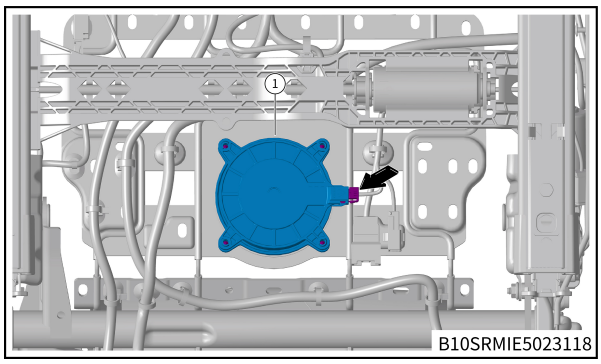
FRONT LEFT SEAT CUSHION VENTILATION FAN

NOTE



This section describes the removal and installation of the front left seat cushion ventilation fan. The removal and installation of the front right seat cushion ventilation fan can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat cushion cover assembly.
   See:Front left seat cushion trim assembly (page 6295)
3. Remove the front left seat cushion ventilation fan.

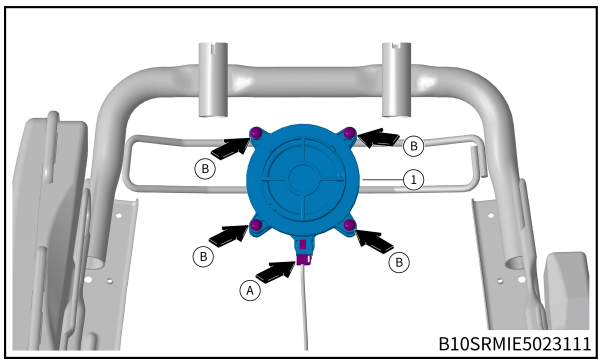
a. Unscrew the 4 fixing screws of the front left seat cushion ventilation fan -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

b. Disconnect 1 connector -arrow- for the front left seat cushion ventilation fan, and remove the front left seat cushion ventilation fan ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved



FRONT LEFT SEATBACK VENTILATION FAN

NOTE

This section describes the removal and installation of the front left seatback ventilation fan, and the removal and installation of the front right seatback ventilation fan can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
3. Remove the front left seat back ventilation fan.

a. Disconnect the 1 connector for the front left seatback ventilation fan -arrow A-, and release the 4 retaining clips for the front left seatback ventilation fan -arrow B-.
b. Remove the front left seat backrest ventilation fan ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

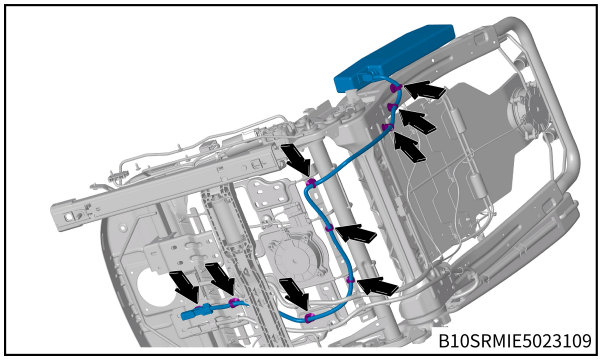
FRONT LEFT SIDE AIRBAG ASSEMBLY

NOTE

This section describes the removal and installation of the front left airbag assembly, and the removal and installation of the front right airbag assembly can generally follow the procedure for the left side.

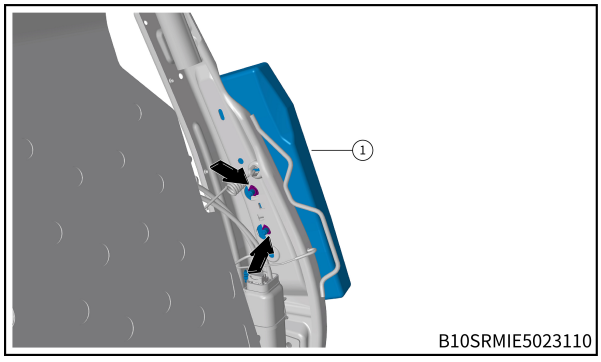
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



ATTENTION

After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.



3. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
4. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
5. Remove the front left airbag assembly.

WARNING

Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。

a. Detach the 9 retaining clips - arrows - of the front left airbag assembly wiring harness.
Recommended tool: Clip remover

b. Unscrew the 2 retaining nuts -arrow- of the front left airbag assembly, and remove the front left airbag assembly ①.
Recommended tool: 10mm socket
Torque: 9±1N m

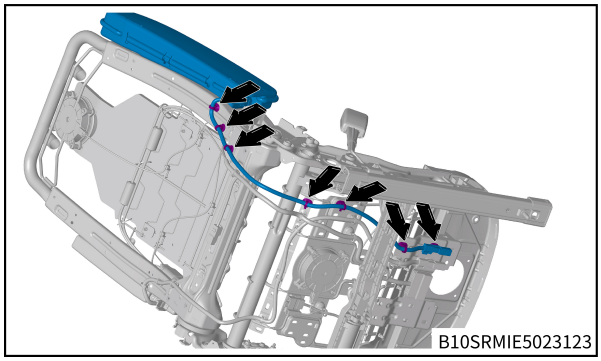
© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.
   b. Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
   c. Ensure the airbag is fully installed in place.
   d. It is strictly forbidden to use a multimeter to measure airbag resistance.

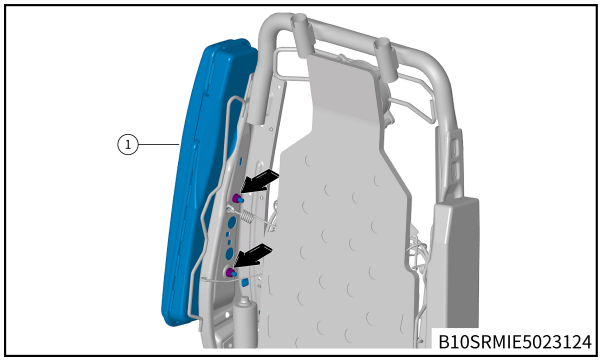
© 2026, All rights reserved

LEFT FAR-SIDE AIRBAG ASSEMBLY



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)



> **ATTENTION**
>
> After disconnecting the negative battery cable, wait at least 90s before proceeding with subsequent operations.

3. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
4. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
5. Remove the left far-side airbag assembly.

> **WARNING**
>
> Before performing any work on the airbag system, please carefully read the "Warnings and Precautions (page 5570)”。

a. Release the 7 retaining clips of the wiring harness for the left far-side airbag assembly -arrow-.
   Recommended tool: Clip remover

b. Unscrew the 2 fixing nuts -arrow- of the left far-side airbag assembly, and remove the left far-side airbag assembly ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Improper handling of a new airbag assembly may cause it to deploy unexpectedly, resulting in personal injury. Therefore, when handling the airbag, ensure the deployment direction faces upward to minimize potential injury.

© 2026, All rights reserved

b. Check whether the malfunction indicator lamp is illuminated, and if so, troubleshoot the fault.
c. Ensure the airbag is fully installed in place.
d. It is strictly forbidden to use a multimeter to measure airbag resistance.

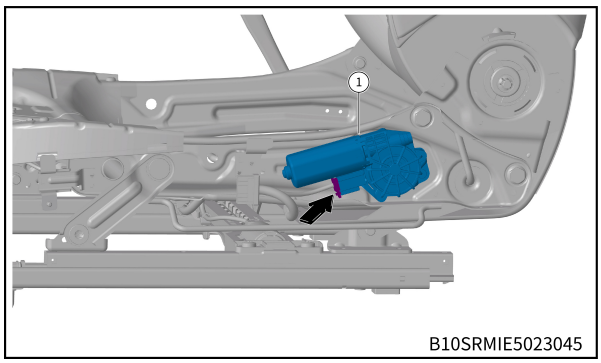
HEIGHT ADJUSTMENT MOTOR ASSEMBLY

NOTE



This section describes the removal and installation of the left height adjustment motor assembly, and the removal and installation of the right height adjustment motor assembly can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat cushion cover assembly.
   See:Front left seat cushion trim assembly (page 6295)
3. Remove the height adjustment motor assembly.

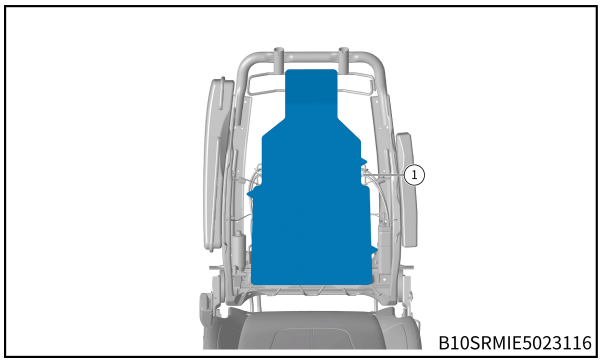
a. Unscrew the 3 mounting nuts of the height adjustment motor assembly -arrow-.
Recommended tool: 10mm socket
Torque: 9±1N m

b. Disconnect 1 connector of the height adjustment motor assembly -arrow-, and remove the height adjustment motor assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved



FRONT LEFT SEATBACK VENTILATION AIR BLADDER

NOTE

This section describes the removal and installation of the front left backrest ventilation airbag, and the removal and installation of the front right backrest ventilation airbag can generally follow the procedure for the left side.

REMOVAL PROCEDURE

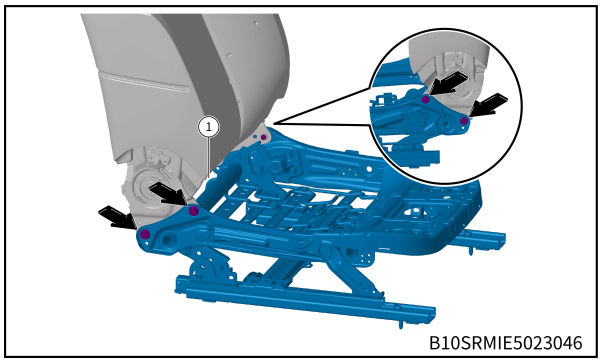
1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
3. Remove the front left backrest ventilation airbag.

a. Remove the ventilation airbag ① of the front left backrest.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved



FRONT LEFT SEAT CUSHION FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat cushion frame assembly. The removal and installation of the front right seat cushion frame assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

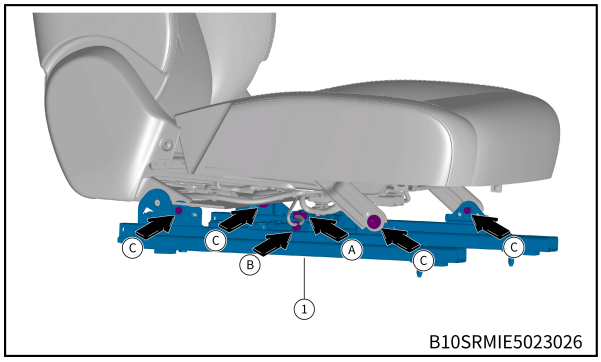
1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat cushion cover assembly.
   See:Front left seat cushion trim assembly (page 6295)
3. Remove the front left seat cushion ventilation fan.
   See:Front left seat cushion ventilation fan (page 6279)
4. Remove the front left seat wiring harness assembly.
   See:Front left seat wiring harness assembly (page 6291)
5. Remove the front seat belt buckle assembly.
   See:Front left seat belt assembly (page 6255)
6. Remove the front left seat cushion frame assembly.

a. Unscrew the 4 mounting bolts -arrow- of the front left seat cushion frame assembly, and remove the front left seat cushion frame assembly ①.
Recommended tool: 14mm socket
Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved



FRONT LEFT POWER SLIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the front left electric slide rail assembly, and the removal and installation of the front right electric slide rail assembly can generally refer to the left side.

REMOVAL PROCEDURE

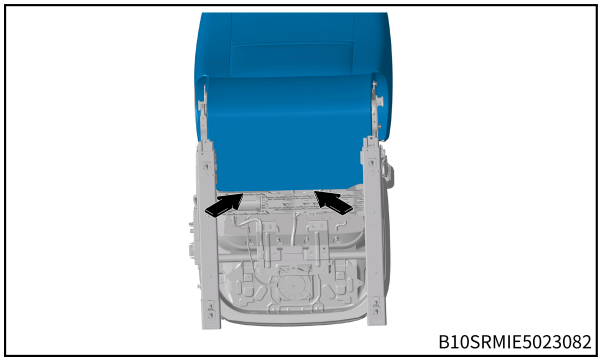
1. Remove the front left seat assembly.
   See:Front left seat assembly (page)
2. Remove the front seat belt buckle assembly.
   See:Front seat belt buckle assembly (page)
3. Remove the front end cover of the front outer slide rail.
   See:Front outer slide rail front end cover (page)
4. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover. (page)
5. Remove the front left power slide rail assembly.

a. Disconnect the 1 connector between the slide rail adjustment motor assembly and the seat wiring harness - Arrow A -, and release the wiring harness retaining clip - Arrow B -.
b. Unscrew the 4 mounting bolts -Arrow C- of the left front electric sliding rail assembly, and remove the left front electric sliding rail assembly ①.
Recommended tool: T50 Torx wrench
Torque: 45±5N m

SETUP

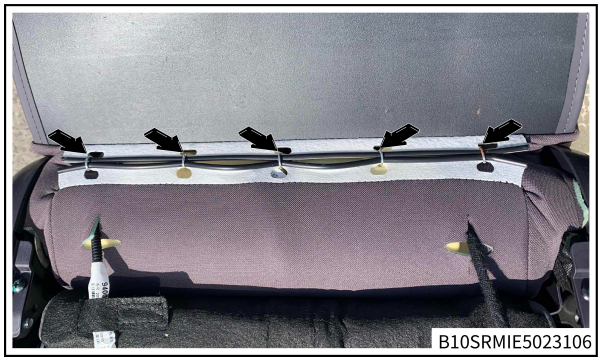
1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. Tighten the fixing bolt to the specified torque.
   c. After installation, check whether the electric slide rail assembly operates normally.

© 2026, All rights reserved



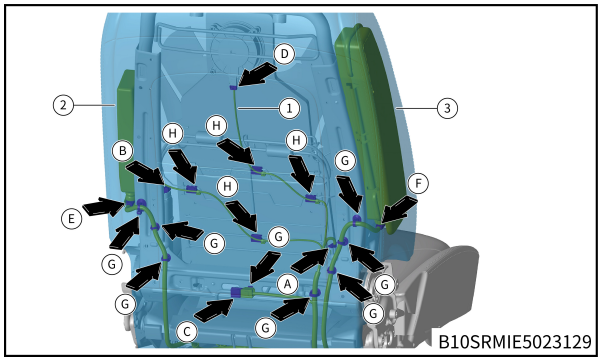
FRONT LEFT SEAT BACKREST TRIM ASSEMBLY

NOTE



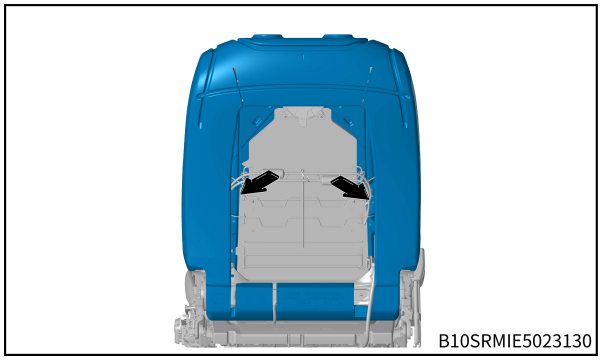
This section describes the removal and installation of the front left seat back cover assembly. The removal and installation of the front right seat back cover assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

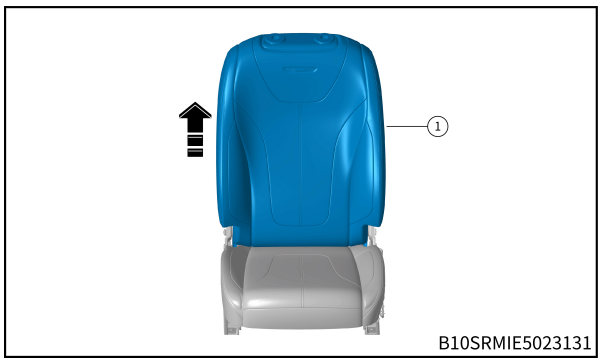


1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the inner trim cover on the outboard side of the front left seat.
   See:Left front seat outboard inner trim cover (page 6308)
3. Remove the inner trim cover on the inner side of the front left seat.
   See:Front left seat inner trim cover (page 6277)
4. Remove the headrest conduit.
   See:Headrest guide tube (page 6299)
5. Remove the front left seat backrest trim assembly.

a. Release the 2 retaining clips at the lower end of the front left seat backrest trim assembly -arrow-, and lift up the lower part of the front left seat backrest trim assembly.



b. Detach the 5 C-type retaining clips of the front left seat back trim assembly -arrows-.
Recommended tool: Needle-nose pliers



c. Disconnect 1 connector of the backrest adjustment motor -arrow A-, and disconnect 1 connector of the pneumatic lumbar support assembly -arrow B-.
d. Disconnect the 1 connector of the front seat backrest heating pad -arrow C-, and disconnect the 1 connector of the front left backrest ventilation fan -arrow D-.

© 2026, All rights reserved

e. Disconnect 1 connector of the front left airbag assembly -Arrow E-, and disconnect 1 connector of the left far-side airbag assembly -Arrow F-..
f. Disconnect the 12 retaining clips of the wiring harness -Arrow G-, -Arrow H-.
g. Remove the seat wiring harness ①, the front left airbag wiring harness ②, and the left far-side airbag wiring harness ③.
Recommended tool: Clip remover

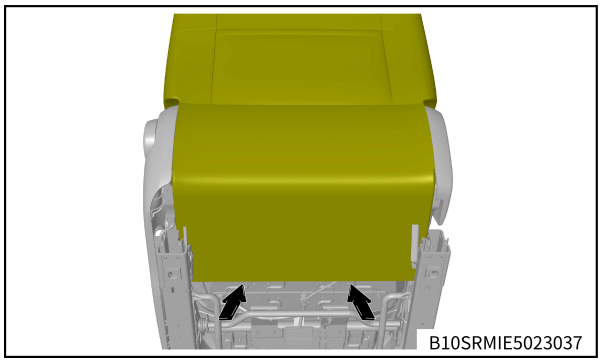
B10SRMIE5023130

h. Release the 2 retaining clips -arrow- of the left front seat backrest trim assembly.

B10SRMIE5023131

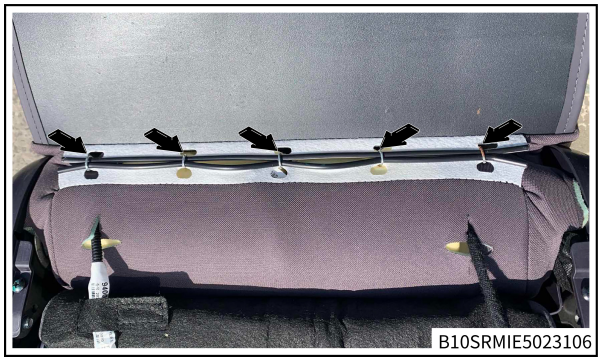
i. Remove the front left seat backrest trim assembly ① in the direction of the arrow.

SETUP



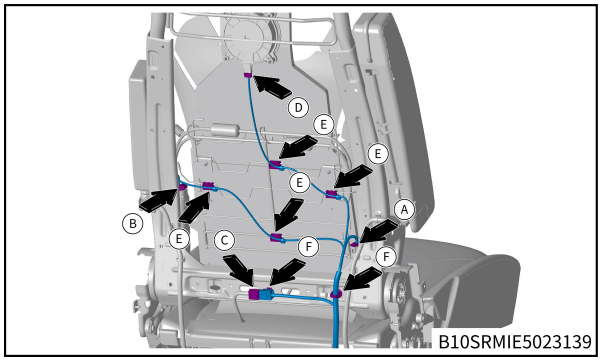
1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved



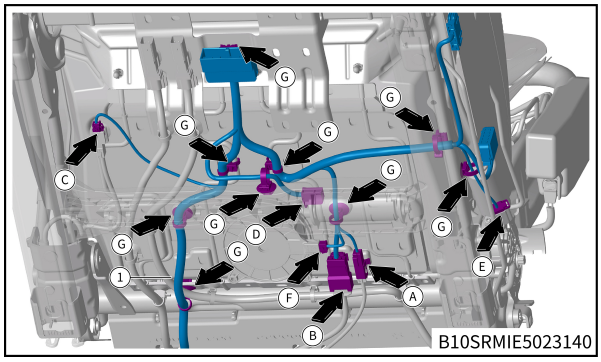
FRONT LEFT SEAT WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE



1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover (page 6272)
3. Remove the front left seat wiring harness assembly.

a. Detach the two retaining clips at the lower end of the front left seat backrest trim assembly - arrow -, and lift up the lower part of the front left seat backrest trim assembly.



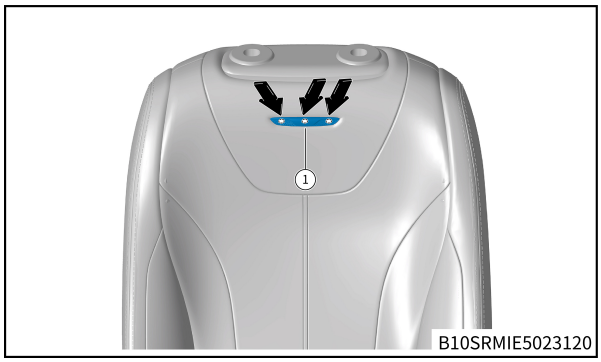
b. Detach the 5 C-type retaining clips of the front left seat back trim assembly -arrows-.
Recommended tool: Needle-nose pliers

c. Disconnect 1 connector of the backrest adjustment motor -arrow A-, and disconnect 1 connector of the pneumatic lumbar support assembly -arrow B-.
d. Disconnect the 1 connector of the front seat backrest heating pad -arrow C-, and disconnect the 1 connector of the front left backrest ventilation fan -arrow D-.
e. Detach the 5 retaining clips of the wiring harness -arrow E-, -arrow F-.
Recommended tool: Clip remover

© 2026, All rights reserved

e. Disconnect 1 connector for the left front seat SBR assembly -Arrow A-, and disconnect 1 connector for the front seat cushion heating pad -Arrow B-.
f. Disconnect 1 connector - arrow C - of the front seat belt buckle assembly, and disconnect 1 connector - arrow D - of the slide rail adjustment motor assembly.
g. Disconnect 1 connector for the height adjustment motor - arrow E -, and disconnect 1 connector for the front left seat cushion ventilation fan - arrow F -.
h. Release the 9 retaining clips of the front left seat wiring harness assembly -arrow G-, and remove the front left seat wiring harness assembly ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

FRONT SEAT BACKREST TRIM

REMOVAL PROCEDURE

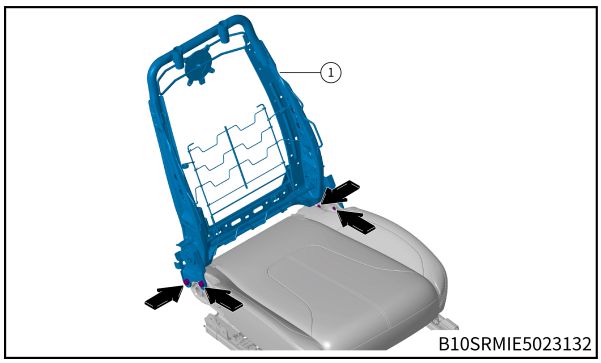
1. Remove the trim on the front seat backrest.

a. Detach the 3 retaining clips -arrow- of the front seat backrest upper trim, and remove the front seat backrest upper trim ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT SEAT BACKREST FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the front left seat back frame assembly. The removal and installation of the front right seat back frame assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
3. Remove the front left seat back ventilation fan.
   See:Front left seatback ventilation fan (page 6280)
4. Remove the front left airbag assembly.
   See:Front left side airbag assembly (page 6281)
5. Remove the left far-side airbag assembly.
   See:Left far-side airbag assembly (page 6283)
6. Remove the front left seat backrest frame assembly.

a. Unscrew the 4 fixing bolts -arrow- of the left front seat backrest frame assembly, and remove the left front seat backrest frame assembly ①.
Recommended tool: T55 Torx bit
Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. Tighten the fixing bolt to the specified torque.

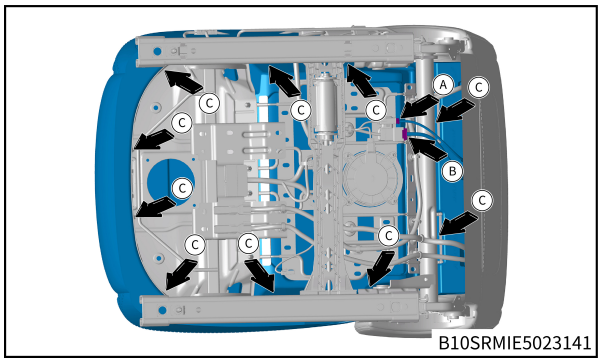
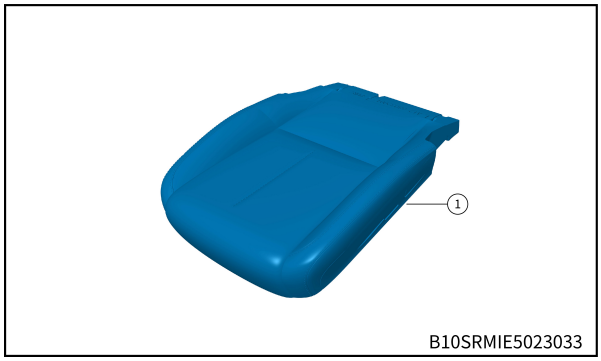
FRONT LEFT SEAT CUSHION TRIM ASSEMBLY

NOTE



This section describes the removal and installation of the left front seat cushion cover assembly, and the removal and installation of the right front seat cushion cover assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE



1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the inner trim cover on the inner side of the front left seat.
   See:Front left seat inner trim cover (page 6277)
3. Remove the inner trim cover on the outboard side of the front left seat.
   See:Left front seat outboard inner trim cover (page 6308)
4. Remove the front left seat cushion cover assembly.

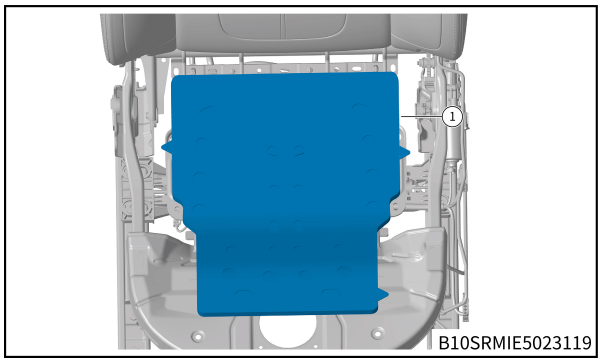
a. Detach the two retaining clips at the lower end of the front left seat backrest trim assembly - arrow -, and lift up the lower part of the front left seat backrest trim assembly.

b. Disconnect 1 connector for the left front seat SBR assembly -Arrow A-, and disconnect 1 connector for the front seat cushion heating pad -Arrow B-.
c. Detach the 10 retaining clips of the front left seat cushion trim assembly -Arrow C-.

d. Remove the front left seat cushion trim assembly ①.

© 2026, All rights reserved

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

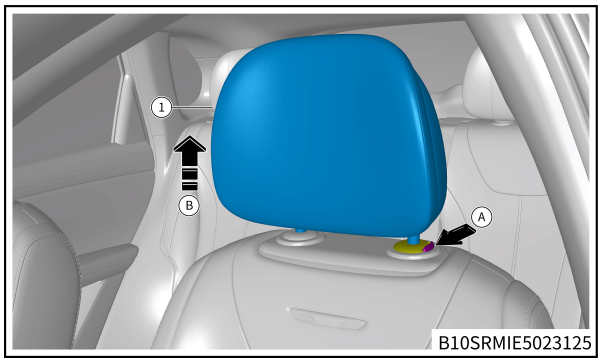
FRONT LEFT SEAT CUSHION VENTILATION AIR BLADDER

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat cushion cover assembly.
   See:Front left seat cushion trim assembly (page 6295)
3. Remove the front left seat cushion ventilation bladder.

a. Remove the front left seat cushion ventilation air bag ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the relevant electrical components can function properly.

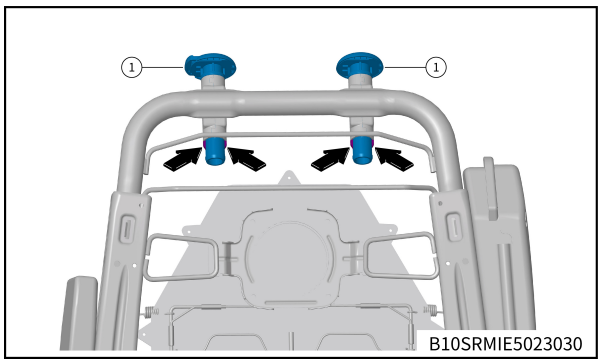
HEADREST GUIDE TUBE

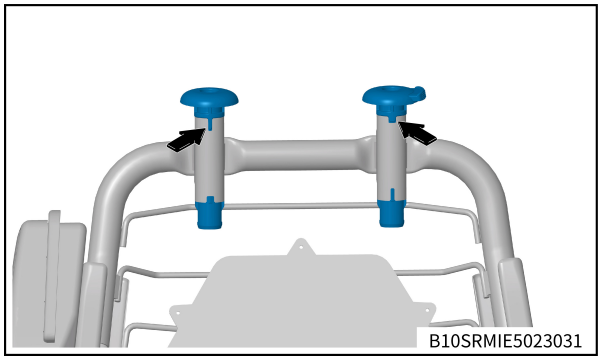
NOTE



This section describes the removal and installation of the front left seat headrest guide tube, and the removal and installation of the front right seat headrest guide tube can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the left front headrest assembly.
   See:Front left headrest assembly (page 6298)
3. Remove the headrest conduit.

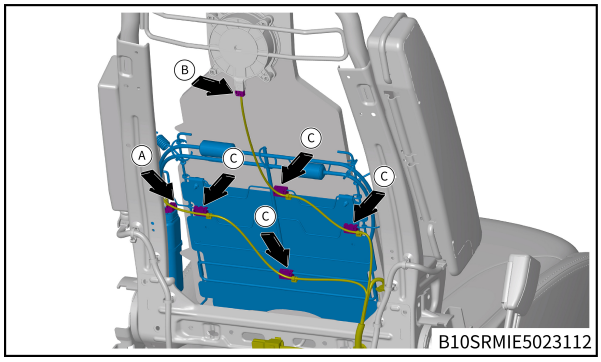


a. Detach the two retaining clips at the lower end of the front left seat backrest trim assembly - arrow -, and lift up the lower part of the front left seat backrest trim assembly.

b. Reach in from the lower end of the front left seat backrest cover assembly and press the 4 retaining clips -arrow- of the headrest guide tube to remove the headrest guide tube ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:



a. During installation, align the headrest guide tube with the retaining slot of the seat back frame - arrow -.

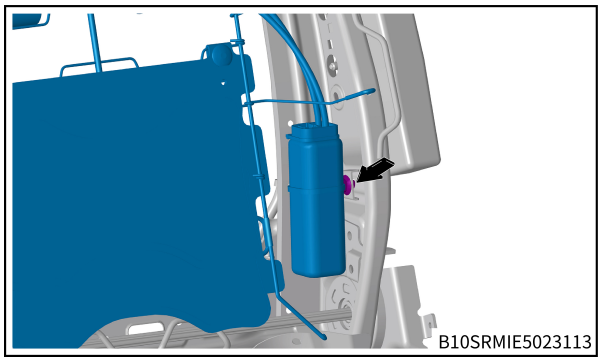
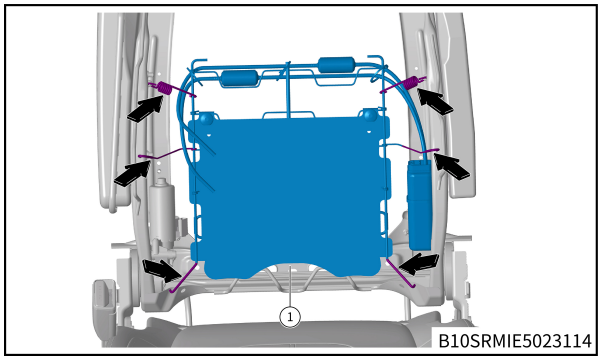
PNEUMATIC LUMBAR SUPPORT ASSEMBLY



REMOVAL PROCEDURE

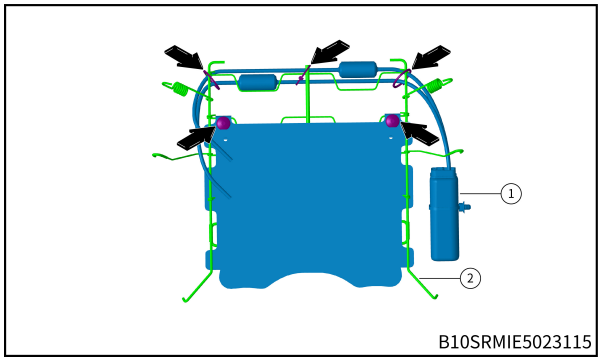
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
4. Remove the front left seat backrest trim assembly.
   See:Front Left Seat Backrest Trim Assembly (page 6289)
5. Remove the lumbar support massage assembly.



B10SRMIE5023112

a. Disconnect 1 connector -Arrow A- between the left front seat wiring harness assembly and the pneumatic lumbar support assembly, and disconnect 1 connector -Arrow B- between the left front seat wiring harness assembly and the front left seatback ventilation fan.
b. Disconnect the 4 retaining clips connecting the front left seat wiring harness assembly to the pneumatic lumbar support assembly -Arrow C -.
   Recommended tool: Clip remover

B10SRMIE5023113



d. Disconnect the 1 retaining clip connecting the air pump to the front left seat backrest frame assembly -arrow-.
   Recommended tool: Clip remover

B10SRMIE5023114

e. Detach the 6 hooks - arrow - connecting the front seatback S-spring to the left front seatback frame assembly, and remove the pneumatic lumbar support assembly with the front seatback S-spring ①.

© 2026, All rights reserved

f. Detach the 5 retaining clips -arrow- connecting the pneumatic lumbar support assembly to the front seatback S-spring, and separate the pneumatic lumbar support assembly ① and the front seatback S-spring ②.
Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

MANUAL SLIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the front left manual slide rail assembly, and the removal and installation of the front right manual slide rail assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front seat belt buckle assembly.
   See:Front seat belt buckle assembly (page 6278)
3. Remove the front end cover of the front outer slide rail.
   See:Front outer slide rail front end cover (page 6309)
4. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover (page 6272)
5. Remove the manual slide rail assembly.

a. Unscrew the 4 fixing bolts -arrow- of the manual slide rail assembly, and remove the manual slide rail assembly ①.
Recommended tool: T50 Torx wrench
Torque: 45±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, test the manual slide rail assembly to ensure it operates normally.

LEFT FRONT BACKREST RELEASE HANDLE

NOTE

This section describes the removal and installation of the front left seat backrest release handle. The removal and installation of the front right seat backrest release handle can generally refer to the left side.

REMOVAL PROCEDURE

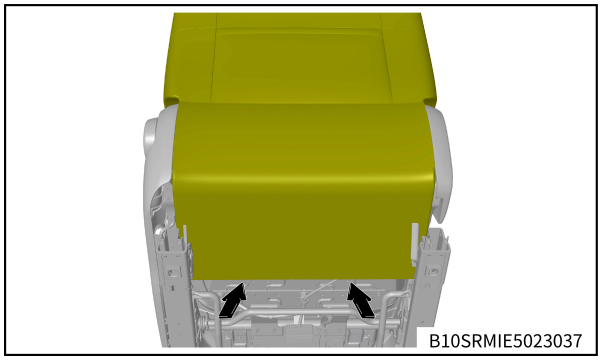
1. Remove the front left backrest release handle cover.
   See:Left front seatback release handle cover (page 6307)
2. Remove the front left seat back release handle.

a. Unscrew the 2 fixing screws -arrow- of the left front seatback release handle, and remove the left front seatback release handle ①.
Recommended tool: Phillips screwdriver

SETUP

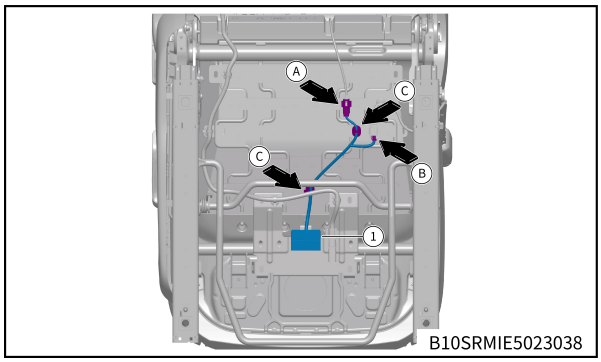
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT SEAT WIRING HARNESS ASSEMBLY (MANUAL)

NOTE



This section describes the removal and installation of the front left seat wiring harness assembly. The removal and installation of the front right seat wiring harness assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat wiring harness assembly.

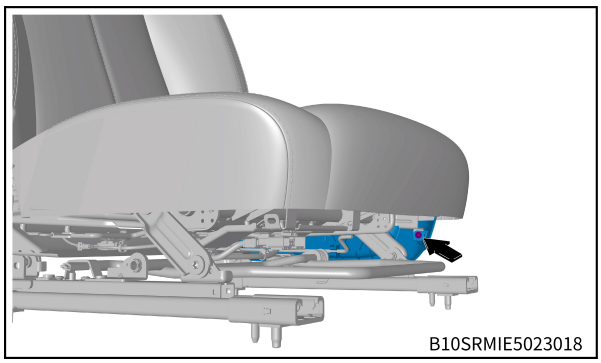
a. Detach the two retaining clips at the lower end of the front left seat backrest trim assembly - arrow -, and lift up the lower part of the front left seat backrest trim assembly.

b. Disconnect 1 connector of the left front seat SBR assembly -Arrow A-, and disconnect 1 connector of the front seat belt buckle -Arrow B-.
c. Release the 2 retaining clips -Arrow C- of the front left seat wiring harness assembly, and remove the front left seat wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP

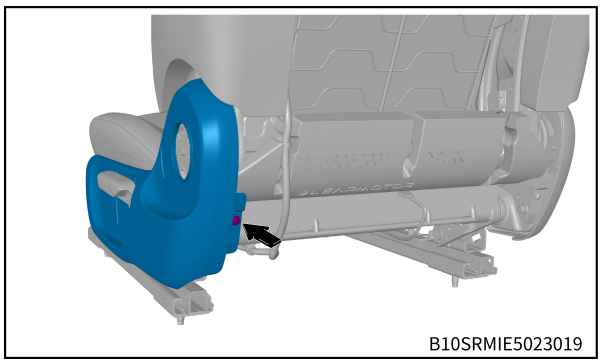
1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved



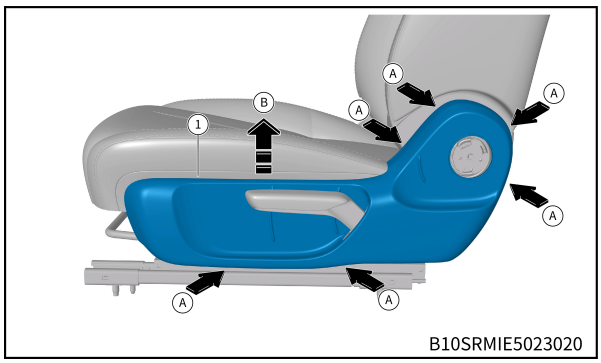
FRONT LEFT SEAT OUTER TRIM COVER (MANUAL)

NOTE



This section describes the removal and installation of the outer cover of the front left seat, and the removal and installation of the outer cover of the front right seat can generally refer to the left side.

REMOVAL PROCEDURE



1. Remove the front left backrest release handle cover.
   See:Left front seatback release handle cover (page 6307)
2. Remove the front left seat back release handle.
   See:Left front backrest release handle (page 6303)
3. Remove the outer trim cover of the left front seat.

a. Unscrew the 1 fixing screw -arrow- inside the outer trim cover of the front left seat.
Recommended tool: Phillips screwdriver

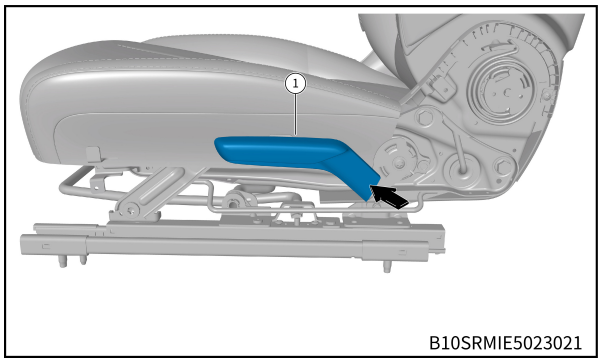
b. Unscrew the 1 fixing screw at the rear end of the outer trim cover of the front left seat -arrow-.
Recommended tool: Phillips screwdriver

b. Release the 6 retaining clips -Arrow A- of the left front seat outer cover, and remove the left front seat outer cover ① in the direction of -Arrow B-.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.

© 2026, All rights reserved



FRONT LEFT SEAT HEIGHT ADJUSTMENT HANDLE

NOTE

This section describes the removal and installation of the height adjustment handle for the front left seat. The removal and installation of the height adjustment handle for the front right seat can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left seat assembly.
   See:Front left seat assembly (page 6267)
2. Remove the front left seat back release handle.
   See:Left front backrest release handle (page 6303)
3. Remove the outer cover of the front left seat (manual).
   See:Front left seat outer trim cover (Manual) (page 6305)
4. Remove the height adjustment handle of the front left seat.

a. Release the 1 retaining clip -arrow- of the front left seat height adjustment handle, and remove the front left seat height adjustment handle ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the retaining clip is damaged, it must be replaced with a new one.

LEFT FRONT SEATBACK RELEASE HANDLE COVER

NOTE

This section describes the removal and installation of the left front seatback release handle cover. The removal and installation of the right front seatback release handle cover can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the front left backrest release handle cover.

a. Release the 3 retaining clips -arrow- of the left front seatback release handle cover, and remove the left front seatback release handle cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

LEFT FRONT SEAT OUTBOARD INNER TRIM COVER

NOTE

This section describes the removal and installation of the outer inner trim cover of the front left seat, and the removal and installation of the outer inner trim cover of the front right seat can be generally performed by referring to the left side.

REMOVAL PROCEDURE

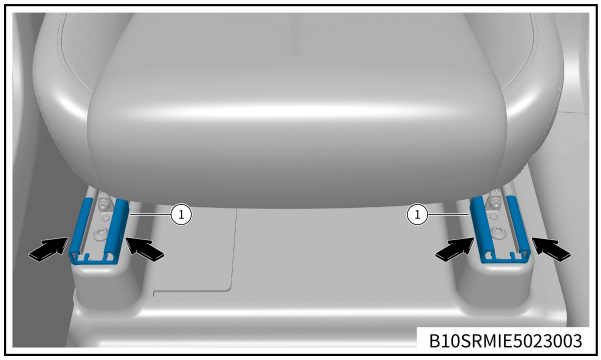
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outer trim cover of the left front seat.
   See:Front left seat outer cover (page 6272)
4. Remove the inner trim cover on the outboard side of the front left seat.

a. Unscrew the 2 fixing screws -arrow- of the front left seat outer inner trim cover, and remove the front left seat outer inner trim cover ①.
Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT OUTER SLIDE RAIL FRONT END COVER

NOTE

This section describes the removal and installation of the front end cover of the front outer slide rail for the left front seat, and the removal and installation of the front and rear end covers of the front outer slide rail for the right front seat can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Adjust the seat to the rearmost position.
2. Remove the front end cover of the front outer slide rail.

a. Release the 4 retaining clips -arrow- of the front outer slide rail front cover, and remove the front outer slide rail front cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

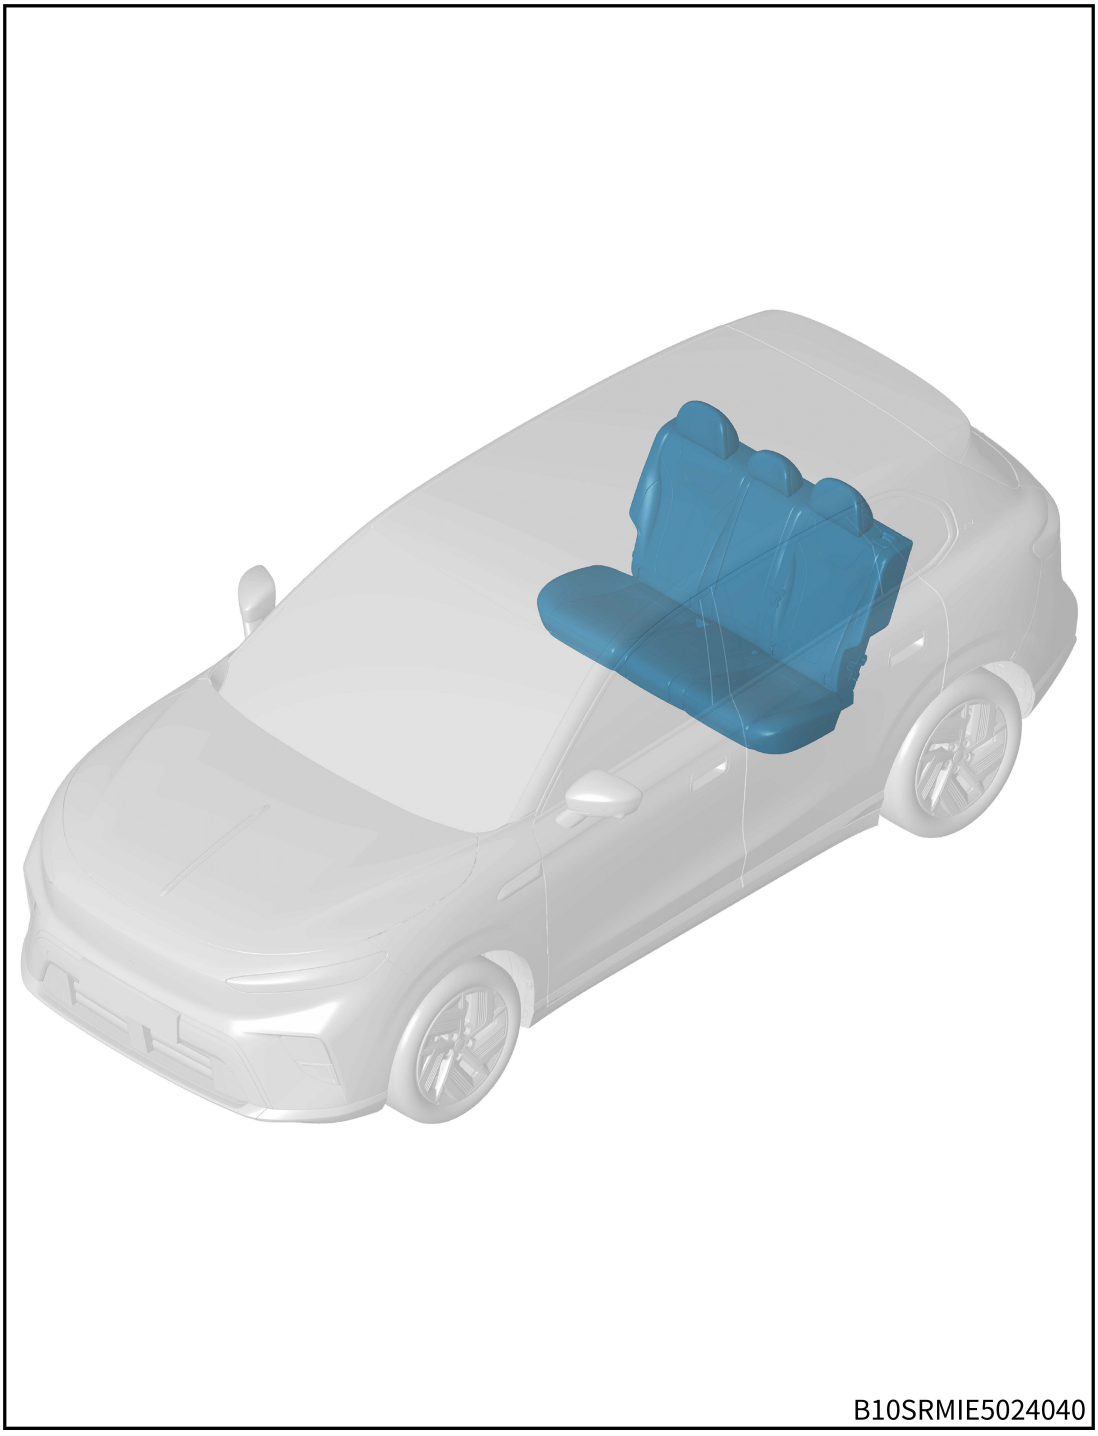
7.23 SECOND-ROW SEATS AND ACCESSORY SYSTEM

7.23.1 PRECAUTIONS



PRECAUTIONS

1. The silicone material is soft: Please avoid contact with sharp objects to prevent it from being cut or punctured.
2. When cleaning, avoid using abrasive or hard cleaning tools (such as scouring pads, brass wire brushes, etc.).
3. Avoid prolonged contact between silicone leather and organic solvents such as gasoline, sewing machine oil, and kerosene.
4. When using alcohol or flammable cleaners, keep away from any ignition sources; wear protective gloves and ensure cleaning is performed in a well-ventilated area.
5. When cleaning with agents other than water, avoid leaving cleaning agent residue on the surface, as the residue may affect the service life and should be removed as soon as possible.
6. When using cleaning agents, please use a colorfast towel, cotton cloth, or sponge for cleaning.
7. Before removing the seat, be sure to protect the vehicle body by laying protective pads to prevent scratching the vehicle body during the removal or extraction of the seat.
8. After removing the seat, do not move the seat track to avoid installation difficulties.
9. During installation, align the seat locating pins with the body locating holes, and then insert the seat fixing bolts.

7.23.6 SERVICE AND REPAIR GUIDANCE

REAR SEAT BACKREST CENTER MOUNTING BRACKET

REMOVAL PROCEDURE

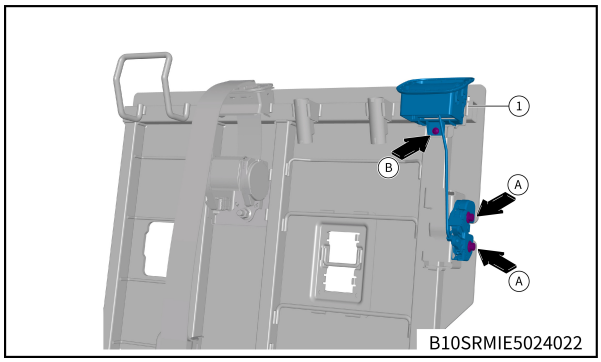
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
4. Remove the rear right seat backrest assembly.
   See:Rear right seatback assembly (page 6323)
5. Remove the luggage compartment partition assembly.
   See:Trunk partition assembly (page 5399)
6. Remove the center mounting bracket of the rear seat backrest.

a. Unscrew the 4 fixing bolts -arrow- of the rear seatback center mounting bracket, and remove the rear seatback center mounting bracket ①.
Recommended tool: 13mm socket
Torque: 50±5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

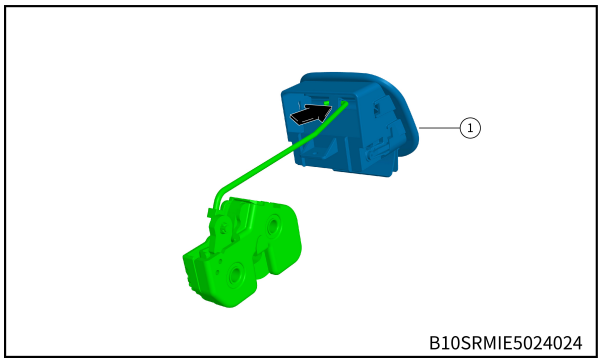
© 2026, All rights reserved



REAR LEFT SEATBACK RELEASE HANDLE BASE

NOTE

This section describes the removal and installation of the rear left seatback release handle base, and the removal and installation of the rear right seatback release handle base can generally follow the procedure for the left side.



REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6321)
3. Remove the base of the rear left seat back unlock handle.

B10SRMIE5024022

a. Unscrew the 2 fixing bolts of the rear left backrest lock assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 25±2N m
b. Unscrew 1 fixing screw -arrow B- from the seatback release handle base, and remove the rear left seatback lock and seatback release handle assembly ①.
   Recommended tool: Phillips screwdriver

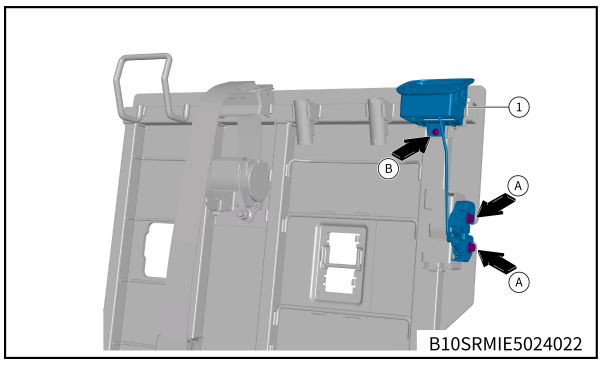
B10SRMIE5024024

c. Disconnect the rear left seatback lock cable from the seatback release handle -arrow-, and remove the rear left seatback release handle base ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

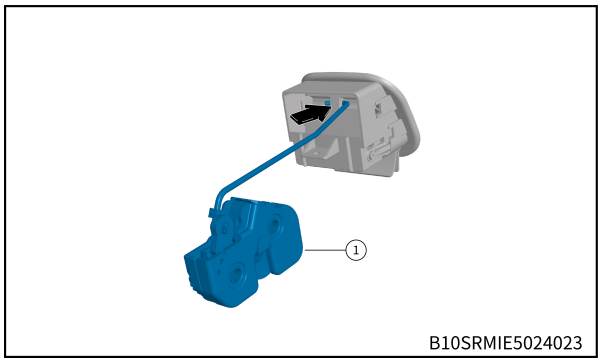
© 2026, All rights reserved



REAR LEFT SEAT BACK LOCK ASSEMBLY

NOTE

This section describes the removal and installation of the rear left seatback lock assembly. The removal and installation of the rear right seatback lock assembly can generally refer to the left side.



REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6321)
3. Remove the rear left seat backrest lock assembly.

B10SRMIE5024022

a. Unscrew the 2 fixing bolts of the rear left backrest lock assembly -arrow A-.
   Recommended tool: 10mm socket
   Torque: 25±2N m
b. Unscrew 1 fixing screw -arrow B- from the seatback release handle base, and remove the rear left seatback lock and seatback release handle assembly ①.
   Recommended tool: Phillips screwdriver

B10SRMIE5024023

c. Disconnect the connection between the rear left seatback lock cable and the seatback release handle -arrow-, and remove the rear left seatback lock assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

REAR LEFT SEATBACK RELEASE HANDLE TRIM COVER

NOTE

This section describes the removal and installation of the trim cover for the rear left seat backrest unlock handle. The removal and installation of the trim cover for the rear right seat backrest unlock handle can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the trim cover of the rear left backrest release handle.

a. Release the 4 retaining clips -arrows- of the rear left seatback release handle trim cover, and remove the rear left seatback release handle trim cover ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

REAR LEFT SEATBACK FRAME ASSEMBLY

NOTE

This section describes the removal and installation of the rear left seatback frame assembly, and the removal and installation of the rear right seatback frame assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6321)
3. Remove the rear left seat backrest lock assembly.
   See:Rear left seat back lock assembly (page 6318)
4. Remove the base of the rear left seat back unlock handle.
   See:Rear left seatback release handle base (page 6317)
5. Remove the rear center seat belt assembly.
   See:Rear center seat belt assembly (page 6324)
6. Remove the left rear seatback frame assembly.

a. Remove the rear left backrest frame assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolts to the specified torque.
   b. If the retaining clip is damaged, it must be replaced with a new one.

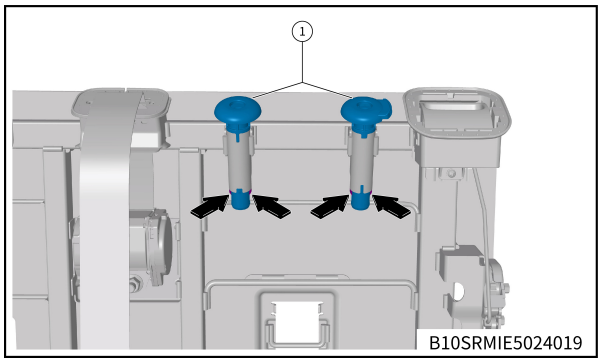
SECOND ROW LEFT SEAT BACKREST COVER ASSEMBLY

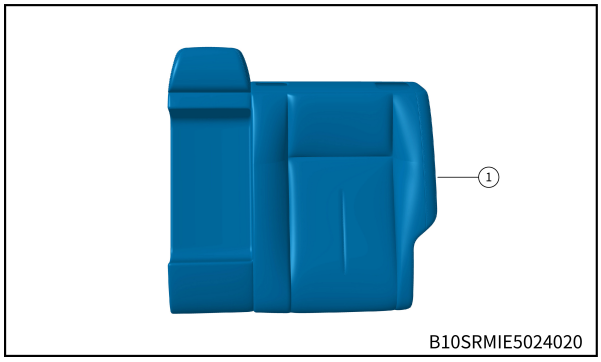
NOTE

This section describes the removal and installation of the seat back cover assembly for the second-row left seat, and the removal and installation of the seat back cover assembly for the second-row right seat can generally follow the procedure for the left side.



REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the rear left headrest assembly.
   See:Rear outboard headrest assembly (page 6330)
3. Remove the rear armrest assembly.
   See:Rear armrest assembly (page 6325)
4. Remove the trim cover of the rear left backrest release handle.
   See:Rear Left Seatback Release Handle Trim Cover (page 6319)
5. Remove the seat belt guide trim cover.
   See:Seat belt guide trim cover (page 6333)
6. Remove the seat back trim assembly of the second row left seat.



a. Release the row of retaining clips at the lower end of the seatback cover assembly of the second row left seat - Arrow A -.
Recommended tool: Flathead screwdriver

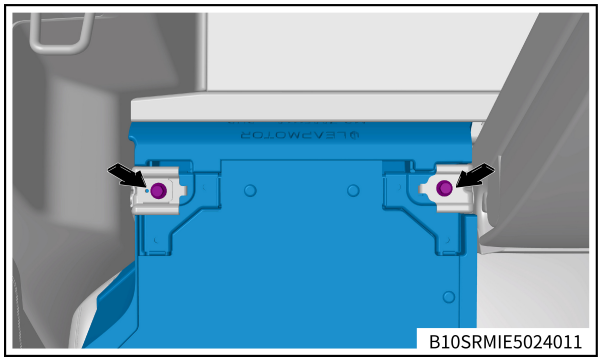
b. Unzip the zipper on the left/right side of the second-row left seat back trim assembly -Arrow B-, and fold back the second-row left seat back trim assembly.

c. Lift the left seat back cover assembly, press the 4 retaining clips of the headrest guide -arrow-, and remove the headrest guide ①.

© 2026, All rights reserved

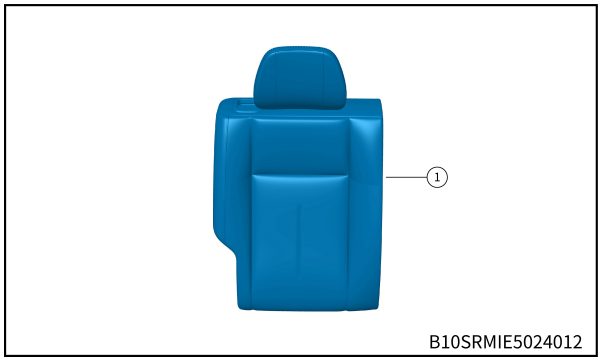
d. Remove the second row left seat backrest trim assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



REAR RIGHT SEATBACK ASSEMBLY

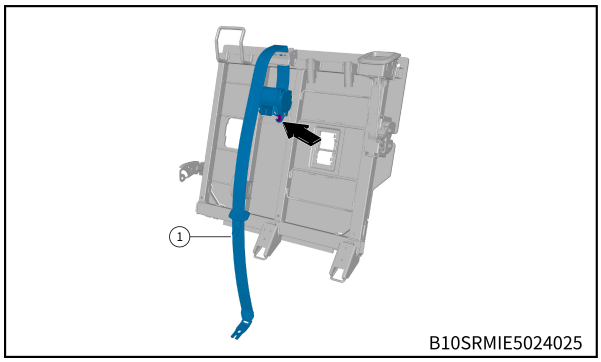
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear right seat backrest assembly.

a. Fold down the right rear seatback assembly.
b. Unscrew the 2 fixing bolts -arrow- securing the rear right backrest assembly to the mounting bracket.
   Recommended tool: 13mm socket
   Torque: 50±5N m

c. Remove the rear right seat back assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

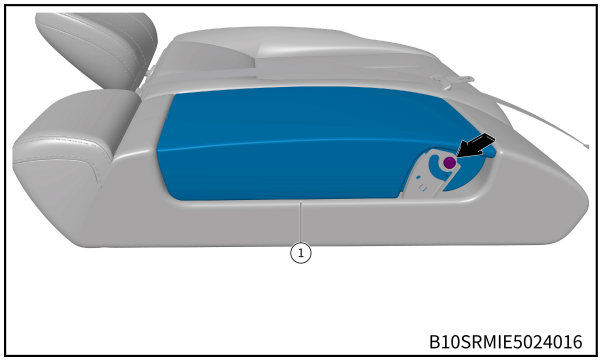
REAR CENTER SEAT BELT ASSEMBLY

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6321)
3. Remove the base of the seat belt guide trim cover.
   See:Seat belt guide trim cover base (page 6332)
4. Remove the rear center seat belt assembly.

a. Unscrew 1 fixing bolt from the lower left trim panel assembly of the instrument panel -Arrow A-, and disconnect the front cover lock cable from the front cover handle assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
b. Unscrew the 1 fixing nut -arrow- of the rear center seat belt assembly, and remove the rear center seat belt assembly ①.
   Recommended tool: 15mm socket
   Torque: 50±5N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

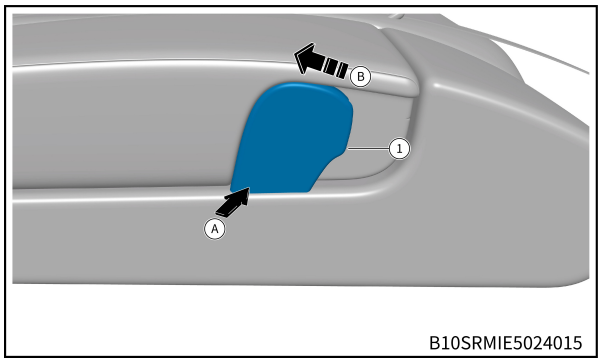
REAR ARMREST ASSEMBLY

REMOVAL PROCEDURE

1. Fold down the right rear seatback assembly.
2. Remove the armrest bracket trim cover.
   See:Armrest bracket trim cover (page 6326)
3. Remove the rear armrest assembly.

a. Unscrew the 1 fixing bolt -arrow- of the rear armrest assembly, and remove the rear armrest assembly ①.
   Recommended tool: T40 Torx wrench
   Torque: 4±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

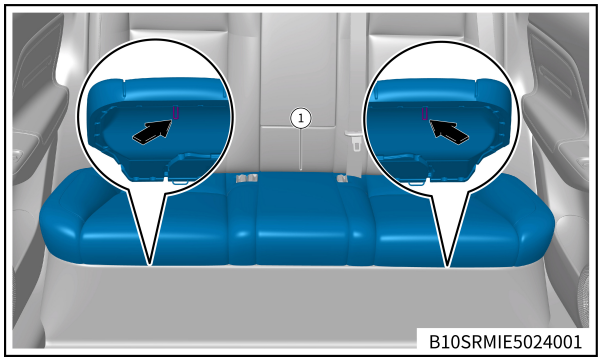
ARMREST BRACKET TRIM COVER

REMOVAL PROCEDURE

1. Fold down the right rear seatback assembly.
2. Remove the armrest bracket trim cover.

a. Disengage 1 retaining clip of the armrest bracket trim cover -arrow A-, and remove the armrest bracket trim cover ① in the direction of -arrow B-.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

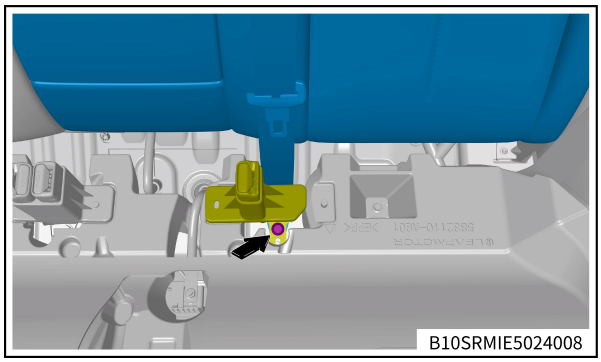
REAR SEAT CUSHION ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.

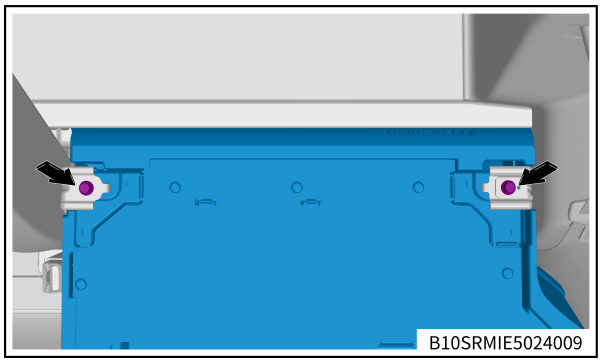
a. Release the 2 fixing clips -arrow- of the rear seat cushion assembly, and remove the rear seat cushion assembly ①.

SETUP



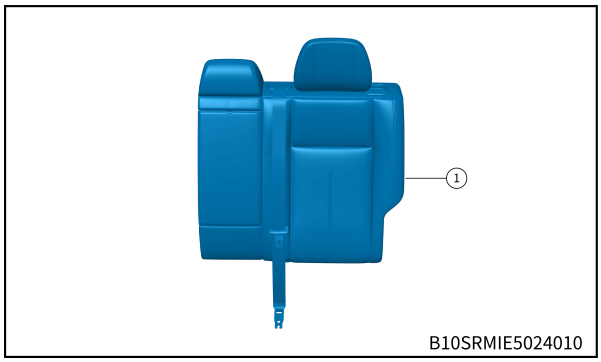
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

© 2026, All rights reserved



REAR LEFT BACKREST ASSEMBLY

REMOVAL PROCEDURE



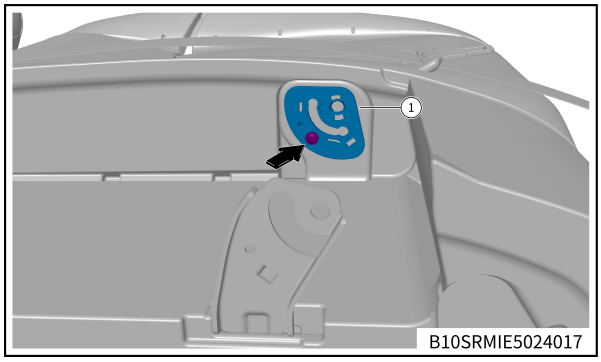
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6327)
4. Remove the rear left backrest assembly.

a. Unscrew 1 mounting bolt -arrow- of the rear center seat belt assembly.
Recommended tool: 14mm socket
Torque: 50±5N m

b. Fold down the rear left seatback assembly.
c. Unscrew the 2 fixing bolts connecting the rear left backrest assembly to the mounting bracket -arrow-.
Recommended tool: 13mm socket
Torque: 50±5N m

d. Remove the rear left seatback assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

LEFT ARMREST BUSHING

REMOVAL PROCEDURE

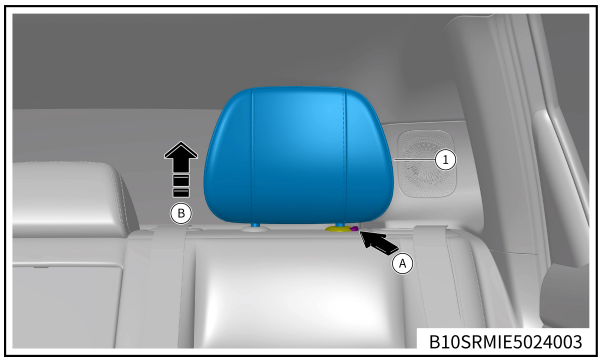
1. Remove the rear armrest assembly.
   See:Rear armrest assembly (page 6325)
2. Remove the left trim of the armrest.

a. Unscrew 1 fixing screw -arrow- of the left armrest trim, and remove the left armrest trim ①.
Recommended tool: Phillips screwdriver

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



REAR OUTBOARD HEADREST ASSEMBLY

NOTE

This section describes the removal and installation of the rear left headrest assembly. The removal and installation of the rear right headrest assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Remove the rear left headrest assembly.

a. Press the headrest guide sleeve retaining clip -arrow A-, and remove the rear outer headrest assembly ① in the direction of -arrow B-.

SETUP

1. The installation procedure is performed in reverse order.

REAR SEAT BACKREST LEFT MOUNTING BRACKET ASSEMBLY

NOTE

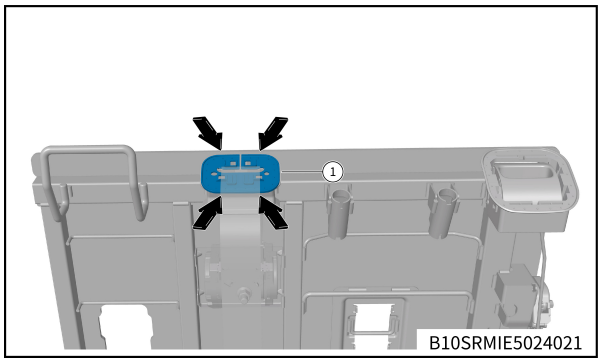
This section describes the removal and installation of the left mounting bracket assembly of the rear seat backrest, and the removal and installation of the right mounting bracket assembly of the rear seat backrest can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
4. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
5. Remove the left mounting bracket assembly of the rear seatback.

a. Unscrew the 2 fixing bolts -arrow- of the rear left backrest mounting bracket assembly, and remove the rear left backrest mounting bracket assembly ①.
Recommended tool: 13mm socket
Torque: 50±5N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.

© 2026, All rights reserved

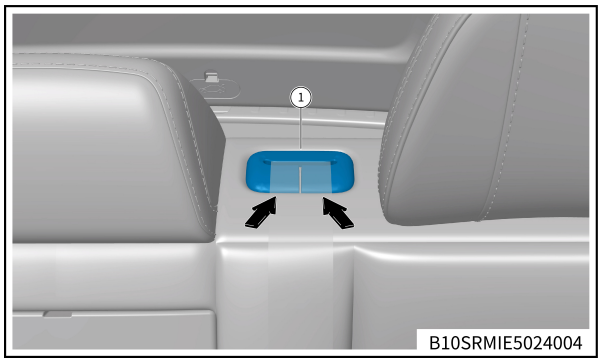
SEAT BELT GUIDE TRIM COVER BASE

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the seat back trim assembly of the second row left seat.
   See:Second row left seat backrest cover assembly (page 6321)
3. Remove the base of the seat belt guide trim cover.

a. Release the 4 retaining clips -arrow- of the seat belt guide trim cover base, and remove the seat belt guide trim cover base ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

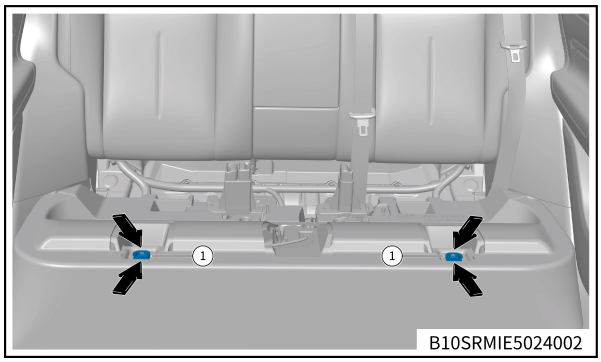
SEAT BELT GUIDE TRIM COVER

REMOVAL PROCEDURE

1. Remove the seat belt guide trim cover.

a. Release the row of retaining clips at the lower end of the seatback cover assembly of the second row left seat - Arrow A -.
Recommended tool: Flathead screwdriver
b. Disengage the 2 retaining clips -arrow- of the seat belt guide trim cover, and remove the seat belt guide trim cover ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

REAR SEAT CUSHION FRONT FIXING BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear seat cushion assembly.
   See:Rear seat cushion assembly (page 6327)
4. Remove the fixing clips at the front of the rear seat cushion.

a. Disengage the 4 retaining clips - arrows - of the front mounting bracket of the rear seat cushion, and remove the front mounting bracket ① of the rear seat cushion.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether all retaining clips are properly installed.

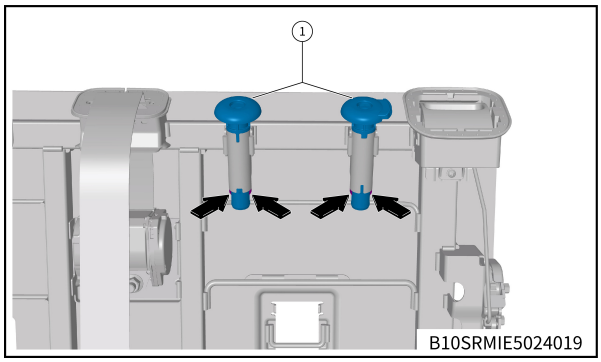
HEADREST GUIDE TUBE

NOTE

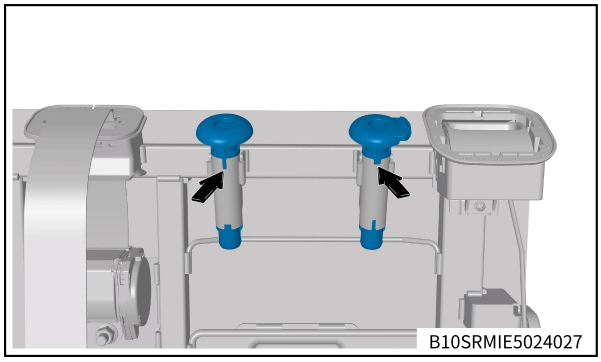


This section describes the removal and installation of the headrest guide for the left rear seat backrest, and the removal and installation of the headrest guide for the right rear seat backrest can generally refer to the left side.

REMOVAL PROCEDURE

1. Remove the rear left backrest assembly.
   See:Rear left backrest assembly (page 6328)
2. Remove the rear left headrest assembly.
   See:Rear outboard headrest assembly (page 6330)
3. Remove the rear armrest assembly.
   See:Rear armrest assembly (page 6325)
4. Remove the trim cover of the rear left backrest release handle.
   See:Rear Left Seatback Release Handle Trim Cover (page 6319)
5. Remove the seat belt guide trim cover.
   See:Seat belt guide trim cover base (page 6332)
6. Remove the headrest conduit.

a. Release the row of retaining clips at the lower end of the seatback cover assembly of the second row left seat - Arrow A -.
Recommended tool: Flathead screwdriver
b. Unzip the zipper on the left/right side of the second-row left seat back trim assembly -Arrow B-, and fold back the second-row left seat back trim assembly.



c. Lift the left seat back cover assembly, press the 4 retaining clips of the headrest guide -arrow-, and remove the headrest guide ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. During installation, align the headrest guide tube with the retaining slot of the seat back frame - arrow -.

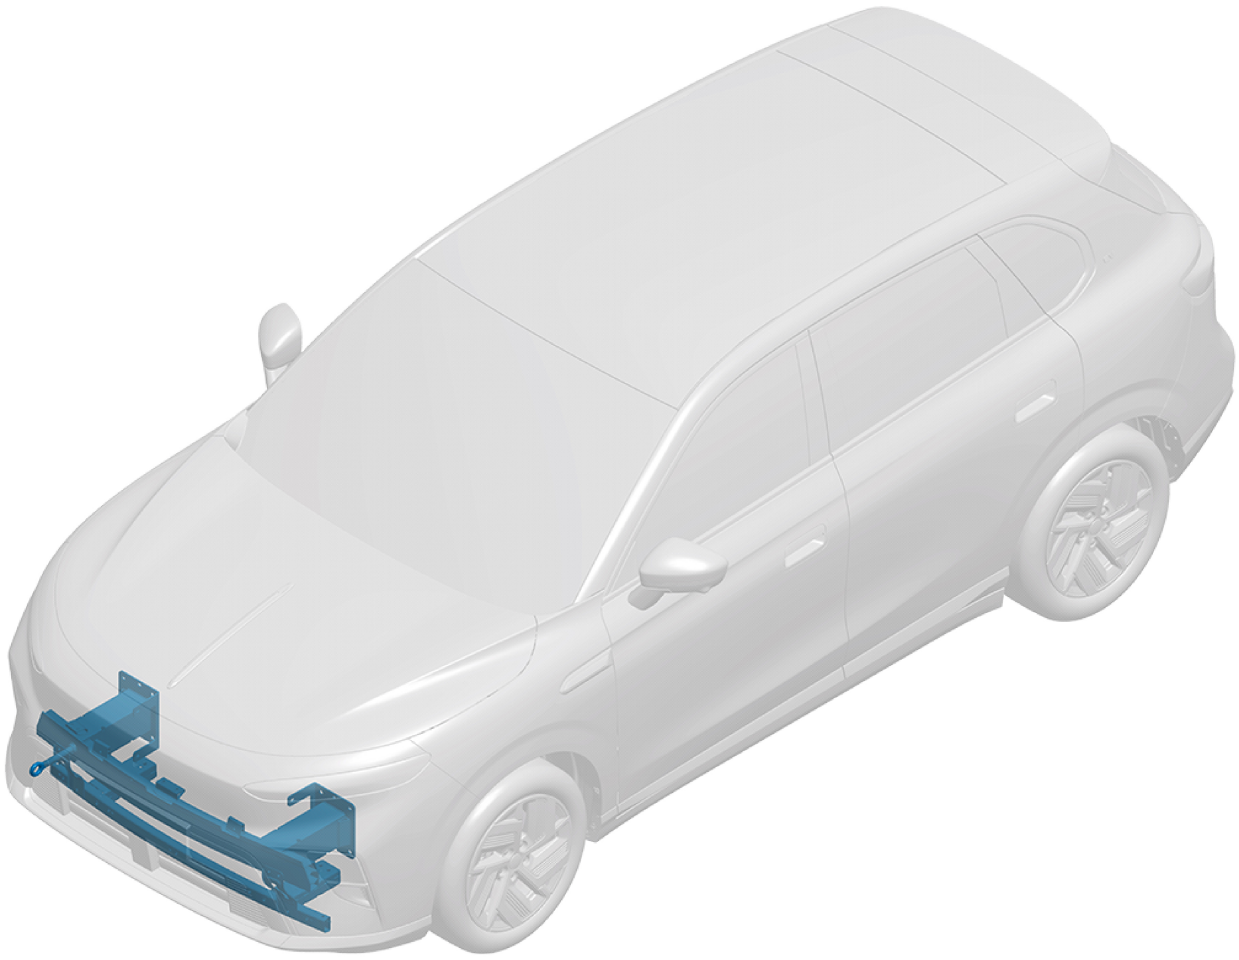
8 BODY SYSTEM

8.1 FRONT CRASH BEAM SYSTEM

8.1.1 PRECAUTIONS



PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the parts meet the original manufacturer's technical requirements.
2. After installation, the fasteners must be checked for the specified torque.
3. The engine compartment wiring harness must be securely fastened along the standard routing as in the original vehicle installation to prevent potential interference faults during vehicle operation.

8.1.6 SERVICE AND REPAIR GUIDANCE

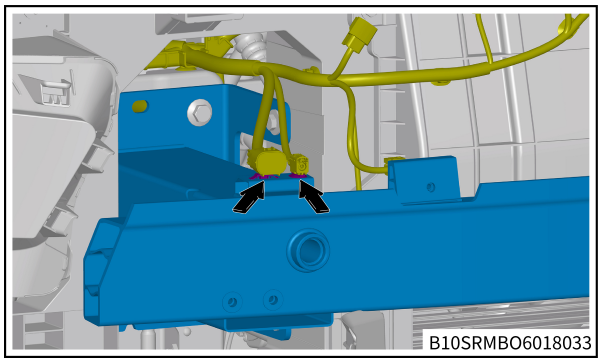
SECONDARY ANTI-COLLISION BEAM ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the cover.
   See:Housing (page 5343)
5. Remove the left/right connection plate of the front bumper beam.
   See:Front bumper beam left connecting plate (page 6345)
6. Remove the front sub anti-collision beam assembly.

a. Unscrew the 4 mounting bolts/nuts connecting the secondary bumper beam assembly to the front subframe assembly -arrow-.
   Recommended tools: 13mm socket, 15mm wrench
   Torque: 45±5N m
b. Remove the secondary bumper beam assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

FRONT BUMPER BEAM LEFT CONNECTING PLATE

NOTE

This section describes the removal and installation of the left connecting plate of the front bumper beam, and the removal and installation of the right connecting plate of the front bumper beam can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the left connecting plate of the front bumper reinforcement.

a. Unscrew the 3 fixing bolts connecting the left connecting plate of the front bumper beam to the front/sub bumper beam assembly - arrow -.
   Recommended tool: 13mm socket
   Torque: 23±2N m
b. Remove the left connecting plate ① of the front bumper beam.

SETUP

1. The installation procedure is performed in reverse order.

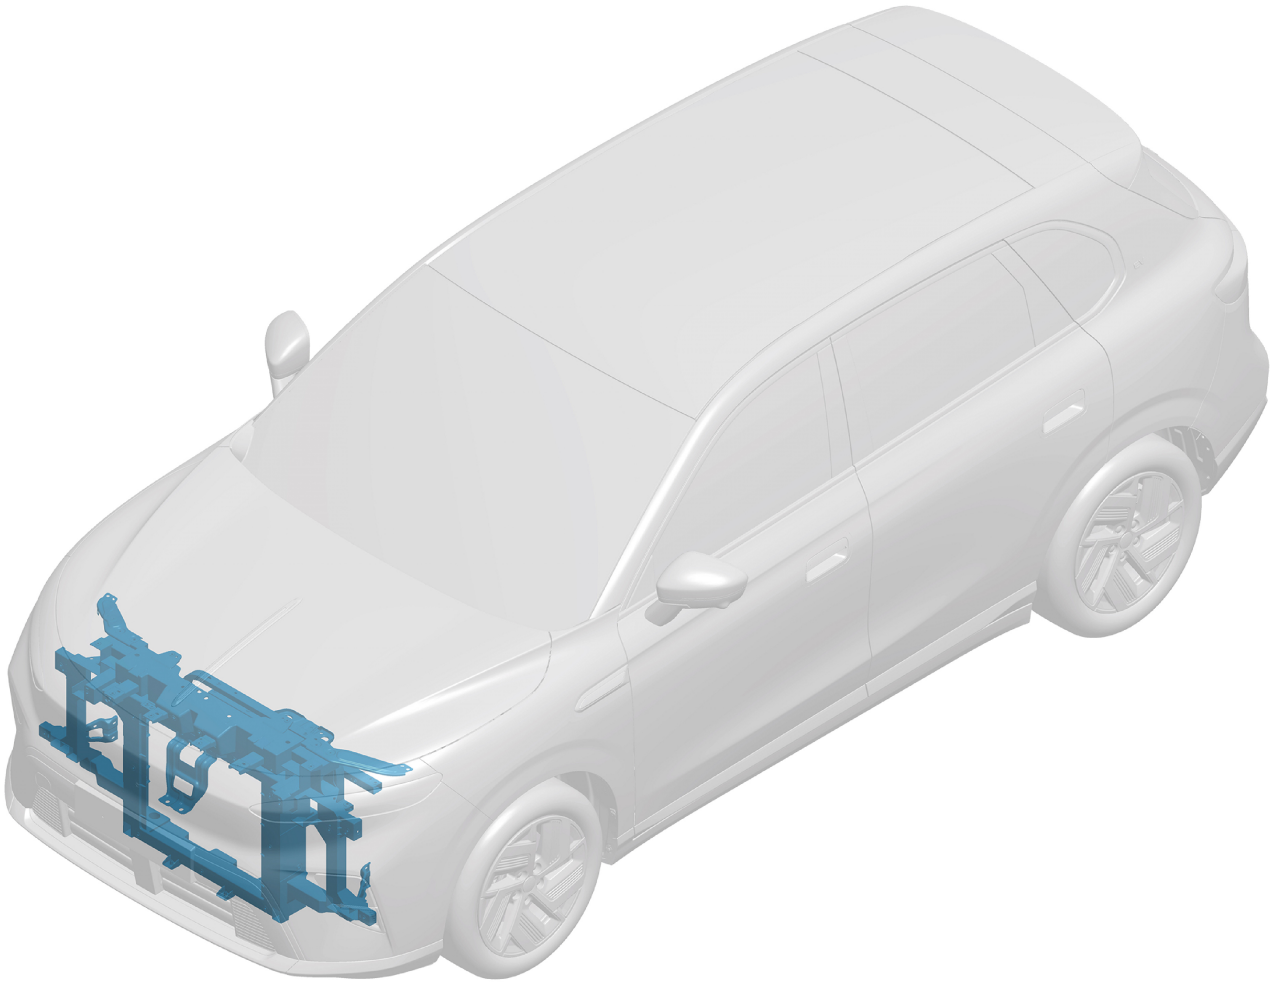
8.2 FRONT END MODULE SYSTEM

8.2.1 PRECAUTIONS



PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the original parts or replacement parts meet the original manufacturer's technical requirements.
2. After installation, the fasteners must be checked for the specified torque.
3. When removing and installing the sub-components of the front-end module, the hood assembly must be securely supported to prevent component damage or even personal injury due to accidental loosening and falling during the operation.
4. Before repairing or replacing parts, fender covers should be laid.

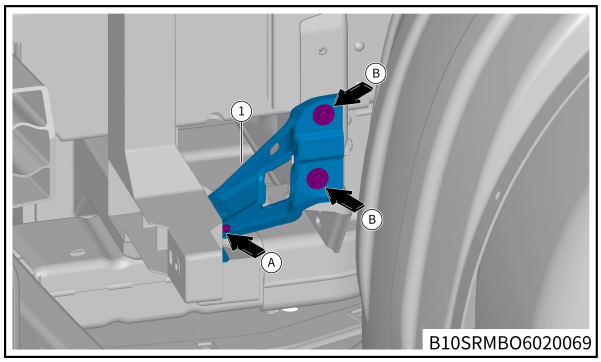
8.2.6 SERVICE AND REPAIR GUIDANCE



FRONT END MODULE LEFT REINFORCEMENT BRACKET ASSEMBLY

NOTE

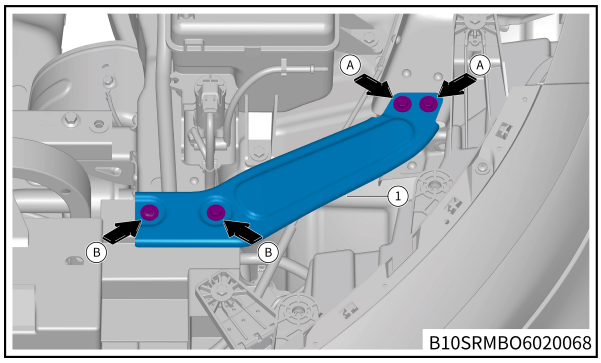
This section describes the removal and installation of the front end module left reinforcement bracket assembly, and the removal and installation of the front end module right reinforcement bracket assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front-end module left reinforcement bracket assembly.

a. Unscrew the 1 fixing bolt connecting the front end module left reinforcement bracket assembly to the front end module assembly -Arrow A -.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Unscrew the 2 mounting bolts connecting the front end module left reinforcement bracket assembly to the body -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 9±1N m
c. Remove the left reinforcement bracket assembly ① of the front end module.

SETUP



1. The installation procedure is performed in reverse order.

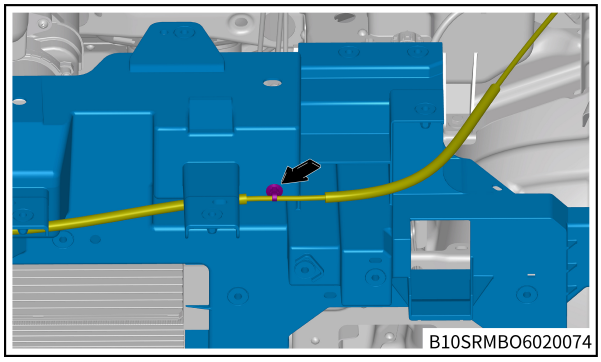
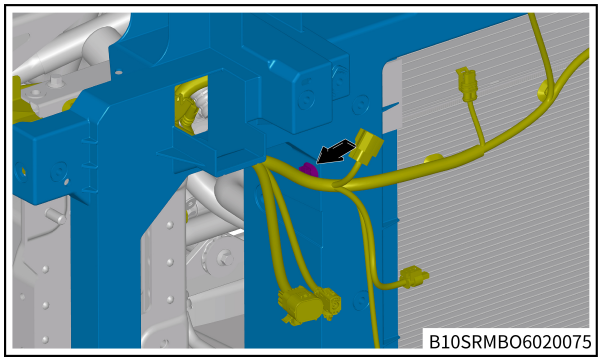
FRONT END MODULE ASSEMBLY

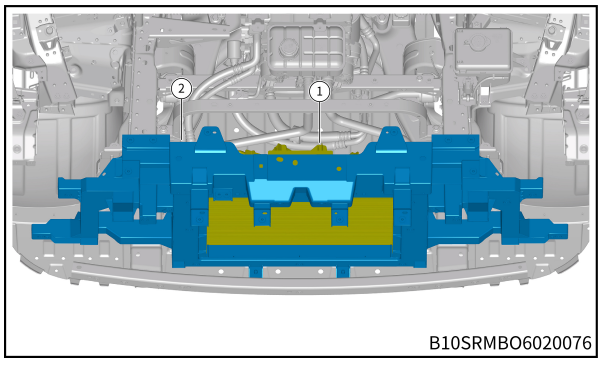


REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Remove the left front headlamp crossmember.
   See:Left front headlight crossmember (page 6354)
5. Remove the right front headlight crossmember assembly.
   See:Front right headlamp crossmember assembly (page 6359)
6. Remove the mounting bracket on the left/right cooling module assembly.
   See:Upper mounting bracket of cooling module assembly (page 5205)
7. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
8. Remove the left/right front combination lamp.
   See:Left front combination lamp (page 9448)
9. Remove the left/right front position turn signal and daytime running light assembly.
   See:Front left turn signal and daytime running light assembly (page 9445)
10. Remove the front-end module left/right reinforcement bracket assembly.
    See:Front End Module Left Reinforcement Bracket Assembly (page 6353)
11. Remove the front cover lock.
    See:Hood lock (page 6443)
12. Remove the hood latch mounting bracket.
    See:Hood latch mounting bracket (page 6360)
13. Remove the front bumper reinforcement assembly.
    See:Front bumper beam assembly (page 6344)
14. Remove the cover.
    See:Housing (page 5343)
15. Remove the low tone horn assembly.
    See:Low-tone horn assembly (page 9464)
16. Remove the tweeter assembly.
    See:Tweeter assembly (page 9465)
17. Remove the driving warning horn assembly.
    See:Driving warning horn assembly (page 9645)
18. Remove the air guide cover.
    See:Air guide cover (page 5342)
19. Remove the front end module assembly.



© 2026, All rights reserved



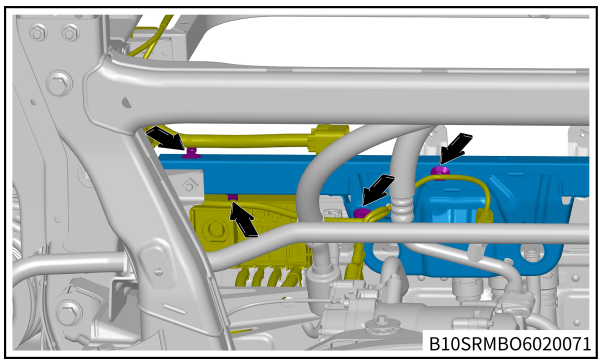
a. Unscrew the 3 fixing bolts connecting the front end module assembly and the front compartment lower cover assembly - arrow -.
Recommended tool: 10mm socket
Torque: 5±1N m

b. Release the 1 retaining clip connecting the hood lock cable assembly to the front end module assembly - arrow -.
Recommended tool: Clip remover

c. Disconnect the 1 fixing clip -arrow- connecting the engine compartment wiring harness assembly to the front end module assembly, and move the engine compartment wiring harness assembly aside.
Recommended tool: Clip remover

d. Disconnect the cooling module assembly heat pump ① from the front end module assembly, and secure the cooling module assembly heat pump ① using a cloth strip, wire, or similar tool.
e. Remove the front end module assembly ②.

SETUP



1. The installation procedure is performed in reverse order.

POWERTRAIN FRAME FRONT CROSSMEMBER ASSEMBLY

REMOVAL PROCEDURE

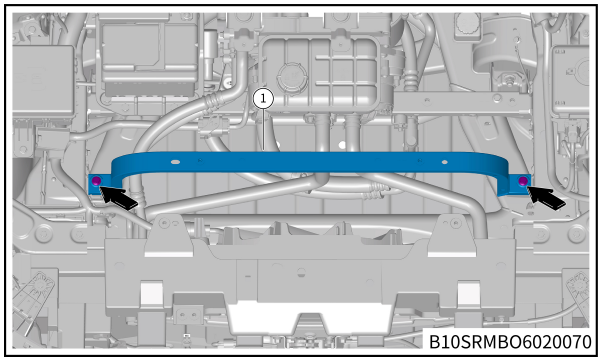
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
3. Remove the battery assembly.
   See:Battery Assembly (page 9594)
4. Remove the battery tray.
   See:Battery tray (page 9595)
5. Remove the super integrated module.
   See:Super Integrated Module (page 5226)
6. Remove the three-electric frame front crossmember assembly.

a. Release the 4 retaining clips - arrow - between the three-electric frame front crossmember assembly and the engine compartment wiring harness assembly.
Recommended tool: Clip remover

b. Unscrew the 1 fixing bolt - Arrow A - connecting the front crossmember assembly of the three-electric system frame to the high- and low-voltage inlet and outlet pipeline assembly.
Recommended tool: 8mm socket
Torque: 9±1N m

c. Unscrew the 2 fixing bolts connecting the three-electric frame front crossmember assembly to the body -Arrow B-, and remove the three-electric frame front crossmember assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP



1. The installation procedure is performed in reverse order.

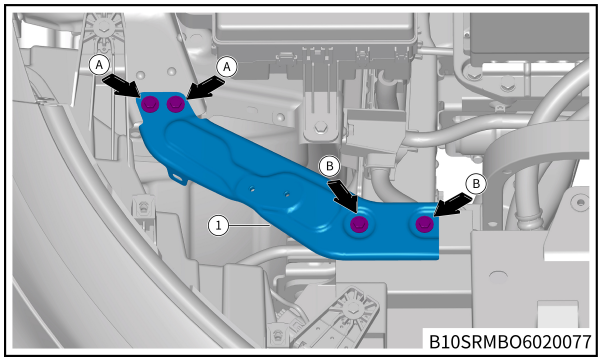
STORAGE BOX MOUNTING BRACKET ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Remove the storage box mounting bracket assembly.

a. Unscrew the 2 fixing bolts -arrow- connecting the storage box mounting bracket assembly to the vehicle body.
   Recommended tool: 10mm socket
   Torque: 23±2N m
b. Remove the storage box mounting bracket assembly ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

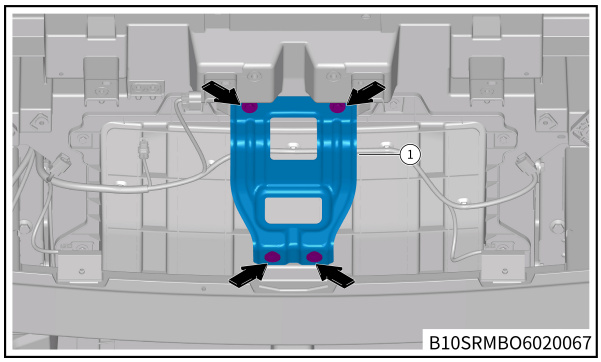
FRONT RIGHT HEADLAMP CROSSMEMBER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front cover support rod assembly.
   See:Hood prop rod sub-assembly (page 6538)
3. Remove the right front headlight crossmember assembly.

a. Unscrew the 2 fixing bolts -Arrow A- connecting the right front headlamp crossmember assembly to the body.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Unscrew the 2 mounting bolts connecting the right front headlamp crossmember assembly to the front end module assembly -Arrow B-, and remove the right front headlamp crossmember assembly ①.
   Recommended tool: 10mm socket
   Torque: 9±1N m

SETUP



1. The installation procedure is performed in reverse order.

8.3 CHARGING PORT FLAP SYSTEM

8.3.1 PRECAUTIONS

PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the parts meet the OEM technical specifications.
2. Do not use metal tools to disassemble the charging port housing assembly to prevent scratching the paint surface.
3. After installation, check the button switch of the charging port housing assembly, the button switch should open and close smoothly, without any sticking.

© 2026, All rights reserved

8.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The charging port protective cover consists of a cover body, a latch, a sealing strip, and other components. The cover body is the main part of the protective cover, typically made of elastic material to closely cover the charging port. The latch is used to secure the protective cover and prevent accidental opening. The sealing strip is located between the cover body and the device to provide water and dust protection.
- It can effectively protect the charging port, preventing dust, moisture, and other contaminants from entering the device, thereby enhancing the durability of the device.
- The protective cover is typically designed for ease of use, making it easy to open and close.

The charging port housing assembly system mainly consists of the following components:

- Charging port housing assembly: Provides sealing to prevent dust, moisture, etc. from entering the device, thereby improving the durability of the device.
- Charging port cover assembly: It can effectively protect the charging port.

CHARGING PORT HOUSING ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the charging port cover assembly.
   See:Charging port cover assembly (page 6601)
3. Remove the charging port box assembly.

a. Detach the 1 connection between the dust cover for the fast and slow charging plug and the charging port housing assembly -arrow-, and remove the dust cover ① for the fast and slow charging plug.
Recommended tool: Interior trim removal tool

b. Use a tool to gently pry open the 4 retaining clips -arrow- connecting the charging port housing assembly to the vehicle body, and disconnect the connection.
Recommended tool: Interior trim removal tool

NOTE

Do not use metal tools during the removal process to avoid scratching the painted surface or damaging the charging port housing assembly.

c. Remove the charging port housing assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check and confirm that the gap values at all parts around the charging port box assembly are within the respective standard ranges, and adjust them if they do not meet the requirements.

8.4 GLASS SYSTEM

8.4.1 PRECAUTIONS

PRECAUTIONS

1. When removing glass components, wear protective gloves and safety goggles to avoid injury to the skin or eyes.
2. When removing the glass, handle it with care and place it securely to prevent damage to the glass during the operation.
3. If the power window encounters an unexpected obstruction during use, promptly disconnect the battery power supply to prevent the motor from burning out.

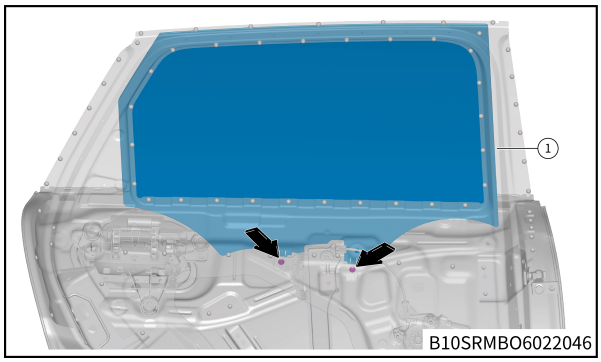
8.4.7 SERVICE AND REPAIR GUIDANCE



REAR LEFT DOOR GLASS ASSEMBLY

NOTE

This section describes the removal and installation of the left rear door glass assembly, and the removal and installation of the right rear door glass assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
3. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
4. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6412)
5. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6413)
6. Remove the left rear door rear guide rail assembly.
   See:Left Rear Door Rear Guide Rail Assembly (page 6411)
7. Remove the rear left door glass assembly.

a. First, lower the left rear door glass assembly to a position below the midpoint before proceeding to the next disassembly step.

NOTE

If a failure of the power window motor assembly prevents the procedure from proceeding, first remove the rear door window regulator mechanism assembly, and then remove the rear door glass assembly.

b. Unscrew the 2 fixing bolts -arrow- connecting the left rear door glass assembly to the left rear door power window regulator assembly.
Recommended tool: 8mm socket
Torque: 9±1N m

© 2026, All rights reserved

c. Slowly remove the left rear door glass assembly ①.

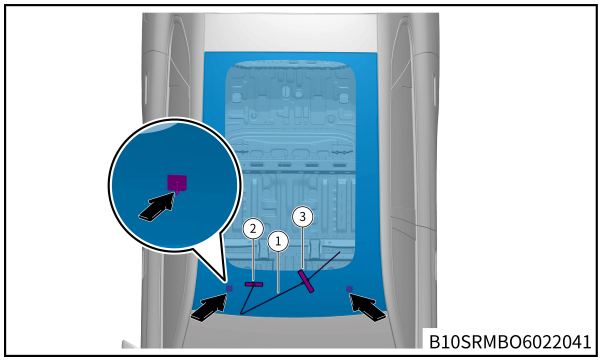
NOTE

When removing the rear door glass assembly, handle it with care to avoid chipping or damaging the glass.

SETUP

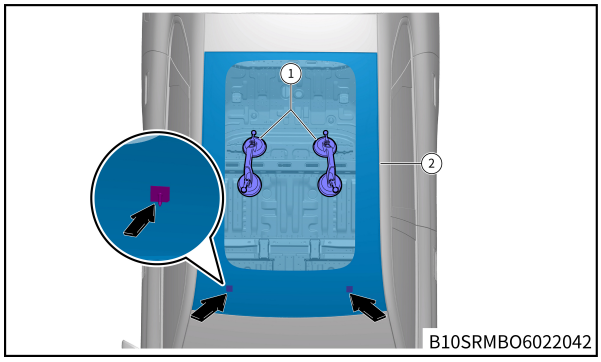
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



ROOF GLASS ASSEMBLY

NOTE



Depending on the configuration, the appearance of the roof glass assembly may vary slightly. Please repair or replace it according to the actual condition of the vehicle. When removing the roof glass assembly, avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the headliner assembly.
   See:Headliner assembly (Panoramic roof) (page 5528)
4. Remove the electric sunshade assembly.
   See:Electric sunshade assembly (page 6575)
5. Remove the roof glass assembly.

a. Use an awl to pierce through the adhesive sealant of the roof glass assembly.
b. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
c. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.
d. There are locating clips -arrow- at the two corners of the roof glass assembly, be careful to avoid them when cutting.
e. Cut the bonded glass with the assistance of another technician.
   Recommended tools: Glass puller, steel wire

f. Disconnect the 2 locating clips -arrow- connecting the roof glass assembly to the vehicle body.
   Recommended tool: Interior trim removal tool
g. Install the glass suction cup ① on the roof glass assembly, and carefully remove the roof glass assembly ②.
   Recommended tool: Glass suction cup

SETUP

1. Install the roof glass assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

ATTENTION

© 2026, All rights reserved

Do not damage the vehicle paint finish.

b. Clean debris from the vehicle interior, and clean the body mounting surface of the roof glass assembly.
c. Use glass cleaner to clean the body mounting surface of the roof glass assembly.
d. Apply glass/paint primer evenly to the body mounting surface of the roof glass assembly.
Body undercoating model: Huitian 8906P
e. Use glass cleaner to clean around the roof glass assembly.
f. Apply glass/paint primer evenly to the installation surfaces around the perimeter of the roof glass assembly.
Glass Primer Model: Huitian 8906G
g. Use a glass sealant gun to evenly apply the glass sealant to the mounting surface of the roof glass assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
Glass sealant model: Huitian 8960H

NOTE

Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Use glass suction cups to carefully attach the roof glass assembly to the vehicle body mounting surface.
i. Gently press around the perimeter of the roof glass assembly to ensure it is properly bonded in place.
j. Use protective tape to secure the roof glass assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

WARNING

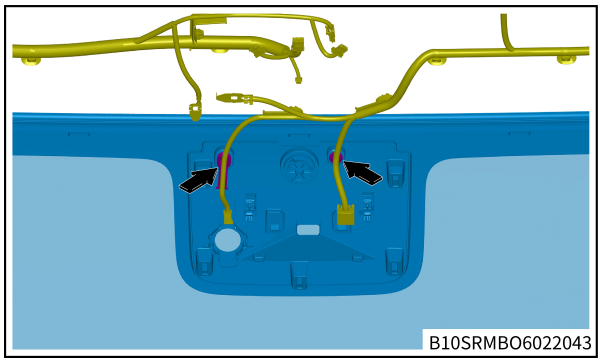
- When removing the film, take care to avoid injury from scattered debris or glass.
- After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

NOTE

- Perform the rain test 3-4 hours after installing the roof glass assembly (at approximately 20℃).
- If any leakage is found, use sealant to repair and seal the area.

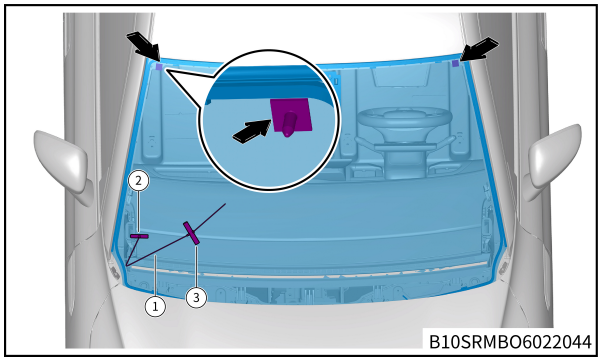
© 2026, All rights reserved



FRONT WINDSHIELD ASSEMBLY

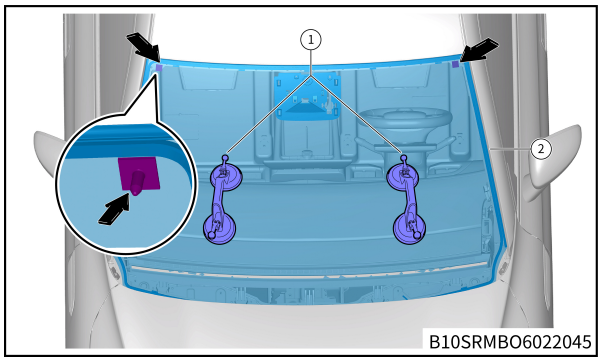
NOTE

When removing the windshield assembly, avoid cutting or scratching the vehicle body.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5522)
4. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
5. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5390)
6. Remove the interior rearview mirror assembly.
   See:Interior rearview mirror assembly (page 5287)
7. Remove the front monocular camera assembly.
   See:Front-view monocular camera assembly (page 9117)
8. Remove the rain and light sensor.
   See:Rain/light sensor (page 9631)
9. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
10. Remove the left/right end covers of the ventilation window cover plate.
    See:Left end cover of ventilation window cover (page 5305)
11. Remove the cowl panel grille assembly.
    See:Cowl Grille Assembly (page 5311)
12. Remove the front wiper motor and linkage assembly.
    See:Front wiper motor and linkage assembly (page 9492)
13. Remove the front windshield assembly.



a. Disconnect the 2 retaining clips - arrow - connecting the instrument panel wiring harness assembly to the front windshield assembly.
   Recommended tool: Interior trim removal tool

© 2026, All rights reserved

b. Use an awl to pierce through the adhesive sealant of the windshield assembly.
c. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
d. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.
e. The front windshield assembly has 2 locating clips - arrow -. Take care to avoid them when cutting.
f. Cut out the bonded glass with the assistance of another technician.
Recommended tools: Glass puller, steel wire

g. Disconnect the 2 locating clips -arrow- connecting the front windshield assembly to the vehicle body.
Recommended tool: Interior trim removal tool
h. Install the glass suction cup ① on the front windshield assembly, and carefully remove the front windshield assembly ②.
Recommended tool: Glass suction cup

SETUP

1. Install the front windshield assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

   ATTENTION

   Do not damage the vehicle paint finish.

   b. Clean debris from the vehicle interior, and clean the body mounting surface of the front windshield assembly.
   c. Use glass cleaner to clean the body mounting surface of the front windshield assembly.
   d. Apply glass/paint primer evenly to the body mounting surface of the windshield assembly.
   Body undercoating model: Huitian 8906P
   e. Use glass cleaner to clean around the front windshield assembly.
   f. Apply the glass/paint primer evenly to the mounting surfaces around the perimeter of the windshield assembly.
   Glass Primer Model: Huitian 8906G
   g. Use a sealant gun to evenly apply the glass sealant onto the mounting surface of the front windshield assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
   Glass sealant model: Huitian 8960H

   NOTE

© 2026, All rights reserved

Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Carefully fit the front windshield assembly onto the body mounting surface using glass suction cups.
i. Gently press around the perimeter of the front windshield assembly to ensure the windshield is properly bonded in place.
j. Use protective tape to secure the front windshield assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

WARNING

- When removing the film, take care to avoid injury from scattered debris or glass.
- After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

NOTE

- Perform the rain test 3-4 hours after installing the windshield (at approximately 20°C).
- If any leakage is found, use sealant to repair and seal the area.

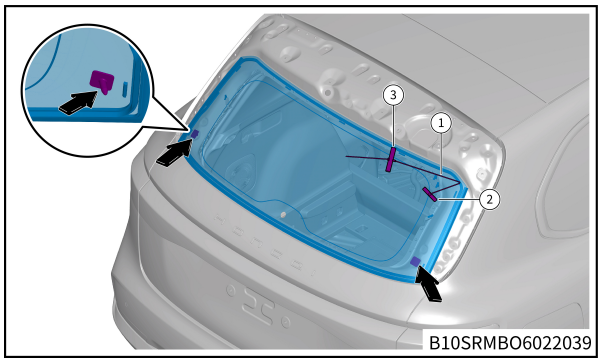
REAR WINDSHIELD ASSEMBLY

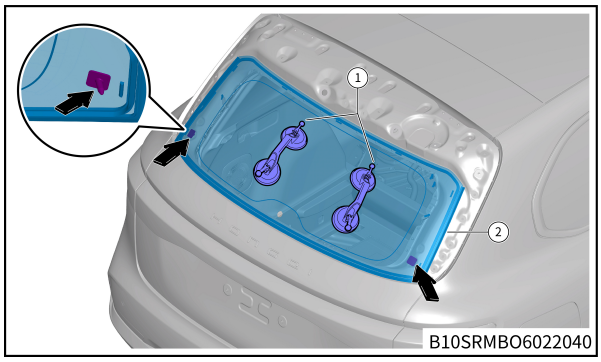
NOTE



When removing the rear windshield assembly, avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
6. Remove the left/right spoiler trim assembly.
   See:Left spoiler trim panel assembly (page 5313)
7. Remove the spoiler assembly.
   See:Spoiler assembly (page 5312)
8. Remove the rear wiper arm and blade assembly.
   See:Rear wiper arm and blade assembly (page 9499)
9. Remove the rear wiper motor.
   See:Rear wiper motor (page 9502)
10. Remove the rear wiper seal.
    See:Rear wiper seal (page 9501)
11. Remove the rear windshield assembly.



a. Disconnect the 2 connectors between the liftgate wiring harness assembly and the rear windshield assembly -arrow-.

b. Use an awl to pierce through the adhesive sealant of the rear windshield assembly.
c. Pass the cutting line through the adhesive sealant and pull it into the vehicle interior.
d. Secure the cutting line ① pulled into the vehicle interior with handles ② and ③ to prevent it from being pulled out.

© 2026, All rights reserved

e. There are 2 locating clips on the rear windshield assembly. Be careful to avoid them when cutting.
f. Cut the bonded glass with the assistance of another technician.
Recommended tools: Glass puller, steel wire

g. Detach the 2 locating clips connecting the rear windshield assembly and the liftgate assembly - arrow -.
Recommended tool: Interior trim removal tool
h. Attach the glass suction cup ① to the rear windshield assembly, and carefully remove the rear windshield assembly ②.
Recommended tool: Glass suction cup

NOTE

When removing the rear windshield assembly, handle it with care to avoid chipping the glass.

SETUP

1. Install the rear windshield assembly.
   a. Use a scraper to scrape off the residual glass adhesive from the vehicle body.

ATTENTION

Do not damage the vehicle paint finish.

   b. Clean debris from the vehicle interior, and clean the body mounting surface of the rear windshield assembly.
   c. Use glass cleaner to clean the body mounting surface of the rear windshield assembly.
   d. Apply glass/paint primer evenly to the body mounting surface of the rear windshield assembly.
   Body undercoating model: Huitian 8906P
   e. Use glass cleaner to clean around the rear windshield assembly.
   f. Apply glass/paint primer evenly to the installation surfaces around the perimeter of the rear windshield assembly.
   Glass Primer Model: Huitian 8906G
   g. Use a sealant gun to evenly apply the glass sealant on the mounting surface of the rear windshield assembly. The sealant application should be even and continuous, and the cross-section of the sealant bead should preferably be trapezoidal or triangular.
   Glass sealant model: Huitian 8960H

NOTE

© 2026, All rights reserved

Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

h. Use glass suction cups to carefully fit the rear windshield assembly onto the body mounting surface.
i. Gently press around the edges of the rear windshield assembly to ensure it is securely adhered in place.
j. Use protective tape to secure the rear windshield assembly until the adhesive cures.
k. Remove the protective film inside the vehicle.

WARNING

- When removing the film, take care to avoid injury from scattered debris or glass.
- After removing the film, check the vehicle interior for any broken glass and clean it up if any is found.

l. Peel off the protective tape.

NOTE

- Conduct the rain test 3-4 hours after installing the rear windshield assembly (at around 20°C).
- If any leakage is found, use sealant to repair and seal the area.

FRONT LEFT DOOR GLASS ASSEMBLY

NOTE

This section describes the removal and installation of the front left door glass assembly, and the removal and installation of the front right door glass assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
3. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
4. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6400)
5. Remove the front left door glass assembly.

a. First, lower the front left door glass assembly to a position below the halfway point, then proceed to the next disassembly step.

NOTE

If the window regulator motor assembly fails and prevents the procedure from continuing, first remove the front door window regulator mechanism assembly, and then remove the front door glass assembly.

b. Detach the retaining clips -arrow- connecting the left front door glass assembly and the left front door power window regulator assembly on both sides.
c. Slowly remove the front left door glass assembly ①.

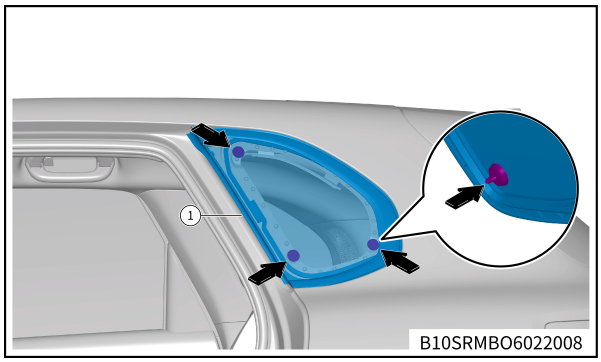
NOTE

When removing the front door glass assembly, handle it with care to avoid damaging the glass.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT REAR QUARTER WINDOW GLASS ASSEMBLY

NOTE

- This section describes the removal and installation of the left rear quarter window glass assembly. The removal and installation of the right rear quarter window glass assembly can generally follow the procedure for the left side.
- When removing the left rear quarter window glass assembly, first apply a protective film to mask and protect the side panel sheet metal at the lower end of the quarter window to avoid scratching or cutting the vehicle body.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the rear left door assembly.
3. Remove the left rear quarter window glass assembly.

a. Use a tool to cut through the glass bonding adhesive of the left rear quarter window glass assembly.
Recommended tool: Glass puller

ATTENTION

Take protective measures during the steel wire cutting process to avoid scratching the sheet metal parts.

b. Release the 3 locating clips - arrow - connecting the left rear quarter window glass assembly to the body, and remove the left rear quarter window glass assembly ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Use a blade to thoroughly remove the glass sealant from the sheet metal area of the quarter window, and any residual glass sealant on the sheet metal must be removed immediately.

ATTENTION

Do not damage the vehicle paint finish.

   b. Use adhesive remover to wipe the sheet metal area of the quarter window clean.
   c. After removing the residual adhesive from the glass, evenly apply the body primer to the body mounting surface of the rear quarter glass assembly.
   Body undercoating model: Huitian 8906P

© 2026, All rights reserved

d. After removing the residual adhesive from the glass, evenly apply the glass primer to the mounting surfaces around the rear quarter window glass assembly.
Glass Primer Model: Huitian 8906G
e. Use a sealant gun to apply the sealant evenly onto the mounting surface of the rear quarter window glass assembly. The sealant bead should be applied evenly and continuously, and its cross-section should preferably be trapezoidal or triangular.
Glass sealant model: Huitian 8960H

> NOTE
>
> Cut the plastic dispensing nozzle into a V-shape so that the sealant applied along the frame forms an inverted V-shape. Apply the sealant evenly and continuously without interruption, and try to apply it along the center of the frame to prevent excessive sealant overflow.

f. Install the rear quarter window glass assembly and perform a rain test after the glass adhesive cures.
g. If any leakage is found, use sealant to repair and seal the area.

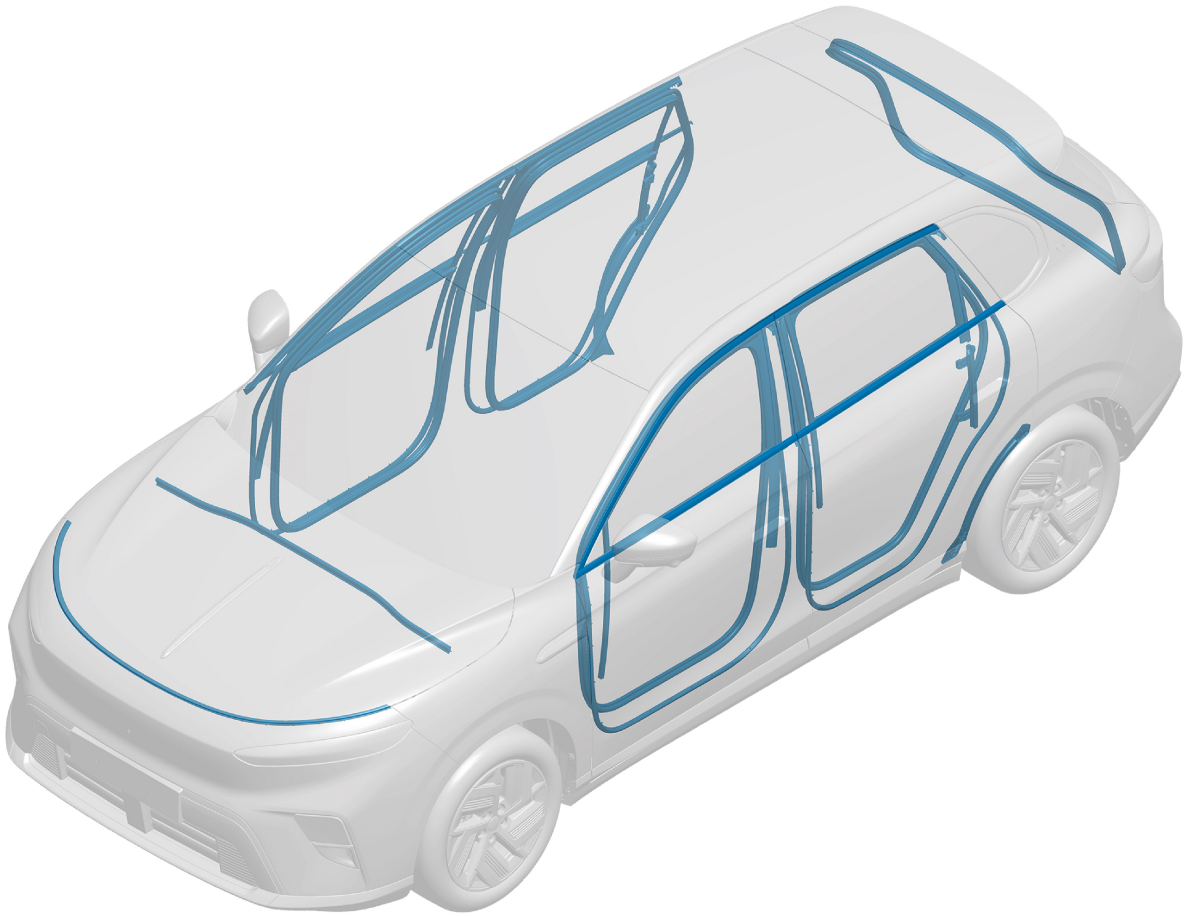
8.5 SEALING SYSTEM

8.5.1 PRECAUTIONS



PRECAUTIONS

1. During removal and installation, do not scratch or damage the seals; otherwise, such damage may cause poor sealing and lead to water ingress.
2. When installing the weatherstrip, do not twist or fold it.
3. The weatherstrip must fit tightly against the sealing surface and be installed securely.
4. After installing critical seals, a water spray test must be conducted to ensure proper sealing.

8.5.6 SERVICE AND REPAIR GUIDANCE

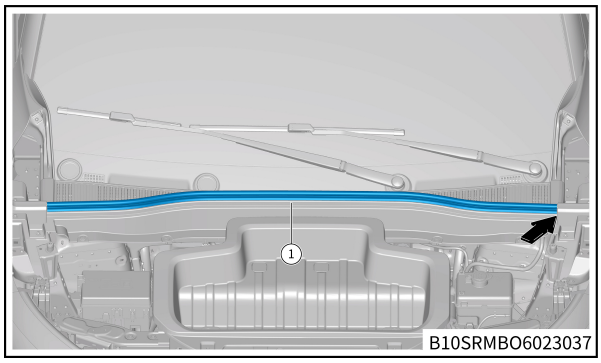
LIFTGATE SEALING STRIP

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the liftgate weatherstrip.

a. Remove the tailgate sealing strip ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the tailgate weatherstrip, align the joint line of the tailgate weatherstrip with the center of the tailgate striker, and press it into position first; the installation sequence of the tailgate weatherstrip is from bottom to top, and from both sides towards the center, pressing it into place progressively; the final installation endpoint is located in the upper center area.
   b. After installation, if necessary, use a pressing fixture or a soft rubber mallet to seat the U-shaped groove of the weatherstrip in place.
   c. After the interior trim parts are assembled, tear off the pull cord of the rubber strip, and ensure that the lip edge overlaps smoothly.
   d. After assembly, check whether the weatherstrip is properly installed all around, ensuring smooth overlap with the sheet metal and interior trim, with no curling or improper installation.
   e. After installation, press and smooth the weatherstrip to prevent water leakage and appearance defects. Ensure the weatherstrip lip is correctly assembled and not inverted.

© 2026, All rights reserved

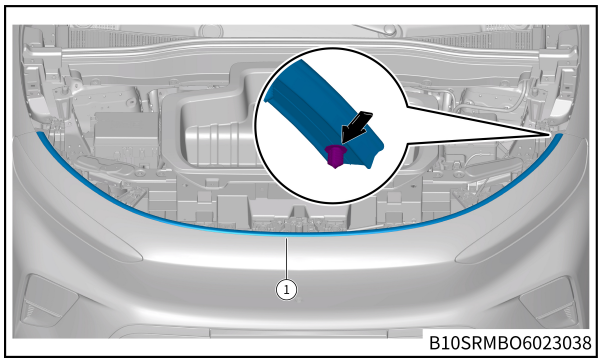
REAR HOOD SEAL

REMOVAL PROCEDURE

1. Open the front hood assembly.
2. Remove the rear seal of the front cover.

a. Detach one end of the rear seal of the front cover -arrow-, and remove the rear seal of the front cover ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Start assembling from one end of the sealing strip. After assembling a section (at approximately the 1/3 position), assemble the other end of the sealing strip, and align both ends with the edges of the snap-fit lips (protruding structures) on the ventilation cover.
   b. Finally, assemble all components in the center position and snap them into place.
   c. The weatherstrip is securely installed, with no sticking or improper seating.
   d. Align the edge of the snap-fit spigot (protruding structure) of the end ventilation cover.
   e. After assembly, the sealing strip shall be free from waves, wrinkles, or other defects.

© 2026, All rights reserved

HOOD FRONT WEATHERSTRIP

REMOVAL PROCEDURE

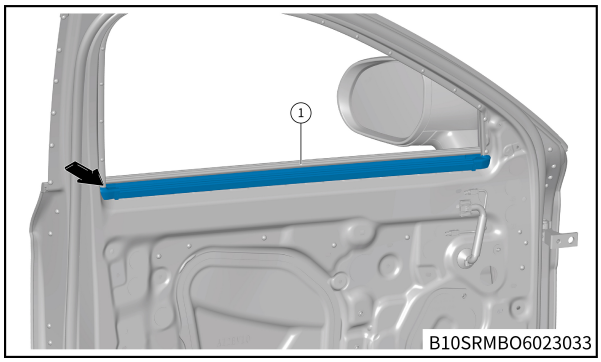
1. Open the front hood assembly.
2. Remove the front sealing strip of the front cover.

a. Release the 22 retaining clips -arrow- connecting the front hood front weatherstrip, and remove the front hood front weatherstrip ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Following the color markers (white markers) on the sealing strip, start installation from the front passenger side starting point, and sequentially snap all sealing strip clips into the corresponding mounting holes on the engine compartment trim and the front bumper.
   b. The sealing strip is securely installed, and the clips are properly seated with no instances of improper installation, disengagement, or partial engagement.

© 2026, All rights reserved



FRONT LEFT DOOR INNER WATER DEFLECTOR

NOTE

This section describes the removal and installation of the inner belt weatherstrip for the front left door, and the removal and installation of the inner belt weatherstrip for the front right door can generally refer to the left side.

REMOVAL PROCEDURE

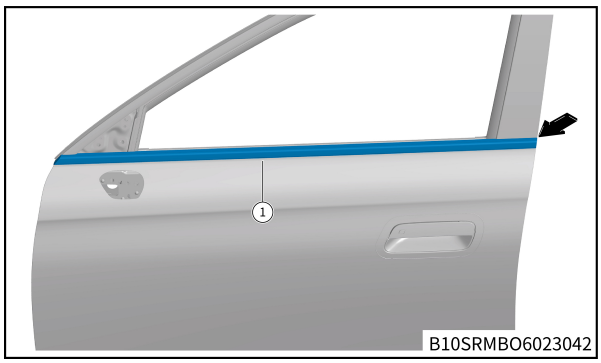
1. Open the front left door assembly.
2. Lower the front left door glass assembly to the lowest position.
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the inner belt weatherstrip of the front left door.

a. Pry up one end of the left front door inner belt weatherstrip - arrow -, and remove the left front door inner belt weatherstrip ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: Assemble the front door inner belt weatherstrip by using the window frame at the B-pillar end of the front door as the positioning reference, and fit the corner joint at the B-pillar end of the inner belt weatherstrip to the B-pillar end with a zero-gap fit for X-direction positioning of the inner belt weatherstrip.
   b. Step 2: After aligning the positioning points at the end, press the front door inner belt weatherstrip vertically downward by hand from the positioning end towards the other end (along the direction of the arrow) until the inner belt weatherstrip is fully clipped into place and fully seated against the sheet metal flange in the Z-direction.
   c. Ensure that the corner joints at both ends of the inner belt weatherstrip fit properly with the vertical sections of the window frames on both sides, without causing gaps, interference, deformation, or other issues.
   d. The inner belt weatherstrip and the glass fit together without causing gaps, edge curling, or other issues.

© 2026, All rights reserved



FRONT LEFT DOOR OUTER BELT MOLDING

NOTE

This section describes the removal and installation of the left front door outer belt molding. The removal and installation of the right front door outer belt molding can generally refer to the left side.

REMOVAL PROCEDURE

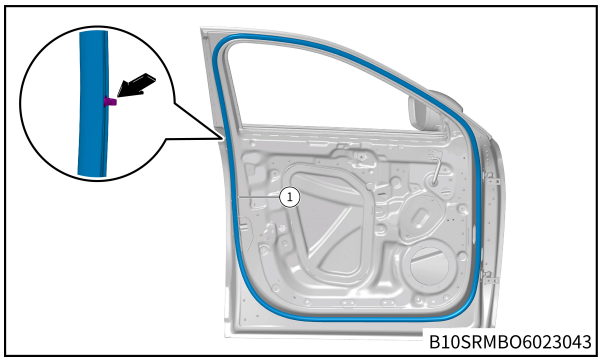
1. Open the front left door assembly.
2. Lower the front door glass assembly to the lowest position.
3. Remove the left triangular outer trim panel assembly.
   See:Left triangular outer trim panel assembly (page 5278)
4. Remove the front left door outer belt molding.

a. Pry up one end of the left front door outer belt molding -arrow-, and remove the left front door outer belt molding ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: When assembling the front door outer belt weatherstrip, use the U-shaped locating notch on the outer panel of the door B-pillar as the locating datum. First, align the built-in limit block at the end of the outer belt weatherstrip with the sheet metal locating notch on the B-pillar and install it.
   b. Step 2: After aligning with the B-pillar sheet metal, sequentially snap the outer belt molding forward (for the front door, towards the front) into the door sheet metal flange, ensuring that the outer belt molding is securely engaged with the inner hooking structure of the door sheet metal, and that the small lower lip on the outer side of the outer belt molding fits snugly against the door sheet metal.
   c. Post-assembly inspection: The outer surfaces and flocked surfaces of the parts must not be soiled, and there shall be no part deformation, scratches, or other cosmetic defects.
   d. Confirm that the outer belt weatherstrip is properly clipped into the door sheet metal flange, fully engaged in the Z-direction, and installed securely and reliably without any looseness.
   e. Ensure that after the outer belt weatherstrip is installed, the B-pillar end of the front door aligns with the door sheet metal, without any step difference, poor fitment, or other issues.
   f. Ensure that both ends of the outer belt weatherstrip fit properly in the mating area with the exterior trim panel, without causing gaps, interference, deformation, or other issues.
   g. The lip of the exterior beltline weatherstrip mates with the glass without causing gaps, edge curling, or other issues.
   h. The small lip at the bottom of the outer belt weatherstrip fits closely against the door sheet metal, preventing any gaps or scratches to the sheet metal paint surface.

© 2026, All rights reserved



FRONT LEFT DOOR SEALING STRIP

NOTE

This section describes the removal and installation of the left front door weatherstrip. The removal and installation of the right front door weatherstrip can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the front left door sealing strip.

a. Detach the 39 retaining clips connecting the left front door weatherstrip to the left front door assembly -arrow-, and remove the left front door weatherstrip ①.
Recommended tool: Interior trim removal tool

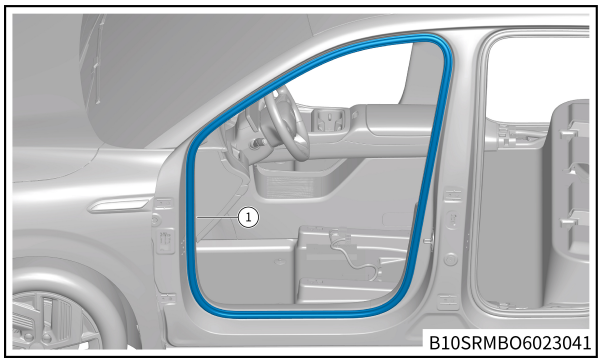
NOTE

During removal, do not pull or tear forcefully to prevent damage to the sealing strip.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Door installation starting point: The front door is installed starting from the center clip at the R-angle of the B-pillar, and the starting clip is white.
   b. Assembly sequence: Insert the clips into the door sheet metal holes in sequence, when installing the clips, simultaneously secure the 3M tape at the front door check, the corresponding sheet metal bonding surfaces must be cleaned before tape application, after cleaning the sheet metal, peel off the release liner and apply the 3M tape to the door sheet metal, after each tape application, use a roller to press back and forth for more than 3 seconds, to ensure the tape is firmly bonded to the sheet metal without detachment, and the weatherstrip must not be subjected to any force other than in the vertical pressing direction within 20 minutes.
   c. All clips must be securely engaged, and there should be no issues such as disengagement or incomplete engagement.
   d. The 3M tape bonds securely. When the temperature is below 20℃, the 3M tape must be heated. The baking temperature range is 35℃~40℃, and the oven temperature should be set to 40℃.
   e. Ensure that the outer lip of the door weatherstrip fits properly against the sheet metal, free of waviness, curled edges, or other defects.
   f. Check the weatherstrip for damage. If damaged, replace it with a new door weatherstrip.

© 2026, All rights reserved



FRONT LEFT DOOR OPENING SEALING STRIP

NOTE

This section describes the removal and installation of the left front door opening weatherstrip, and the removal and installation of the right front door opening weatherstrip can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the left A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
4. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
5. Remove the left B-pillar upper interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
6. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
7. Remove the front left door opening sealing strip.

a. Remove the front left door opening weatherstrip ①.

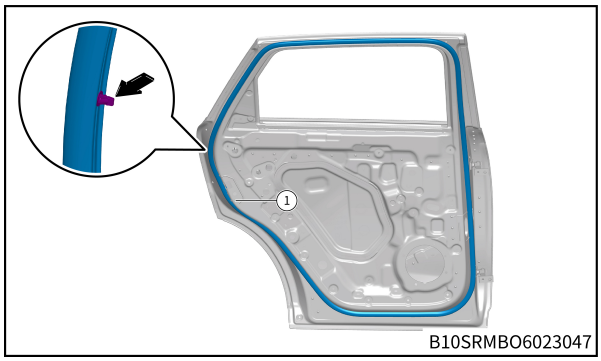
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Markings:
      - Front door: Left yellow, right blue.
   b. Identify the corresponding parts by the color of the marking points to ensure they match the respective doors and prevent incorrect installation.
   c. When installing the front door aperture weatherstrip, start by aligning the color marking point on the weatherstrip parallel to the side panel limiter mounting hole. Snap the weatherstrip into the door aperture flange, install the weatherstrip in both the upward and downward directions, ensure it is fully seated, continue the installation down to the lower sill, and complete the process at the installation stop area.
   d. After installation, if necessary, use a pressing fixture or a soft rubber mallet to seat the U-shaped groove of the weatherstrip in place.
   e. After the interior trim parts are assembled, tear off the pull cord of the rubber strip, and ensure that the lip edge overlaps smoothly.

© 2026, All rights reserved

f. The weatherstrip is securely snap-fitted to the sheet metal.
g. Ensure no waviness or dislodgement around the entire circumference, and check the assembly condition at the corners during the process.
h. After installation, press and smooth the weatherstrip to prevent water leakage and appearance defects. Ensure the weatherstrip lip is correctly assembled and not inverted.

© 2026, All rights reserved



LEFT REAR DOOR WEATHERSTRIP

NOTE

This section describes the removal and installation of the left rear door weatherstrip. The removal and installation of the right rear door weatherstrip can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the left rear door weatherstrip.

a. Detach the 40 retaining clips -arrow- connecting the left rear door weatherstrip to the left rear door assembly, and remove the left rear door weatherstrip ①.
Recommended tool: Interior trim removal tool

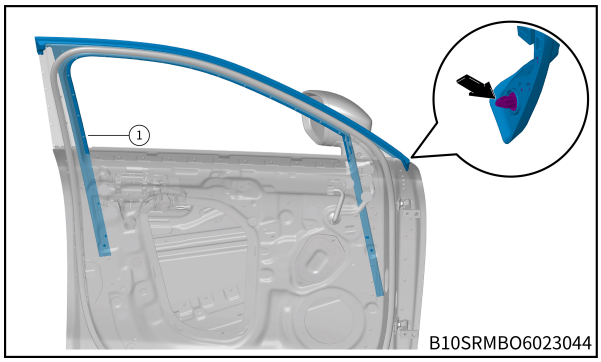
NOTE

During removal, do not pull or tear forcefully to prevent damage to the sealing strip.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Door installation starting point: The rear door is installed starting from the center clip at the R-angle of the B-pillar, and the starting clip is white.
   b. Assembly sequence: Insert the clips into the door sheet metal holes in sequence, and when installing the clips, simultaneously secure the 3M tape at the rear door check, ensuring the corresponding sheet metal bonding surfaces are cleaned before applying the tape, and after cleaning the sheet metal, peel off the release liner, apply the 3M tape to the door sheet metal, after each piece of tape is applied, use a roller to press back and forth for more than 3 seconds, to ensure the tape is firmly bonded to the sheet metal without detachment, and within 20 minutes, the weatherstrip must not be subjected to any forces other than in the vertical pressing direction.
   c. All clips must be securely engaged, and there should be no issues such as disengagement or incomplete engagement.
   d. The 3M tape bonds securely. When the temperature is below 20℃, the 3M tape must be heated. The baking temperature range is 35℃~40℃, and the oven temperature should be set to 40℃.
   e. Ensure that the outer lip of the door weatherstrip fits properly against the sheet metal, free of waviness, curled edges, or other defects.
   f. Check whether the sealing strip is damaged; if so, replace it with a new rear door sealing strip.

© 2026, All rights reserved



FRONT LEFT DOOR GUIDE CHANNEL WEATHERSTRIP

NOTE

This section introduces the removal and installation of the window run channel seal for the front left door, and the removal and installation of the window run channel seal for the front right door can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left front door inner triangular trim panel assembly.
   See:Front left door inner sail panel assembly (page 5354)
4. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
5. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6400)
6. Remove the front left door outer belt molding.
   See:Front left door outer belt molding (page 6401)
7. Remove the left front B-pillar outer trim panel assembly.
   See:B-Pillar Front Left Outer Trim Panel Assembly (page 5308)
8. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
9. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
10. Remove the front left door glass assembly.
    See:Front left door glass assembly (page 6387)
11. Remove the front left power window regulator assembly.
    See:Left front door power window regulator assembly (page 6428)
12. Remove the front left door guide channel weatherstrip.

a. Release the 1 retaining clip - arrow - connecting the left front door guide channel weatherstrip to the left front door assembly, and remove the left front door guide channel weatherstrip ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: First, assemble the guide channel at the B-pillar corner joint. The B-pillar corner joint contains a rigid insert, and the locating pins on the insert correspond to the locating slots on the door sheet metal.

© 2026, All rights reserved

During assembly, ensure that the locating pins are fully engaged in the locating slots on the door sheet metal to limit movement in the X direction.

b. Step 2: After the B-pillar corner assembly is completed, sequentially from rear to front, fully snap the U-shaped clip slot of the guide groove into the door sheet metal flange; ensure the guide groove is fully assembled in the Y-direction and abuts against the sheet metal flange. After assembly, ensure that the inner lip mates with the sheet metal without edge curling.
c. Step 3: Snap the A-pillar vertical straight strip of the front door guide channel into the front guide rail of the front door, ensuring that the A-pillar straight strip is fully engaged in the guide rail.
d. Step 4: After the front door upper window frame section, the front door B-pillar outer trim panel, and the front door rear guide rail are assembled, sequentially snap the rear vertical section into the B-pillar outer trim panel and the front door rear guide rail, ensuring that the outer lip of the guide groove fits well against the trim panel in the Y-direction and does not protrude beyond the edge of the trim panel.
e. Step 5: Finally, fold out the inner lip of the front door guide channel to cover the sheet metal flange, ensuring that the entire circumferential lip properly covers the sheet metal flange.
f. Step 6: Snap the snap-fit features of the corner joint at the frontmost end of the front door guide channel and the corner clips onto the door inner panel, ensuring no interference, edge curling, gaps, or other issues occur.
g. After installation, check and confirm that it is fully and properly installed in place, and ensure there are no wrinkles on the guide channel weatherstrip.
h. After installation, operate the front door power window regulator and confirm that the glass moves up and down without any sticking or abnormal noise.

REAR LEFT DOOR OPENING WEATHERSTRIP

NOTE

This section describes the removal and installation of the left rear door aperture seal, and the removal and installation of the right rear door aperture seal can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
3. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
4. Remove the left B-pillar upper interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
5. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
6. Remove the sealing strip of the rear left door opening.

a. Remove the left rear door opening seal ①.

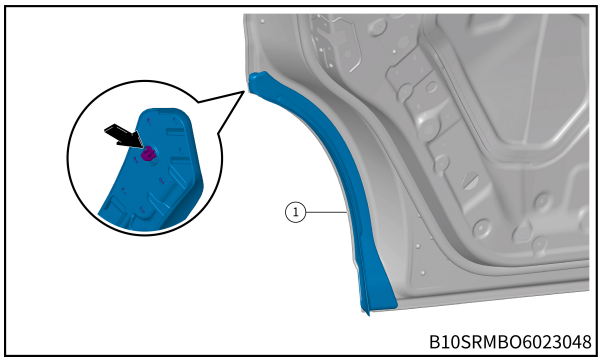
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Markings:
      - Rear door: Red on the left, green on the right.
   b. Identify the corresponding parts by the color of the marking points to ensure they match the respective doors and prevent incorrect installation.
   c. When installing the rear door aperture weatherstrip, start the installation by aligning the color mark on the weatherstrip parallel to the side panel limiter mounting hole. Snap the weatherstrip into the door aperture flange, and install it in both upward and downward directions. Ensure the weatherstrip is fully seated, install it down to the lower sill position, and finish the installation at the installation stop area.
   d. After installation, if necessary, use a pressing fixture or a soft rubber mallet to seat the U-shaped groove of the weatherstrip in place.
   e. After the interior trim parts are assembled, tear off the pull cord of the rubber strip, and ensure that the lip edge overlaps smoothly.
   f. The weatherstrip is securely snap-fitted to the sheet metal.
   g. Ensure no waviness or dislodgement around the entire circumference, and check the assembly condition at the corners during the process.

© 2026, All rights reserved

h. After installation, press and smooth the weatherstrip to prevent water leakage and appearance defects. Ensure the weatherstrip lip is correctly assembled and not inverted.

© 2026, All rights reserved



LEFT REAR DOOR WHEEL ARCH WEATHERSTRIP

NOTE

This section describes the removal and installation of the left rear door wheel arch seal. The removal and installation of the right rear door wheel arch seal can generally refer to the left side.

REMOVAL PROCEDURE

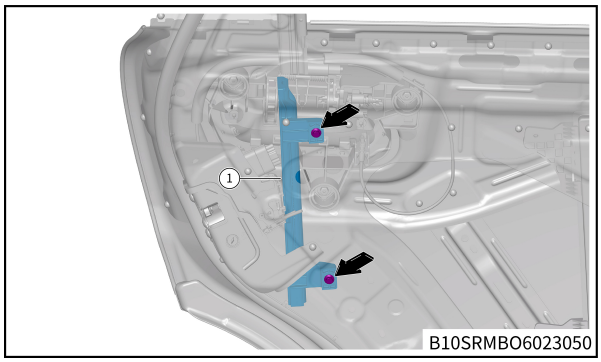
1. Open the rear left door assembly.
2. Remove the rear left wheel arch seal.

a. Detach the 9 retaining clips - arrow - connecting the left rear door wheel arch weatherstrip to the left rear door assembly, and remove the left rear door wheel arch weatherstrip ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Align the clip at the assembly starting point of the wheelhouse seal with the mounting hole at the assembly starting point of the door sheet metal, sequentially snap all clips into the sheet metal holes from top to bottom, and ensure each clip is fully seated, with no disengaged or partially engaged clips.
   b. After assembly, check whether the sealing strip is properly installed all around, ensuring there is no curling or improper installation.

© 2026, All rights reserved



LEFT REAR DOOR REAR GUIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the rear guide rail assembly for the left rear door. The removal and installation of the rear guide rail assembly for the right rear door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

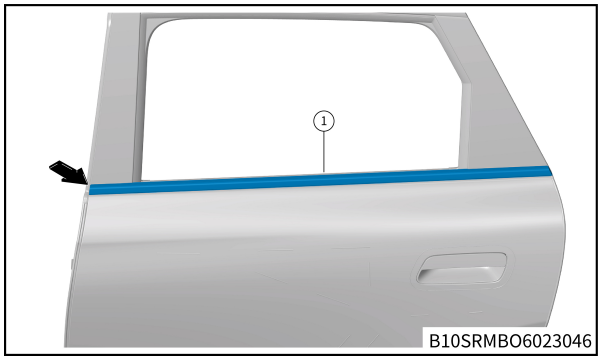
1. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
2. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
3. Remove the left rear door rear guide rail assembly.

a. Raise the left rear door glass assembly to the highest position.
b. Unscrew the 2 fixing bolts -arrow- connecting the left rear door rear guide rail assembly to the left rear door assembly, and remove the left rear door rear guide rail assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Confirm that the rear door glass assembly raises and lowers smoothly without any sticking, abnormal noises, or other issues.

© 2026, All rights reserved



LEFT REAR DOOR OUTER BELT WEATHERSTRIP

NOTE

This section describes the removal and installation of the left rear door outer belt molding. The removal and installation of the right rear door outer belt molding can generally be performed by referring to the left side.

REMOVAL PROCEDURE

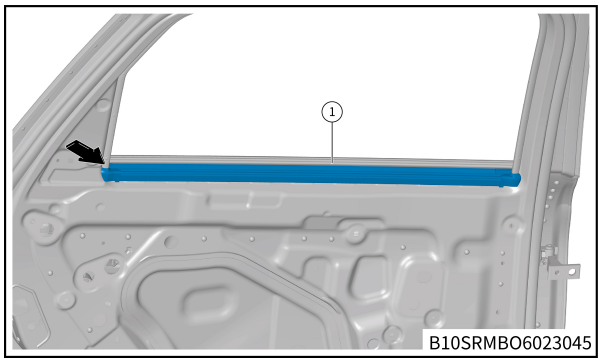
1. Open the rear left door assembly.
2. Lower the left rear door glass assembly to the lowest position.
3. Remove the outer belt weatherstrip of the left rear door.

a. Pry up one end of the left rear door outer belt molding -arrow-, and remove the left rear door outer belt molding ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: For the assembly of the rear door outer belt weatherstrip, using the U-shaped locating notch on the B-pillar outer panel as the locating reference, first align the embedded limit block at the end of the outer belt weatherstrip with the locating notch on the B-pillar sheet metal and install it.
   b. Step 2: After aligning with the B-pillar panel, sequentially snap the outer belt weatherstrip into the door panel flange towards the rear (rearward for the rear door). Ensure that the outer belt weatherstrip is securely engaged with the inner locking structure of the door panel, and that the small lower lip on the outer side of the outer belt weatherstrip fits snugly against the door panel.
   c. Post-assembly inspection: The outer surfaces and flocked surfaces of the parts must not be soiled, and there shall be no part deformation, scratches, or other cosmetic defects.
   d. Confirm that the outer belt weatherstrip is properly clipped into the door sheet metal flange, fully engaged in the Z-direction, and installed securely and reliably without any looseness.
   e. Ensure that after the outer belt weatherstrip is assembled, the rear door B-pillar end aligns with the door sheet metal, without any step difference, poor fitment, or other issues.
   f. Ensure that both ends of the outer belt weatherstrip fit properly in the mating area with the exterior trim panel, without causing gaps, interference, deformation, or other issues.
   g. The lip of the exterior beltline weatherstrip mates with the glass without causing gaps, edge curling, or other issues.
   h. The small lip at the bottom of the outer belt weatherstrip fits closely against the door sheet metal, preventing any gaps or scratches to the sheet metal paint surface.

© 2026, All rights reserved



LEFT REAR DOOR INNER BELT WEATHERSTRIP

NOTE

This section describes the removal and installation of the inner belt weatherstrip for the left rear door, and the removal and installation of the inner belt weatherstrip for the right rear door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Lower the rear door glass assembly to the lowest position.
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the inner belt weatherstrip of the left rear door.

a. Pry up one end of the left rear door inner belt weatherstrip - arrow -, and remove the left rear door inner belt weatherstrip ①.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: Install the rear door inner belt weatherstrip using the window frame at the B-pillar end of the rear door as the positioning reference. Align the corner joint at the B-pillar end of the inner belt weatherstrip with the B-pillar end for a zero-gap fit to achieve X-direction positioning of the inner belt weatherstrip.
   b. Step 2: After aligning the positioning points at the end, press the inner belt weatherstrip of the rear door vertically downward by hand from the positioning end towards the other end (along the arrow direction), until the inner belt weatherstrip is fully clipped into place and completely flush with the sheet metal stop in the Z-direction.
   c. Ensure that the corner joints at both ends of the inner belt weatherstrip fit properly with the vertical sections of the window frames on both sides, without causing gaps, interference, deformation, or other issues.
   d. The inner belt weatherstrip and the glass fit together without causing gaps, edge curling, or other issues.

REAR LEFT DOOR GUIDE CHANNEL SEALING STRIP

NOTE

This section describes the removal and installation of the left rear door guide channel seal. The removal and installation of the right rear door guide channel seal can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
5. Remove the left rear door rear guide rail assembly.
   See:Left Rear Door Rear Guide Rail Assembly (page 6411)
6. Remove the outer belt weatherstrip of the left rear door.
   See:Left rear door outer belt weatherstrip (page 6412)
7. Remove the inner belt weatherstrip of the left rear door.
   See:Left rear door inner belt weatherstrip (page 6413)
8. Remove the rear left door glass assembly.
   See:Rear left door glass assembly (page 6377)
9. Remove the B-pillar left rear outer trim panel assembly.
   See:Rear Left B-Pillar Outer Trim Panel Assembly (page 5309)
10. Remove the left outer trim panel assembly of the C-pillar.
    See:Left C-pillar outer trim panel assembly (page 5310)
11. Remove the rear left door guide channel sealing strip.

a. Remove the left rear door guide channel seal ①.
   Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Step 1: Assemble the rear door guide channel starting from the B-pillar end. The B-pillar corner joint contains a hard insert, and the locating pins on the insert correspond to the locating slots on the door sheet metal. During assembly, ensure that the locating pins are fully engaged in the locating slots on the door sheet metal to restrict movement in the X direction.

© 2026, All rights reserved

b. Step 2: After the B-pillar corner joint is assembled, sequentially snap the U-shaped clip slots of the guide channel completely into the door sheet metal rabbet from front to rear (before all the top trim clip slots are fully snapped in, first snap the C-pillar corner joint into the sheet metal to avoid scratching the C-pillar corner joint); ensure the guide channel is properly assembled in the Y-direction and seated against the sheet metal rabbet. After assembly, ensure that the inner lip mates with the sheet metal without edge curling.
c. Step 3: After the upper window frame section, the rear door B-pillar outer trim panel, and the rear door front guide rail are assembled, sequentially snap the front vertical section guide channel into the rear door B-pillar outer trim panel and the rear door front guide rail, ensuring that the outer lip of the guide channel fits snugly against the trim panel in the Y direction and does not protrude beyond the edge of the trim panel.
d. Step 4: First, snap the lower corner joint of the B-pillar seam strip onto the door sheet metal (before snapping, pre-install the upper end of the B-pillar seam strip onto the B-pillar outer trim panel to ensure that the lower corner joint of the B-pillar seam strip fits flush with the rear door B-pillar outer trim panel in the Z-direction), then snap the B-pillar seam strip into the clip groove of the B-pillar trim panel from bottom to top; snap it fully into place in the X-direction, ensuring that the outer surface of the seam strip does not protrude beyond the edge of the trim panel.
e. Step 5: After the rear door C-pillar outer trim panel is assembled, sequentially snap the guide groove of the rear vertical section into the rear door C-pillar outer trim panel, ensuring that the outer lip of the guide groove fits well with the trim panel in the Y-direction without protruding beyond the edge of the trim panel, and simultaneously ensuring that the corner joint of the middle section of the C-pillar is securely engaged with the trim panel (during assembly, push the vertical section of the C-pillar upwards in the Z-direction, and then use a scraper to assist in assembly).
f. Step 6: Finally, fold out the inner lip of the rear door guide channel to wrap the sheet metal flange, ensuring the wrapping lip properly covers the sheet metal flange all around. Fold out the wrapping lip in one direction to prevent deformation.
g. After installation, check and confirm that it is fully and properly installed in place, and ensure there are no wrinkles on the guide channel weatherstrip.
h. Confirm that the rear door glass assembly raises and lowers smoothly without any sticking, abnormal noises, or other issues.

8.6 POWER WINDOW SYSTEM

8.6.1 PRECAUTIONS

PRECAUTIONS

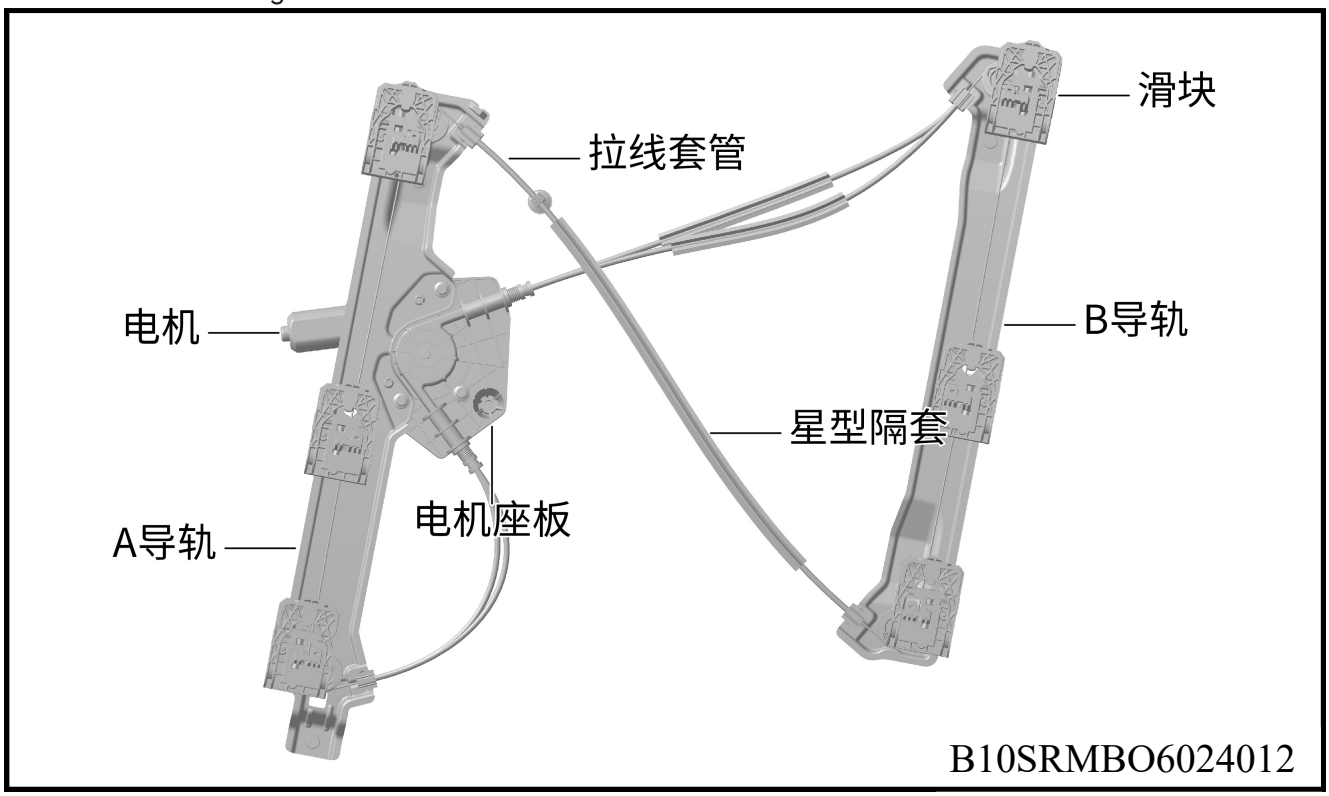
1. If the power window encounters an unexpected obstruction during use, promptly disconnect the battery power to prevent damage to the window regulator motor.
2. When disconnecting the connector, do not pull on the wiring harness to prevent damage to the harness.
3. When installing or removing the window regulator, please wear long-sleeved workwear and protective gloves to avoid being cut by sheet metal parts.
4. After assembly is completed, perform a power-on test on the window regulator, raise and lower the window glass for two cycles, and confirm that the glass operates smoothly without sticking, abnormal noises, or other abnormalities.

© 2026, All rights reserved

8.6.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

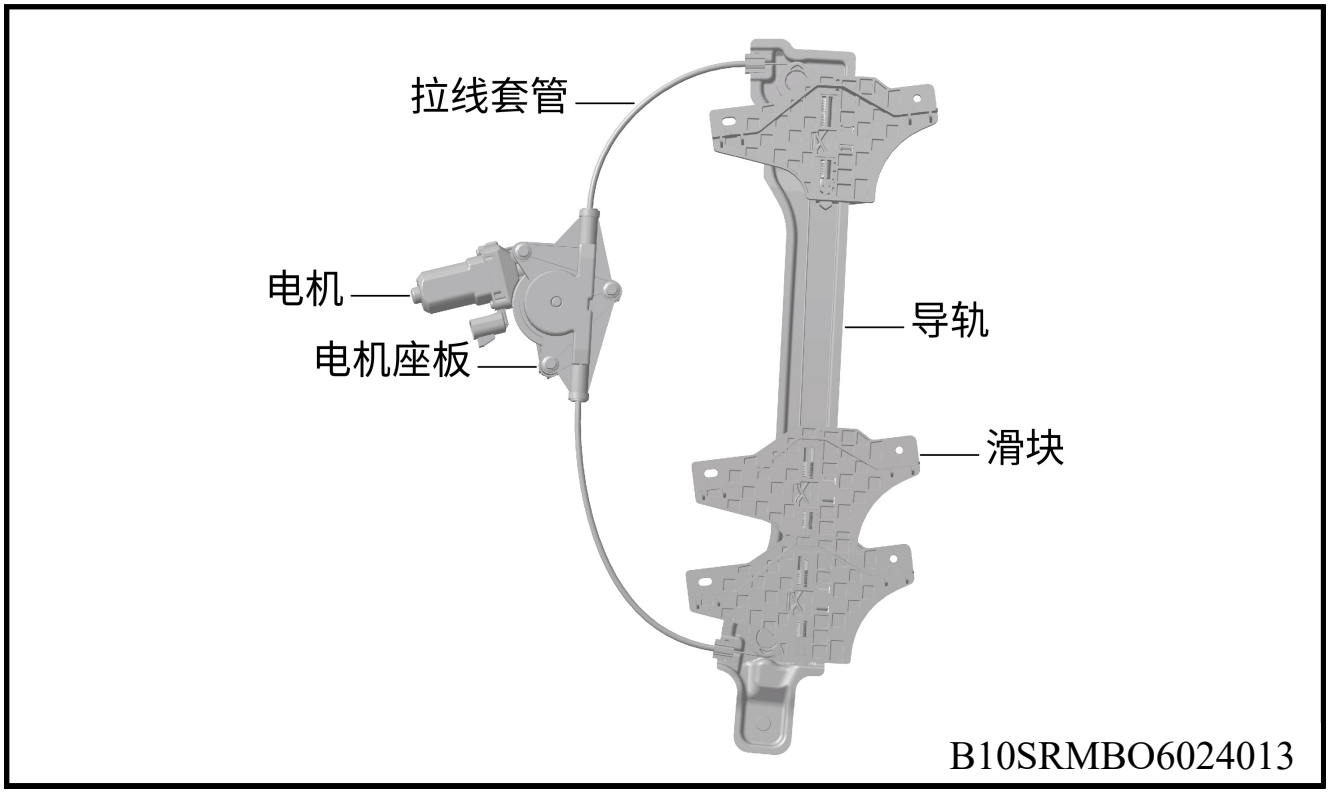
System Overview



All four doors of this vehicle are equipped with a power window system that, in conjunction with the main zone controller, enables one-touch up/down, anti-pinch, soft stop, and speed control functions.

- The driver's window switch can be used to control the raising and lowering of any door window.
- The power window switch on each door can control the raising and lowering of the window on that door.
- You can raise or lower any door window via the central display screen.

System Composition



The window regulator assembly consists of the motor mounting plate, motor, A guide rail, B guide rail, cable sheath, slider, star spacer, etc.

- Front door window regulator:

- Rear door window regulator:

© 2026, All rights reserved

Introduction to Main Features

- Window up/down:
  a. The power window switch controls the manual/automatic raising and lowering of the window via the main zone controller.
  b. The driver controls the passenger side by transmitting information via CAN signals.
- Soft Stop:
  After window learning, the window features a soft stop function at the upper and lower ends.
  a. Front door position range: Within 3 mm upward from the outer belt weatherstrip.
  b. Rear door position range: Within (6 mm) upward from the lower limit.

> **ATTENTION**
>
> ◦ If the window anti-pinch function is suppressed or the learning status is lost, the downward soft stop function will not be available. When the window is at the lower soft stop position, the user can also manually re-learn the mechanical lower limit position through the down switch.

- Anti-pinch function:
  If an object is detected and the anti-pinch function is triggered during the automatic raising of the window in the anti-pinch zone, the window will lower by at least 150 mm or to the soft stop position.

> **ATTENTION**
>
> ◦ After the initialization is lost, the window can be manually raised using the switch, after which re-initialization is required to restore the automatic raising function.

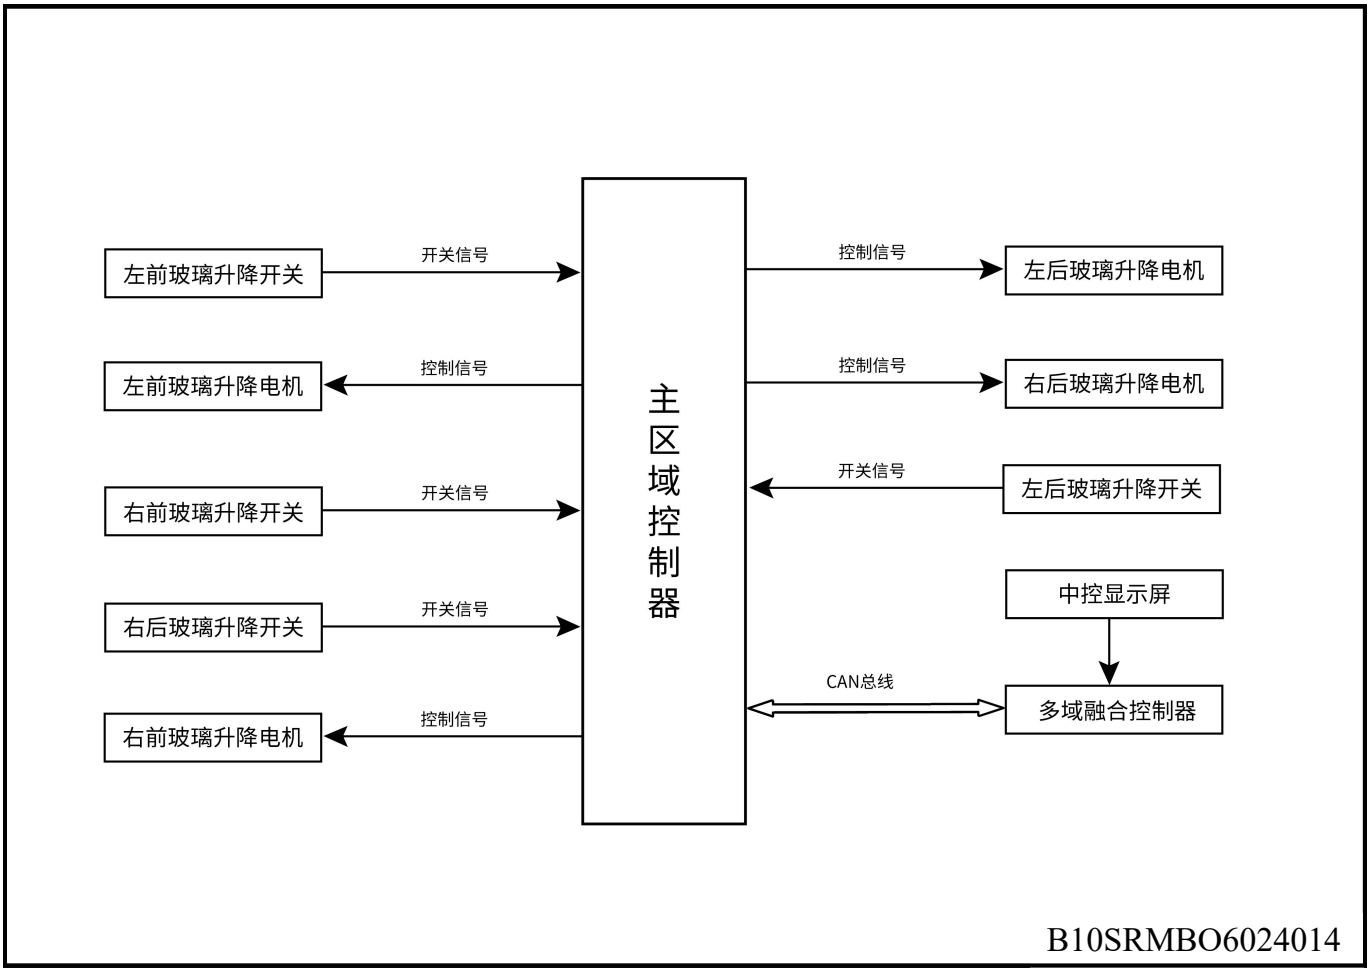
- Thermal protection:

© 2026, All rights reserved

To prevent the power window system from becoming inoperative due to motor overheating, the main zone controller software features a thermal protection function.
After the motor enters thermal protection, it takes up to 2 minutes to move at least once again.
When in thermal protection mode, the system is not allowed to enter sleep mode.
Only the following actions are allowed:

a. Before the thermal protection function is activated, the current window raising/lowering operation shall be allowed to complete.
b. Once the thermal protection function is activated, new window-up commands will not be accepted.
c. After the thermal protection function is activated, new window lowering commands are permitted.

Window initialization lost



- In the following situations, the main zone controller will lose the anti-pinch function and require reinitialization.
  a. Power loss during motor operation.
  b. Cannot be raised automatically and has no anti-pinch function.
  c. No soft stop function.
  d. Can only be raised and lowered manually.

Initialization Method

- Prerequisites: Battery voltage (9~16V)
- Steps:
  a. Close the door requiring initialization.
  b. Use the switch to manually lower the window to the mechanical hard stop, then raise it to the mechanical hard stop.
  c. Run the window to the hard stop and hold for more than 1s. Release the switch after the main zone controller stops the motor.

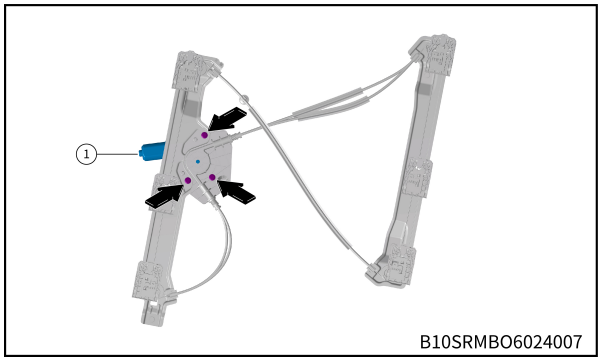
8.6.7 SERVICE AND REPAIR GUIDANCE



FRONT LEFT DOOR WINDOW REGULATOR MOTOR ASSEMBLY

NOTE

This section describes the removal and installation of the left front door window regulator motor assembly, and the removal and installation of the right front door window regulator motor assembly can generally follow the same procedure as the left side.

REMOVAL PROCEDURE

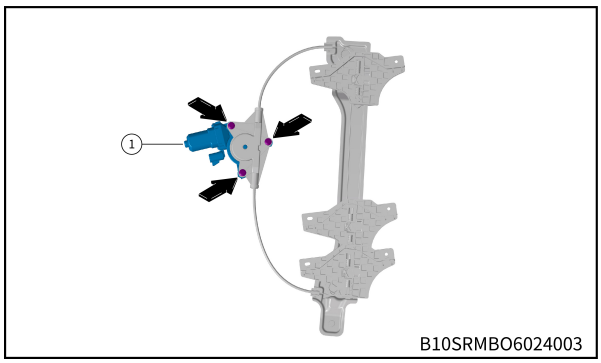
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
3. Remove the front left door window regulator motor assembly.

a. Unscrew the 3 fixing bolts -arrow- connecting the left front door window regulator motor assembly to the left front door window regulator mechanism assembly, and remove the left front door window regulator motor assembly ①.
Recommended tool: 8mm socket
Torque: 4±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is completed, perform initialization learning for the window regulator.
      - Close the door.
      - Manually lower the window to the lowest point.
      - Manually raise the window to the top stop and hold for more than 3s. After the motor stops, release the button.
      - Manually lower the window to the fully down position to complete the window initialization.

© 2026, All rights reserved



LEFT REAR DOOR WINDOW REGULATOR MOTOR ASSEMBLY

NOTE

This section describes the removal and installation of the window regulator motor assembly for the left rear door. The removal and installation of the window regulator motor assembly for the right rear door can generally refer to the left side.

REMOVAL PROCEDURE

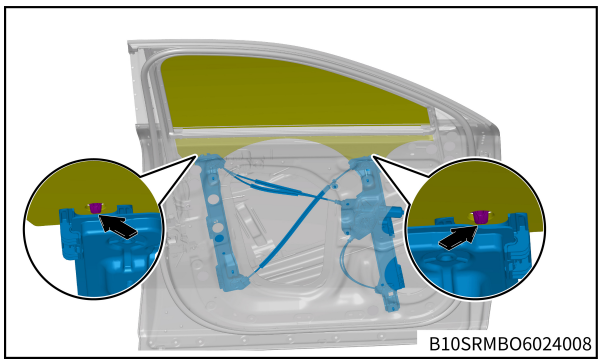
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left power window regulator assembly.
   See:Left rear door power window regulator assembly (page 6430)
3. Remove the left rear door window regulator motor assembly.

a. Unscrew the 3 mounting bolts -arrow- connecting the left rear door window regulator motor assembly to the left rear door window regulator mechanism assembly, and remove the left rear door window regulator motor assembly ①.
Recommended tool: 8mm socket
Torque: 4±0.5N m

SETUP

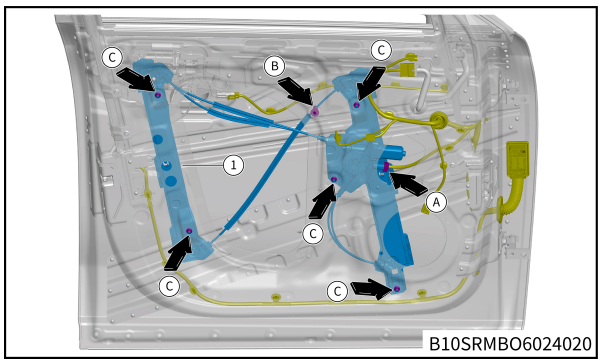
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is completed, perform initialization learning for the window regulator.
      - Close the door.
      - Manually lower the window to the lowest point.
      - Manually raise the window to the top stop and hold for more than 3s. After the motor stops, release the button.
      - Manually lower the window to the fully down position to complete the window initialization.

© 2026, All rights reserved



LEFT FRONT DOOR POWER WINDOW REGULATOR ASSEMBLY

NOTE



This section describes the removal and installation of the front left power window regulator assembly. The removal and installation of the front right power window regulator assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
5. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
6. Remove the front left power window regulator assembly.

a. Unscrew and remove the 2 retaining clips on both sides connecting the left front door glass assembly to the left front door power window regulator assembly - arrow -, and secure the left front door glass assembly with tape or other tools to prevent it from falling.

b. Disconnect 1 connector -arrow A- between the front left power window regulator assembly and the front left door wiring harness assembly.
c. Detach the 1 fixing clip connecting the front left power window regulator assembly to the front left door assembly - Arrow B -.
   Recommended tool: Clip remover
d. Unscrew the 5 fixing nuts connecting the front left door power window regulator assembly to the front left door assembly - arrow C -.
   Recommended tool: 10mm socket
   Torque: 9±1N m
e. Remove the front left power window regulator assembly ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is completed, perform initialization learning for the window regulator.
      - Close the door.
      - Manually lower the window to the lowest point.
      - Manually raise the window to the top stop and hold for more than 3s. After the motor stops, release the button.
      - Manually lower the window to the fully down position to complete the window initialization.

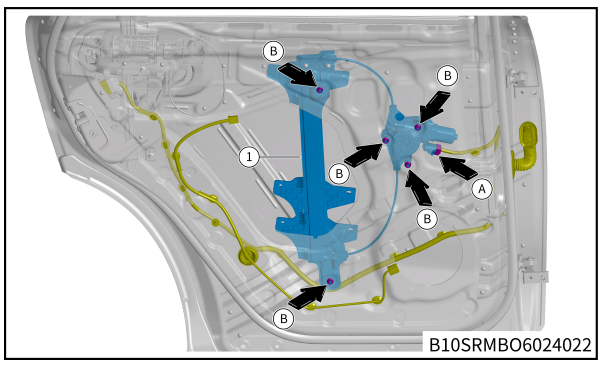
LEFT REAR DOOR POWER WINDOW REGULATOR ASSEMBLY

NOTE



This section describes the removal and installation of the power window regulator assembly for the left rear door, and the removal and installation of the power window regulator assembly for the right rear door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
5. Remove the rear left power window regulator assembly.

a. Unscrew the 2 retaining bolts -arrow- connecting the left rear door glass assembly ① to the left rear door power window regulator assembly, and use tape or other tools to secure the left rear door glass assembly ① to prevent it from falling.
Recommended tool: 8mm socket
Torque: 9±1N m

b. Disconnect the 1 connector between the left rear door power window regulator assembly and the left rear door wiring harness assembly - arrow A -.
c. Unscrew the 5 fixing nuts connecting the left rear door power window regulator assembly to the left rear door assembly - Arrow B -.
Recommended tool: 10mm socket
Torque: 9±1N m
d. Remove the left rear door power window regulator assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is completed, perform initialization learning for the window regulator.
      - Close the door.
      - Manually lower the window to the lowest point.
      - Manually raise the window to the top stop and hold for more than 3s. After the motor stops, release the button.

© 2026, All rights reserved

- Manually lower the window to the fully down position to complete the window initialization.

8.7 LOCKING SYSTEM

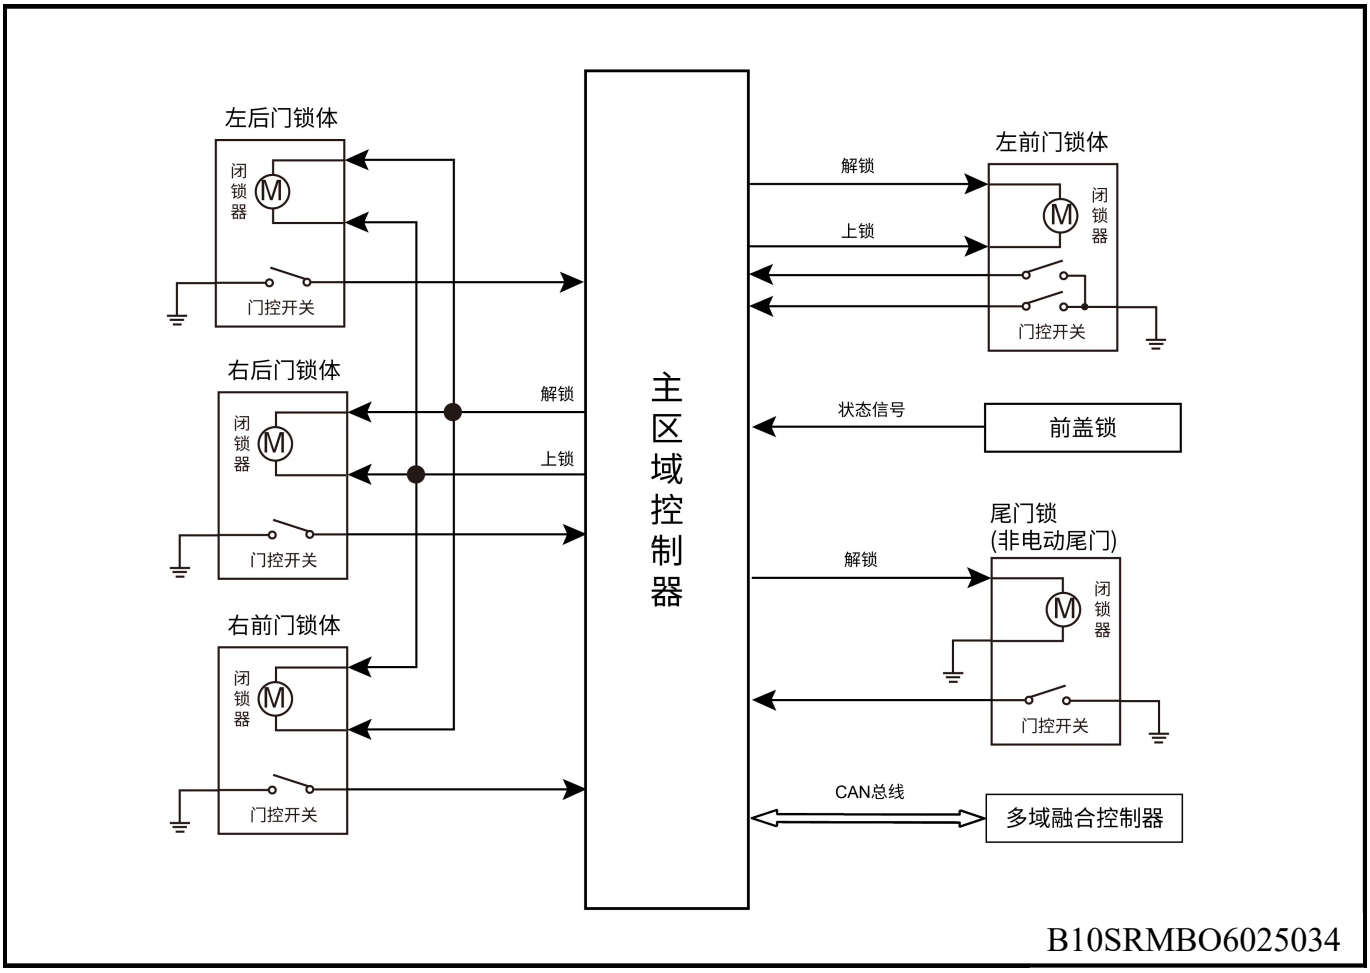
8.7.1 PRECAUTIONS

PRECAUTIONS

1. When repairing the door lock, wear long-sleeved work clothes and protective gloves to avoid being cut by sheet metal parts.
2. After servicing the door lock, ensure that the door lock is in the open position before closing the door; otherwise, the door lock will be damaged.
3. When disconnecting the connector, do not pull the wiring harness forcefully to prevent damage to the wiring harness.

© 2026, All rights reserved

8.7.2 STRUCTURE AND PRINCIPLE INTRODUCTION



STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

1. The Main Zone Controller is the main control unit for the various functions of the door lock system, responsible for controlling door locking and unlocking, opening or closing the trunk lock, child lock control, and the charging port cover open/close control function.
2. The four door lock motors directly receive the operation trigger signals from the main zone controller via hardwiring to perform door locking, unlocking, and automatic locking while driving. The trunk lock motor is also connected to the tailgate controller via hardwiring, responsible for executing the opening and closing actions of the trunk lock.
3. The door lock system of this vehicle model incorporates an intelligent mobile phone Bluetooth control function based on traditional mechanical control and remote key control.
4. The central locking system consists of the main zone controller, remote key, mechanical key, four door locks, trunk lock, hood lock, slow charging plug lock, and CAN communication network.
5. The main functions of the central locking system are as follows:
    - Remote key unlocking/locking
    - Crash Unlock
    - Automatic locking
    - Trunk Unlocking/Locking
    - Unlocking/Locking the slow charging plug lock
    - Vehicle anti-theft alarm
    - Door ajar prompt

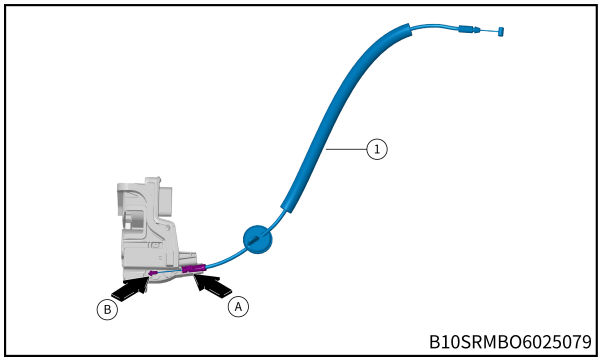
8.7.7 SERVICE AND REPAIR GUIDANCE



FRONT DOOR INNER RELEASE CABLE

NOTE

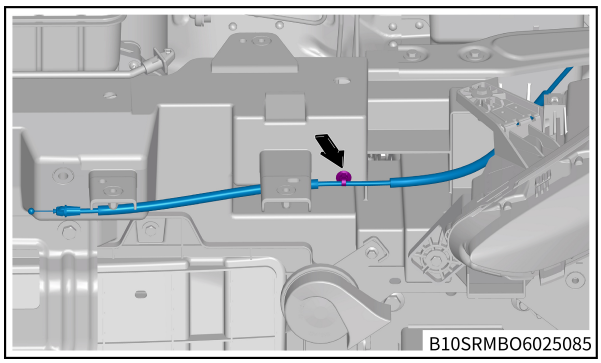
This section describes the removal and installation of the inside door handle release cable for the front left door, and the removal and installation for the front right door are generally similar to those for the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door lock body.
   See:Front left door lock body (page 6456)
3. Remove the front door inside release cable.

a. Detach the 1 retaining clip connecting the front door inside release cable to the slot of the front left door lock body - arrow A -.
Recommended tool: Interior trim removal tool
b. Disconnect the front door inside release cable from the left front door lock body -Arrow B-, and remove the front door inside release cable ①.

SETUP



1. The installation procedure is performed in reverse order.

HOOD LATCH RELEASE CABLE ASSEMBLY

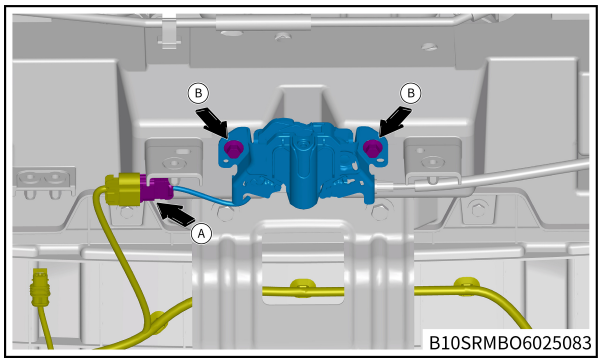
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5311)
4. Remove the front wiper motor and linkage assembly.
   See:Front wiper motor and linkage assembly (page 9492)
5. Remove the front cover lock.
   See:Hood lock (page 6443)
6. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
7. Remove the front hood release handle assembly.
   See:Hood release handle assembly (page 5440)
8. Remove the front cover lock cable assembly.

a. Release the 1 retaining clip connecting the hood lock cable assembly to the front end module assembly - arrow -.
Recommended tool: Clip remover

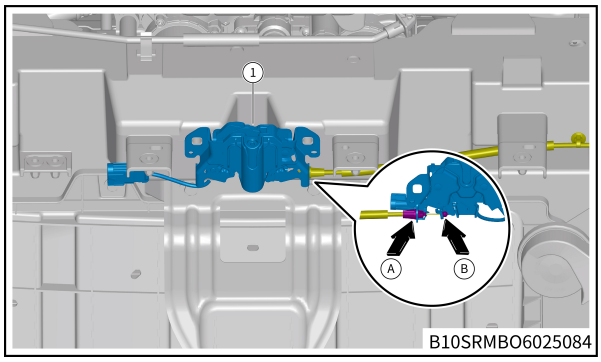
b. Detach the 4 retaining clips connecting the hood lock cable assembly to the vehicle body - Arrow A -.
Recommended tool: Clip remover
c. Detach the 1 rubber grommet connecting the hood lock cable assembly to the vehicle body - Arrow B -, and remove the hood lock cable assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check the hood release cable and route it properly, ensuring that no section is too tight or too loose.

© 2026, All rights reserved



HOOD LOCK

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the front hood assembly.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the front cover lock.

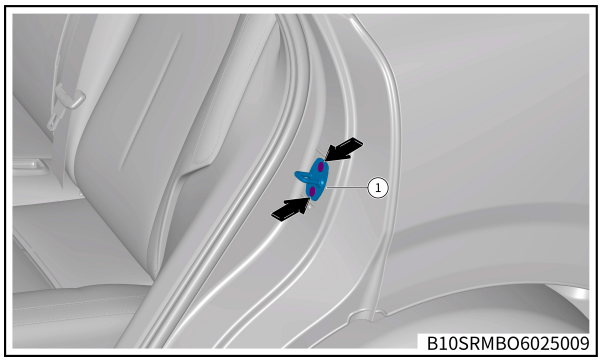
a. Disconnect the 1 connector - arrow A - between the front cover lock and the front compartment wiring harness assembly, and release the connector retaining clip.
   Recommended tool: Clip remover
b. Unscrew the 2 fixing bolts connecting the front cover lock to the front end module assembly - Arrow B -.
   Recommended tool: 10mm socket
   Torque: 23±2N m

c. Disconnect the 1 connection between the hood latch cable assembly and the hood latch slot -Arrow A-.
d. Disconnect 1 connection between the hood latch and the hood latch cable assembly -Arrow B-, and remove the hood latch ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT DOOR STRIKER (REAR)

NOTE

This section describes the removal and installation of the rear striker of the left front door, and the removal and installation of the rear striker of the right front door can generally refer to the left side.

REMOVAL PROCEDURE

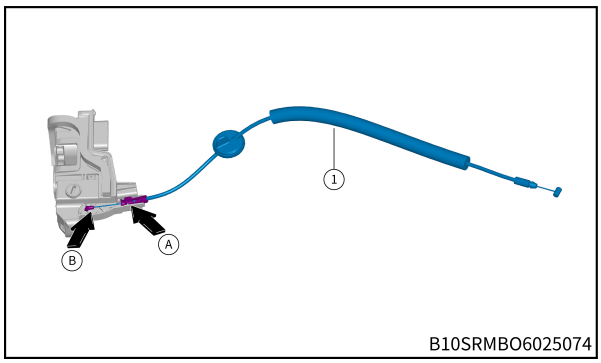
1. Open the rear left door assembly.
2. Remove the front door striker.

a. Unscrew the 2 fixing bolts -arrow- connecting the front door striker to the vehicle body, and remove the front door striker ①.
Recommended tool: T40 Torx wrench
Torque: 23±2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



REAR DOOR INSIDE RELEASE CABLE

NOTE

This section describes the removal and installation of the inside release cable for the left rear door. The removal and installation of the inside release cable for the right rear door can generally refer to the left side.

REMOVAL PROCEDURE

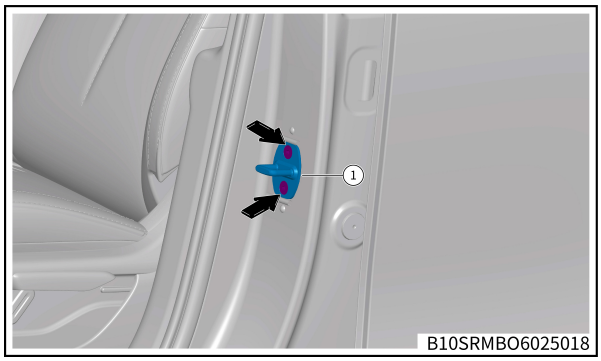
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door lock body.
   See:Left rear door lock body (page 6453)
3. Remove the rear door inside release cable.

a. Detach the 1 retaining clip connecting the rear door inside release cable to the left rear door lock body slot - arrow A -.
   Recommended tool: Interior trim removal tool
b. Disconnect the rear door inside release cable from the left rear door lock body -Arrow B-, and remove the rear door inside release cable ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT DOOR STRIKER (FRONT)

NOTE

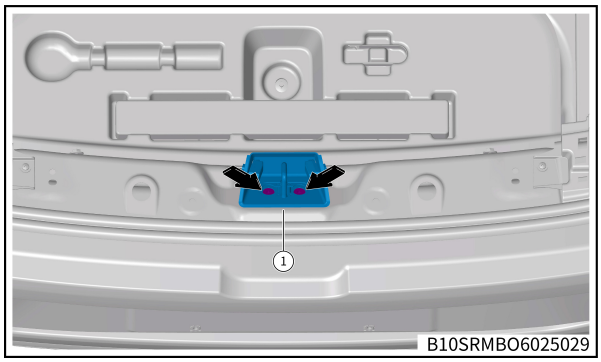
This section describes the removal and installation of the front left door latch (front). The removal and installation of the front right door latch (front) can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the front door striker.

a. Unscrew the 2 fixing bolts -arrow- connecting the front door striker to the vehicle body, and remove the front door striker ①.
Recommended tool: T40 Torx wrench
Torque: 23±2N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

TAILGATE STRIKER

REMOVAL PROCEDURE

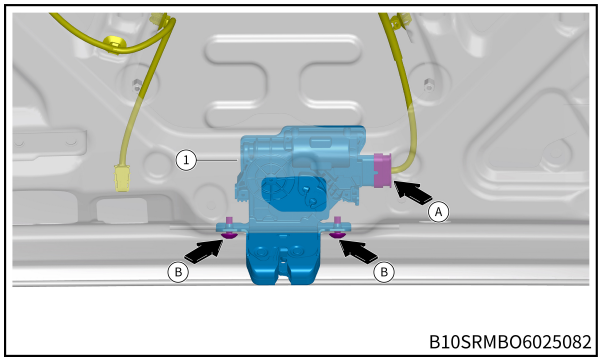
1. Open the liftgate assembly.
2. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5405)
3. Remove the liftgate striker cover.
   See:Tailgate latch cover (page 6449)
4. Remove the liftgate striker.

a. Unscrew the 2 fixing bolts -arrow- connecting the liftgate latch to the vehicle body, and remove the liftgate latch ①.
Recommended tool: T30 Torx socket wrench
Torque: 23±2N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



TAILGATE LOCK

REMOVAL PROCEDURE

NOTE

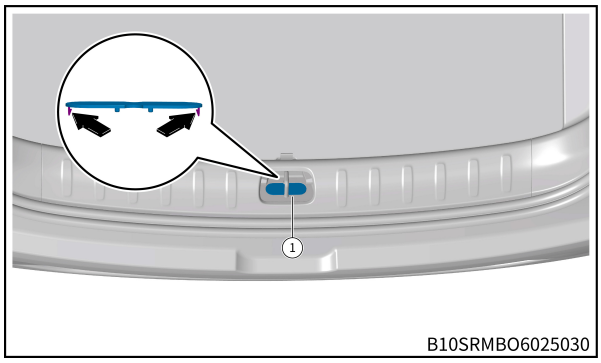
Depending on the configuration, the appearance of the tailgate lock assembly may vary slightly. Specific maintenance, disassembly, or assembly should be performed according to the actual vehicle.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5375)
6. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
7. Remove the tailgate lock trim cover.
   See:Tailgate lock trim cover (page 6455)
8. Remove the liftgate lock.

B10SRMBO6025082

a. Disconnect the 1 connector between the liftgate wiring harness assembly and the liftgate lock - Arrow A -.
b. Unscrew the 2 mounting bolts -Arrow B- connecting the tailgate lock to the tailgate assembly, and remove the tailgate lock ①.
   Recommended tool: T30 Torx socket wrench
   Torque: 8±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

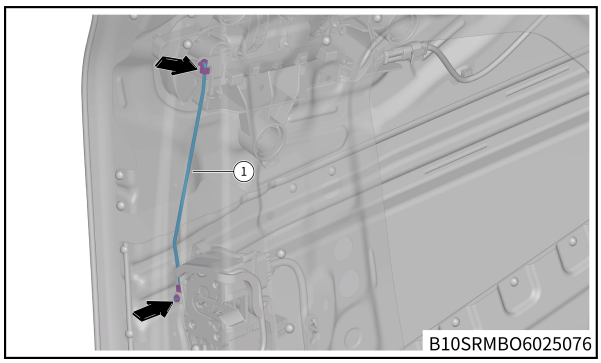
TAILGATE LATCH COVER

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the liftgate striker cover.

a. Release the 2 retaining clips -arrow- connecting the tailgate striker cover to the tailgate striker, and remove the tailgate striker cover ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LOCK CYLINDER ROD

REMOVAL PROCEDURE

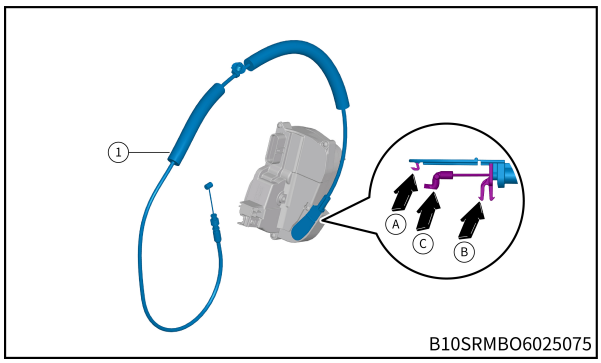
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
3. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
4. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
5. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
6. Remove the lock cylinder rod.

a. Release the 2 retaining clips - arrow - of the lock cylinder rod, and remove the lock cylinder rod ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT REAR DOOR OUTSIDE HANDLE RELEASE CABLE

NOTE

This section describes the removal and installation of the left rear door outside handle release cable, and the removal and installation of the right rear door outside handle release cable can generally refer to the left side.

REMOVAL PROCEDURE

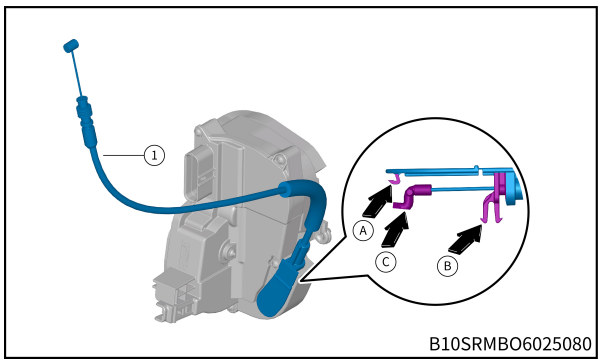
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door lock body.
   See:Left rear door lock body (page 6453)
3. Remove the exterior door handle release cable of the left rear door.

a. Pry up 1 retaining clip of the dust cover of the left rear door lock body - Arrow A -.
   Recommended tool: Interior trim removal tool
b. Disconnect the 1 retaining clip connecting the left rear door outside handle cable to the left rear door lock body slot -Arrow B-.
   Recommended tool: Interior trim removal tool
c. Disconnect the left rear door outside handle cable from the left rear door lock body -Arrow C-, and remove the left rear door outside handle cable ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT OUTSIDE HANDLE RELEASE CABLE

NOTE

This section describes the removal and installation of the outside handle cable for the left front door, and the removal and installation of the outside handle cable for the right front door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

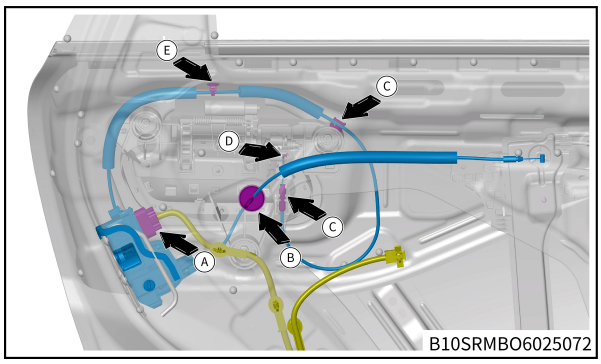
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door lock body.
   See:Front left door lock body (page 6456)
3. Remove the exterior door handle cable of the left front door.

a. Pry up 1 retaining clip connected to the dust cover of the left front door lock body - arrow A -.
   Recommended tool: Interior trim removal tool
b. Disconnect the 1 retaining clip connecting the left front door outside handle cable to the left front door lock body slot -arrow B-.
   Recommended tool: Interior trim removal tool
c. Disconnect the left front door outside handle cable from the left front door lock body -Arrow C-, and remove the left front door outside handle cable ①.

SETUP

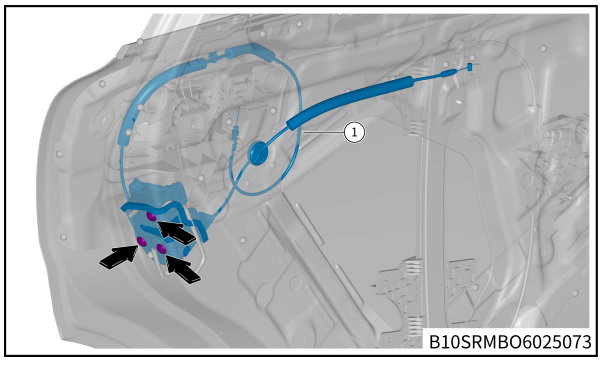
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT REAR DOOR LOCK BODY

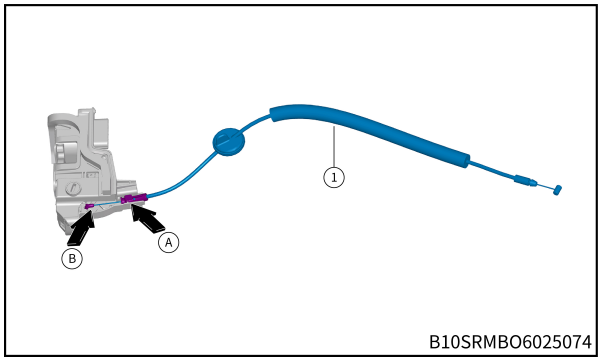
NOTE



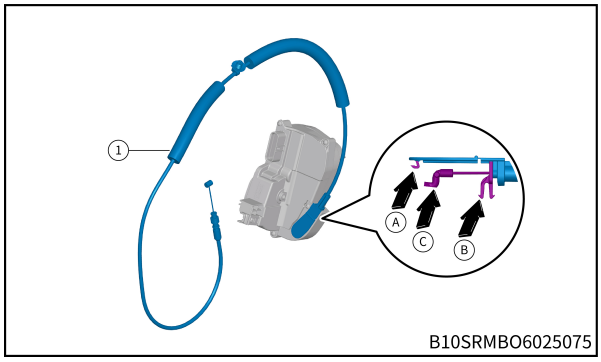
This section describes the removal and installation of the left rear door lock body, and the removal and installation of the right rear door lock body can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
5. Remove the left rear door rear guide rail assembly.
   See:Left Rear Door Rear Guide Rail Assembly (page 6411)
6. Remove the rear left door lock body.

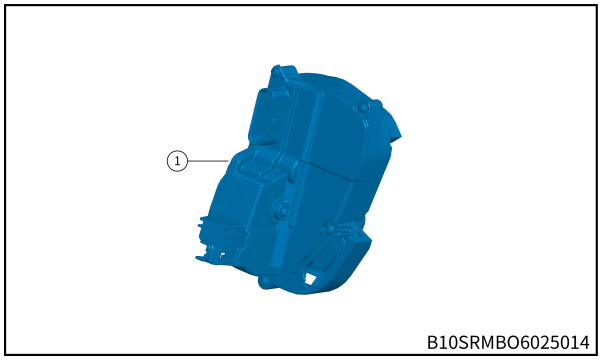


a. Disconnect 1 connector between the left rear door lock body and the left rear door wiring harness assembly - arrow A -.
b. Disconnect 1 grommet connecting the rear door inside release cable to the left rear door assembly - Arrow B -.
c. Disconnect the 2 connections between the left rear door outside handle release cable and the clip slot of the left rear door outside handle -Arrow C-.
   Recommended tool: Clip remover
d. Disconnect the left rear door outside handle from the left rear door outside release cable -Arrow D-.
e. Detach the 1 retaining clip connecting the left rear door outside handle cable to the left rear door assembly - Arrow E -.
   Recommended tool: Clip remover



f. Unscrew the 3 fixing bolts -arrow- connecting the left rear door lock body to the left rear door assembly, and remove the left rear door lock body with inner/outer cable assembly ①.
   Recommended tool: T30 Torx socket wrench
   Torque: 8±1N m

© 2026, All rights reserved



B10SRMBO6025074

g. Detach the 1 retaining clip connecting the rear door inside release cable to the left rear door lock body slot - arrow A -.
Recommended tool: Interior trim removal tool
h. Disconnect the rear door inside release cable from the left rear door lock body -Arrow B-, and remove the rear door inside release cable ①.

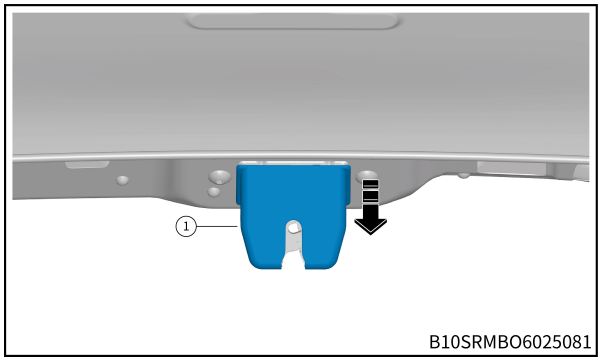
B10SRMBO6025075

i. Pry up 1 retaining clip of the dust cover of the left rear door lock body - Arrow A -.
Recommended tool: Interior trim removal tool
j. Disconnect the 1 retaining clip connecting the left rear door outside handle cable to the left rear door lock body slot -Arrow B-.
Recommended tool: Interior trim removal tool
k. Disconnect the left rear door outside handle cable from the left rear door lock body -Arrow C-, and remove the left rear door outside handle cable ①.

B10SRMBO6025014

l. Remove the left rear door lock body ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

TAILGATE LOCK TRIM COVER

REMOVAL PROCEDURE

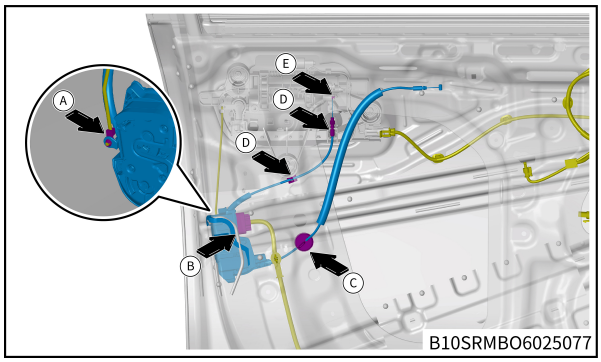
1. Open the liftgate assembly.
2. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
3. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
4. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
5. Remove the tailgate lock trim cover.

a. Remove the tailgate lock trim cover ① in the direction of the arrow.
   Recommended tool: Interior trim removal tool

SETUP

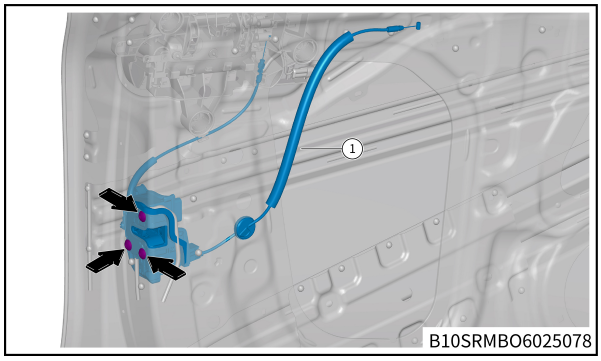
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT DOOR LOCK BODY

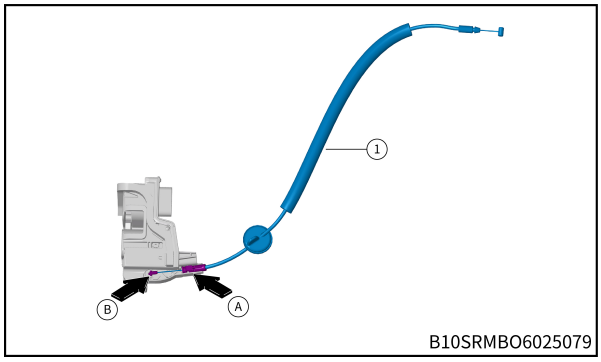
NOTE



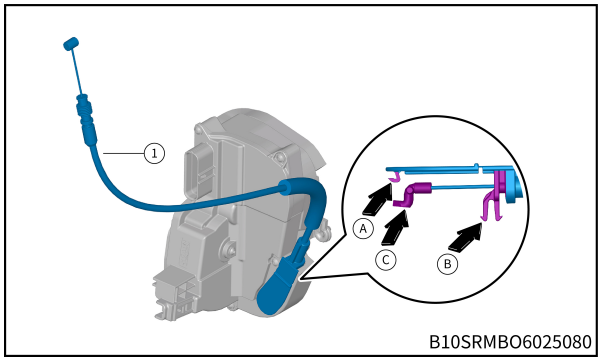
This section describes the removal and installation of the left front door lock body. The removal and installation of the right front door lock body can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
5. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
6. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
7. Remove the front left door lock body.



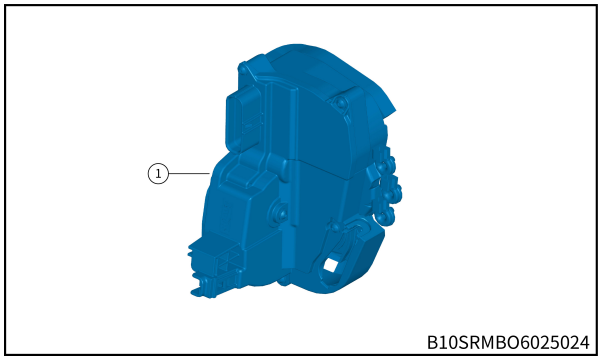
a. Disconnect the left front door lock body from the lock cylinder rod - arrow A -.
b. Disconnect 1 connector between the left front door lock body and the left front door wiring harness assembly - Arrow B -.
c. Disconnect 1 grommet connecting the front door inside release cable to the left front door assembly -Arrow C-.
d. Disconnect the 2 connections between the left front door outside handle release cable and the slot on the left front door outside handle - arrow D -.
e. Disconnect the left front door exterior handle release cable from the left front door exterior handle -Arrow E-.



f. Unscrew the 3 fixing bolts - arrow - connecting the left front door lock body to the left front door assembly, and remove the left front door lock body with inner/outer release cable assembly ①.
Recommended tool: T30 Torx socket wrench
Torque: 8±1N m

© 2026, All rights reserved

g. Detach the 1 retaining clip connecting the front door inside release cable to the slot of the front left door lock body - arrow A -.
Recommended tool: Interior trim removal tool



h. Disconnect the front door inside release cable from the left front door lock body -Arrow B-, and remove the front door inside release cable ①.

i. Pry up 1 retaining clip of the front door lock body dust cover - Arrow A -.
Recommended tool: Interior trim removal tool

j. Disconnect the 1 retaining clip connecting the left front door outside handle cable to the left front door lock body slot -arrow B-.
Recommended tool: Interior trim removal tool

k. Disconnect the left front door outside handle cable from the left front door lock body -Arrow C-, and remove the left front door outside handle cable ①.

l. Remove the front left door lock body ①.

SETUP

1. The installation procedure is performed in reverse order.

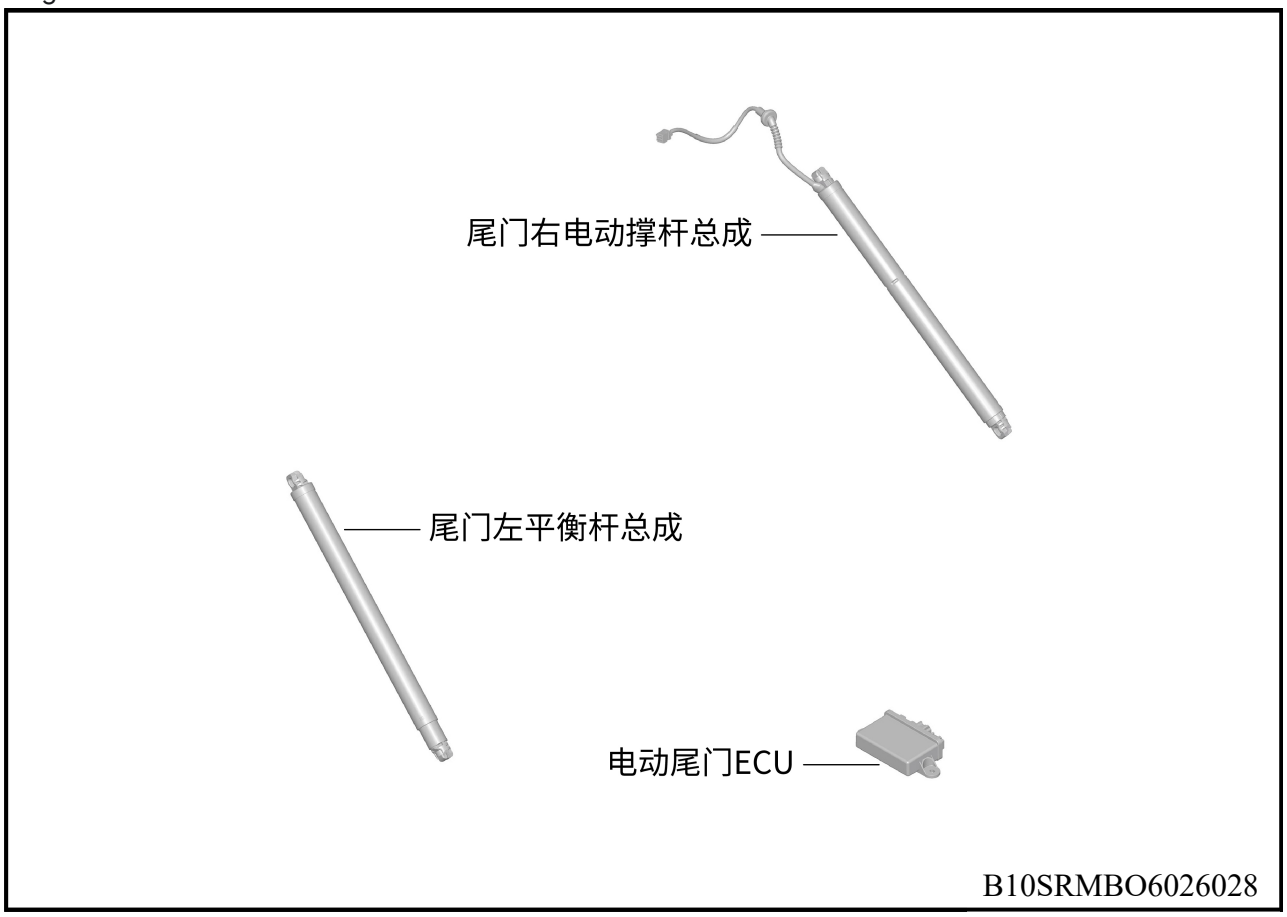
© 2026, All rights reserved

8.8 SUPPORT AND LIMITING SYSTEM

8.8.1 PRECAUTIONS

PRECAUTIONS

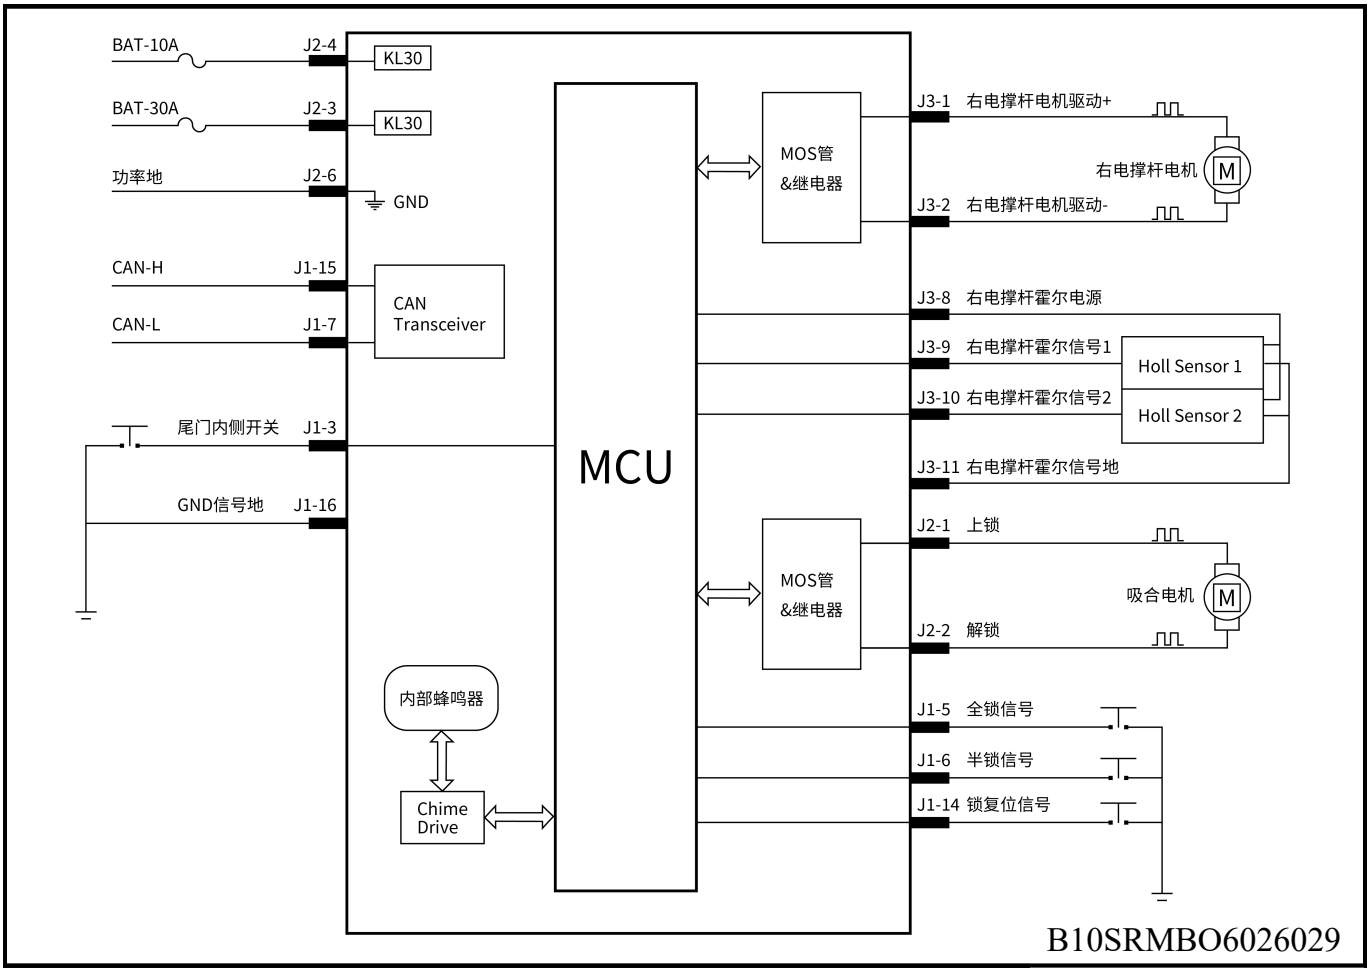
1. Before repairing or replacing parts, carefully check whether the original or replacement parts meet the technical requirements.
2. After installation, the fasteners must be checked for the specified torque.
3. When removing liftgate-related components, at least two technicians must assist in the removal and installation to prevent the liftgate assembly from falling and causing personal injury or vehicle damage.



© 2026, All rights reserved

8.8.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION



System Overview

- The power liftgate uses a single-drive electric strut.
  a. Basic functions: anti-pinch, hold, and height setting.
  b. Related components: Self-latching lock, tailgate outside switch, tailgate inside switch.
  c. Main components: Tailgate left balance rod assembly, tailgate right electric strut assembly, power tailgate ECU.

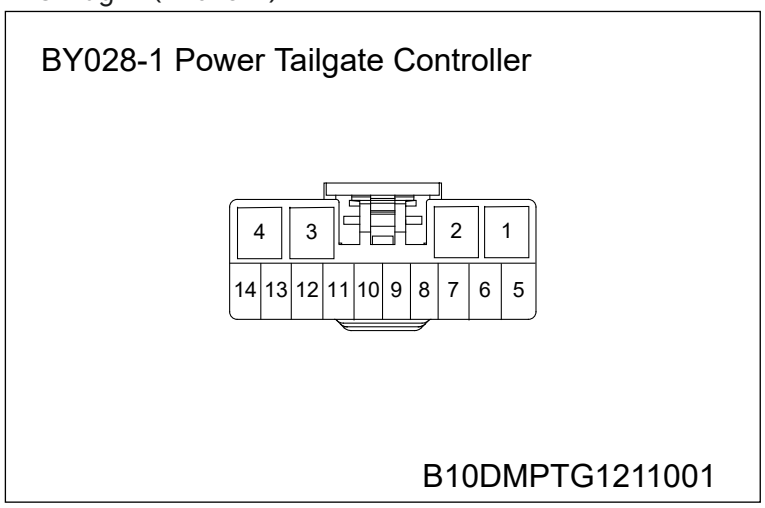
8.8.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-PTG

Using a diagnostic tool, fault codes can be read via the vehicle's OBD diagnostic connector. By utilizing the PTG data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-PTG

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

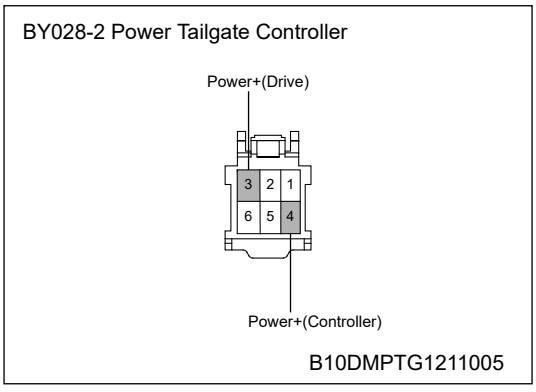
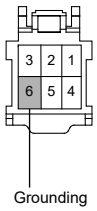
DTC: B111717-PTG

Fault code	Description
B111717	ECU supply voltage too high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the power tailgate controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the power tailgate controller fuses SD06 and DF06. Fuse specifications: SD06 25A, DF06 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the power tailgate controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-2 of the power tailgate controller. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 3 of harness connector BY 028-2 of the power tailgate controller and the body ground to check if it is normal. E Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 4 of the harness connector BY028-2 of the power tailgate control unit and the body gr ound to check whether it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	F Confirm whether the voltage meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the power tailgate controller.	
BY028-2 Power Tailgate Controller  B10DMPTG1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-2 of the power tailgate controller. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 6 of the harness c onnector BY028-2 of the power tailgate controller and the body ground is normal. Resistance standard value: Less than 1 Ω D. Confirm whether the resistance meets the standard value .
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

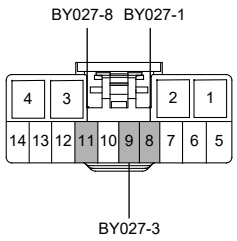
DTC: B1D8239-PTG

Fault code	Description
B1D8239	Hall Sensor A Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

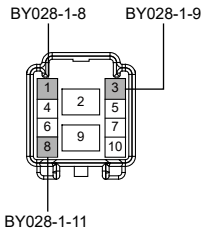
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the right power tailgate strut assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211012

BY027 Right Tailgate Electric Strut Assembly

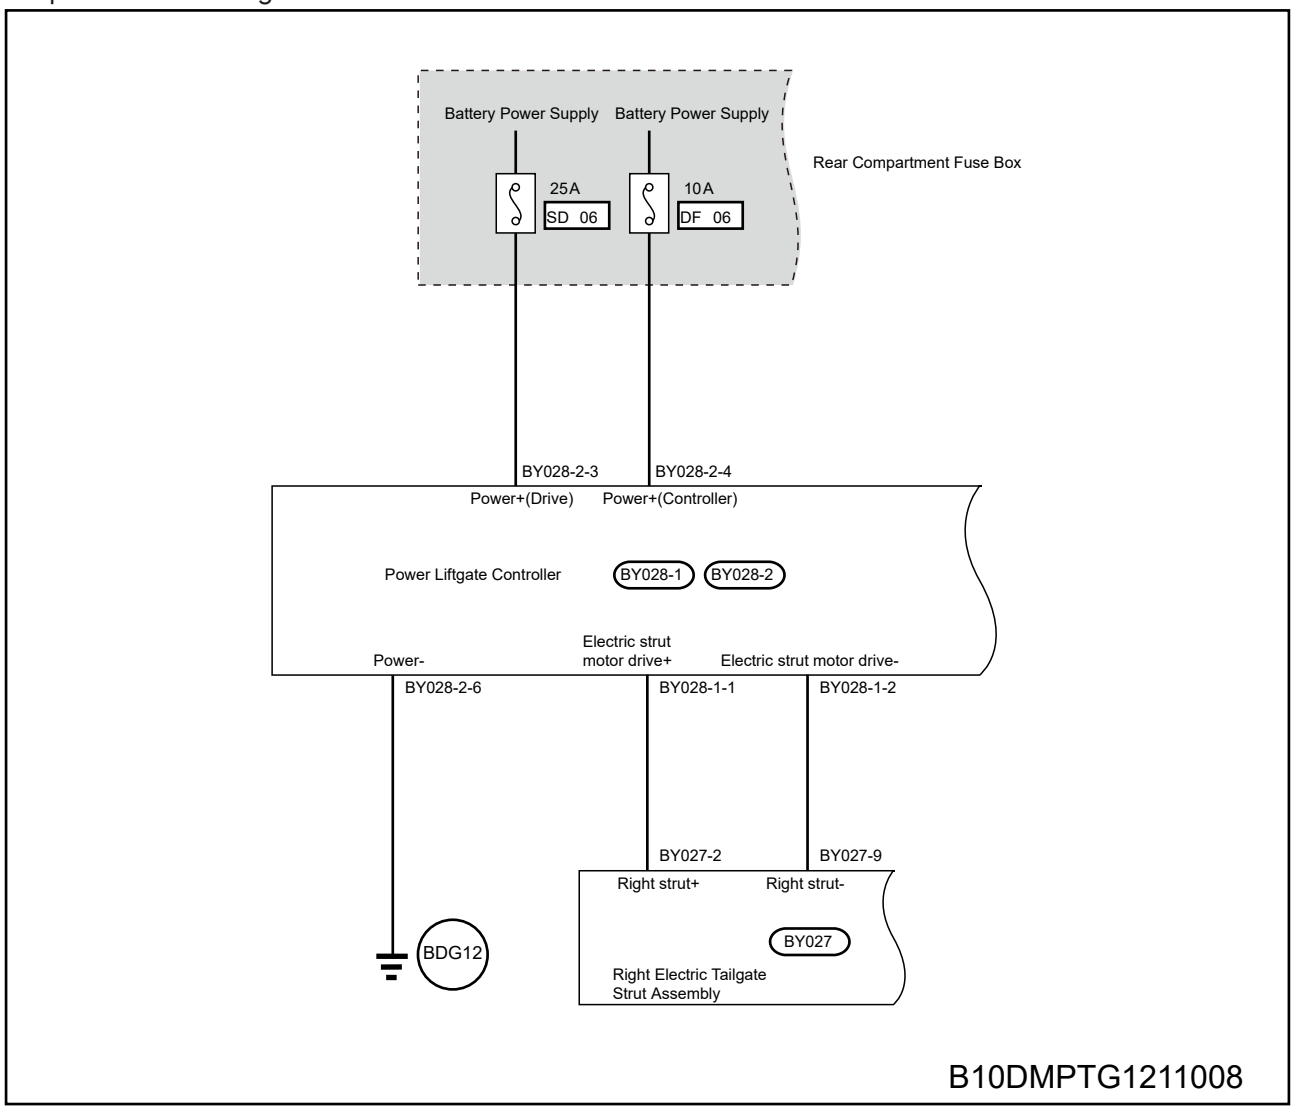
B10DMPTG1211013

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the right electric strut assembly of the tailgate.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of wire harness connector BY028-1 of the power tailgate controller and terminal 3 of wire harness connector BY027 of the right electric tailgate strut assembly to check whether it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of harness connector BY028-1 of the power tailgate controller and terminal 1 of harness connector BY027 of the right electric tailgate strut assembly to check whether it is normal.
F Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of harness connector BY028-1 for the power tailgate control module and terminal 8 of harness connector BY027 for the right power tailgate electric strut assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 8, 9, and 11 of the power tailgate controller harness connector BY028-1 and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
H Confirm whether the resistance meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 8, 9, and 11 of the power tailgate controller wire harness connector BY028-1 and the body ground is normal.
Voltage standard value: 0V
K Confirm whether the voltage meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Replace the right electric strut assembly of the tailgate.	
	A Replace the right tailgate electric strut assembly. B After replacing the right tailgate electric strut assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

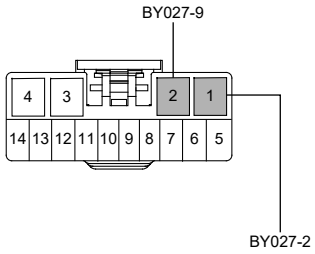
DTC: B1D8111-PTG

Fault code	Description
B1D8111	Strut motor shorted to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

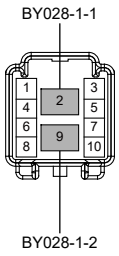
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the right power tailgate strut assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211009

BY027 Right Tailgate Electric Strut Assembly

B10DMPTG1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the right electric strut assembly of the tailgate.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of harness connector BY028-1 of the power tailgate controller and terminal 2 of harness connector BY027 of the tailgate right electric strut assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 2 of harness connector BY028-1 of the power tailgate controller and terminal 9 of harness connector BY027 of the right power tailgate strut assembly is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 1 and 2 of the power tailgate controller harness connector BY028-1 and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the right electric strut assembly of the tailgate.

A Replace the right tailgate electric strut assembly.
B After replacing the right tailgate electric strut assembly, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the power liftgate controller.

A Replace the power liftgate controller.

© 2026, All rights reserved

	B After replacing the power tailgate controller, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

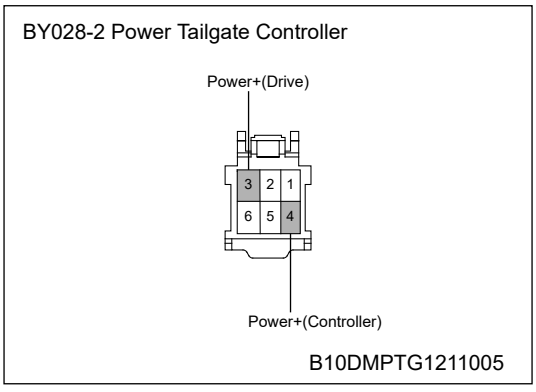
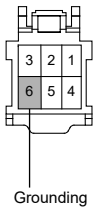
DTC: B111716-PTG

Fault code	Description
B111716	ECU supply voltage too low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the power tailgate controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the power tailgate controller fuses SD06 and DF06. Fuse specifications: SD06 25A, DF06 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply wiring harness of the power tailgate controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-2 of the power tailgate controller. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 3 of harness connector BY 028-2 of the power tailgate controller and the body ground to check if it is normal. E Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 4 of the harness connector BY028-2 of the power tailgate control unit and the body gr ound to check whether it is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	F Confirm whether the voltage meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the power tailgate controller.	
BY028-2 Power Tailgate Controller  B10DMPTG1211006	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-2 of the power tailgate controller. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 6 of the harness c onnector BY028-2 of the power tailgate controller and the body ground is normal. Resistance standard value: Less than 1 Ω D. Confirm whether the resistance meets the standard value .
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

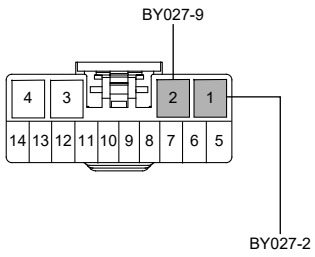
DTC: B1D8113-PTG

Fault code	Description
B1D8113	Strut motor open circuit

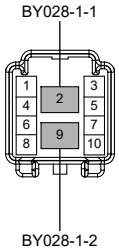
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check whether the wiring harness connecting the power tailgate controller and the right power tailg ate strut assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211009

BY027 Right Tailgate Electric Strut Assembly

B10DMPTG1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the ri ght electric strut assembly of the tailgate.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of harness connector BY028-1 of the power tailgate controller and terminal 2 of h arness connector BY027 of the tailgate right electric strut a ssembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 2 of harness conn ector BY028-1 of the power tailgate controller and terminal 9 of harness connector BY027 of the right power tailgate st rut assembly is normal.
Resistance standard value: Less than 1 Ω
F Check whether the resistance meets the standard value.

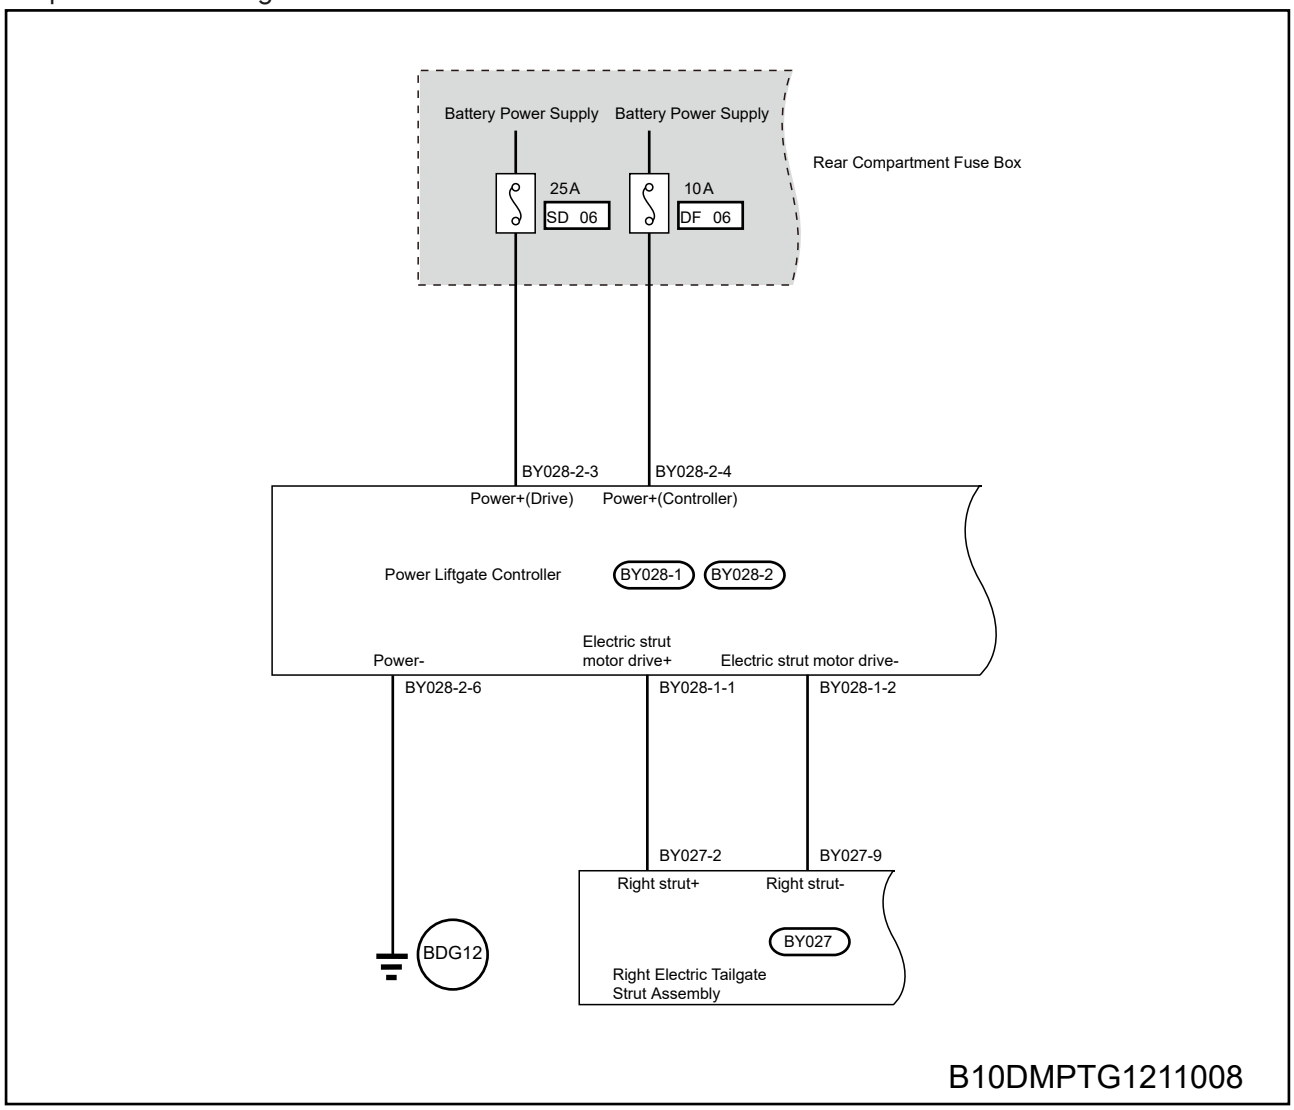
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the right electric strut assembly of the tailgate.

	A Replace the right tailgate electric strut assembly. B After replacing the right tailgate electric strut assembly, is the fault cleared?

Yes》》》 System normal.
No》》》 Go to step 4.
Step 4 Replace the power liftgate controller.

	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

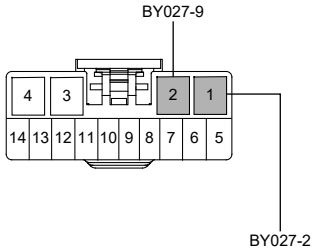
DTC: B1D8112-PTG

Fault code	Description
B1D8112	Strut motor short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

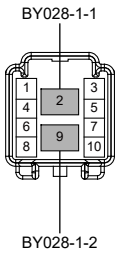
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the right power tailgate strut assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211009

BY027 Right Tailgate Electric Strut Assembly

B10DMPTG1211010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the right electric strut assembly of the tailgate.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of harness connector BY028-1 of the power tailgate controller and terminal 2 of harness connector BY027 of the tailgate right electric strut assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 2 of harness connector BY028-1 of the power tailgate controller and terminal 9 of harness connector BY027 of the right power tailgate strut assembly is normal.
Resistance standard value: Less than 1 Ω
F Check whether the resistance meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 1 and 2 of the harness connector BY028-1 of the power tailgate control module and the body ground is normal.
Voltage standard value: 0V
I Verify that the voltage meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

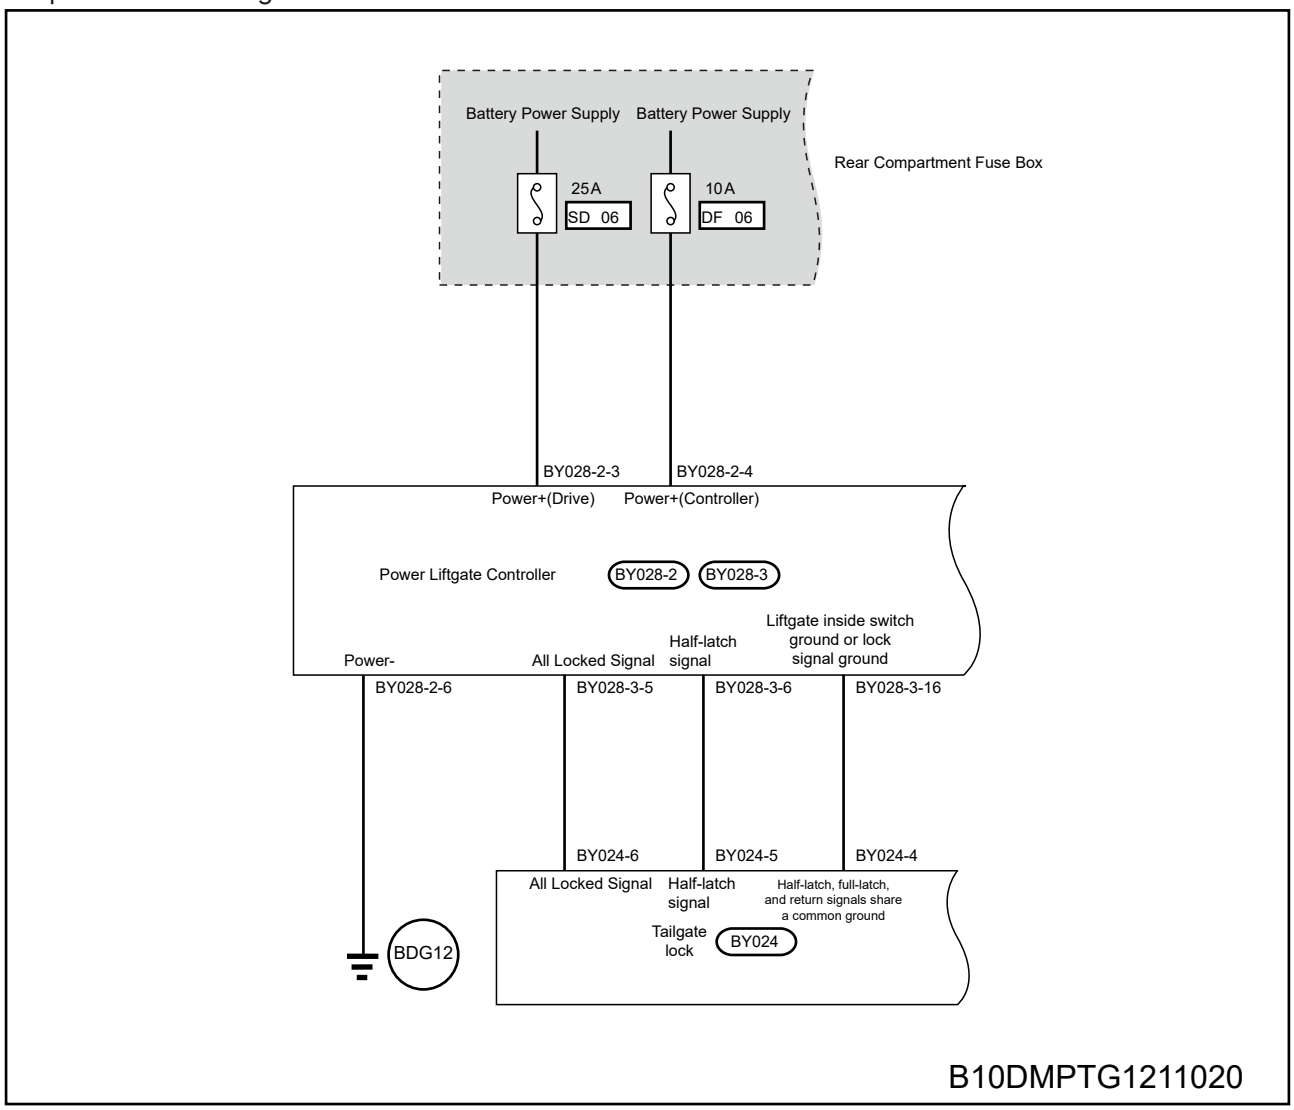
Step 3 Replace the right electric strut assembly of the tailgate.

A Replace the right tailgate electric strut assembly.
B After replacing the right tailgate electric strut assembly, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

© 2026, All rights reserved



Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

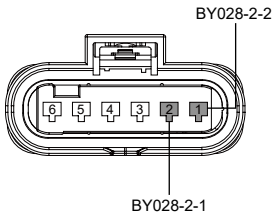
Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the power tailgate controller and the tailgate lock is normal.

BY028-2 Power Tailgate Controller

B10DMPTG1211026

BY024 Tailgate Lock

B10DMPTG1211027

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-2 of the power tailgate controller.
C Disconnect the wiring harness connector BY024 of the tailgate lock.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wire harness connector BY028-2 of the power tailgate controller and terminal 2 of the wire harness connector BY024 of the tailgate lock to check if it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of harness connector BY028-2 of the power tailgate control module and terminal 1 of harness connector BY024 of the tailgate lock is normal.
Resistance standard value: Less than 1 Ω
F Check whether the resistance meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the power tailgate controller harness connector BY028-2 and the body ground to check whether the voltage is normal.
Voltage standard value: 0V
I Verify that the voltage meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the tailgate lock.

A Replace the tailgate lock.
B After replacing the tailgate lock, is the fault resolved?

Yes》》》 System normal.

No》》》
Go to step 4.

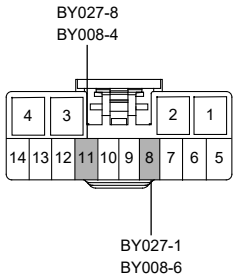
DTC: B1D8411-PTG

Fault code	Description
B1D8411	Hall sensor power supply short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

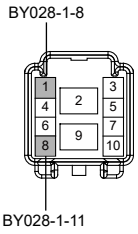
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

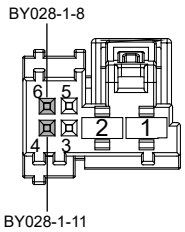
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the Hall sensor power and ground wiring harness is normal.

BY028-1 Power Tailgate Controller



B10DMPTG1211017

BY027 Right Tailgate Electric Strut Assembly

B10DMPTG1211018

BY008 Power Sunshade Assembly

B10DMPTG1211019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the ri ght electric strut assembly of the tailgate.
D Disconnect the wiring harness connector BY008 of the ele ctric sunshade assembly.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of harness connector B Y028-1 of the power tailgate controller and terminal 1 of ha rness connector BY027 of the right electric tailgate strut ass embly to check whether it is normal.
F Use a multimeter, select the resistance range, and measur e the resistance between terminal 11 of harness connector BY028-1 for the power tailgate control module and terminal 8 of harness connector BY027 for the right power tailgate el ectric strut assembly to check whether it is normal.
G Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 8 of wire harn ess connector BY028-1 of the power tailgate controller and terminal 6 of wire harness connector BY008 of the power su nshade assembly is normal.
H Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 11 of the wire harness connector BY028-1 for the power tailgate controlle r and terminal 4 of the wire harness connector BY008 for th e power sunshade assembly is normal.
Resistance standard value: Less than 1 Ω
I Use a multimeter, select the resistance range, and measure the resistance between terminals 8 and 11 of the wire harn ess connector BY028-1 of the power tailgate controller and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
J Confirm whether the resistance meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the right electric strut assembly of the tailgate or the electric sunshade assembly.

© 2026, All rights reserved

	A Replace the right electric strut assembly of the tailgate or the electric sunshade assembly. B After replacing the right electric tailgate strut assembly or the electric sunshade assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

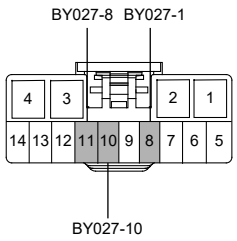
DTC: B1D8339-PTG

Fault code	Description
B1D8339	Hall Sensor B Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

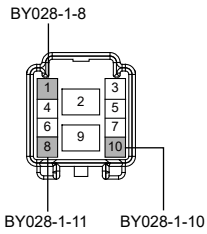
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the right power tailgate strut assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211014

BY027 Right Tailgate Electric Strut Assembly

B10DMPTG1211015

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY027 for the right electric strut assembly of the tailgate.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of the power tailgate controller harness connector BY028-1 and terminal 10 of the tailgate right electric strut assembly harness connector BY027 to check whether it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of harness connector BY028-1 of the power tailgate controller and terminal 1 of harness connector BY027 of the right electric tailgate strut assembly to check whether it is normal.
F Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of harness connector BY028-1 for the power tailgate control module and terminal 8 of harness connector BY027 for the right power tailgate electric strut assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 8, 10, and 11 of the power tailgate controller harness connector BY028-1 and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
H Confirm whether the resistance meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J. Use a multimeter, select the DC voltage range, and measure the voltage between terminals 8, 10, and 11 of harness connector BY028-1 for the power tailgate control module and the body ground to check if it is normal.
Voltage standard value: 0V
K Confirm whether the voltage meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

	Yes》》》 Go to step 2.
Step 2 Check whether the wiring harness between the power tailgate controller and the tailgate lock is normal.	
BY028-2 Power Tailgate Controller  B10DMPTG1211026 BY024 Tailgate Lock  B10DMPTG1211027	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-2 of the power tailgate controller. C Disconnect the wiring harness connector BY024 of the tail gate lock. D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wire harness connector BY028-2 of the power tailgate controller and terminal 2 of the wire harness connector BY024 of the tailgate lock to check if it is normal. E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of harness connector BY028-2 of the power tailgate control module and terminal 1 of harness connector BY024 of the tailgate lock is normal. Resistance standard value: Less than 1 Ω F. Use a multimeter, set it to the resistance range, and measure whether the resistance between terminals 1 and 2 of the power tailgate control module harness connector BY028-2 and body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the tailgate lock.	
	A Replace the tailgate lock. B After replacing the tailgate lock, is the fault resolved?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller.

© 2026, All rights reserved

	B After replacing the power tailgate controller, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

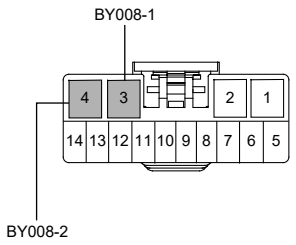
DTC: B1D9013-PTG

Fault code	Description
B1D9013	Sunshade motor open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

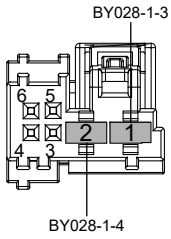
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the electric sunshade assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211029

BY008 Power Sunshade Assembly

B10DMPTG1211030

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY008 of the electric sunshade assembly.
D Use a multimeter, select the resistance range, and check if the resistance between terminal 3 of harness connector BY028-1 of the power tailgate control module and terminal 1 of harness connector BY008 of the power sunshade assembly is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 of harness connector BY028-1 of the power tailgate controller and terminal 2 of harness connector BY008 of the power sunshade assembly is normal.
Resistance standard value: Less than 1 Ω
F Check whether the resistance meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the electric sunshade assembly.

A Replace the power sunshade assembly.
B After replacing the electric sunshade assembly, is the fault cleared?

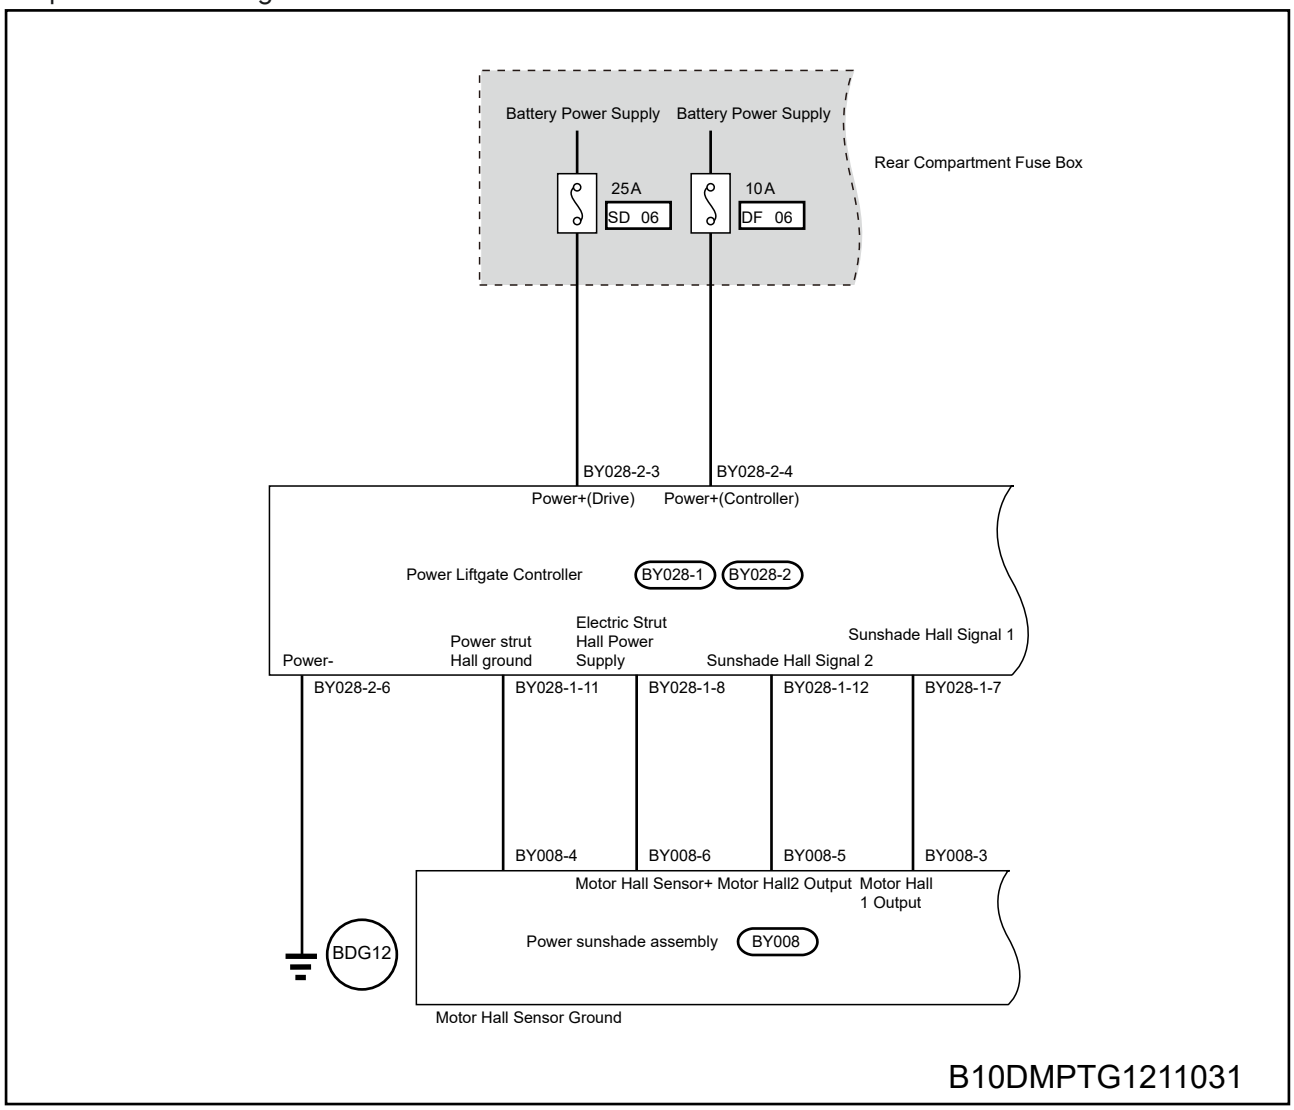
Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the power liftgate controller.

A Replace the power liftgate controller.
B After replacing the power tailgate controller, is the fault cleared?

© 2026, All rights reserved



Yes 》》》 System normal.
Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

© 2026, All rights reserved

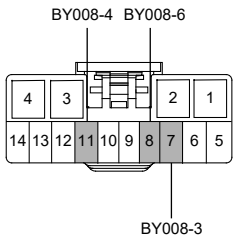
DTC: B1D9139-PTG

Fault code	Description
B1D9139	Sunshade Hall Sensor A Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

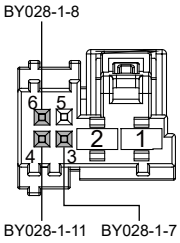
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the electric sunshade assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211032

BY008 Power Sunshade Assembly

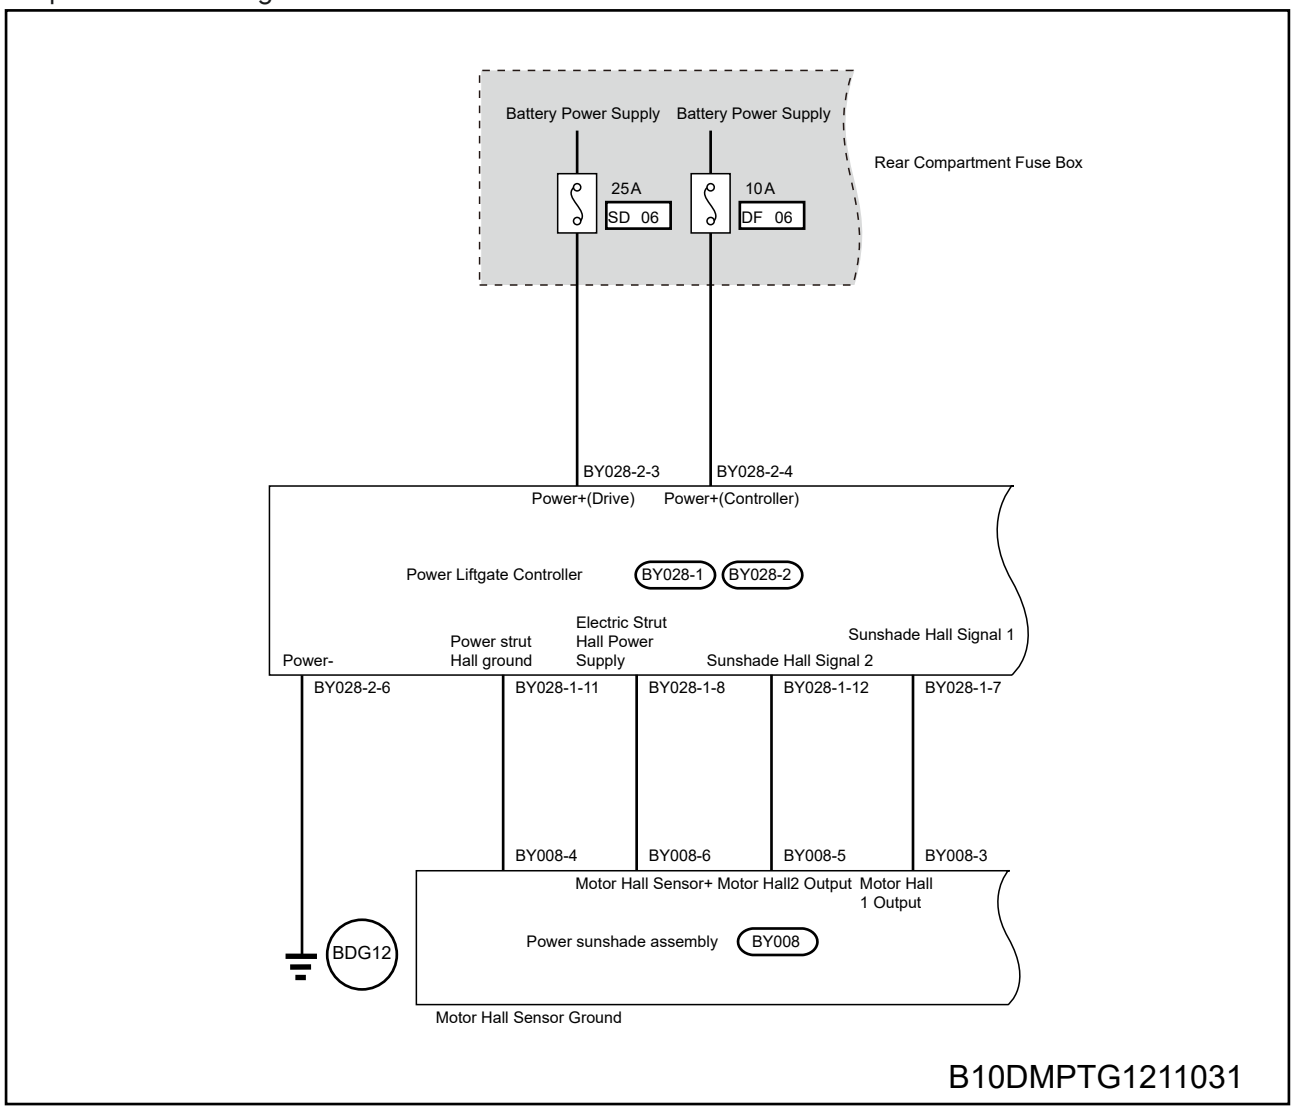
B10DMPTG1211033

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY008 of the electric sunshade assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 7 of the wire harness connector BY028-1 of the power tailgate controller and terminal 3 of the wire harness connector BY008 of the power sunshade assembly to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 8 of the power tailgate controller wire harness connector BY028-1 and terminal 6 of the power sunshade assembly wire harness connector BY008 is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance between terminal 11 of the power tailgate controller harness connector BY028-1 and terminal 4 of the power sunshade assembly harness connector BY008 is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter set to the resistance range to measure the resistance between terminals 7, 8, and 11 of the power tailgate controller harness connector BY028-1 and body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
H Confirm whether the resistance meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measure the voltage between terminals 7, 8, and 11 of the wiring harness connector BY028-1 of the power tailgate controller and the body ground to check whether it is normal.
Voltage standard value: 0V
K Confirm whether the voltage meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Replace the electric sunshade assembly.	
	A Replace the power sunshade assembly. B After replacing the electric sunshade assembly, is the faul t cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

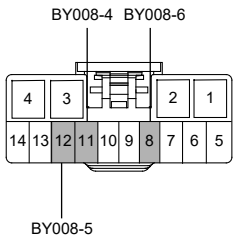
DTC: B1D9239-PTG

Fault code	Description
B1D9239	Sunshade Hall Sensor B Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

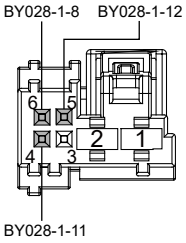
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the electric sunshade assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211034

BY008 Power Sunshade Assembly

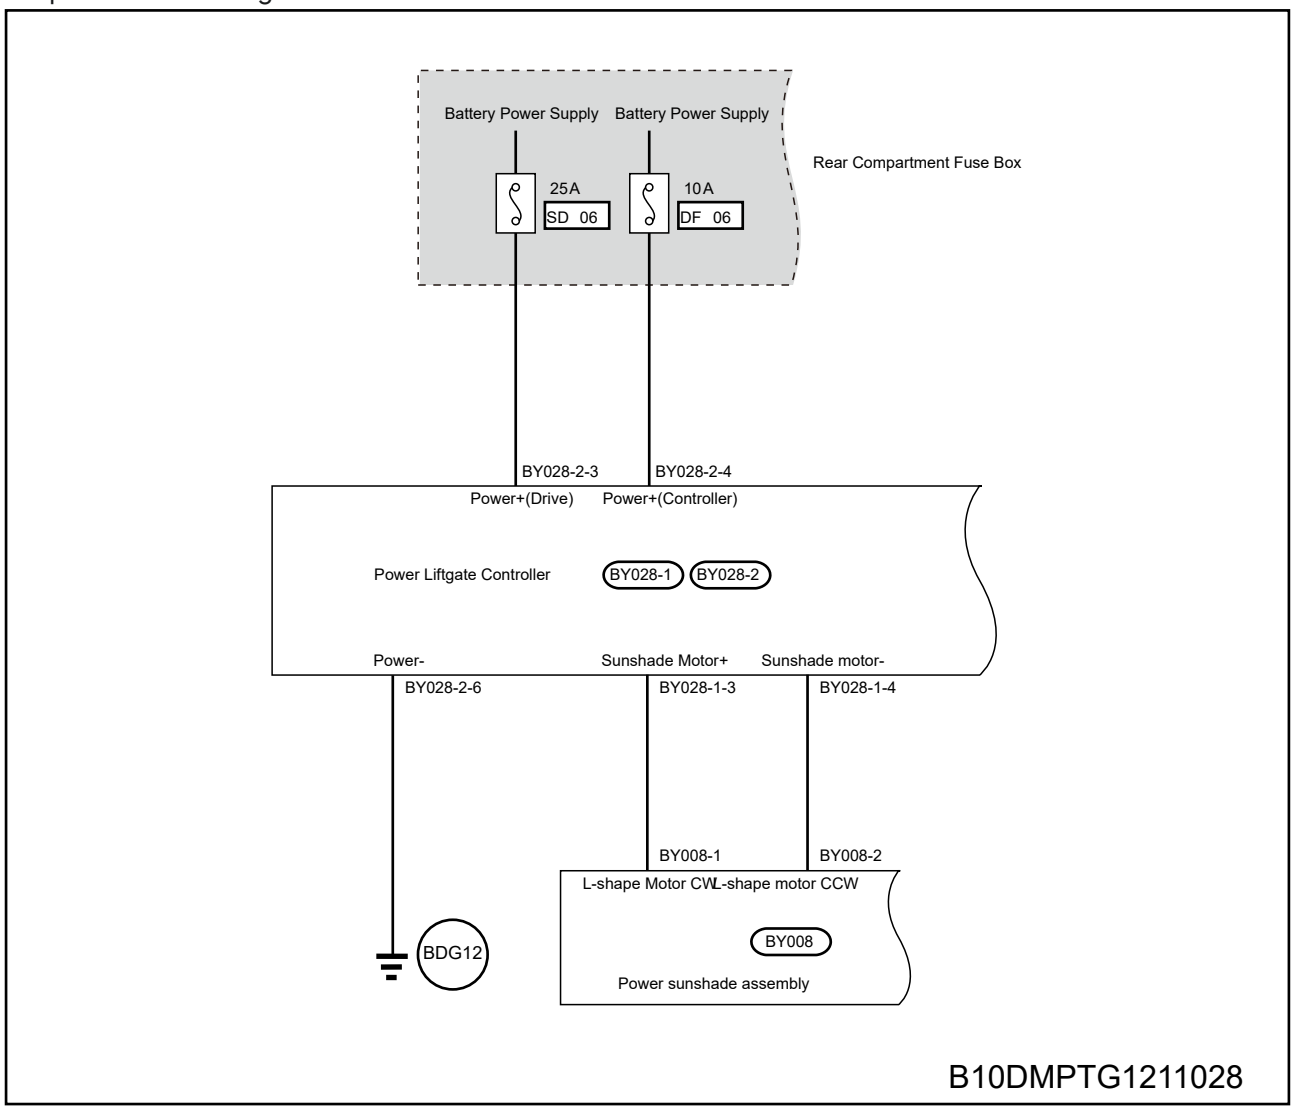
B10DMPTG1211035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY008 of the electric sunshade assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of the power tailgate control module wire harness connector BY028-1 and terminal 5 of the power sunshade assembly wire harness connector BY008 to check if it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 8 of the power tailgate controller wire harness connector BY028-1 and terminal 6 of the power sunshade assembly wire harness connector BY008 is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance between terminal 11 of the power tailgate controller harness connector BY028-1 and terminal 4 of the power sunshade assembly harness connector BY008 is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, set it to the resistance range, and check whether the resistance between terminals 8, 11, and 12 of the power tailgate controller harness connector BY028-1 and the body ground is normal.
Standard resistance value: 10kΩ or higher
H Confirm whether the resistance meets the standard value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter set to the DC voltage range to measure whether the voltage between terminals 8, 11, and 12 of the power tailgate controller harness connector BY028-1 and the body ground is normal.
Voltage standard value: 0V
K Confirm whether the voltage meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Replace the electric sunshade assembly.	
	A Replace the power sunshade assembly. B After replacing the electric sunshade assembly, is the faul t cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

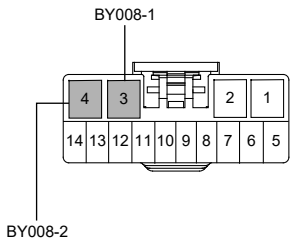
DTC: B1D9012-PTG

Fault code	Description
B1D9012	Sunshade motor shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

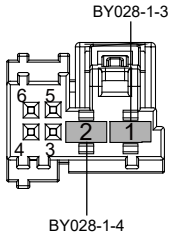
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the electric sunshade assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211029

BY008 Power Sunshade Assembly

B10DMPTG1211030

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY008 of the electric sunshade assembly.
D Use a multimeter, select the resistance range, and check if the resistance between terminal 3 of harness connector BY028-1 of the power tailgate control module and terminal 1 of harness connector BY008 of the power sunshade assembly is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 of harness connector BY028-1 of the power tailgate controller and terminal 2 of harness connector BY008 of the power sunshade assembly is normal.
Resistance standard value: Less than 1 Ω
F Check whether the resistance meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 3 and 4 of the harness connector BY028-1 of the power tailgate controller and the body ground is normal.
Voltage standard value: 0V
I Verify that the voltage meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

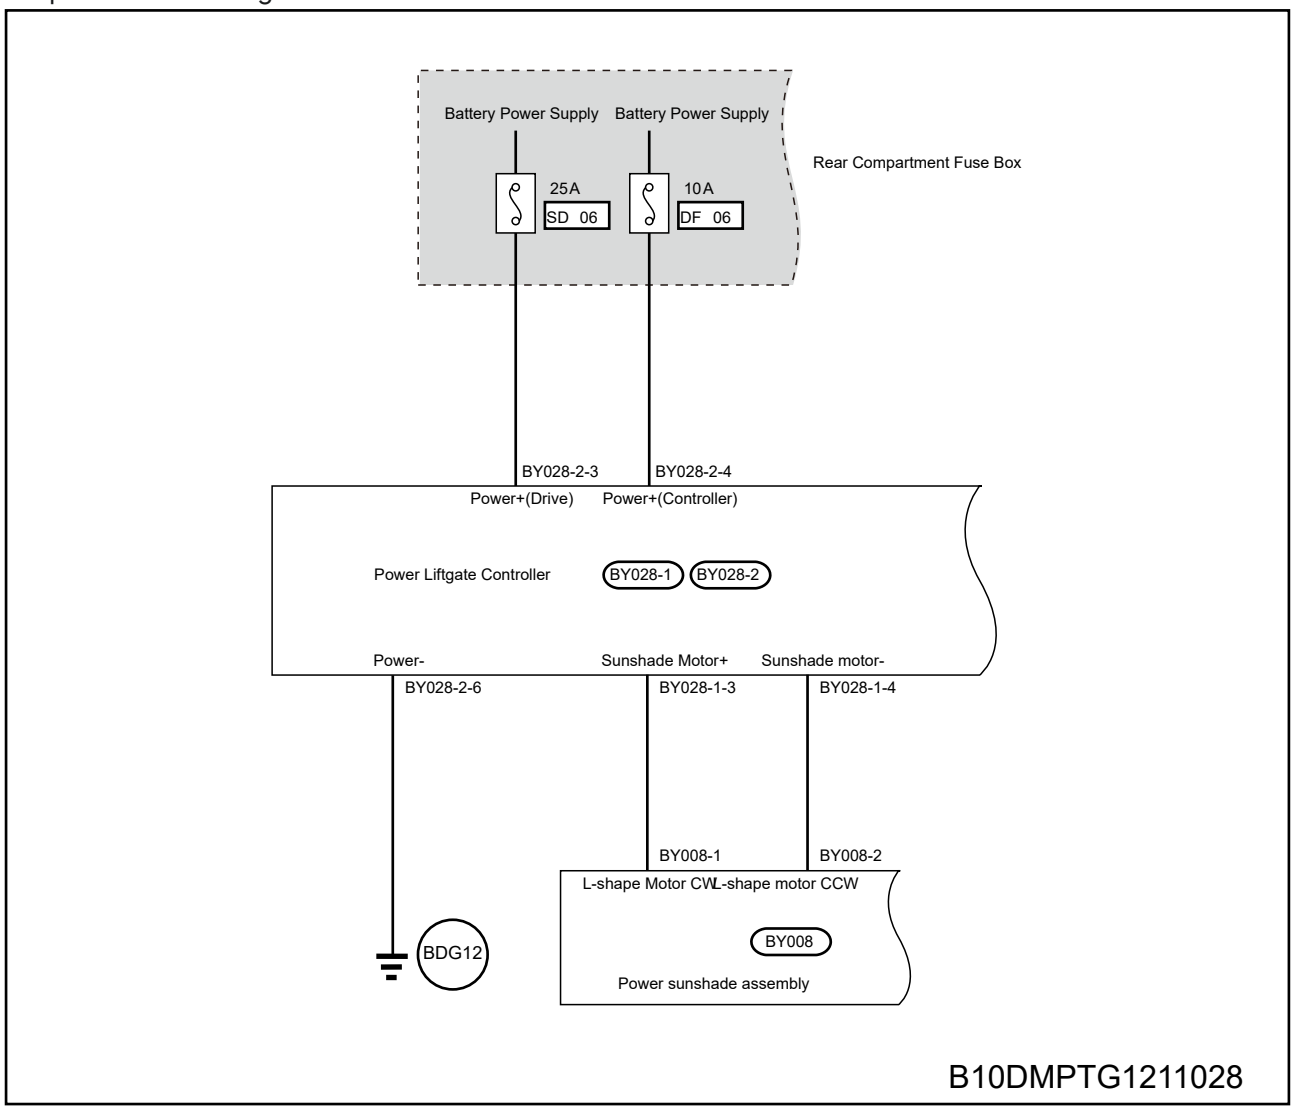
Step 3 Replace the electric sunshade assembly.

A Replace the power sunshade assembly.
B After replacing the electric sunshade assembly, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

© 2026, All rights reserved



Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

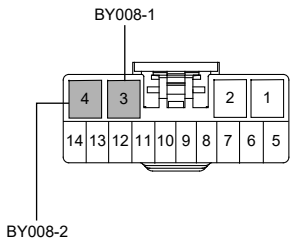
DTC: B1D9011-PTG

Fault code	Description
B1D9011	Sunshade motor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

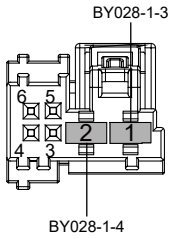
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check whether the wiring harness connecting the power tailgate controller and the electric sunshade assembly is normal.

BY028-1 Power Tailgate Controller

B10DMPTG1211029

BY008 Power Sunshade Assembly

B10DMPTG1211030

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY028-1 of the power tailgate controller.
C Disconnect the wiring harness connector BY008 of the electric sunshade assembly.
D Use a multimeter, select the resistance range, and check if the resistance between terminal 3 of harness connector BY028-1 of the power tailgate control module and terminal 1 of harness connector BY008 of the power sunshade assembly is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 of harness connector BY028-1 of the power tailgate controller and terminal 2 of harness connector BY008 of the power sunshade assembly is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure whether the resistance between terminals 3 and 4 of the power tailgate controller harness connector BY028-1 and the body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the electric sunshade assembly.

A Replace the power sunshade assembly.
B After replacing the electric sunshade assembly, is the fault cleared?

Yes 》 》 》 System normal.

No 》 》 》
Go to step 4.

Step 4 Replace the power liftgate controller.

A Replace the power liftgate controller.

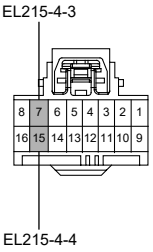
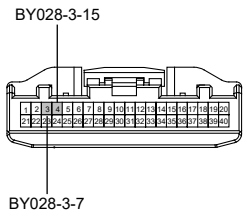
DTC: B1FD161-PTG

Fault code	Description
B1FD161	VIU and PTG authentication failed or timed out





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the IMMO key.	
	A Use the diagnostic tool to check whether the IMMO key h as been written.
	No》》》 Rewrite the IMMO key.
	Yes》》》 Go to step 3.
Step 3 Check the COM-CAN harness between the power tailgate controller and the multi-domain fusion co ntroller.	
BY028-3 Power Tailgate Controller  B10DMPTG1211037 EL215-4 Multi-Domain Fusion Controller  B10DMPTG1211038	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-3 of the power tailgate control unit. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 15 of harness con nector BY028-3 of the electric tailgate controller and termin al 4 of harness connector EL215-4 of the multi-domain fusi on controller is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of harness connector BY028-3 on the power tailgate control module and terminal 3 of harness connector EL215-4 on the multi-domain fusio n controller to check if the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Power-off and power-on test.	
	A. Perform multiple power on/off cycles and check if the fau lt is eliminated.
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

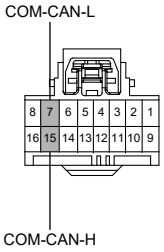
DTC: U007388-PTG

Fault code	Description
U007388	Body CAN2 Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the CAN harness of the power tailgate controller is normal.	
BY028-3 Power Tailgate Controller  B10DMPTG1211007	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BY028-3 of the power tailgate control unit. C. Connect the negative terminal of the battery to power o n the vehicle. D. Using a multimeter, select the DC voltage range, and mea sure the voltage between terminal 7 and body ground, and between terminal 15 and body ground, of the harness conn ector BY028-3 of the power tailgate control module. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and ground of the power tailgate control unit.	
	A Check whether the power supply and ground of the powe r tailgate controller are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.

© 2026, All rights reserved

Step 5 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

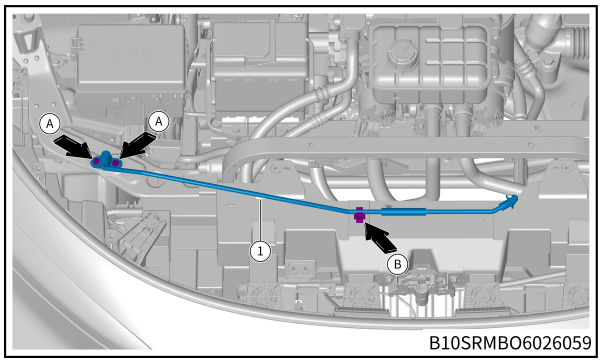
8.8.7 MAINTENANCE TOOLS

GENERAL TOOLS

Serial No.	Tool name	Tool Outline Drawing	Description
1	Socket wrench		Removal and installation of fi xing bolts/nuts
2	Box-end wrench		Removal and Installation of Fixing Bolt
3	Screwdriver		Remove the strut spring clip
4	Torx wrench		Removal and Installation of Fixing Bolt



© 2026, All rights reserved

8.8.8 SERVICE AND REPAIR GUIDANCE

HOOD PROP ROD SUB-ASSEMBLY

REMOVAL PROCEDURE

1. Open the front hood assembly.
2. Remove the front cover strut subassembly.

a. Unscrew the 2 fixing bolts connecting the front cover strut sub-assembly to the front end module assembly-Arrow A-.
Recommended tool: 8mm socket
Torque: 9±1N m

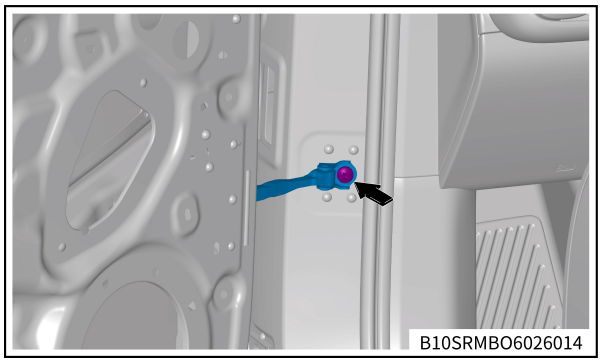
> NOTE
>
> When removing the front hood strut sub-assembly, the front hood assembly must be supported with a wooden stick or other supports to prevent the front hood assembly from falling.

b. Disconnect the hood strut sub-assembly from the hood strut retaining clip - Arrow B -.
c. Remove the front cover strut sub-assembly ①.

SETUP

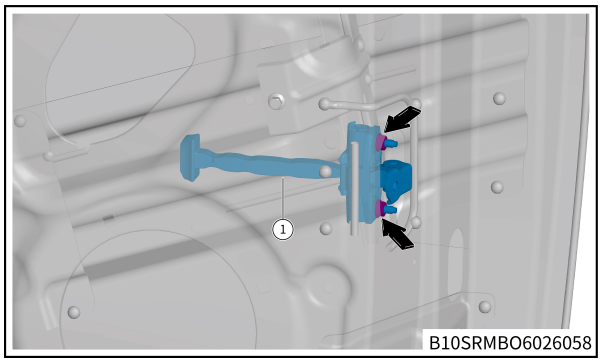
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT DOOR CHECK ASSEMBLY

NOTE



This section describes the removal and installation of the front left door check assembly. The removal and installation of the front right door check assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the left front door inner triangular trim panel assembly.
   See:Front left door inner sail panel assembly (page 5354)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the woofer assembly (front door).
   See:Woofer Assembly (Front Door) (page 9474)
5. Remove the front door check assembly.

a. Unscrew the 1 mounting bolt -arrow- connecting the front door check link assembly to the body.
Recommended tool: T45 Torx key
Torque: 28±2N m

b. Unscrew the 2 fixing nuts -arrow- connecting the front door check link assembly to the left front door assembly, and remove the front door check link assembly ①.
Recommended tool: 10mm socket
Torque: 9±1N m

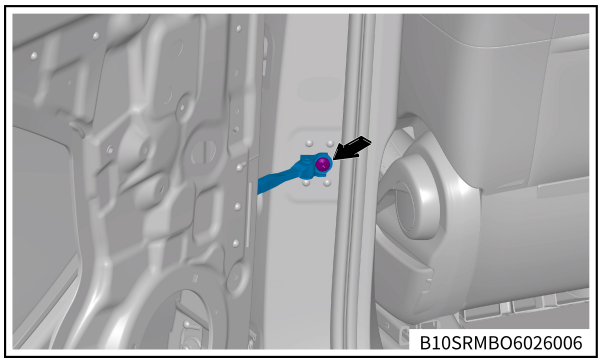
NOTE

Raise the front door glass assembly to the highest position, and the front door check assembly can be removed from the mounting position of the woofer assembly.

SETUP

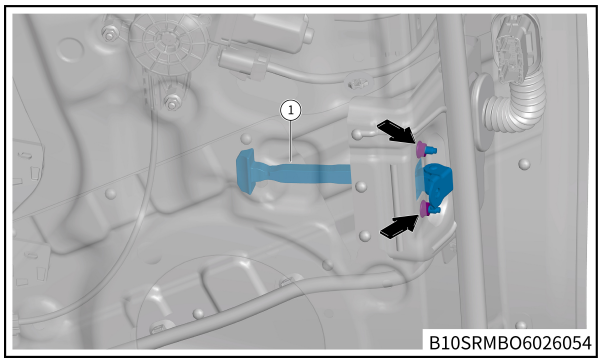
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After the door check assembly is installed, open and close the door more than 5 times to perform a functional check. If any abnormal noise is detected, remove the mounting bolts (body side and door side) and reassemble.

© 2026, All rights reserved



REAR DOOR CHECK ASSEMBLY

NOTE



This section describes the removal and installation of the left rear door check link assembly, and the removal and installation of the right rear door check link assembly can generally be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
3. Remove the woofer assembly (rear door).
   See:Woofer Assembly (Rear Door) (page 9477)
4. Remove the rear door check assembly.

a. Unscrew the 1 fixing bolt -arrow- connecting the rear door check link assembly to the vehicle body.
Recommended tool: T45 Torx key
Torque: 28±2N m

b. Unscrew the 2 fixing nuts -arrow- connecting the rear door check assembly to the left rear door assembly, and remove the rear door check assembly ①.
Recommended tool: 10mm socket
Torque: 9±1N m

NOTE

Raise the rear door glass assembly to the highest position, and the rear door check assembly can be removed from the mounting position of the bass speaker assembly.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After the door check assembly is installed, open and close the door more than 5 times to perform a functional check. If any abnormal noise is detected, remove the mounting bolts (body side and door side) and reassemble.

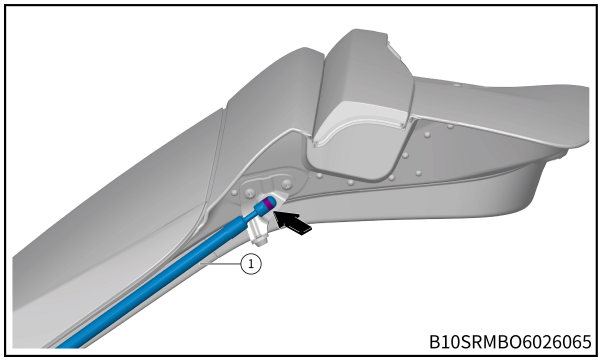
TAILGATE GAS SPRING ASSEMBLY

NOTE

This section describes the removal and installation of the liftgate left gas spring assembly. The removal and installation of the liftgate right gas spring assembly can generally refer to the left side.

REMOVAL PROCEDURE



1. Open the liftgate assembly.
2. Remove the tailgate gas strut assembly.

a. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the liftgate gas spring assembly to the left body bracket of the liftgate gas spring, and disconnect it.
Recommended tool: Flathead screwdriver

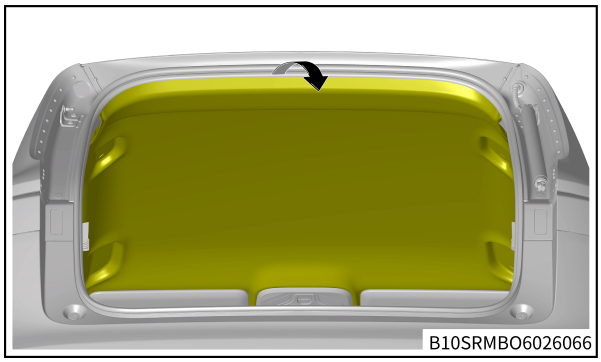
NOTE

The liftgate is prone to tilting and requires two service technicians to assist with removal and installation.

b. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the liftgate gas spring assembly to the left bracket of the liftgate electric strut, and disconnect it.
Recommended tool: Flathead screwdriver

c. Remove the tailgate gas strut assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, pull the gas spring with appropriate force in the opposite direction of the ball socket assembly to ensure the ball socket does not detach from the ball pin and is fully assembled in place.
   b. After installation, check the retaining clip on the gas spring to ensure it is not lifted or protruding and is fully seated in place.

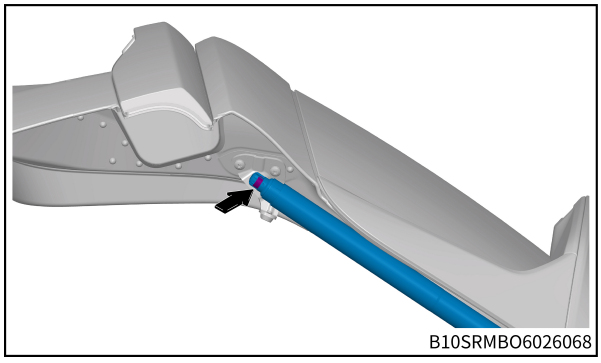
RIGHT LIFTGATE ELECTRIC STRUT ASSEMBLY

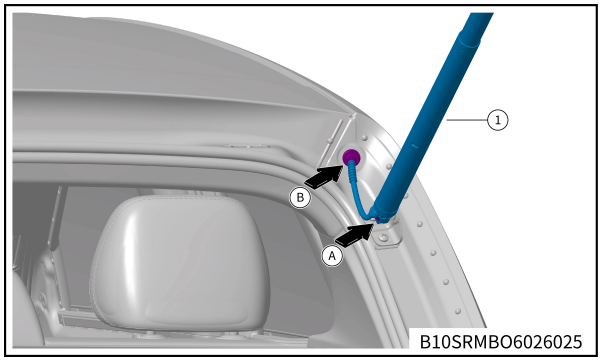
REMOVAL PROCEDURE



1. Open the liftgate assembly.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the left/right lower C-pillar interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
5. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
6. Remove the left/right grab handle assembly of the rear folding roof.
   See:Rear folding roof left handle assembly (page 5532)
7. Remove the right electric strut assembly of the tailgate.

a. Lift up one side of the headliner assembly in the direction of the arrow.

b. Disconnect 1 connector -arrow- between the liftgate right electric strut assembly and the floor wiring harness assembly.



c. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the tailgate right electric strut assembly to the right bracket of the tailgate electric strut, and disconnect it.
Recommended tool: Flathead screwdriver

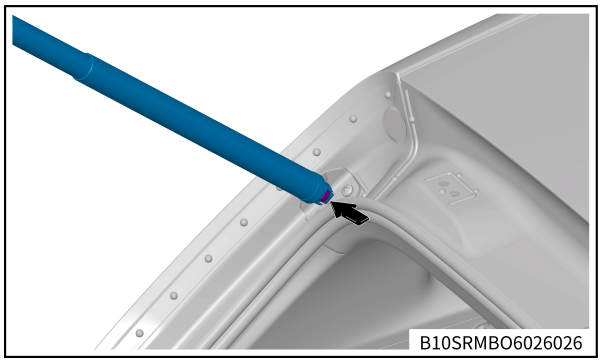
NOTE

The liftgate is prone to tilting and requires two service technicians to assist with removal and installation.

© 2026, All rights reserved

d. Use a flathead screwdriver to pry up the 1 retaining clip - Arrow A - connecting the right electric tailgate strut assembly to the tailgate electric strut body bracket, and disconnect it. **Recommended tool: Flathead screwdriver**
e. Disconnect 1 waterproof rubber boot from the wiring harness of the right tailgate electric strut assembly - arrow B -.
f. Remove the tailgate right electric strut assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After assembly, pull the electric strut with appropriate force in the opposite direction to the ball socket assembly to ensure that the ball socket does not detach from the ball pin and is fully assembled in place.
   b. After assembly, pull the sheath with moderate force in the opposite direction to the wire harness sheath installation, ensuring that the sheath does not disengage from the mounting hole and is fully seated in place.
   c. To prevent damage to the internal mechanism of the power liftgate strut, after the power liftgate strut is installed and before all components on the liftgate (such as the liftgate interior trim panel, liftgate glass, liftgate full-width lamp, and liftgate exterior trim panel) are fully assembled, you must hold the liftgate and slowly open it to the maximum position when opening it manually. It is strictly prohibited to allow the liftgate to automatically pop open rapidly to the maximum position before all components on the liftgate are fully installed.
   d. To prevent damage to the internal mechanism of the electric tailgate strut, after all components on the tailgate are fully assembled, open and close the tailgate slowly when operating it manually (manual opening and closing time must be greater than 6s). It is strictly prohibited to open or close the tailgate with excessive force.
   e. To prevent damage to the internal mechanism of the tailgate electric strut, it is prohibited to apply external force to accelerate the tailgate movement during the power opening and closing process.

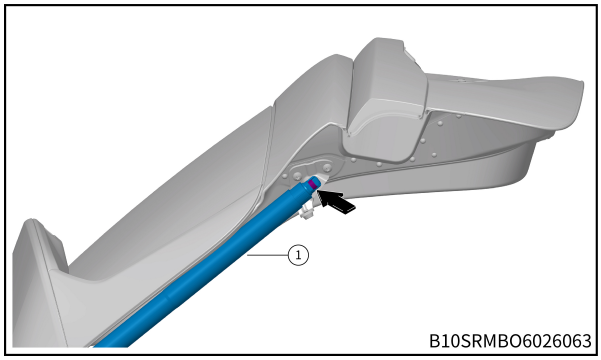
LEFT TAILGATE BALANCE ROD ASSEMBLY



REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the left balance rod assembly of the tailgate.

a. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the tailgate left balance rod assembly to the tailgate electric strut body bracket, and disconnect it.
Recommended tool: Flathead screwdriver

> **NOTE**
>
> The liftgate is prone to tilting and requires two service technicians to assist with removal and installation.

b. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the tailgate left balance rod assembly to the left bracket of the tailgate electric strut, and disconnect the connection.
Recommended tool: Flathead screwdriver
c. Remove the tailgate left balance rod assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, pull the stabilizer bar with appropriate force in the opposite direction of the ball socket assembly to ensure that the ball socket does not detach from the ball stud and is fully assembled in place.
   b. After installation, inspect the snap ring on the balance rod to ensure it is not protruding and is fully seated.

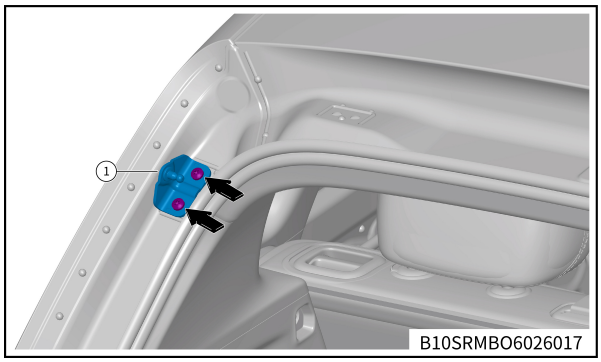
LIFTGATE POWER STRUT BODY BRACKET

NOTE

This section describes the removal and installation of the left body bracket for the liftgate electric strut, and the removal and installation of the right body bracket for the liftgate electric strut can generally refer to the left side.

REMOVAL PROCEDURE



1. Open the liftgate assembly.
2. Remove the body bracket of the tailgate electric strut.

a. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the lower end of the power liftgate strut to the power liftgate strut body bracket, and disconnect the connection.
Recommended tool: Flathead screwdriver

NOTE

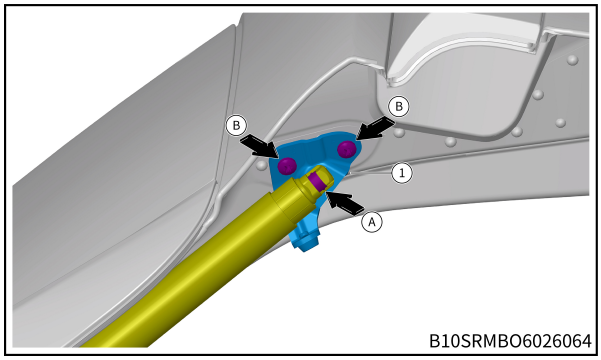
The tailgate is prone to tilting during removal, requiring two service technicians to assist with the removal and installation.

b. Unscrew the 2 mounting bolts -arrow- connecting the body bracket of the tailgate electric strut to the body, and remove the body bracket ① of the tailgate electric strut.
Recommended tool: T45 Torx key
Torque: 28±3N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT BRACKET FOR LIFTGATE ELECTRIC STRUT

NOTE

This section describes the removal and installation of the left bracket of the power liftgate electric strut, and the removal and installation of the right bracket of the power liftgate electric strut can generally refer to the left side.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the left bracket of the tailgate electric strut.

a. Use a flathead screwdriver to pry up the 1 retaining clip -Arrow A- connecting the upper end of the power liftgate strut to the left bracket of the power liftgate strut, and disconnect it.
Recommended tool: Flathead screwdriver

b. Unscrew the 2 fixing bolts -Arrow B- connecting the left bracket of the liftgate electric strut to the liftgate assembly, and remove the left bracket of the liftgate electric strut ①.
Recommended tool: T45 Torx key
Torque: 28±3N m

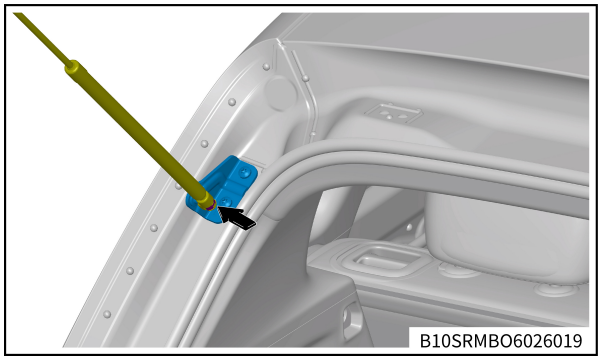
NOTE

The tailgate is prone to tilting during removal, requiring two service technicians to assist with the removal and installation.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

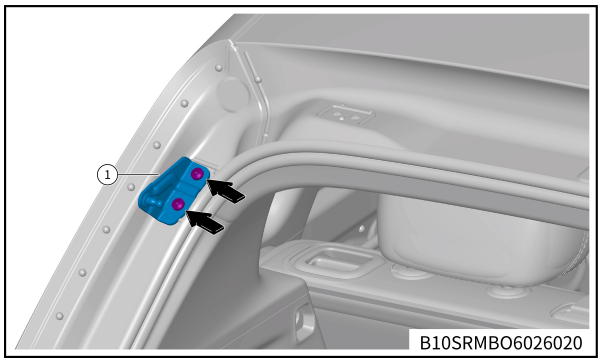


LEFT BODY BRACKET FOR LIFTGATE GAS SPRING

NOTE

This section describes the removal and installation of the left body bracket for the liftgate gas strut. The removal and installation of the right body bracket for the liftgate gas strut can generally follow the procedure for the left side.

REMOVAL PROCEDURE



1. Open the liftgate assembly.
2. Remove the left body bracket of the liftgate gas spring.

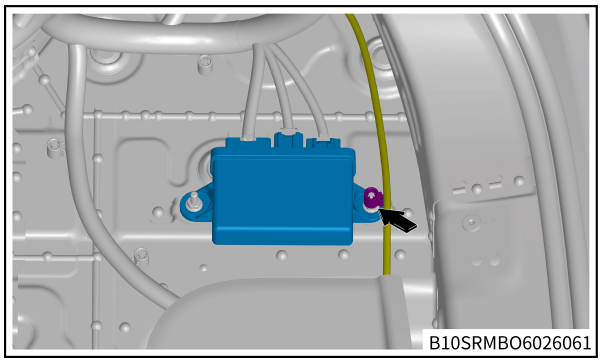
a. Use a flathead screwdriver to pry up the 1 retaining clip - arrow - connecting the lower end of the liftgate gas strut to the left body bracket of the liftgate gas strut, and disconnect it.
Recommended tool: Flathead screwdriver

NOTE

The tailgate is prone to tilting during removal, requiring two service technicians to assist with the removal and installation.

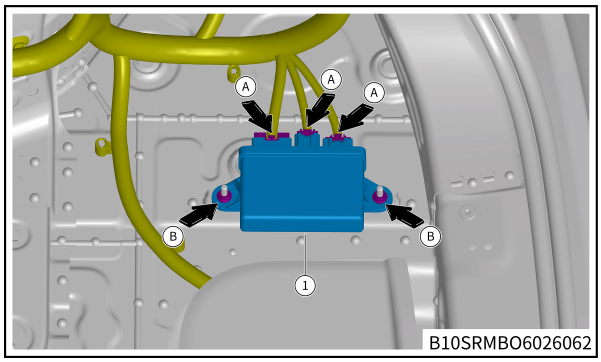
b. Unscrew the 2 mounting bolts -arrow- connecting the left body bracket of the liftgate gas strut to the body, and remove the left body bracket ① of the liftgate gas strut.
Recommended tool: T45 Torx socket
Torque: 28±3N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



POWER LIFTGATE CONTROLLER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the power liftgate controller.

a. Release the 1 fixing clip -arrow- connecting the fast and slow charging cable assembly to the vehicle body, and move the wiring harness aside.
Recommended tool: Clip remover

b. Disconnect the 3 connectors between the power liftgate controller and the floor wiring harness assembly - Arrow A -.
c. Unscrew the 2 mounting nuts - Arrow B - securing the power liftgate controller to the vehicle body, and remove the power liftgate controller ①.
Recommended tool: 10mm socket
Torque: 4±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the power liftgate controller requires following these steps to ensure software version compatibility:
      - Record the old version: Before removal, read and record the software version number of the old power liftgate controller.
      - Check for new version: After installing the new power tailgate controller, first read its software version number.

      Version Comparison and Processing:
      - If the new version ≥ the old version, the replacement process will be completed normally.
      - If the new version < the old version, the software of the new power tailgate controller must first be updated to the old version or a higher version before it can be put into use.

   b. If a new power liftgate controller is replaced, a matching operation must be performed:
      - Manually close the liftgate until the latch engages the lock.
      - Write key - Diagnostic tool operation: Corresponding vehicle model -- System diagnostics - IMMO key injection.

© 2026, All rights reserved

- PTG Power Tailgate Controller - Routine Control (Sunshade Calibration) or central control screen calibration learning, on the central control screen, enter the Vehicle Control - Doors & Windows - Sunshade interface, long press (hold) the fully open or fully close button, after 10 seconds, the sunshade moves in the opening direction, moving all the way to the hard stop in the fully open direction, the sunshade moves in the closing direction again, stops at the fully closed position, records the fully closed position, the sunshade moves in the opening direction again, stops at the fully open position, the initialization is complete, release the button.
- After software flashing is completed, the vehicle must be locked and enter sleep mode for more than 1 minute.

c. Power liftgate learning (manual learning):
   - If the vehicle loses power while the power liftgate is open or during the power opening or closing process, and the power liftgate fails to operate after power is restored, manually close the liftgate to the first latch position. The soft close latch will then automatically draw the liftgate from the first latch position to the fully latched position. Once the self-learning process is completed, the power opening and closing functions of the power liftgate will return to normal.

d. After installation, check that all systems of the power liftgate controller are functioning properly.

LEFT REAR DOOR FRONT GUIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the front guide rail assembly for the left rear door, and the removal and installation of the front guide rail assembly for the right rear door can generally refer to the left side.

REMOVAL PROCEDURE

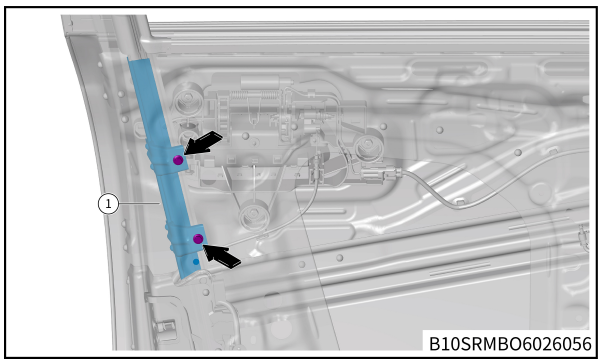
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
3. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
4. Remove the woofer assembly (rear door).
   See:Woofer Assembly (Rear Door) (page 9477)
5. Remove the left rear door front guide rail assembly.

a. Raise the left rear door glass assembly to the highest position.
b. Unscrew the 2 fixing bolts -arrow- connecting the left rear door front guide rail assembly to the left rear door assembly, and remove the left rear door front guide rail assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT FRONT DOOR REAR GUIDE RAIL ASSEMBLY

NOTE

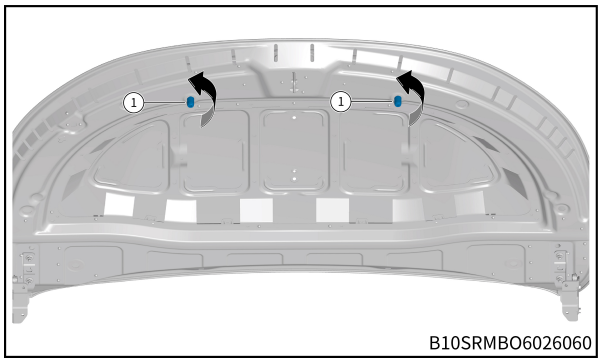
This section describes the removal and installation of the left front door rear guide rail assembly, and the removal and installation of the right front door rear guide rail assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
3. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
4. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
5. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
6. Remove the left front door rear guide rail assembly.

a. Unscrew the 2 fixing bolts -arrow- connecting the left front door rear guide rail assembly to the left front door assembly, and remove the left front door rear guide rail assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

BUMPER BLOCK (HOOD)

REMOVAL PROCEDURE

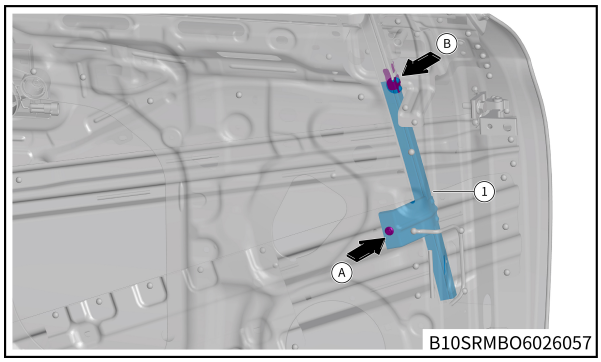
1. Open the front hood assembly.
2. Remove the bump stop.

a. Unscrew buffer block ① counterclockwise in the direction of the arrow.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the peripheral clearance and flatness of the front cover assembly.
   See:Adjust the front cover assembly (page 6629)

© 2026, All rights reserved



FRONT LEFT DOOR FRONT LOWER GUIDE RAIL ASSEMBLY

NOTE

This section describes the removal and installation of the left front door front lower guide rail assembly. The removal and installation of the right front door front lower guide rail assembly can generally refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
3. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
4. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
5. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
6. Remove the woofer assembly (front door).
   See:Woofer Assembly (Front Door) (page 9474)
7. Remove the front lower guide rail assembly of the front left door.

a. Unscrew the 1 fixing bolt - Arrow A - connecting the left front door lower front guide rail assembly to the left front door assembly.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the front left door front lower guide rail assembly from the front left door front guide rail - Arrow B -.
c. Remove the front lower guide rail assembly ① of the front left door.

SETUP

1. The installation procedure is performed in reverse order.

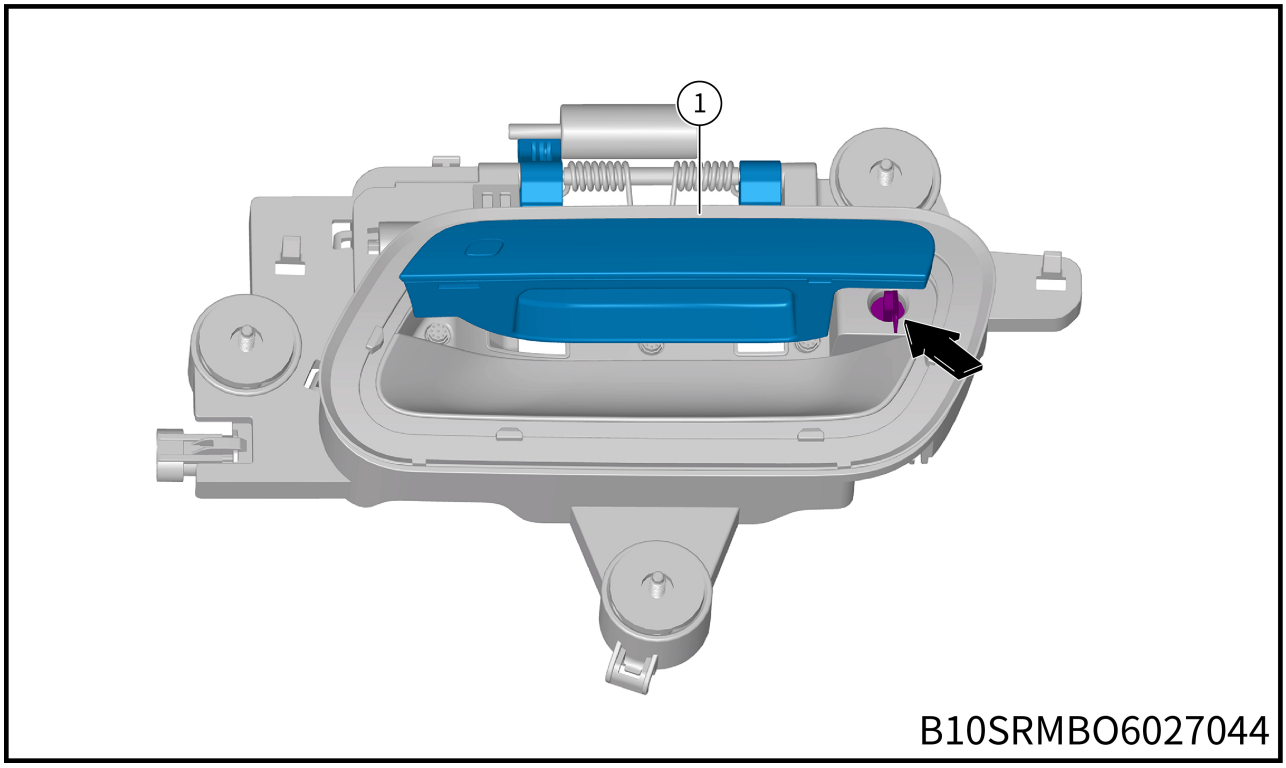
© 2026, All rights reserved

8.9 EXTERIOR HANDLE SYSTEM

8.9.1 PRECAUTIONS

PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the parts meet the OEM technical specifications.
2. Ensure the exterior door handle is properly seated against the door before tightening the bolts.
3. After installation, check the clearance between the outside handle and the door surface. If it does not meet the standard, readjust it.
4. After installation is completed, the fasteners must be checked for the specified torque to ensure they are properly tightened.

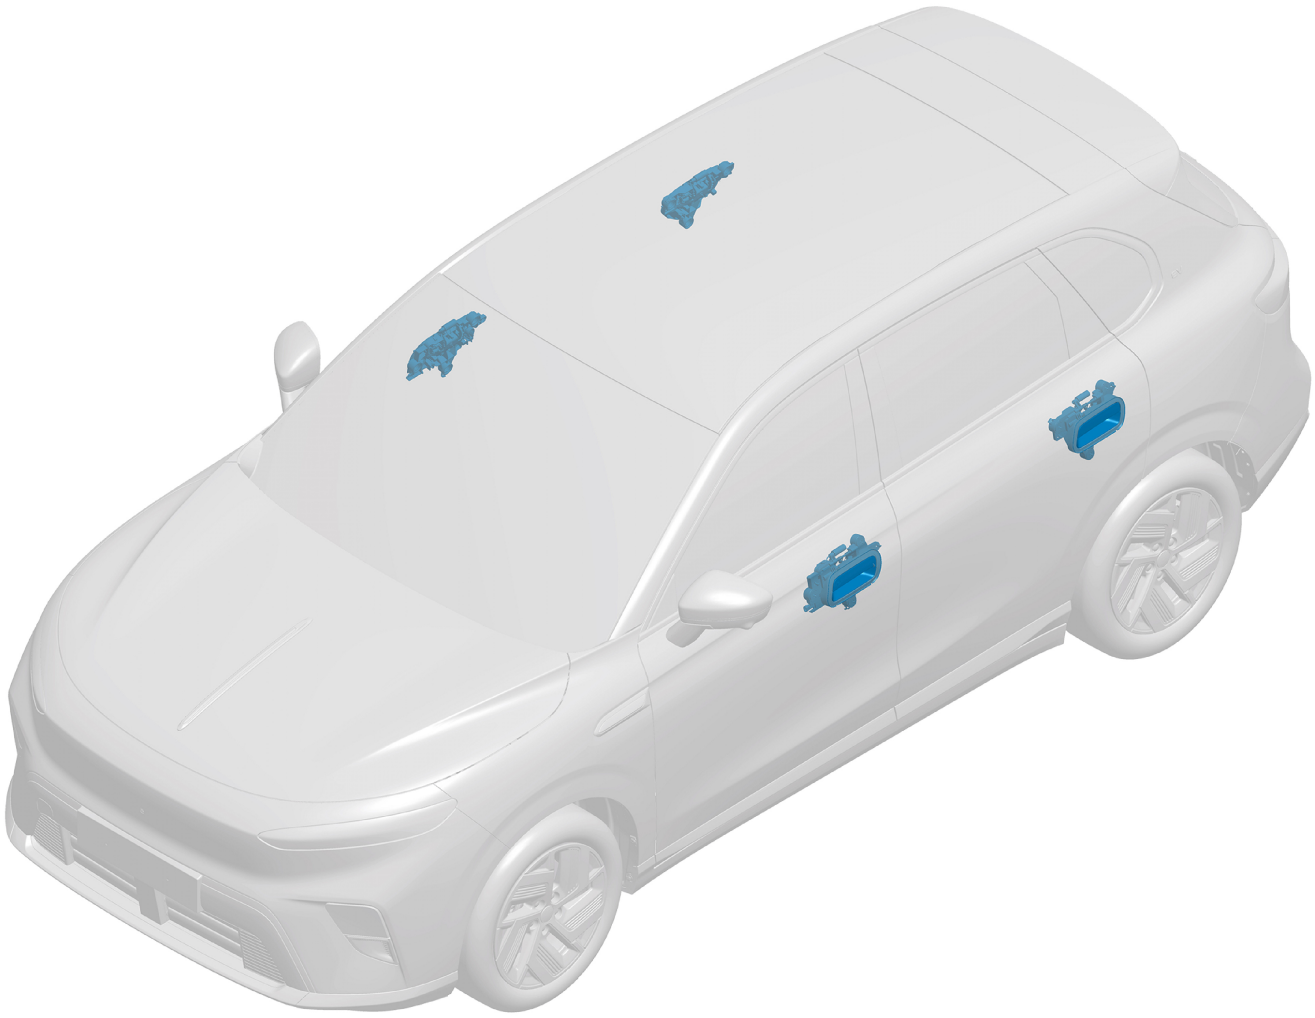


© 2026, All rights reserved

8.9.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview



- When the vehicle is powered off:
  a. In the event of a power failure, pull the door handle ①. The handle unfolds, exposing the mechanical lock cylinder. Use the mechanical key to unlock the left front door -arrow-, then pull the handle to open the left front door.

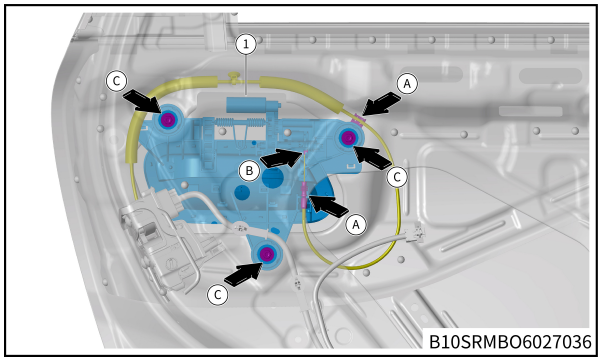
LEFT REAR DOOR OUTSIDE HANDLE

NOTE

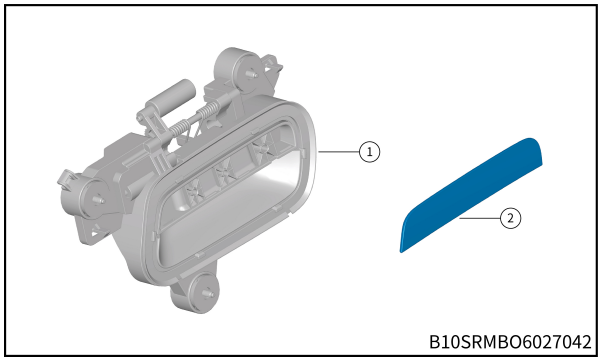


This section describes the removal and installation of the left rear exterior door handle, and the removal and installation of the right rear exterior door handle can generally follow the procedure for the left side.

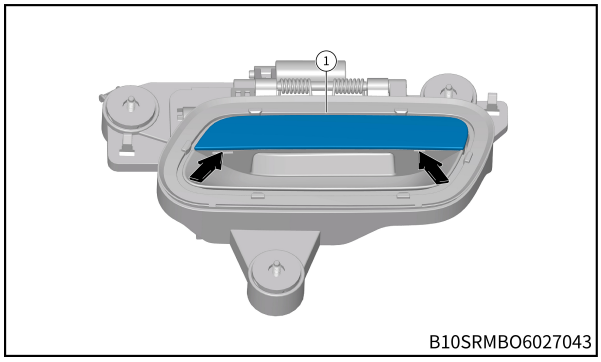
REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
3. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
4. Remove the left rear outside door handle.

a. Remove the 3 patches (aluminum foil) - arrows - on the left rear door assembly.
Recommended tool: Interior trim removal tool



b. Disconnect the 2 connections between the left rear door outside handle release cable and the clip slot of the left rear door outside handle -Arrow A-.
Recommended tool: Clip remover
c. Disconnect the 1 connection between the left rear outside door handle and the left rear outside door release cable -arrow B-.
d. Unscrew the 3 fixing bolts connecting the left rear outside door handle to the left rear door assembly -arrow C-.
Recommended tool: 10mm socket
Torque: 5±1N m
e. Remove the left rear door outside handle ①.



SETUP

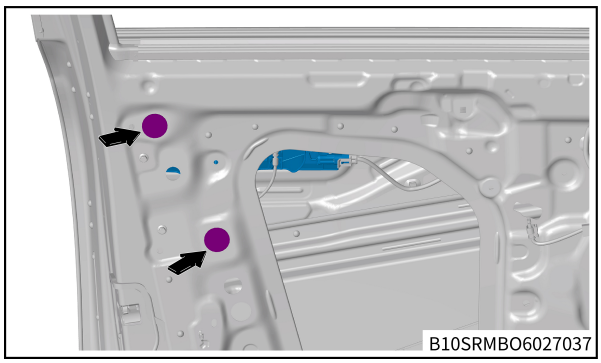
1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. The unpainted rear door outside handle parts are supplied as after-sales spare parts in separate pieces, consisting of the outside handle shell ① and the main body ②, and must be assembled after painting.

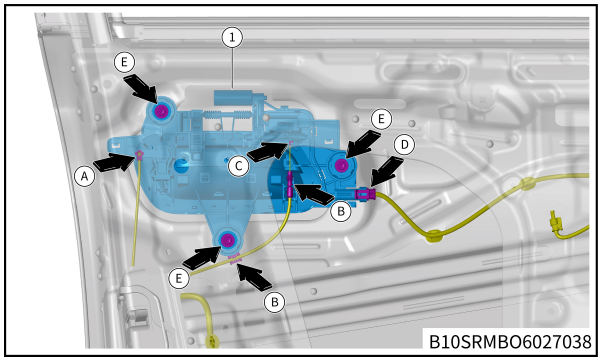
b. Outside handle housing removal and installation procedure:
   - Pull the door handle to tilt it upward.
   - Insert a flathead screwdriver at the -arrow- position to release the 2 retaining clips connecting the outer handle housing and the outer handle body.
     Recommended tool: Flathead screwdriver
   - Remove the outer handle housing ①.
   - The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT EXTERIOR DOOR HANDLE

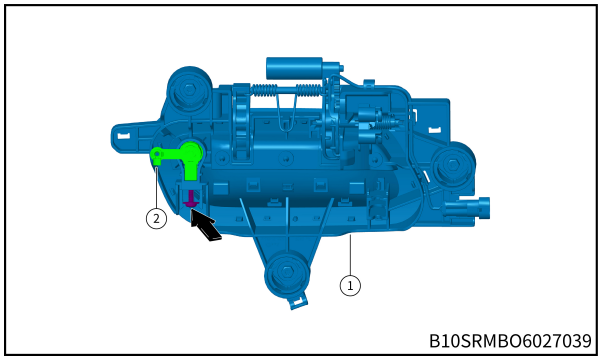
NOTE



This section describes the removal and installation of the left front exterior door handle, and the removal and installation of the right front exterior door handle are largely similar to those of the left side.

REMOVAL PROCEDURE

1. Open the front door assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
5. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
6. Remove the inner belt weatherstrip of the front left door.
   See:Front left door inner water deflector (page 6400)
7. Remove the front left door glass assembly.
   See:Front left door glass assembly (page 6387)
8. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
9. Remove the outside handle of the front left door.

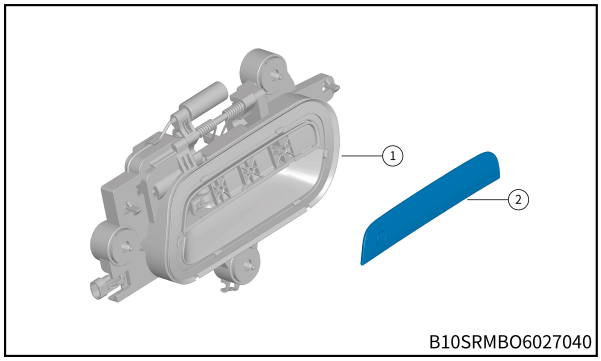


a. Remove the 2 patches (aluminum foil) - arrow - on the left front door assembly.
Recommended tool: Interior trim removal tool

b. Disconnect the 1 connection between the lock cylinder rod and the left front exterior door handle - arrow A -.
c. Disconnect the 2 connections between the left front door outside release cable and the clip slot of the left front door outside handle - arrow B -.
Recommended tool: Clip remover
d. Disconnect 1 connection between the left front door outside handle and the left front door outside release cable - arrow C -.

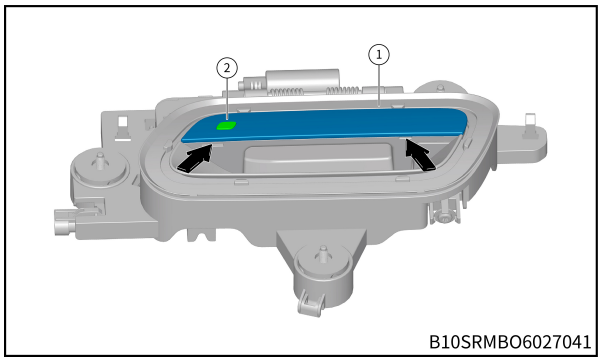
© 2026, All rights reserved

e. Disconnect the 1 connector between the left front door outside handle and the left front door wiring harness assembly - arrow D -.
f. Unscrew the 3 retaining bolts -arrow E- that secure the left front door outside handle to the left front door assembly.
Recommended tool: 10mm socket
Torque: 5±1N m
g. Remove the left front door outside handle with mechanical lock cylinder assembly ①.



B10SRMBO6027039

h. Unscrew the 1 fixing bolt -arrow- connecting the left front door outside handle to the mechanical lock cylinder assembly.
Recommended tool: T25 Torx wrench
Torque: 2±1N m
i. Remove the left front door outside handle ① and the mechanical lock cylinder assembly ②.



SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

B10SRMBO6027040

a. The after-sales spare parts for the unpainted parts of the front exterior door handle are in the form of the outer handle body ① and the housing ② in a separated state, and must be assembled after painting.

B10SRMBO6027041

b. Outside handle housing removal and installation procedure:
- Pull the door handle to tilt it upward.
- Insert a flathead screwdriver at the -arrow- position to release the 2 retaining clips connecting the outer handle housing and the outer handle body.
Recommended tool: Flathead screwdriver
- Remove the outer handle housing ①.

© 2026, All rights reserved

- The installation procedure is performed in reverse order.

ATTENTION

If the outer handle housing is on the driver's side, the button switch ② needs to be removed and painted separately; otherwise, the button switch may produce abnormal noise when pressed.

© 2026, All rights reserved

8.10 SUNROOF SYSTEM

8.10.1 PRECAUTIONS

PRECAUTIONS

1. Before removing the electric sunshade assembly, check whether there are abnormal noises, sticking, or other issues during the operation of the sunshade. If any fault occurs, the cause of the fault must be investigated.
2. During handling and installation, do not touch the drive wire of the sunshade to prevent the wire from detaching and springing back, which may cause personal injury.
3. Apply an appropriate amount of grease or lubricant during installation to ensure adequate lubrication.
4. The sunshade must be initialized after installation.
5. When disconnecting the sunshade SCU assembly connector, do not pull the wiring harness to prevent damage to the wiring harness.
6. Before repairing or replacing parts, carefully check whether the original or replacement parts meet the technical requirements.
7. After installation, the fasteners must be checked for the specified torque.
8. Removal and installation of the electric sunshade assembly requires two technicians to work together.
9. After installation, ensure that the electric sunshade assembly operates normally.

© 2026, All rights reserved

8.10.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The electric sunshade used in this vehicle model consists of the frame assembly, sunshade motor, and other components. It supports functions such as button control, display screen control, voice control, remote control, and APP remote control.

Principle Introduction

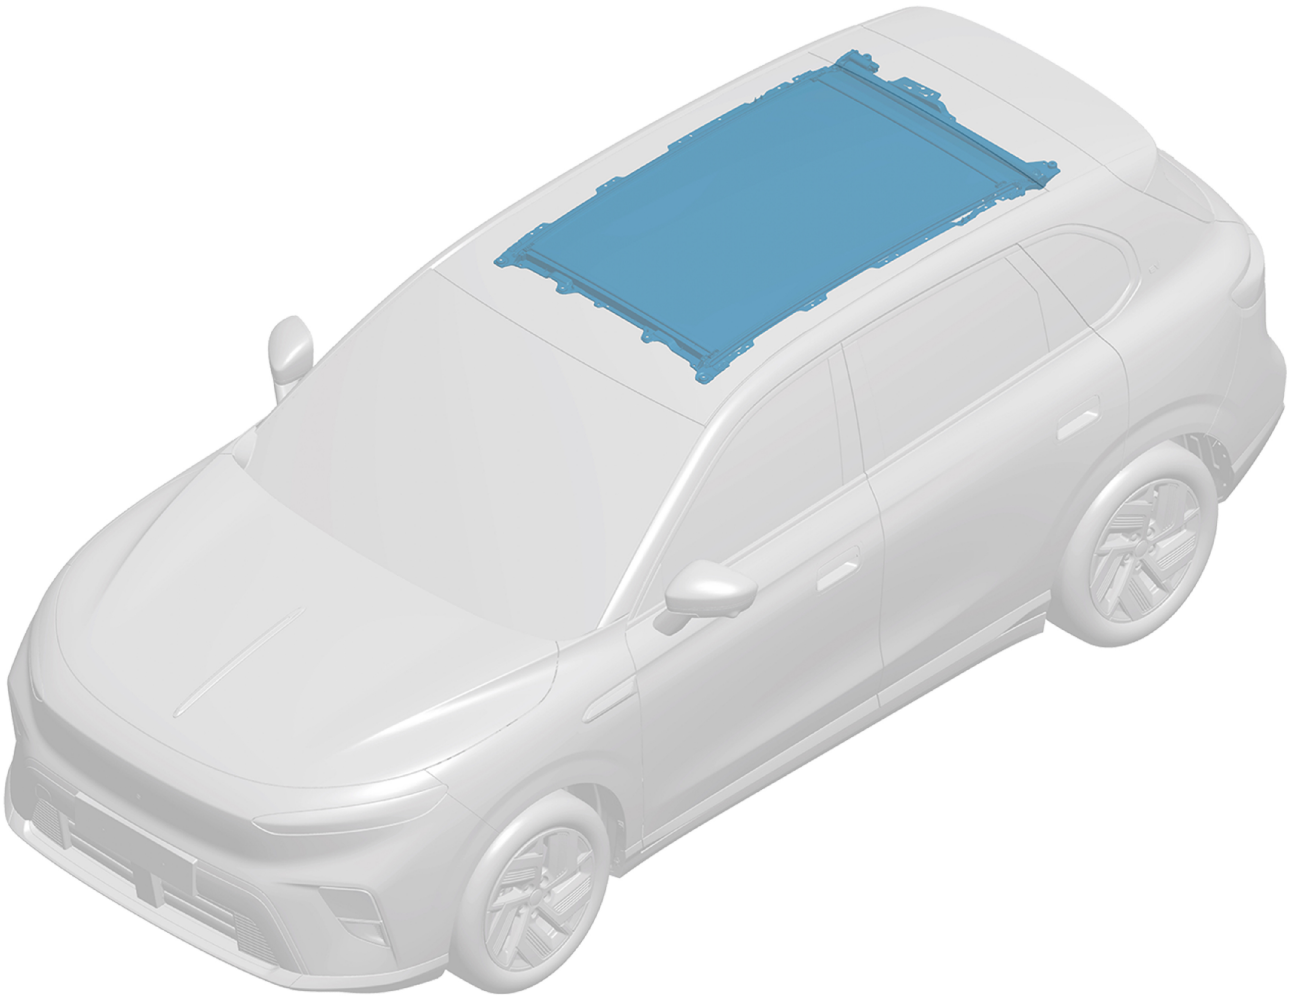
- The power liftgate ECU controls the sunshade motor to drive the cable, moving the curtain fabric to slide in the left and right guide rails to perform opening and closing actions.

Sunshade Initialization and Self-Learning

- The initialization/self-learning process must be re-performed in the following three cases:
  a. If power is lost during the operation of the sunshade, the ECU may malfunction and require re-initialization.
  b. The sunshade is not in the initial position after replacing the sunshade motor.
  c. After a period of use (generally around 2 years), you may notice that the sunshade cannot close completely (due to wear and clearance between mechanical moving parts after prolonged use).
- Initialization/Self-Learning Process
  a. To perform the first-time initialization/self-learning procedure for the sunshade, the switch harness and the sunshade connectors must be connected correctly, the power supply must be turned on, and the power mode must be in the ON1\ON2\ON3 state.
- Operation Steps
  - Press and hold the sunshade close button: After 10 seconds, the sunshade moves in the closing direction in a stepping manner, pausing for 500 ms every 50 mm, until it reaches the sunshade hard stop. After the sunshade reaches the hard stop, it retracts a certain distance and stops at the fully closed position.
- Release the switch
  - Operate the sunshade close button again within 6 seconds and hold it: after 4 seconds, the sunshade opens, the sunshade moves to the fully open position and stops; the sunshade begins the closing movement, the sunshade ends the movement at the fully closed position.
  - Release the switch, and the sunshade initialization and self-learning processes end.

- If any of the following events occurs during the sunshade initialization/self-learning process, the sunshade initialization/self-learning will not be completed:
  a. The close button was not continuously pressed and held during the initialization/self-learning process.
  b. The power switch or power supply is turned off.
  c. The sunshade has not moved to the closed position.

- Thermal protection function.
  a. After the motor runs continuously for 120s (the timer increments while the motor is running and decrements when it stops), it enters thermal protection mode. In this mode, the sunroof can only be closed manually and cannot be opened.
  Upon entering thermal protection, the motor cools for 18s, the available operating time increases by 9s, and if the cooling time exceeds 18s, the available operating time will continue to increase, but will not exceed 120s.



© 2026, All rights reserved

- Anti-pinch function.
  a. The sunshade features an anti-pinch function. During the closing operation, if an obstacle is encountered at a distance of 4mm to 200mm from the fully closed position, the sunshade will retract 200mm or return to the fully open position, and the anti-pinch force will not exceed 100N.

8.10.5 COMMON FAULTS

LIST OF FAULT SYMPTOMS

Symptom	Possible causes	Detection Method	Recommended Measures
Sunshade malfunction	1. Sunshade motor problem	Operate the sunshade motor	Replace sunshade motor
	2. Wiring harness connector fault	Check the wiring harness connectors for looseness and the pins for corrosion.	Replace wiring harness connector
	3.Sunshade anti-pinch function malfunction	Not reproduced after sunshade initialization	Sunshade Initialization
Abnormal noise from sunshade	1. The connection between the sunshade and the mushroom fastener on the headliner is loose.	Press the headliner mushroom clip firmly to verify the abnormal noise	Replace or repair headliner mushroom fasteners
	2. Debris in the sunshade guide rail	Check the guide rails, mechanical assembly, wind deflector, and soundproof seals for lubricant and debris.	Clear debris, apply oil manually
	3.Sunshade fixing bolts not tightened	Remove the headliner, verify whether the bolts are tightened.	Replace the bolt and tighten to the specified torque of 9±1N·m

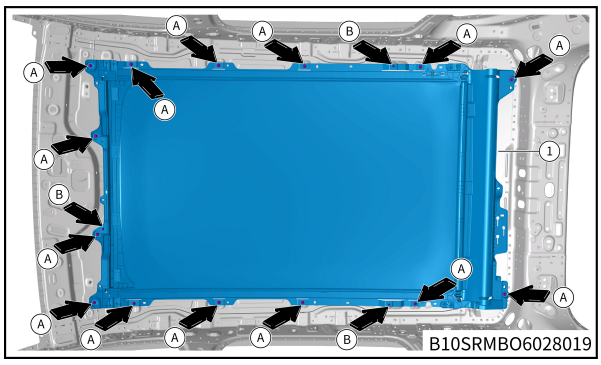
8.10.8 SERVICE AND REPAIR GUIDANCE

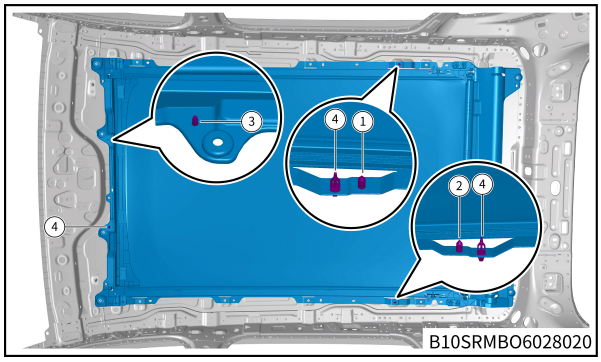


ELECTRIC SUNSHADE ASSEMBLY

REMOVAL PROCEDURE

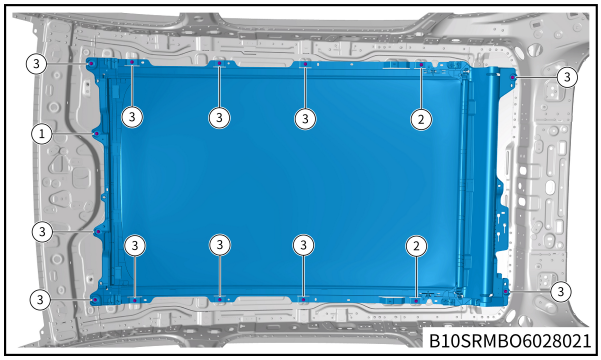
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the headliner assembly.
   See:Headliner assembly (Panoramic roof) (page 5528)
4. Remove the electric sunshade assembly.

a. Disconnect 1 connector -arrow- between the electric sunshade assembly and the floor wiring harness assembly.



b. Unscrew the 14 mounting bolts connecting the electric sunblind assembly to the body -Arrow A-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
c. Disconnect the 3 locating clip pins - Arrow B - connecting the electric sunshade assembly to the vehicle body, and remove the electric sunshade assembly ①.
   Recommended tool: Clip remover

> **ATTENTION**
>
> When removing the power sunshade assembly, an additional technician is required to assist in supporting it to prevent the component from falling and being damaged.



SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

© 2026, All rights reserved

a. Position the sunshade assembly onto the sunroof reinforcement panel according to the main locating pin ① on the right guide rail, the secondary locating pin ② on the left guide rail, and the auxiliary locating pin ③ on the front crossmember, and pre-install it using the pre-installation clips ④ on the left and right guide rails and the front crossmember of the sunshade.

b. Tighten the sunshade assembly in sequence. First, tighten bolt ① next to the auxiliary locating pin of the sunshade; second, tighten bolt ② next to the main and secondary locating pins of the sunshade; third, bolt the electric sunshade assembly to the sunroof reinforcement plate ③.
Recommended tool: 8mm socket
Torque: 9±1N m

c. After installation or repair of the electric sunshade, initialization and self-learning must be performed to ensure its smooth operation.
d. If the sunshade fails to close properly or does not close completely after a period of use, the sunshade needs to be initialized.
e. Initialization/Self-Learning Process
    a. To perform the initialization/self-learning process for the sunshade, the switch harness and the sunshade connectors must be connected correctly, the power supply must be turned on, and the power mode must be in the ON1\ON2\ON3 state.
f. Sunshade initialization operation:
    - On the "Settings - Doors and Windows" interface of the central control screen, press and hold the sunshade button for 10s until the sunshade starts to operate (you can release the button once the sunshade starts to operate). The sunshade will move to the fully open position, and then move to the fully closed position. After recording the fully closed position, the sunshade will move to the fully open position again and stop, completing the initialization.
    - The central control panel will prompt whether the sunshade initialization is successful or failed. If the sunshade initialization fails, please repeat the above steps.
g. If any of the following events occurs during the sunshade initialization/self-learning process, the sunshade initialization/self-learning will not be completed:
    a. The fully open or fully close button was not continuously pressed and held during the initialization/self-learning process.
    b. The power switch or power supply is turned off.
    c. The input voltage range of the sunshade segment is not within the 9V~16V range.
    d. Voltage fluctuation greater than 0.9 V within 100 ms.
h. After installation is completed, the electric sunshade assembly must be tested, and there should be no sticking or jamming during the test.
i. After installation, ensure that the relevant electrical components function properly.

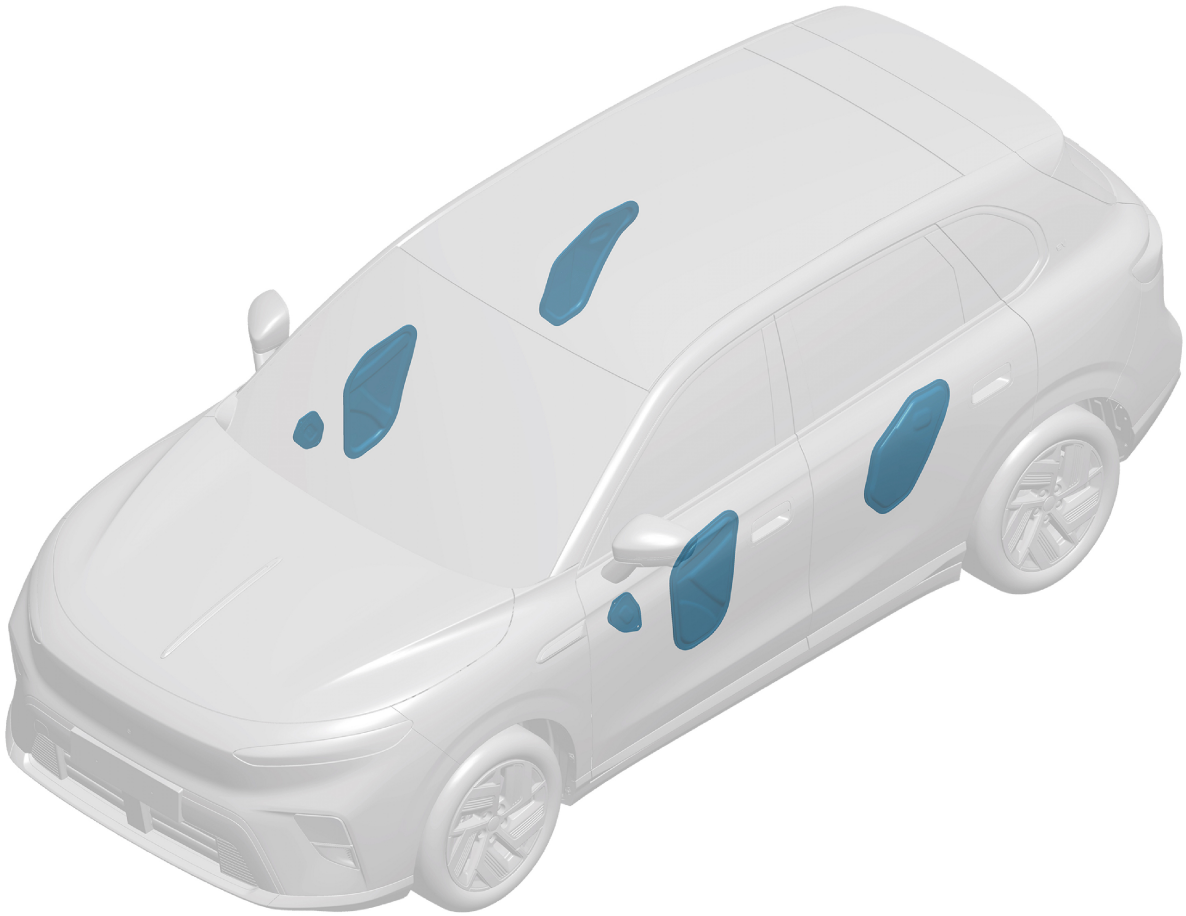
8.11 BLIND PLUG SYSTEM

8.11.1 PRECAUTIONS



PRECAUTIONS

1. The waterproof film must fit snugly against the sealing surface and be securely installed.
2. When installing the waterproof film, do not twist or fold it.
3. After installing the waterproof film, check the sealing to prevent water leakage.
4. When removing the waterproof film, use a heat gun to heat the bonding area of the waterproof film, and do not tear it forcefully during the removal process to prevent component damage.

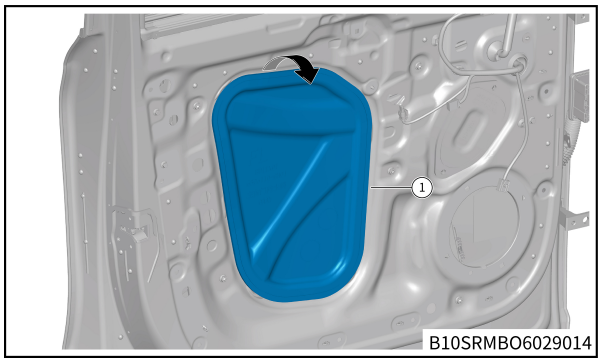
8.11.5 SERVICE AND REPAIR GUIDANCE



FRONT LEFT DOOR WATERPROOF MEMBRANE

NOTE

This section describes the removal and installation of the water shield for the front left door, and the removal and installation of the water shield for the front right door can generally follow the procedures for the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the left front door inner triangular trim panel assembly.
   See:Front left door inner sail panel assembly (page 5354)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door waterproof membrane.

a. Slowly remove the waterproof membrane ① of the left front door in the direction of the arrow.

NOTE

When removing the front door waterproof membrane, use a heat gun to heat the adhesive area of the membrane, and do not tear it off forcefully during removal to prevent component damage.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, wipe the sheet metal bonding surface with a cloth to ensure it is dry and free of dust, and after installation, roll the bonding area to ensure a secure bond.
   b. When the working environment temperature is below 20°C, the butyl sealant on the waterproof membrane needs to be preheated. When using an oven, the set temperature must not exceed 40°C, while ensuring that the temperature of the bonding surface of the waterproof membrane is not less than 25°C.
   c. The waterproof membrane must be properly installed; otherwise, there is a risk of water leakage.

REAR LEFT DOOR WATERPROOF FILM

NOTE

This section describes the removal and installation of the water shield for the left rear door, and the removal and installation for the right rear door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
3. Remove the waterproof film on the rear left door.

a. Slowly remove the waterproof membrane ① of the left rear door in the direction of the arrow.

NOTE

When removing the waterproof film on the rear door, use a heat gun to heat the bonding area of the film, do not tear it off forcefully during removal, to prevent component damage.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, wipe the sheet metal bonding surface with a cloth to ensure it is dry and free of dust, and after installation, roll the bonding area to ensure a secure bond.
   b. When the working environment temperature is below 20℃, the butyl sealant on the waterproof membrane needs to be preheated. When using an oven, the set temperature must not exceed 40℃, while ensuring that the temperature of the bonding surface of the waterproof membrane is not less than 25℃.
   c. The waterproof membrane must be properly installed; otherwise, there is a risk of water leakage.

FRONT DOOR FRONT WATERPROOF FILM

NOTE

This section describes the removal and installation of the waterproof membrane at the front of the left front door. The removal and installation for the right front door can generally follow the procedure for the left side.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
3. Remove the front water shield of the front door.

a. Slowly peel off the waterproof film ① at the front portion of the front door along the direction of the arrow.

NOTE

When removing the front waterproof membrane of the front door, use a heat gun to heat the bonding area of the waterproof membrane. Do not tear it forcefully during removal to prevent component damage.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Before installation, wipe the sheet metal bonding surface with a cloth to ensure it is dry and free of dust, and after installation, roll the bonding area to ensure a secure bond.
   b. When the working environment temperature is below 20°C, the butyl sealant on the waterproof membrane needs to be preheated. When using an oven, the set temperature must not exceed 40°C, while ensuring that the temperature of the bonding surface of the waterproof membrane is not less than 25°C.
   c. The waterproof membrane must be properly installed; otherwise, there is a risk of water leakage.

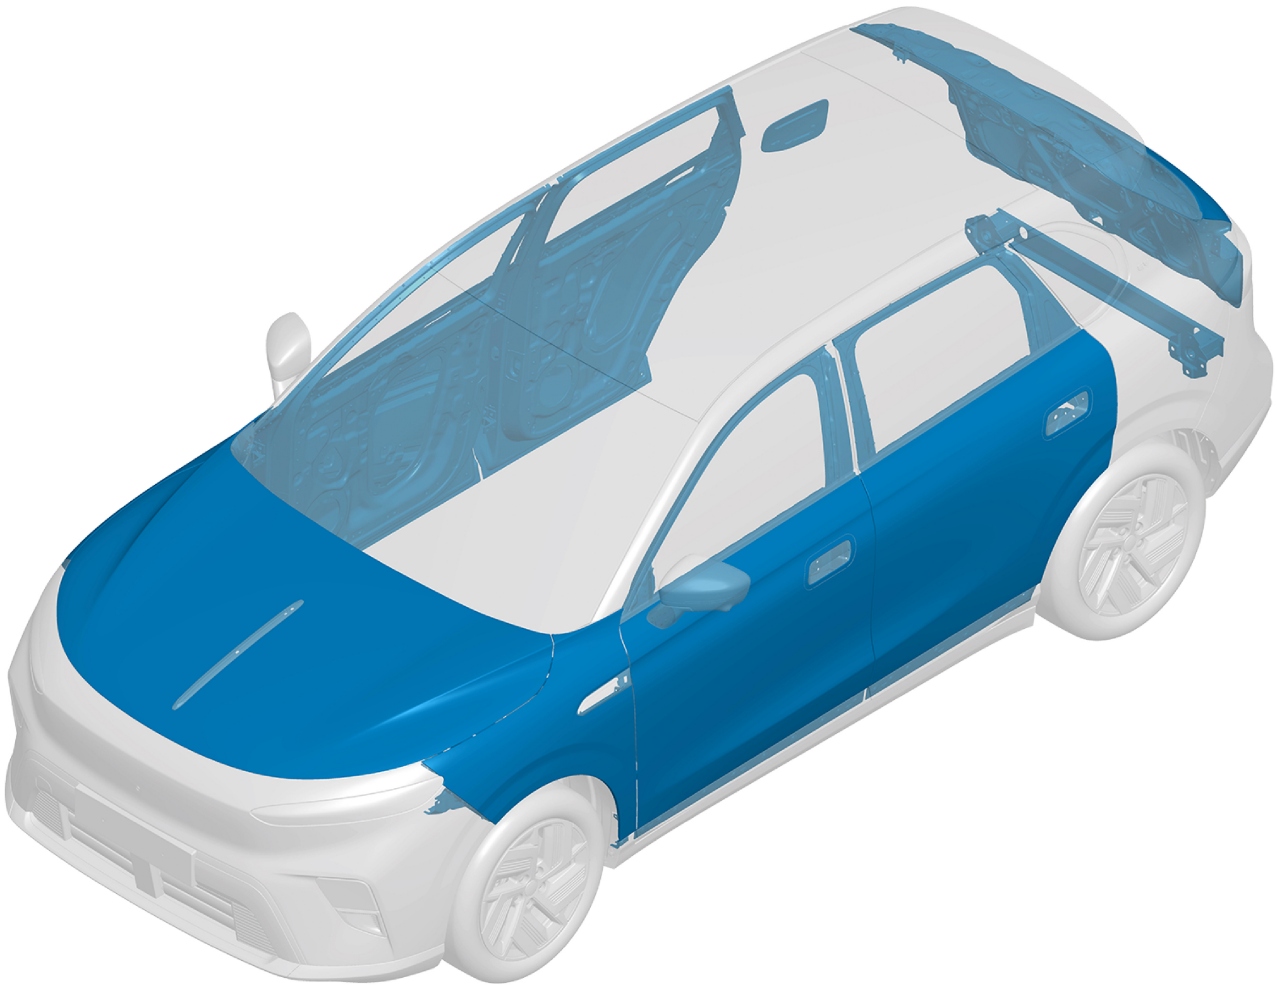
8.12 PAINTED BODY SYSTEM

8.12.1 PRECAUTIONS



PRECAUTIONS

1. Before repairing or replacing parts, carefully check whether the original or replacement parts meet the technical requirements.
2. After installation, the fasteners must be checked for the specified torque.
3. When removing the front hood assembly, front door assembly, liftgate assembly, and rear door assembly, at least two service technicians must assist in the removal and installation to prevent the assemblies from falling suddenly and causing personal injury or vehicle damage.
4. Before removal, lay a fender cover to prevent scratching the paint surface.
5. Before tightening the fender mounting bolts, check the clearance between the fender and the surrounding panels, and proceed with the subsequent operations after confirming it meets the standard values.

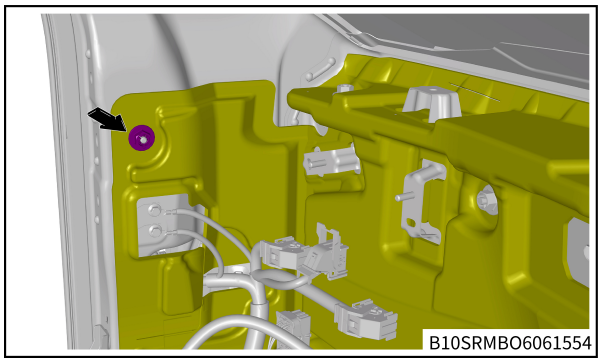
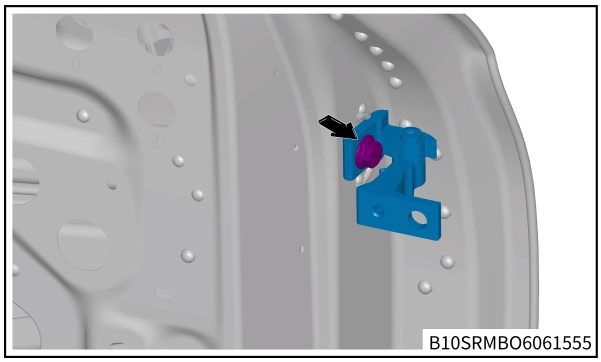
8.12.6 SERVICE AND REPAIR GUIDANCE



FRONT DOOR HINGE - LEFT (FRONT DOOR - UPPER)

NOTE

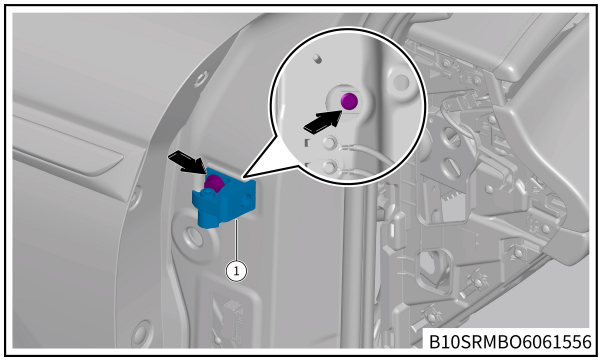


If both front door hinges need to be replaced or repaired simultaneously, first replace or repair one hinge, and then replace or repair the other.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the left trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
5. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
6. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
7. Remove the main zone controller.
   See:Master Zone Controller (page 6640)
8. Remove the front door hinge - left.

a. Unscrew the 1 plastic nut - arrow - connecting the inner dash insulator to the body, and lift up one corner of the inner dash insulator.



b. Unscrew the 1 fixing bolt - arrow - connecting the left front door hinge to the left front door assembly.
Recommended tool: 15mm socket
Torque: 52±5N m

NOTE

When removing the left front door hinge, the door will tilt, requiring another technician to assist in supporting the front door assembly.

© 2026, All rights reserved

c. Unscrew the 2 fixing bolts -arrow- connecting the left front door hinge to the vehicle body.
Recommended tool: 15mm wrench
Torque: 35±3N m
d. Remove the front door hinge - Left ①.

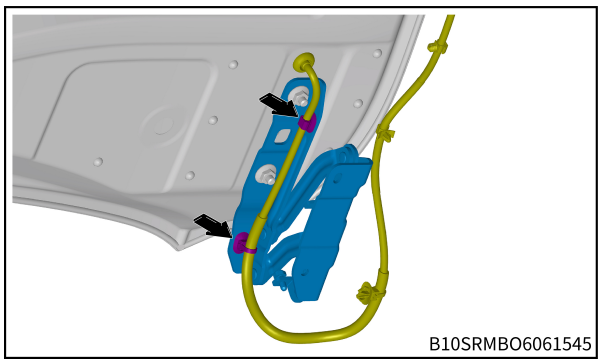
NOTE

When removing the left front door hinge, the door will tilt, requiring another technician to assist in supporting the front door assembly.

SETUP

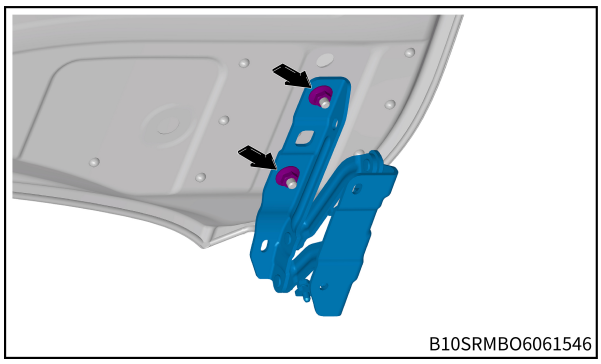
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



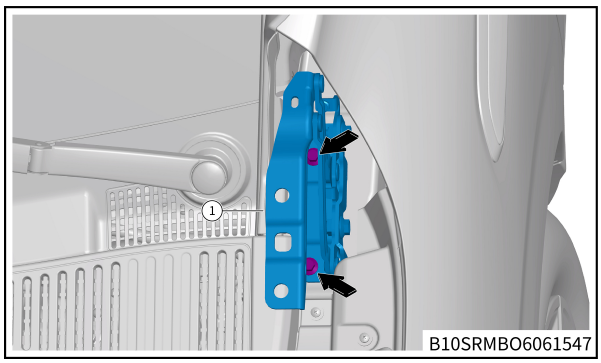
LEFT HOOD HINGE ASSEMBLY

NOTE



- This section describes the removal and installation of the front hood left hinge assembly, and the removal and installation of the front hood right hinge assembly can generally follow the procedure for the left side.
- If both hood hinge assemblies need to be replaced or repaired simultaneously, first replace or repair one hood hinge assembly, and then replace or repair the other.

REMOVAL PROCEDURE



1. Open the front hood assembly.
2. Remove the front cover left hinge assembly.

a. Disconnect the 2 retaining clips connecting the front washer line to the front hood left hinge assembly - arrow -.
Recommended tool: Clip remover

b. Unscrew the 2 fixing nuts -arrow- connecting the front cover left hinge assembly to the front cover assembly.
Recommended tool: 13mm socket
Torque: 25±2N m

c. Unscrew the 2 fixing bolts -arrow- connecting the front hood left hinge assembly to the body, and remove the front hood left hinge assembly ①.
Recommended tool: 10mm socket

© 2026, All rights reserved

Torque: 25±2N m

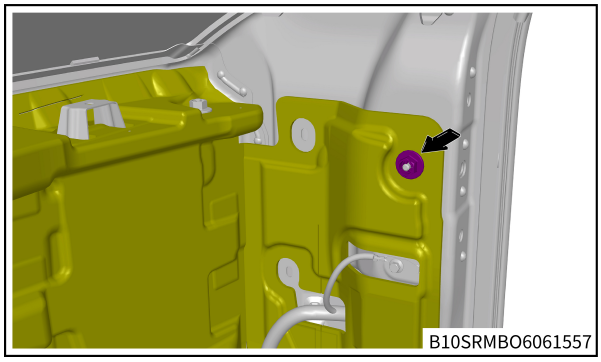
NOTE

The hood assembly is relatively heavy and requires the joint assistance of two technicians for removal and installation. During removal, be sure to support and hold the hood assembly securely to avoid breaking the glass.

SETUP

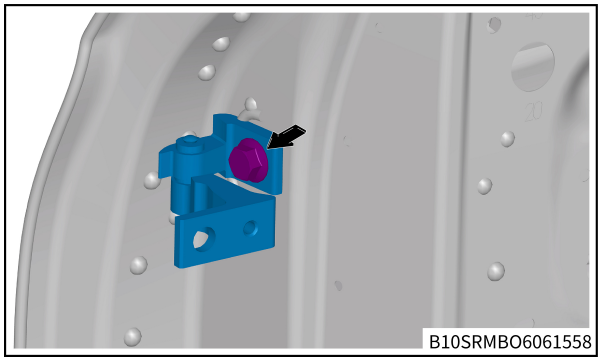
1. Perform the installation procedure in reverse order, and note the following:
   a. Adjust the peripheral clearance and flatness of the front cover assembly.
   See:Adjust the front cover assembly (page 6629)

© 2026, All rights reserved



FRONT DOOR HINGE - RIGHT (FRONT DOOR - UPPER)

NOTE

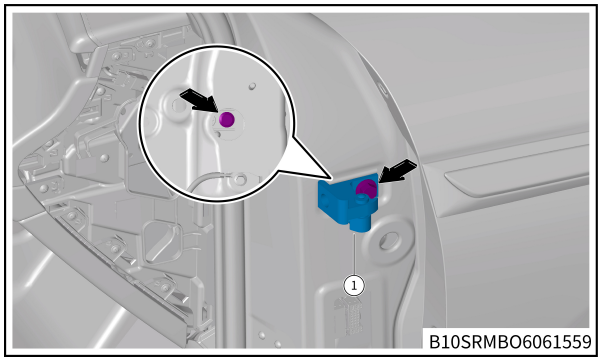


If both front door hinges need to be replaced or repaired simultaneously, first replace or repair one hinge, and then replace or repair the other.

REMOVAL PROCEDURE

1. Open the right front door assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
5. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
6. Remove the right trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
7. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
8. Remove front door hinge - right.

a. Unscrew the 1 plastic nut - arrow - connecting the inner dash insulator to the body, and lift up one corner of the inner dash insulator.



b. Unscrew 1 fixing bolt - arrow - connecting the front door hinge - right to the right front door assembly.
Recommended tool: 15mm socket
Torque: 52±5N m

NOTE

When removing the front door hinge - right, the door will tilt, requiring an additional technician to assist in supporting the front door assembly.

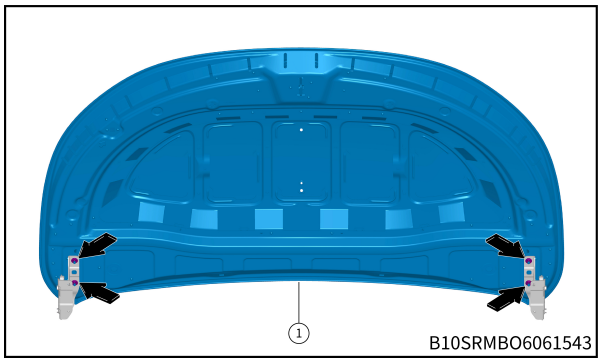
© 2026, All rights reserved

c. Unscrew the 2 fixing bolts -arrow- connecting the right front door hinge to the body.
Recommended tool: 15mm wrench
Torque: 35±3N m
d. Remove the right front door hinge ①.

NOTE

When removing the front door hinge - right, the door will tilt, requiring an additional technician to assist in supporting the front door assembly.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

HOOD ASSEMBLY

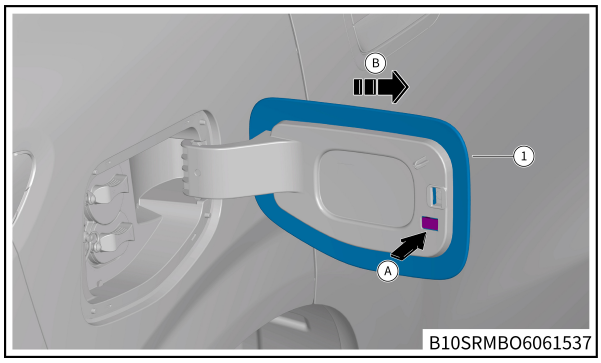
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the front hood assembly.
3. Remove the front washer line 1.
   See:Front washer line 1 (page 9515)
4. Remove the front washer line with the nozzle.
   See:Front washer line with nozzle (page 9516)
5. Remove the front washer line.
   See:Front washer line (page 9514)
6. Remove the front badge.
   See:Front badge (page 5336)
7. Remove the front cover assembly.

a. Unscrew the 4 fixing nuts -arrow- connecting the front cover assembly to the front cover left/right hinge assembly.
   Recommended tool: 13mm socket
   Torque: 25±2N m
b. Remove the front cover assembly ①.

> NOTE
>
> The hood assembly is relatively heavy and requires the joint assistance of two maintenance technicians for removal and installation. During removal and installation, take care not to smash the windshield assembly. After lowering the hood assembly, place it on a rubber mat to avoid scratching the painted surface of the hood assembly.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the peripheral clearance and flatness of the front cover assembly.
      See:

© 2026, All rights reserved

CHARGING PORT COVER ASSEMBLY

REMOVAL PROCEDURE

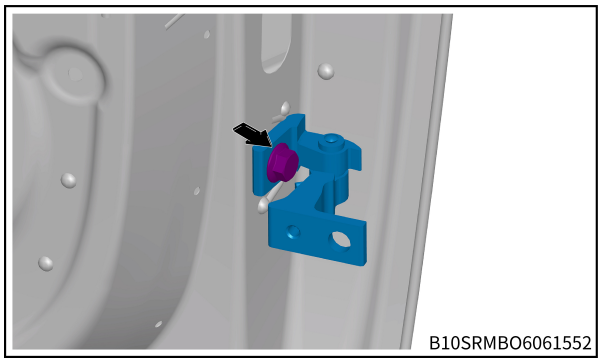
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Remove the charging port cover assembly.

a. Open the charging port cover assembly.
b. Pry up the fixing clip at -Arrow A-, and remove the charging port cover assembly ① in the direction of -Arrow B-.
Recommended tool: Interior trim removal tool

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

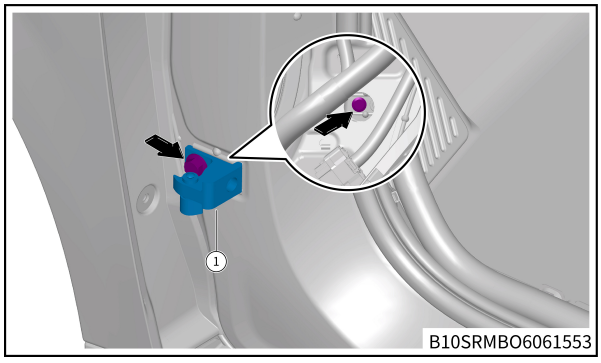


FRONT DOOR HINGE - LEFT (FRONT DOOR - LOWER)

NOTE

- This section describes the removal and installation of the left front door hinge, and the removal and installation of the right front door hinge can generally refer to the left side.
- If both front door hinges need to be replaced or repaired simultaneously, first replace or repair one hinge, and then replace or repair the other.

REMOVAL PROCEDURE



1. Open the front left door assembly.
2. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the front door hinge - left.

a. Unscrew the 1 fixing bolt - arrow - connecting the left front door hinge to the left front door assembly.
Recommended tool: 15mm socket
Torque: 52±5N m

NOTE

When removing the left front door hinge, the door will tilt, requiring another technician to assist in supporting the front door assembly.

b. Unscrew the 2 fixing bolts -arrow- connecting the left front door hinge to the vehicle body.
Recommended tool: 15mm wrench
Torque: 35±3N m
c. Remove the front door hinge - Left ①.

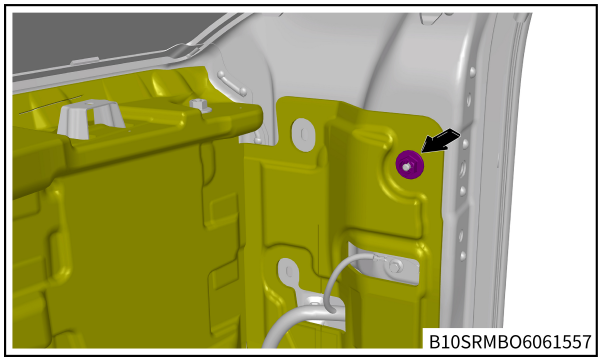
NOTE

When removing the left front door hinge, the door will tilt, requiring another technician to assist in supporting the front door assembly.

SETUP

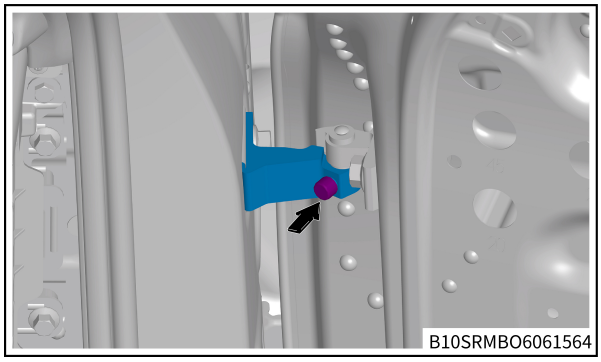
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



RIGHT FRONT DOOR HINGE BODY-SIDE HINGE (FRONT DOOR - UPPER)

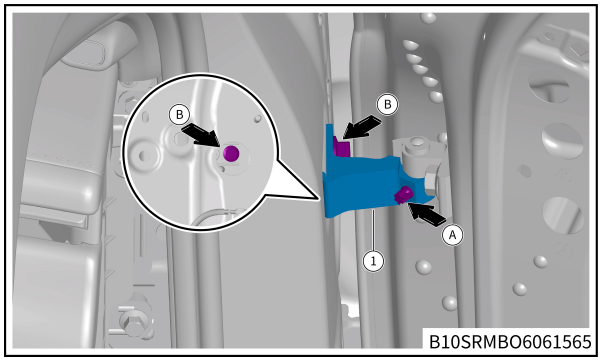
NOTE



If both body-side hinges of the front door need to be replaced or repaired simultaneously, first remove and install one body-side hinge, and then remove and install the other.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
4. Remove the right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
5. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
6. Remove the right trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
7. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
8. Remove the body-side hinge of the right front door.



a. Unscrew the 1 plastic nut - arrow - connecting the inner dash insulator to the body, and lift up one corner of the inner dash insulator.

b. Remove the front door hinge bolt sleeve -arrow-.

© 2026, All rights reserved

c. Unscrew the 1 locating bolt -arrow A- connecting the body-side hinge of the right front door hinge to the door-side hinge of the right front door hinge.
Recommended tool: E8mm Torx socket
Torque: 24±2N m

d. Unscrew the 2 mounting bolts -arrow B- connecting the body-side bracket of the right front door hinge to the body, and remove the body-side bracket of the right front door hinge ①.
Recommended tool: 15mm wrench
Torque: 35±3N m

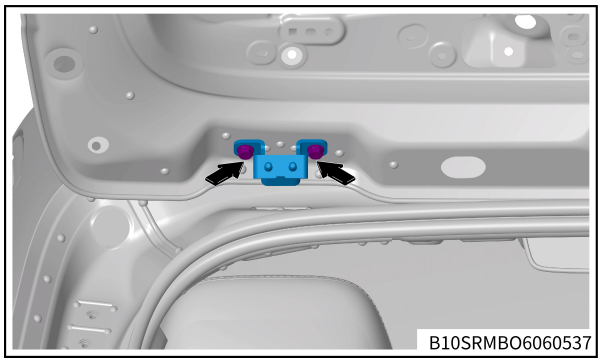
NOTE

When removing the body-side hinge of the front door, the door will sag, requiring an additional technician to assist in supporting the front door assembly.

SETUP

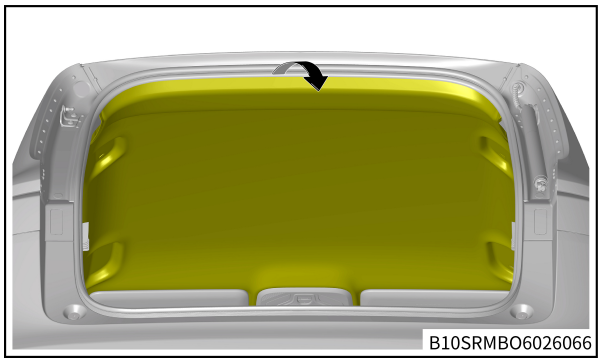
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LIFTGATE HINGE ASSEMBLY

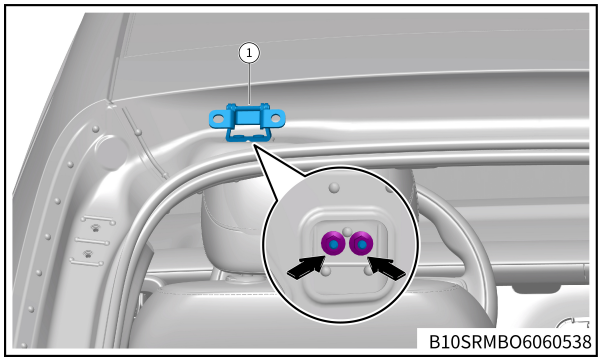
NOTE



- This section describes the removal and installation of the left liftgate hinge assembly. The removal and installation of the right liftgate hinge assembly can generally follow the procedure for the left side.
- If both liftgate hinge assemblies need to be replaced or repaired simultaneously, first replace or repair one liftgate hinge assembly, and then replace or repair the other.

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right lower C-pillar interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
5. Remove the left/right grab handle assembly of the rear folding roof.
   See:Rear folding roof left handle assembly (page 5532)
6. Remove the tailgate hinge assembly.



a. Unscrew the 2 fixing bolts connecting the liftgate hinge assembly to the liftgate assembly - arrow -.
Recommended tool: 13mm socket
Torque: 25±2N m

b. Lift one side of the headliner assembly along the arrow.

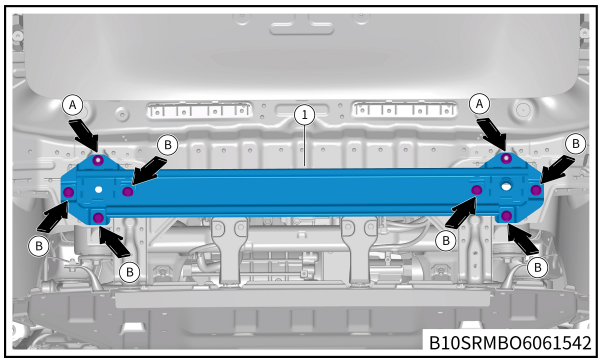
© 2026, All rights reserved

c. Unscrew the 2 fixing nuts - arrow - connecting the liftgate hinge assembly to the vehicle body, and remove the liftgate hinge assembly ①.
Recommended tool: 13mm socket
Torque: 25±2N m

NOTE

The liftgate assembly is relatively heavy and requires two technicians to work together for removal and installation.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the clearances around the liftgate assembly and its flatness.
   See:Adjust the liftgate assembly (page 6634)

© 2026, All rights reserved

REAR IMPACT BEAM ASSEMBLY

REMOVAL PROCEDURE

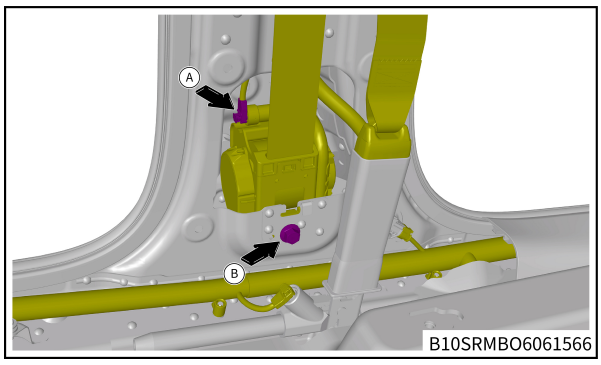
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the rear impact beam assembly.

a. Unscrew the 2 fixing nuts connecting the rear bumper beam assembly to the vehicle body - Arrow A -.
   Recommended tool: 15mm socket
   Torque: 50±5N m
b. Unscrew the 6 mounting bolts - Arrow B - connecting the rear bumper beam assembly to the vehicle body, and remove the rear bumper beam assembly ①.
   Recommended tool: 15mm socket
   Torque: 50±5N m

SETUP

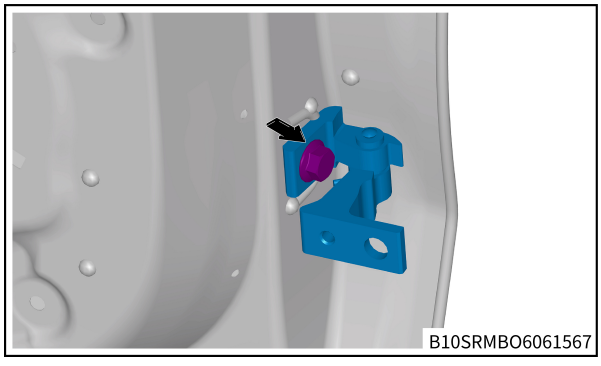
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT DOOR HINGE - LEFT (REAR DOOR)

NOTE

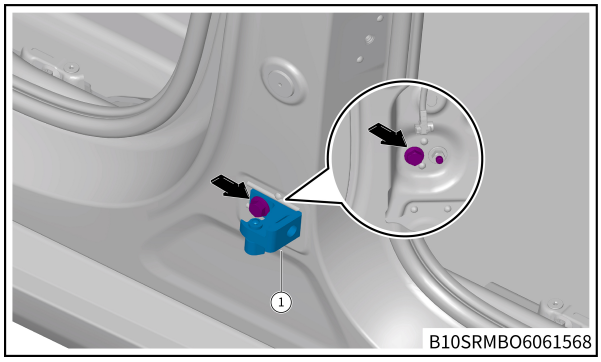


- This section describes the removal and installation of the front door hinge - Left (rear door), and the removal and installation of the front door hinge - Right (rear door) can generally follow the procedure for the left side.
- If both rear door hinges need to be replaced simultaneously, first replace or repair one hinge, and then replace or repair the other.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
5. Remove the front door hinge - left.

a. Disconnect the 1 connector between the front left seat belt assembly and the floor wiring harness assembly - arrow A -.
b. Unscrew the 1 fixing bolt -Arrow B- connecting the front left seat belt assembly to the body, and remove the front left seat belt assembly.
   Recommended tool: 14mm socket
   Torque: 50±5N m



c. Unscrew the 1 fixing bolt -arrow- connecting the front door hinge - left to the left rear door assembly.
   Recommended tool: 15mm wrench
   Torque: 52±5N m

NOTE

When removing the front door hinge - left (rear door), the door may tilt, requiring another technician to assist in supporting the rear door assembly.

© 2026, All rights reserved

d. Unscrew the 2 fixing bolts -arrow- connecting the left front door hinge to the vehicle body.
Recommended tool: 15mm wrench
Torque: 35±3N m
e. Remove the front door hinge - Left ①.

NOTE

When removing the front door hinge - left (rear door), the door may tilt, requiring another technician to assist in supporting the rear door assembly.

SETUP

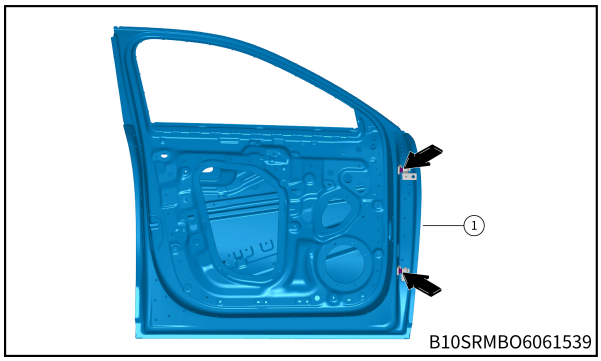
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

LEFT FRONT DOOR ASSEMBLY

NOTE

This section describes the removal and installation of the front left door assembly. The removal and installation of the front right door assembly can generally be performed by referring to the left side.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left front door inner triangular trim panel assembly.
   See:Front left door inner sail panel assembly (page 5354)
4. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
5. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
6. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
7. Remove the left front door outer trim panel assembly.
   See:Front left door exterior trim panel assembly (page 5294)
8. Remove the front left door glass assembly.
   See:Front left door glass assembly (page 6387)
9. Remove the woofer assembly (front door).
   See:Woofer Assembly (Front Door) (page 9474)
10. Remove the front left power window regulator assembly.
    See:Left front door power window regulator assembly (page 6428)
11. Remove the lower guide rail assembly of the left front door.
    See:Front left door front lower guide rail assembly (page 6553)
12. Remove the left front door rear guide rail assembly.
    See:Left front door rear guide rail assembly (page 6551)
13. Remove the left triangular outer trim panel assembly.
    See:Left triangular outer trim panel assembly (page 5278)
14. Remove the front left door sealing strip.
    See:Front left door sealing strip (page 6402)
15. Remove the front left door outer belt molding.
    See:Front left door outer belt molding (page 6401)
16. Remove the inner belt weatherstrip of the front left door.
    See:Front left door inner water deflector (page 6400)
17. Remove the front left door guide channel weatherstrip.
    See:Front left door guide channel weatherstrip (page 6406)
18. Remove the outside handle of the front left door.
    See:Front left exterior door handle (page 6563)
19. Remove the front left door lock body.
    See:Front left door lock body (page 6456)
20. Remove the left exterior rearview mirror assembly.

© 2026, All rights reserved

See:Left exterior rearview mirror assembly (page 5279)

21. Remove the lock cylinder rod.
    See:Lock cylinder rod (page 6450)
22. Remove the front door check assembly.
    See:Front door check assembly (page 6539)
23. Remove the left front door wiring harness assembly.
    See:Front left door wiring harness assembly (page 9555)
24. Remove the front left door assembly.

a. Unscrew the 2 fixing bolts -arrow- connecting the left front door assembly to the front door hinge - left.
   Recommended tool: 15mm wrench
   Torque: 52±5N m
b. Remove the left front door assembly ①.

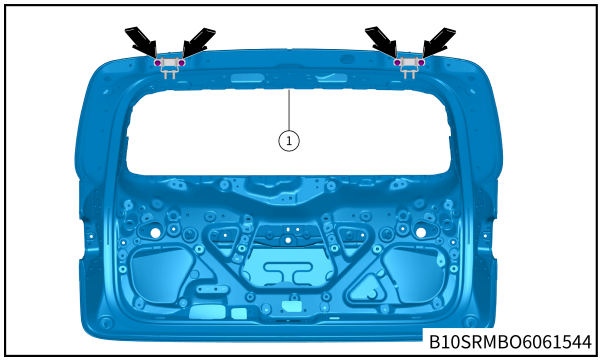
NOTE

The front door assembly is relatively heavy, requiring two service technicians to work together to remove the left front door assembly. Place the front door on a protective rubber mat to prevent scratching the painted surface of the door.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the gaps and flushness around the front door assembly.
      See:Adjust the front door assembly (page 6631)

© 2026, All rights reserved



TAILGATE ASSEMBLY

NOTE

The liftgate assembly is relatively heavy, and its removal and installation require the assistance of two technicians.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the buffer block (liftgate).
   See:Buffer block (tailgate) (page 6628)
4. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
5. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
6. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
7. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9457)
8. Remove the spoiler assembly.
   See:Spoiler assembly (page 5312)
9. Remove the liftgate lock.
   See:Tailgate lock (page 6448)
10. Remove the left/right side bracket of the tailgate electric strut.
    See:Left bracket for liftgate electric strut (page 6546)
11. Remove the liftgate wiring harness assembly.
    See:Liftgate wiring harness assembly (page 9541)
12. Remove the rear windshield assembly.
    See:Rear windshield assembly (page 6384)
13. Remove the liftgate assembly.

a. Unscrew the 4 fixing bolts -arrow- connecting the liftgate assembly to the liftgate hinge assembly, and remove the liftgate assembly ①.
Recommended tool: 13mm socket

© 2026, All rights reserved

Torque: 25±2N m

NOTE

The liftgate assembly is relatively heavy and requires two technicians to work together to remove it. Place the liftgate assembly on a rubber mat to prevent scratching its painted surface.

SETUP

1. Perform the installation procedure in reverse order, while noting the following.
   a. Adjust the clearances around the liftgate assembly and its flatness.
   See:Adjust the liftgate assembly (page 6634)

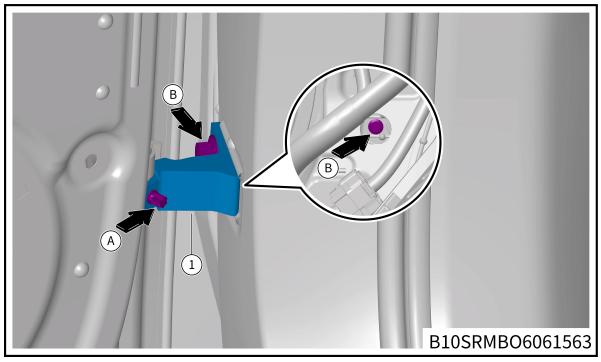
LEFT FRONT DOOR HINGE BODY-SIDE HINGE (FRONT DOOR - LOWER)

NOTE



- This section describes the removal and installation of the left front door body-side hinge, and the removal and installation of the right front door body-side hinge can generally be performed by referring to the left side.
- If both body-side hinges of the front door need to be replaced or repaired simultaneously, first remove and install one body-side hinge, and then remove and install the other.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
3. Remove the lower left A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
4. Remove the body-side hinge of the left front door hinge.

a. Remove the front door hinge bolt sleeve -arrow-.

b. Unscrew the 1 locating bolt -arrow A- connecting the body-side hinge of the left front door hinge to the door-side hinge of the left front door hinge.
   Recommended tool: E8mm Torx socket
   Torque: 24±2N m
c. Unscrew the 2 mounting bolts -arrow B- connecting the body-side bracket of the left front door hinge to the body, and remove the body-side bracket of the left front door hinge ①.
   Recommended tool: 15mm wrench

© 2026, All rights reserved

Torque: 52±5N m

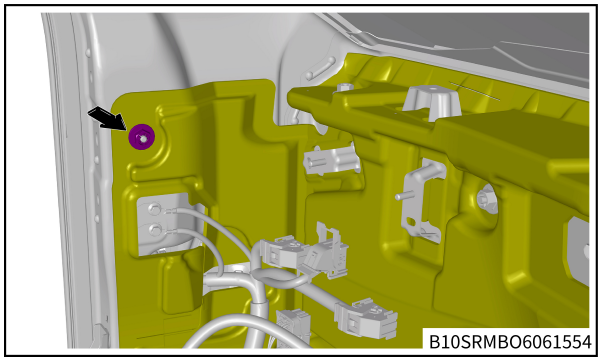
NOTE

When removing the body-side hinge of the front door, the door will sag, requiring an additional technician to assist in supporting the front door assembly.

SETUP

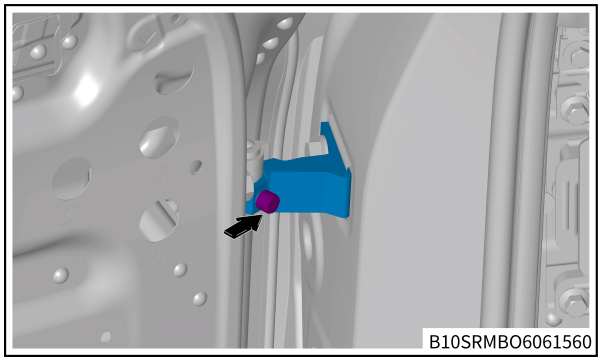
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT FRONT DOOR HINGE BODY-SIDE HINGE (FRONT DOOR - UPPER)

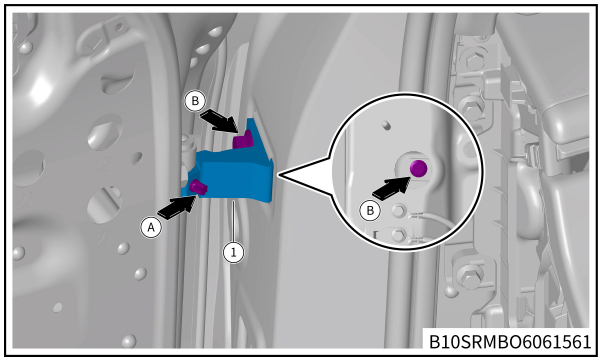
NOTE



If both body-side hinges of the front door need to be replaced or repaired simultaneously, first remove and install one body-side hinge, and then remove and install the other.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left extension plate assembly of the auxiliary instrument panel.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the left trim panel assembly of the center console.
   See:Center console left trim panel assembly (page 5469)
5. Remove the instrument panel left end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
6. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
7. Remove the main zone controller.
   See:Master Zone Controller (page 6640)
8. Remove the body-side hinge of the left front door hinge.



a. Unscrew the 1 plastic nut - arrow - connecting the inner dash insulator to the body, and lift up one corner of the inner dash insulator.

b. Remove the front door hinge bolt sleeve -arrow-.

© 2026, All rights reserved

c. Unscrew the 1 locating bolt -arrow A- connecting the body-side hinge of the left front door hinge to the door-side hinge of the left front door hinge.
Recommended tool: E8mm Torx socket
Torque: 24±2N m

d. Unscrew the 2 mounting bolts -arrow B- connecting the body-side bracket of the left front door hinge to the body, and remove the body-side bracket of the left front door hinge ①.
Recommended tool: 15mm wrench
Torque: 35±3N m

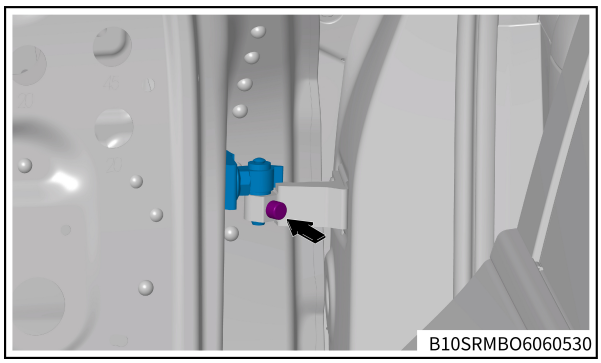
NOTE

When removing the body-side hinge of the front door, the door will sag, requiring an additional technician to assist in supporting the front door assembly.

SETUP

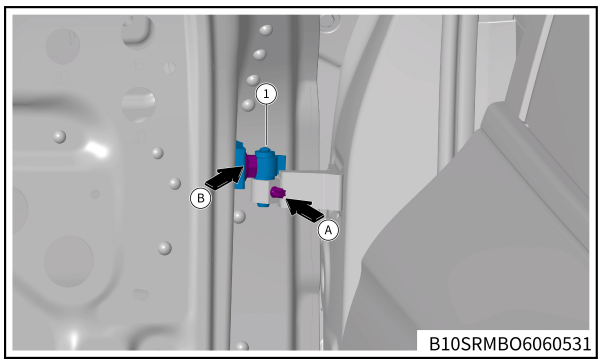
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT FRONT DOOR HINGE, DOOR SIDE HINGE (FRONT DOOR)

NOTE



- This section describes the removal and installation of the door-side hinge for the single hinge on the front left door, and the removal and installation of the door-side hinge for the single hinge on the front right door can generally refer to the left side.
- If both door-side hinges of the front door need to be replaced or repaired simultaneously, first replace or repair one door-side hinge, and then replace or repair the other.

REMOVAL PROCEDURE

1. Open the front left door assembly.
2. Remove the door-side hinge of the front left door.

a. Remove the front door hinge bolt sleeve -arrow-.

b. Unscrew the 1 locating bolt -arrow A- connecting the door-side hinge of the left front door hinge to the body-side hinge of the left front door hinge.
Recommended tool: E8mm Torx socket
Torque: 24±2N m

c. Unscrew the 1 fixing bolt - Arrow B - connecting the left front door hinge door-side leaf to the left front door assembly, and remove the left front door hinge door-side leaf ①.
Recommended tool: 15mm socket
Torque: 52±5N m

NOTE

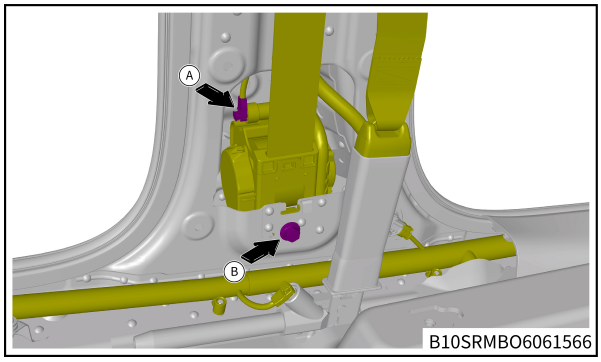
When removing the door-side hinge of the front door, the door may tilt, requiring an additional technician to assist in supporting the front door assembly.

© 2026, All rights reserved

SETUP

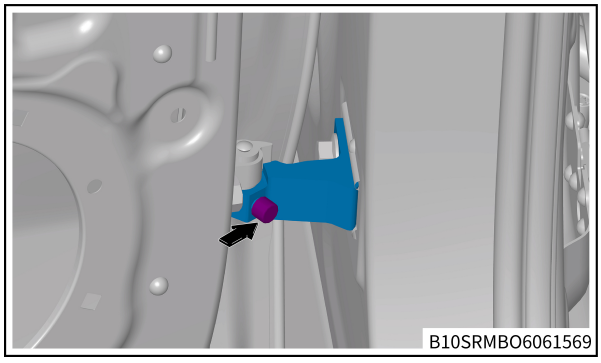
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



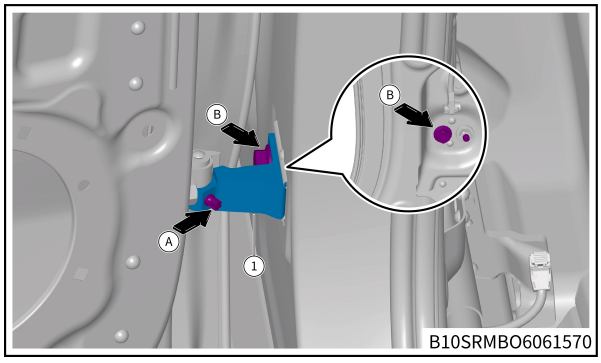
LEFT FRONT DOOR HINGE BODY SIDE HINGE (REAR DOOR)

NOTE



- This section describes the removal and installation of the left front door hinge (body side) and the left rear door hinge (body side), the removal and installation of the right front door hinge (body side) and the right rear door hinge (body side) can generally be performed by referring to the left side.
- If both body-side hinges of the rear door need to be replaced simultaneously, first replace one body-side hinge, and then proceed with the removal and installation of the other body-side hinge.

REMOVAL PROCEDURE



1. Open the rear left door assembly.
2. Remove the left B-pillar upper trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
3. Remove the left B-pillar lower interior trim panel assembly.
   See:Left B-pillar lower interior trim panel assembly (page 5387)
4. Remove the body-side hinge of the left front door hinge.

a. Disconnect the 1 connector between the front left seat belt assembly and the floor wiring harness assembly - arrow A -.
b. Unscrew the 1 fixing bolt -Arrow B- connecting the front left seat belt assembly to the body, and remove the front left seat belt assembly.
   Recommended tool: 14mm socket
   Torque: 50±5N m

c. Remove the rear door hinge bolt sleeve -arrow-.

d. Unscrew the 1 locating bolt -arrow A- connecting the body-side hinge of the left front door hinge to the door-side hinge of the left front door hinge.
   Recommended tool: E8mm Torx socket
   Torque: 24±2N m
e. Unscrew the 2 mounting bolts -arrow B- connecting the body-side bracket of the left front door hinge to the body, and remove the

© 2026, All rights reserved

body-side bracket of the left front door hinge ①.

Recommended tool: 15mm wrench

Torque: 35±3N m

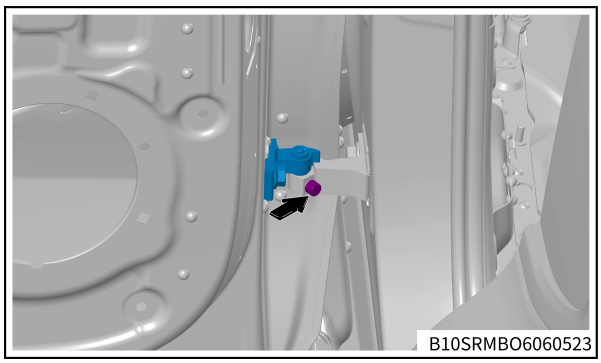
NOTE

When removing the body-side hinge of the front door hinge (rear door), the door may tilt, requiring another technician to assist in supporting the rear door assembly.

SETUP

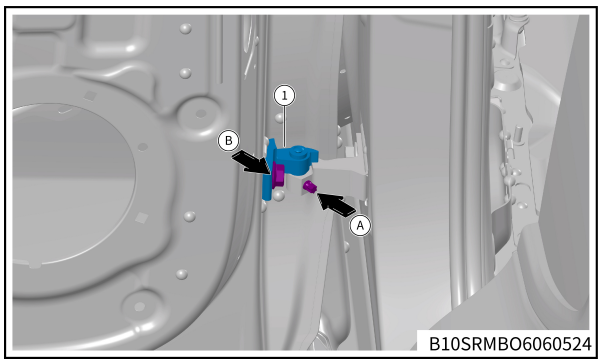
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



LEFT FRONT DOOR HINGE, DOOR-SIDE HINGE (REAR DOOR)

NOTE



- This section describes the removal and installation of the single door-side hinge for the left front door (rear door). The removal and installation of the single door-side hinge for the right front door (rear door) can generally be performed by referring to the left side.
- If both door-side hinges of the rear door need to be replaced simultaneously, first replace one door-side hinge, and then proceed with the removal and installation of the other door-side hinge.

REMOVAL PROCEDURE

1. Open the rear left door assembly.
2. Remove the door-side hinge of the front left door.

a. Remove the rear door hinge bolt sleeve -arrow-.

b. Unscrew the 1 locating bolt -arrow A- connecting the door-side hinge of the left front door hinge to the body-side hinge of the left front door hinge.
Recommended tool: E8mm Torx socket
Torque: 24±2N m

c. Unscrew the 1 fixing bolt - arrow B - connecting the door-side leaf of the left front door hinge to the left rear door assembly, and remove the door-side leaf of the left front door hinge ①.
Recommended tool: 15mm wrench
Torque: 52±5N m

NOTE

When removing the door-side hinge of the front door hinge (rear door), the door will tilt, requiring another technician to assist in supporting the rear door assembly.

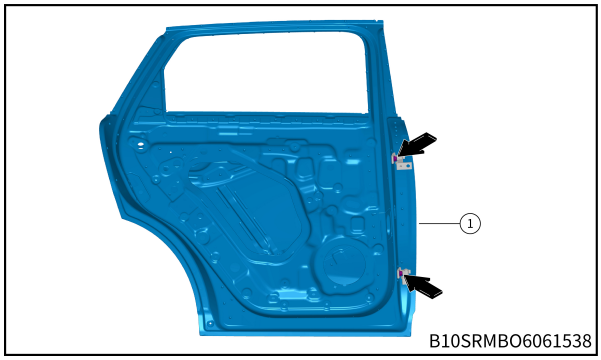
LEFT REAR DOOR ASSEMBLY

NOTE

This section describes the removal and installation of the left rear door assembly, and the removal and installation of the right rear door assembly can generally refer to the left side.



REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
5. Remove the rear left door glass assembly.
   See:Rear left door glass assembly (page 6377)
6. Remove the rear left power window regulator assembly.
   See:Left rear door power window regulator assembly (page 6430)
7. Remove the left rear door front guide rail assembly.
   See:Left Rear Door Front Guide Rail Assembly (page 6550)
8. Remove the left rear door rear guide rail assembly.
   See:Left Rear Door Rear Guide Rail Assembly (page 6411)
9. Remove the left rear door weatherstrip.
   See:Left rear door weatherstrip (page 6405)
10. Remove the rear left wheel arch seal.
    See:Left rear door wheel arch weatherstrip (page 6410)
11. Remove the left rear door exterior trim panel assembly.
    See:Left rear door exterior trim panel assembly (page 5293)
12. Remove the outer belt weatherstrip of the left rear door.
    See:Left rear door outer belt weatherstrip (page 6412)
13. Remove the inner belt weatherstrip of the left rear door.
    See:Left rear door inner belt weatherstrip (page 6413)
14. Remove the left rear outside door handle.
    See:Left rear door outside handle (page 6561)
15. Remove the rear left door guide channel sealing strip.
    See:Rear left door guide channel sealing strip (page 6414)
16. Remove the B-pillar left rear outer trim panel assembly.
    See:Rear Left B-Pillar Outer Trim Panel Assembly (page 5309)
17. Remove the left outer trim panel assembly of the C-pillar.
    See:Left C-pillar outer trim panel assembly (page 5310)
18. Remove the rear left door lock body.
    See:Left rear door lock body (page 6453)
19. Remove the woofer assembly (rear door).
    See:Woofer Assembly (Rear Door) (page 9477)
20. Remove the left rear door wiring harness assembly.

© 2026, All rights reserved

See:Left rear door wiring harness assembly (page 9557)

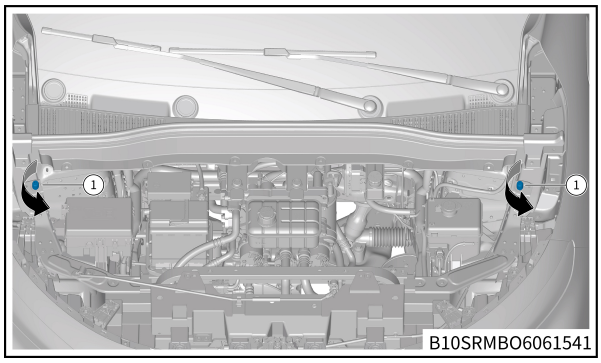
21. Remove the rear door check assembly.
    See:Rear door check assembly (page 6540)
22. Remove the left rear door assembly.

a. Unscrew the 2 fixing bolts -arrow- connecting the left rear door assembly to the left front door hinge.
   Recommended tool: 15mm wrench
   Torque: 52±5N m
b. Remove the left rear door assembly ①.

NOTE

The rear door assembly is relatively heavy and requires two service technicians to work together to remove it. Place the rear door assembly on a rubber mat to prevent scratching the painted surface of the door.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the gaps and flushness around the rear door assembly.
      See:Adjust the rear door assembly (page 6627)

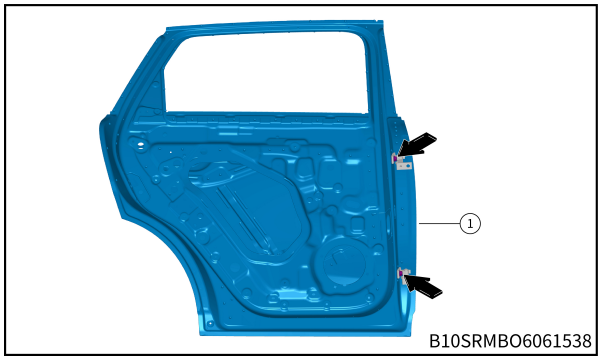
© 2026, All rights reserved

BUFFER BLOCK (FRONT COMPARTMENT)

REMOVAL PROCEDURE

1. Open the front hood assembly.
2. Remove the bump stop.

a. Unscrew buffer block ① counterclockwise in the direction of the arrow.

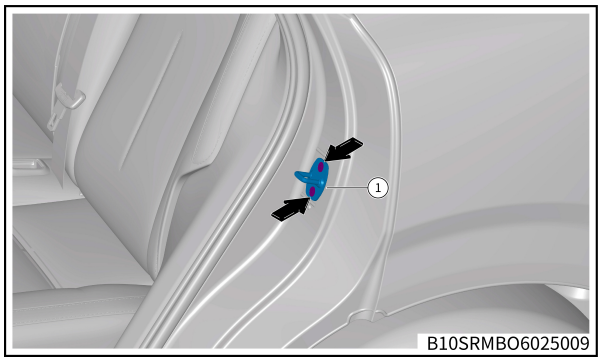


SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the peripheral clearance and flatness of the front cover assembly.
   See:Adjust the front cover assembly (page 6629)

© 2026, All rights reserved

ADJUST THE REAR DOOR ASSEMBLY



1. Check the clearance and flatness around the rear door assembly.
   a. Check and confirm that the gap values at all positions around the rear door are within the respective standard ranges; if they do not meet the requirements, adjust the body panel gaps.
2. Adjust the rear door assembly clearance.

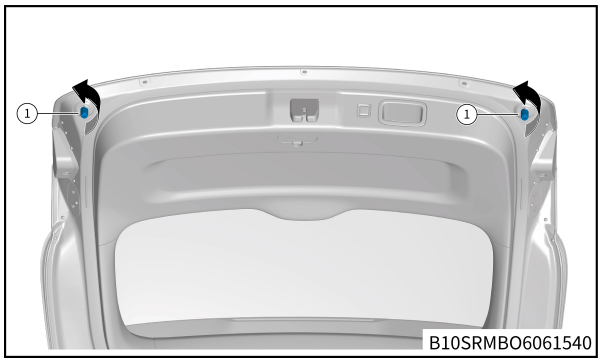
   a. Open the rear door assembly ①.
   b. Loosen the 2 fixing bolts -arrow- connecting the rear door assembly ① to the rear door hinge assembly.
   Recommended tool: 15mm wrench
   Torque: 52±5N m
   c. After adjusting the rear door assembly ① clearance to the proper position, tighten the hinge fixing bolt -arrow-.

> NOTE
>
> Before tightening the bolts, do not vigorously operate or open and close the doors, otherwise the adjusted position will change.

3. Adjust the flatness of the rear door assembly.

   a. Loosen the 2 fixing bolts -arrow- securing the front door striker (rear door) to the body, and adjust the position of the front door striker (rear door) ① up/down and left/right to change the gap and flushness between the rear door assembly and the body.
   Recommended tool: T40 Torx wrench
   Torque: 23±2N m

4. Close and lock the rear door, and check that the gap and flushness between the rear door assembly and the surrounding sheet metal parts meet the standard values.



> NOTE
>
> If the test result does not meet the standard value, readjust it according to the above steps.

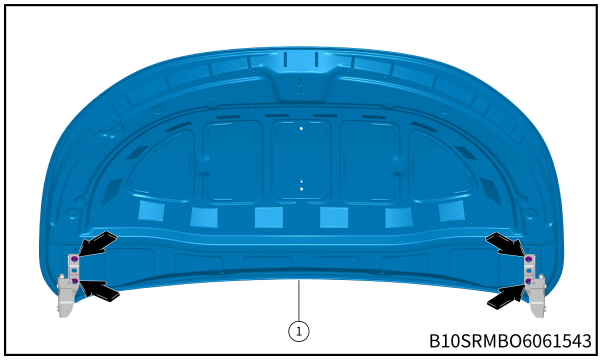
© 2026, All rights reserved

BUFFER BLOCK (TAILGATE)

REMOVAL PROCEDURE

1. Open the liftgate assembly.
2. Remove the bump stop.

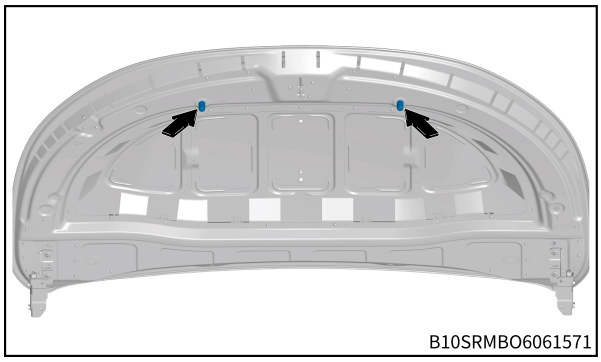
a. Unscrew buffer block ① counterclockwise in the direction of the arrow.



SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Adjust the clearances around the liftgate assembly and its flatness.
   See:Adjust the liftgate assembly (page 6634)

© 2026, All rights reserved



ADJUST THE FRONT COVER ASSEMBLY

1. Check the clearance around the front cover assembly and its flatness.
   a. Check and confirm that the gap values at all parts around the hood are within the respective standard ranges, and if they do not meet the requirements, adjust the body panel gaps.
2. Adjust the front cover assembly gap.

   a. Open and securely support the front hood assembly ①.
   b. Loosen the 4 fixing nuts -arrow- connecting the front cover assembly ① to the front cover left/right hinge assembly.
   Recommended tool: 13mm socket
   Torque: 25±2N m
   c. Move the front cover assembly ① slightly in the required adjustment direction.
   d. After adjusting the gap of the front hood assembly ① to the proper position, tighten the hinge fixing nut -arrow-.

3. Adjust the flatness of the front cover assembly.

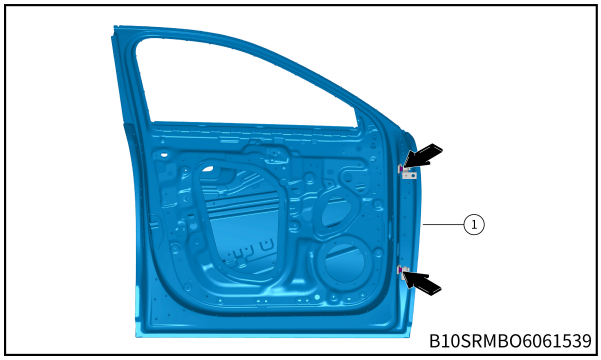
   a. Rotate the buffer block -arrow- located on the front cover clockwise or counterclockwise appropriately.

> **NOTE**
>
> Rotating the buffer block clockwise lowers the hood assembly, and vice versa raises it.

   b. Rotate the buffer block -arrow- located in the front compartment clockwise or counterclockwise as appropriate.

> **NOTE**
>
> Rotating the buffer block clockwise lowers the hood assembly, and vice versa raises it.

4. Close and lock the front hood assembly, and check that the gap and flushness between the front hood assembly and the surrounding panels meet the standard values.



> **NOTE**
>
> If the test result does not meet the standard value, readjust it according to the above steps.

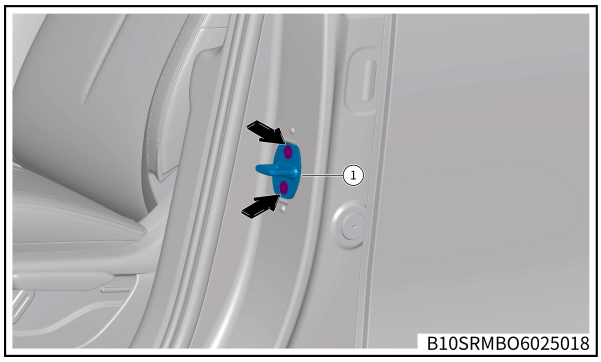
ADJUST THE FRONT DOOR ASSEMBLY



1. Check the clearance and flatness around the front door assembly.
   a. Check and confirm that the gap values at all positions around the front door are within the respective standard ranges. If they do not meet the requirements, adjust the body panel gaps.
2. Adjust the front door assembly clearance.

   a. Open the front door assembly ①.
   b. Loosen the 2 fixing bolts -arrow- connecting the front door assembly ① to the front door upper/lower hinge assembly.
   Recommended tool: 15mm wrench
   Torque: 52±5N m
   c. After adjusting the front door assembly ① clearance to the proper position, tighten the hinge fixing bolt -arrow-.

> **NOTE**
>
> Before tightening the bolts, do not vigorously operate or open and close the doors, otherwise the adjusted position will change.

3. Adjust the flatness of the front door assembly.

   a. Loosen the 2 fixing bolts -arrow- connecting the front door striker to the body, and adjust the position of the front door striker ① up/down and left/right to change the gap and flushness between the front door assembly and the body.
   Recommended tool: T40 Torx wrench
   Torque: 23±2N m

4. Close the front door assembly, and check that the gap and flushness between the front door assembly and the surrounding sheet metal parts meet the standard values.

> **NOTE**
>
> If the test result does not meet the standard value, readjust it according to the above steps.

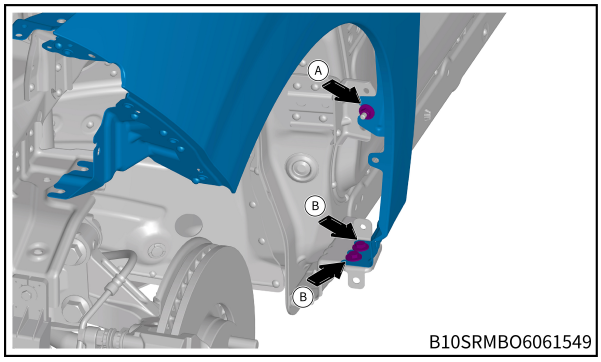
LEFT FENDER ASSEMBLY

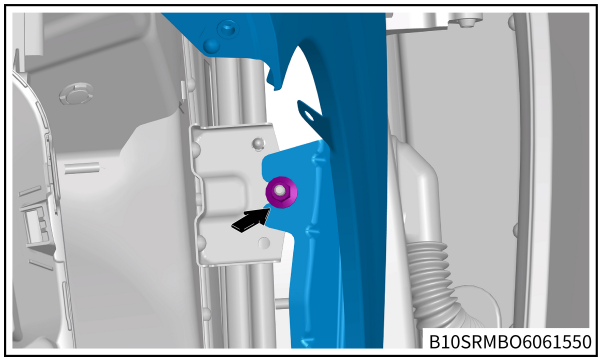
NOTE

This section describes the removal and installation of the left fender assembly. The removal and installation of the right fender assembly can generally be performed with reference to the left side.



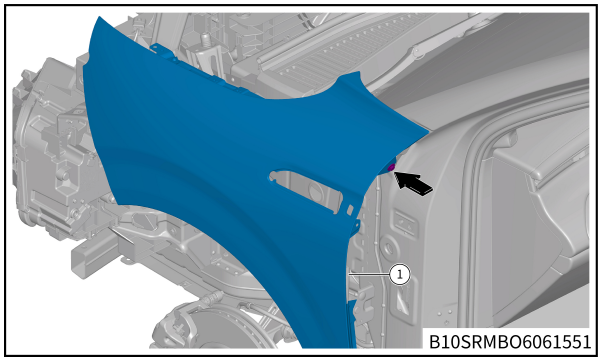
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left end cover of the ventilation window cover.
   See:Left end cover of ventilation window cover (page 5305)
4. Remove the left hinge trim panel.
   See:Left hinge trim panel (page 5304)
5. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
6. Remove the front left wheel arch liner assembly.
   See:Front Left Wheel Arch Liner Assembly (page 5328)
7. Remove the left side skirt panel assembly.
   See:Left side skirt assembly (page 5295)
8. Remove the left front steering daytime running lamp assembly.
   See:Front left turn signal and daytime running light assembly (page 9445)
9. Remove the front bumper left mounting bracket assembly 1.
   See:Front bumper left mounting bracket assembly 1 (page 5244)
10. Remove the front bumper left mounting bracket 2.
    See:Front bumper left mounting bracket 2 (page 5243)
11. Remove the left blind spot camera trim panel assembly.
    See:Left Blind Spot Camera Trim Panel Assembly (page 5335)
12. Remove the left fender liner assembly.
    See:Left fender liner assembly (page 5339)
13. Remove the left fender assembly.



a. Unscrew the 5 mounting bolts connecting the left fender assembly to the body -arrow-.
Recommended tool: 10mm socket
Torque: 9±1N m

© 2026, All rights reserved

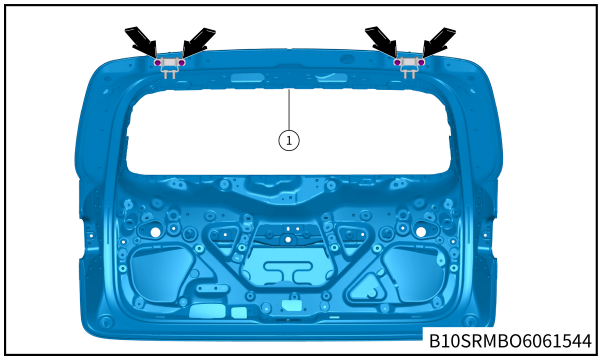


b. Unscrew the 1 fixing nut connecting the left fender assembly to the body - arrow A -.
Recommended tool: 10mm socket
Torque: 9±1N m

c. Unscrew the 2 mounting bolts connecting the left fender assembly to the body - Arrow B -.
Recommended tool: 10mm socket
Torque: 9±1N m

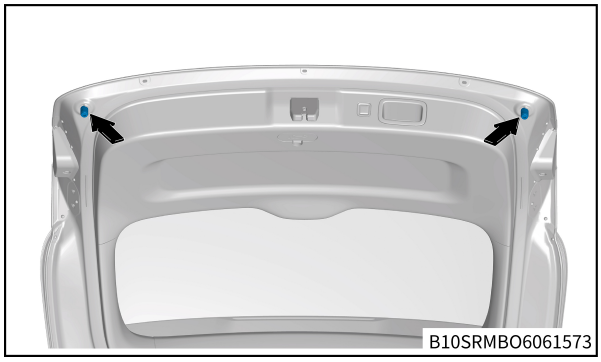
d. Unscrew the 1 fixing nut connecting the left fender assembly to the body -arrow-.
Recommended tool: 10mm socket
Torque: 9±1N m

e. Unscrew 1 fixing bolt -arrow- connecting the left fender assembly to the body, and remove the left fender assembly ①.
Recommended tool: 10mm socket
Torque: 9±1N m



SETUP

1. Perform the installation procedure in reverse order, and note the following:
   a. Before tightening the fender mounting bolts, check the clearance between the fender and the surrounding panels, and proceed with the subsequent operations after confirming it meets the standard values.



© 2026, All rights reserved

ADJUST THE LIFTGATE ASSEMBLY

1. Check the clearance and flatness around the liftgate assembly.
   a. Check and confirm that the gap values around the tailgate are within the respective standard ranges. If they do not meet the requirements, adjust the body panel gaps.
2. Adjust the liftgate assembly gap.

a. Open the tailgate assembly ①.
b. Loosen the 4 fixing bolts -arrow- connecting the tailgate assembly ① to the left/right tailgate hinge assembly.
Recommended tool: 13mm socket
Torque: 25±2N m
c. Slightly move the tailgate assembly ① in the required adjustment direction.
d. Tighten the fixing bolts -arrow- connecting the tailgate assembly ① to the left/right tailgate hinge assembly.

e. Adjust the flatness of the tailgate assembly by rotating the buffer block located on the tailgate assembly clockwise or counterclockwise as appropriate - arrow -.

> NOTE
>
> Rotating the buffer block clockwise lowers the liftgate assembly, and vice versa raises it.

3. Close the liftgate, and check that the gap and flush between the liftgate assembly and the surrounding sheet metal parts meet the standard values.

> NOTE
>
> If the test result does not meet the standard value, readjust it according to the above steps.

9 ELECTRICAL AND ELECTRONIC SYSTEM

9.1 BODY CONTROL SYSTEM

9.1.1 PRECAUTIONS

PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Warning regarding disconnecting the battery:

> **ATTENTION**
>
> Before servicing any electrical components, the central control panel must be powered off for maintenance, and all electrical loads must be turned off, unless otherwise specified in the operating procedures. If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

2. Warning Regarding Road Test:

> **ATTENTION**
>
> Test drive the vehicle while ensuring safety and comply with all traffic regulations. Do not attempt any operation that may compromise vehicle control. Failure to comply with these safety instructions may result in serious personal injury and vehicle damage.

3. Precautions for setting the central control panel to the maintenance power-off state when disconnecting the battery:

> **ATTENTION**
>
> Whenever connecting or disconnecting battery cables, battery chargers, or jumper cables, be sure to set the central control screen to the maintenance power-off state. Otherwise, it may result in damage to control modules or other electrical components.

9.1.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Body Control System:

1. System Overview:
   - The body control system includes the main zone controller.
   - The main zone controller controls the following functions:
     - Front combination lamp
     - Vanity mirror lamp
     - Reading lamp
     - Hazard warning lamp
     - Rear combination lamp
     - License plate light
     - Rear fog lamp
     - Reversing lamp
     - Brake light
     - Trunk light
     - Front wiper motor
     - Steering wheel heating
     - Front Left and Right Window Up/Down
     - Left and Right Rear Window Up/Down
     - Left and Right Front Door Locks
     - Left and right rear door locks
     - Left and right exterior rearview mirror heating, adjustment, turn signal lamps, and blind spot warning lights
     - Washer motor
     - Front hood lock
     - Horn
     - Charge port door lock
     - Slow charging port lock
     - Trunk lock
     - Driver Seat Adjustment
     - Front Passenger Seat Adjustment
     - Front Seat Ventilation
     - Front Seat Heating

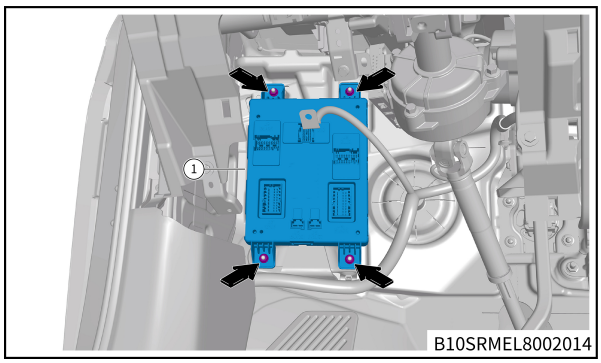
9.1.6 SERVICE AND REPAIR GUIDANCE



MASTER ZONE CONTROLLER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the main zone controller.

a. Disconnect the 7 connector plugs of the main zone controller -Arrow A-, -Arrow B-, -Arrow C-, -Arrow D-, -Arrow E-, -Arrow F-.

b. Unscrew the 4 mounting nuts -arrow- of the main zone controller, and remove the main zone controller ①.
Recommended tool: 10mm socket
Torque: 5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the main zone controller requires the use of a diagnostic tool to perform the following operations:

> **ATTENTION**
>
> After installing the controller, first read its software version. If the new version is higher than or equal to the old version, it can be used normally. If the new version is lower than the old version, the controller software must first be updated to the original vehicle version or the corresponding OTA version.

- Write VIN: Select the corresponding vehicle model - System Diagnostics - ZCUM - Data Writing - Write VIN.
- IMMO Injection: Select the corresponding vehicle model - System Diagnostics - Select the corresponding configuration - IMMO Injection.

9.2.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Smart Cabin System:

1. System Overview:
   - The intelligent cockpit system includes an 8.8-inch instrument display, a 14.6-inch central control display, and a telematics host. The multi-domain fusion controller integrates functions such as vehicle control, multimedia entertainment, 360-degree surround view, and digital instrument cluster, controls the intelligent driving assistance system, and provides driving assistance functions.
2. System Composition:
   - This system consists of a multi-domain fusion controller, a central control display, and an instrument display.
3. Smart Cockpit System Schematic:

9.2.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-TBOX

Fault codes can be read through the vehicle's OBD diagnostic interface using a diagnostic tool. By utilizing the TBOX data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without disassembling any parts. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION-TBOX

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST-TBOX

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B150004	High CPU usage	Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150104	CPU usage is too low	Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150204	High memory usage	Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150304	Memory usage is too low	Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150498	SoC Overheating Fault	1. High ambient temperature 2. Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150582	MCU and SoC communication failure	Abnormal MCU operation	1.Restart the TBOX (disconnect and reconnect the negative battery terminal or the TBOX main connector) 2. Replace the TBOX
B150604	EMMC Failure	eMMC Module Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150787	Abnormal GPS serial port data	1.Abnormal GPS antenna connection 2.GPS antenna abnormal 3.TBOX Abnormal	1.Check the GPS antenna connection 2. Check and replace GPS antenna assembly 3.Check and replace the TBOX

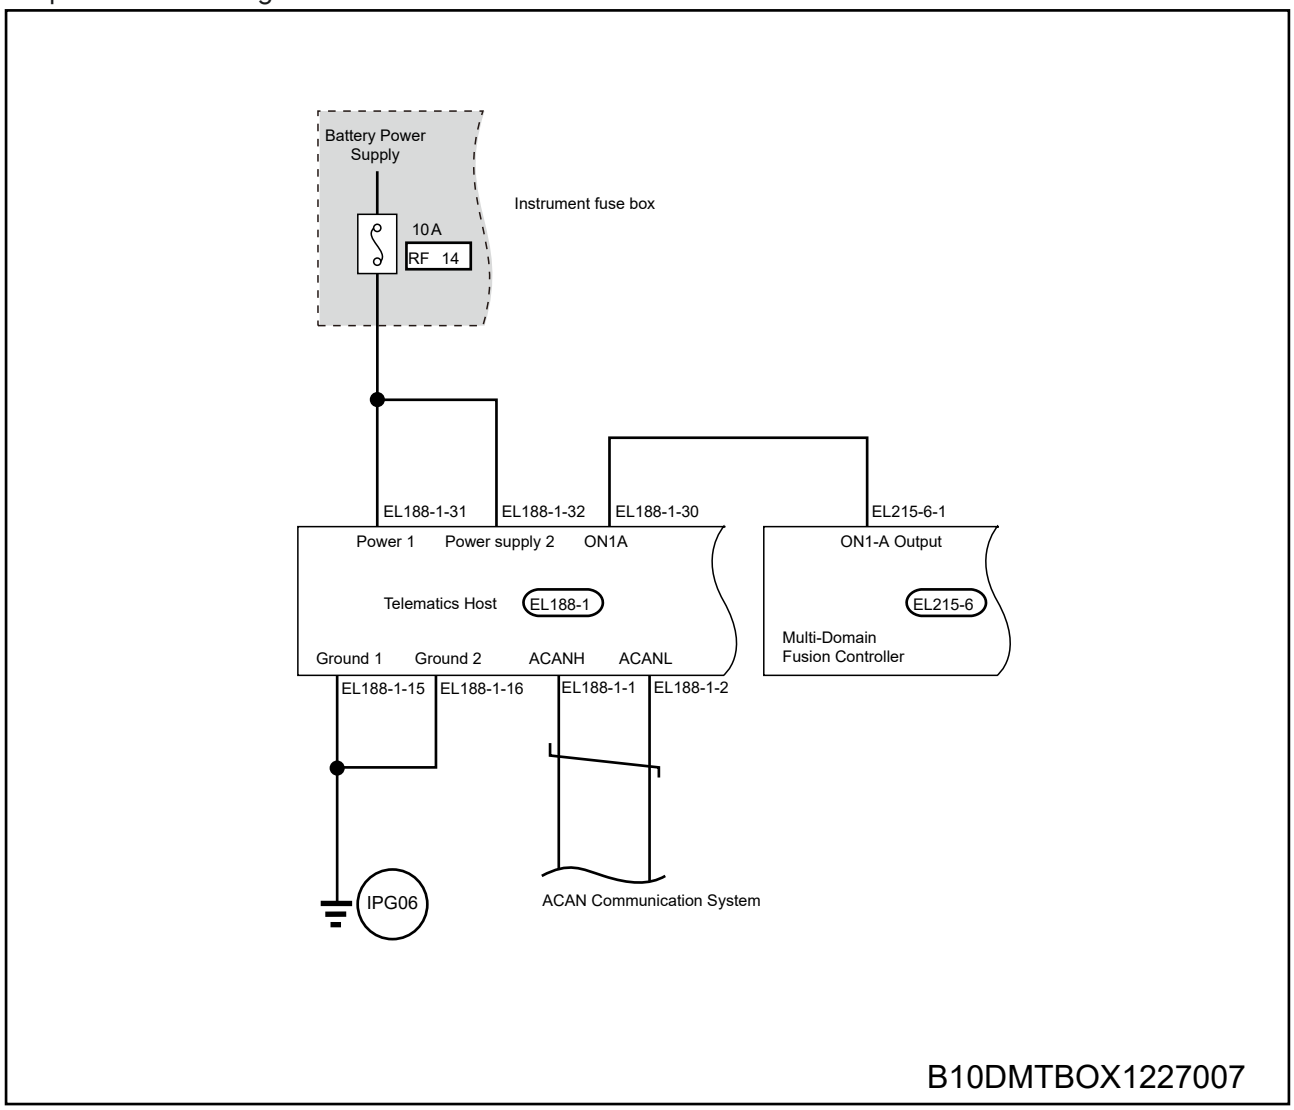
© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B150813	Communication antenna connection disconnected	1. Abnormal wiring harness connection 2. Communication antenna malfunction	1. Disconnect and reconnect the connector 2.Replace the wiring harness
B150811	Communication antenna short to ground fault	1. Abnormal wiring harness connection 2. Communication antenna malfunction	1.Check the communication antenna connection status 2. Replace the TBOX
B150A44	SIM Abnormal	Abnormal SIM card	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150C13	GNSS Antenna Connection Disconnected	1. Abnormal wiring harness connection 2. Communication antenna malfunction	1. Disconnect and reconnect the connector 2.Replace the wiring harness
B150C11	GNSS Antenna Short to Ground Fault	1. Abnormal wiring harness connection 2. Communication antenna malfunction	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the external GNSS antenna 3.Replace TBOX
B150D82	Communication Between TBOX and HPC	1. Ethernet network exception 2.HPC controller failure	1. Check the Ethernet network 2.Check the HPC controller
B150E82	USB Network Communication (TBOX and V2X)	Internal System Fault	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B150F01	HPC Wake-up Output Fault	System hardware failure	1.Restart the TBOX and confirm whether the fault is cleared. 2. Replace the TBOX
B151042	RTC Fault	1. Battery discharge 2. I2C access failure 3.RTC chip damaged	1. Check the battery 2. Restart the TBOX 3.Replace TBOX

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B151111	MIC Short to Ground Fault (Detection required if eCall is configured)	1. Abnormal wiring harness connection 2. MIC abnormal	1.Check the MIC connection status 2. Replace the TBOX
B151112	MIC short to 12V fault (Detection required when equipped with eCall)	1. Abnormal wiring harness connection 2. MIC abnormal	1.Check the MIC connection status 2. Replace the TBOX
B151113	MIC disconnection fault (detection required when eCall is configured)	1. Abnormal wiring harness connection 2. MIC abnormal	1.Check the MIC connection status 2. Replace the TBOX
B151219	Horn overcurrent fault (Detection required when eCall is configured)	1. Abnormal wiring harness connection 2.Abnormal horn	1.Check the horn connection status 2. Replace the TBOX
B151213	Horn disconnect fault (to be checked when eCall is configured)	1. Abnormal wiring harness connection 2.Abnormal horn	1.Check the horn connection status 2. Replace the TBOX
B151212	Horn output shorted to PVDD (Detection required when eCall is configured)	1. Abnormal wiring harness connection 2.Abnormal horn	1.Check the horn connection status 2. Replace the TBOX
B151211	Horn output short to ground (Detection required when eCall is configured)	1. Abnormal wiring harness connection 2.Abnormal horn	1.Check the horn connection status 2. Replace the TBOX
B151200	Horn output short circuit (check required when eCall is configured)	1. Abnormal wiring harness connection 2.Abnormal horn	1.Check the horn connection status 2. Replace the TBOX
B151300	T-BOX network port physical connection disconnected	1.Physical interface abnormality 2.T-BOX Malfunction	1.Check the physical interface status 2. Replace the TBOX
B151400	T-BOX has not received the QNX broadcast packet	1. Abnormal wiring harness connection 2.HPC Abnormality 3. T-BOX Abnormality	1.Check the wiring harness connection status 2.Replacement of HPC 3.Replace the T-BOX
B151500	Abnormal configuration content	Software Issues	1. Check software version 2.Rewrite offline configuration information 3.Replace TBOX
B151600	Connection error	Network failure	1. Check the SIM card plan

© 2026, All rights reserved



DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
			2.Check the connector wiring harness 3.Replace TBOX
B151700	Network card error	Hardware failure	1.Wire harness inspection and maintenance 2. Replace the TBOX
B151800	PHY abnormal	Connector and wiring harness cause	1.Check the wiring harness connection status 2. Replace T-BOX
B151801	4G network abnormal	1.TBOX software issue 2. TBOX SIM Card Issue	1. Restart TBOX 2. Replace the TBOX

DTC: B150498-TBOX

Fault code	Description
B150498	SoC Overheating Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the ambient temperature.	
	A Check whether the ambient temperature is too high.
	Yes 》》》 Wait until the temperature drops and recheck.
	No 》》》 Go to step 3.
Step 3 Restart the telematics host.	
	A Restart the telematics host. B Clear fault codes. C Read the fault codes again. D Check whether the same fault code is displayed.
	No 》》》 System normal.
	Yes 》》》 Go to step 4.
Step 4 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telem atics host are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B151500-TBOX

Fault code	Description
B151500	Abnormal configuration content

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the software version.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and read the software version of the telematics host to check whether it is correct.
	No》》》 Rewrite the telematics host software program.
	Yes》》》 Go to step 3.
Step 3 Rewrite the end-of-line configuration information.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to rewrite the EOL configuration information of the telematics host. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

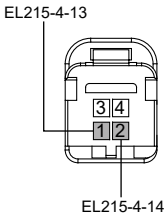
DTC: B151400-TBOX

Fault code	Description
B151400	T-BOX has not received the QNX broadcast packet

1. Simplified Circuit Diagram

2. Diagnostic Steps

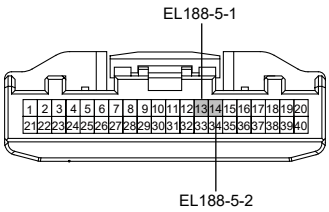
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is nor mal.

EL188-5 Telematics Host

B10DMTBOX1227051

EL215-4 Multi-Domain Fusion Controller

B10DMTBOX1227052

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-5 of the t elematics host.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter set to the resistance range to measure whether the resistance between terminal 1 of wiring harnes s connector EL188-5 of the telematics host and terminal 13 of wiring harness connector EL215-4 of the multi-domain f usion controller is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of wiring harness con nector EL188-5 of the telematics host and terminal 14 of wi ring harness connector EL215-4 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

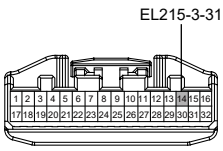
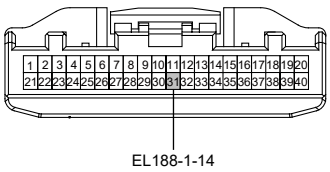
DTC: B150F01-TBOX

Fault code	Description
B150F01	HPC Wake-up Output Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Restart the telematics host.	
	A Restart the telematics host. B Clear fault codes. C Read the fault codes again. D Check whether the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is normal.	
EL188-1 Telematics Main Unit  B10DMTBOX1227054 EL215-3 Multi-Domain Fusion Controller  B10DMTBOX1227055	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 14 of the harness connector EL188-1 of the connected vehicle host and terminal 31 of the harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the harness connector EL188-1 of the telematics host and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 14 of the wiring harness connector EL188-1 of the connected vehicle host and the body ground to check whether it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

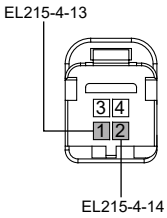
DTC: B150D82-TBOX

Fault code	Description
B150D82	Communication Between TBOX and HPC

1. Simplified Circuit Diagram

2. Diagnostic Steps

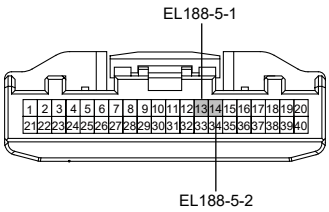
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is nor mal.

EL188-5 Telematics Host

B10DMTBOX1227051

EL215-4 Multi-Domain Fusion Controller

B10DMTBOX1227052

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-5 of the t elematics host.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter set to the resistance range to measure whether the resistance between terminal 1 of wiring harnes s connector EL188-5 of the telematics host and terminal 13 of wiring harness connector EL215-4 of the multi-domain f usion controller is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of wiring harness con nector EL188-5 of the telematics host and terminal 14 of wi ring harness connector EL215-4 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

Fault code	Description
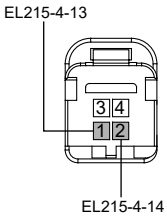
B151300	T-BOX network port physical connection disconnected

1. Simplified Circuit Diagram

2. Diagnostic Steps

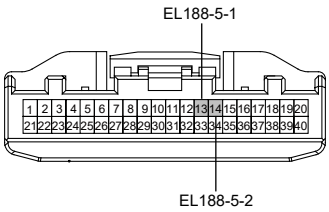
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is nor mal.

EL188-5 Telematics Host

B10DMTBOX1227051

EL215-4 Multi-Domain Fusion Controller

B10DMTBOX1227052

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-5 of the t elematics host.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter set to the resistance range to measure whether the resistance between terminal 1 of wiring harnes s connector EL188-5 of the telematics host and terminal 13 of wiring harness connector EL215-4 of the multi-domain f usion controller is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of wiring harness con nector EL188-5 of the telematics host and terminal 14 of wi ring harness connector EL215-4 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

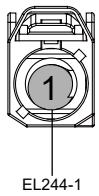
DTC: B150787-TBOX

Fault code	Description
B150787	Abnormal GPS serial port data

1. Simplified Circuit Diagram

2. Diagnostic Steps

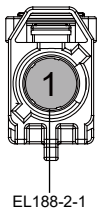
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the telematics host and the GPS antenna assembly is normal.

EL188-2 Telematics Host

B10DMTBOX1227048

EL244 GPS天线总成

B10DMTBOX1227049

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-2 of the telematics host.
C Disconnect the harness connector EL244 of the GPS antenna assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the T-Box harness connector EL188-2 and terminal 1 of the GPS antenna assembly harness connector EL244 to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measure the resistance value between terminal 1 of the wire harness connector EL188-2 of the telematics host and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL188-2 of the telematics host and the body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the GPS antenna assembly.

A Replace the GPS antenna assembly.
B After replacing the GPS antenna assembly, is the fault cleared?

Yes》》》 System normal.

No》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

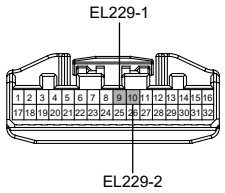
DTC: B151213–TBOX

Fault code	Description
B151213	Horn disconnected fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

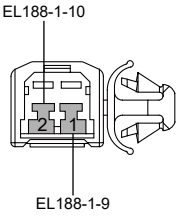
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the E-CALL speaker and the telematics host.

EL188-1 Telematics Main Unit

B10DMTBOX1227060

EL229 E-CALL扬声器

B10DMTBOX1227061

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the wiring harness connector EL229 of the E-CALL speaker.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL229 of the E-CALL speaker and terminal 9 of the wire harness connector EL188-1 of the telematics control unit to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wire harness connector EL229 of the E-CALL speaker and terminal 10 of the wire harness connector EL188-1 of the telematics host to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the E-CALL speaker.

A Replace the E-CALL speaker.
B After replacing the E-CALL speaker, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

Next》》》
Go to step 5.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the E-CALL speaker and the telematics host.	
EL188-1 Telematics Main Unit  B10DMTBOX1227060 EL229 E-CALL扬声器  B10DMTBOX1227061	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector EL229 of the E-CALL speaker. D. Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL229 of the E-CALL speaker and terminal 9 of the wire harness connector EL188-1 of the telematics control unit to check whether the resistance value is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wire harness connector EL229 of the E-CALL speaker and terminal 10 of the wire harness connector EL188-1 of the telematics host to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Use a multimeter set to the resistance range to check whether the resistance between terminals 9 and 10 of the wire harness connector EL188-1 of the telematics host and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value. H Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 9 and 10 of the wiring harness connector EL188-1 of the telematics host and the vehicle body ground to check whether the voltage value is normal. Voltage standard value: 0V J Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the E-CALL speaker.	
	A Replace the E-CALL speaker.

© 2026, All rights reserved

	B After replacing the E-CALL speaker, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

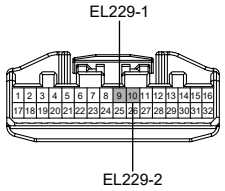
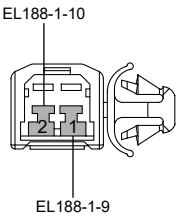
DTC: B151219–TBOX

Fault code	Description
B151219	Horn overcurrent fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the E-CALL speaker and the telematics host.	
EL188-1 Telematics Main Unit  B10DMTBOX1227060 EL229 E-CALL扬声器  B10DMTBOX1227061	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector EL229 of the E-CALL speaker. D. Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL229 of the E-CALL speaker and terminal 9 of the wire harness connector EL188-1 of the telematics control unit to check whether the resistance value is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wire harness connector EL229 of the E-CALL speaker and terminal 10 of the wire harness connector EL188-1 of the telematics host to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Use a multimeter set to the resistance range to check whether the resistance between terminals 9 and 10 of the wire harness connector EL188-1 of the telematics host and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value. H Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 9 and 10 of the wiring harness connector EL188-1 of the telematics host and the vehicle body ground to check whether the voltage value is normal. Voltage standard value: 0V J Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the E-CALL speaker.	
	A Replace the E-CALL speaker.

© 2026, All rights reserved

	B After replacing the E-CALL speaker, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

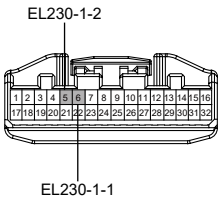
DTC: B151111-TBOX

Fault code	Description
B151111	MIC short to ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

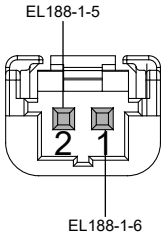
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the telematics host and the E-CALL microphone is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227063

EL230-1 E-CALL麦克风

B10DMTBOX1227064

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the wiring harness connector EL230-1 for the E-CALL microphone.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wiring harness connector EL188-1 of the telematics control unit and terminal 2 of wiring harness connector EL230-1 of the E-CALL microphone to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the wiring harness connector EL188-1 of the telematics host and terminal 1 of the wiring harness connector EL230-1 of the E-CALL microphone to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure whether the resistance between terminals 5 and 6 of the wire harness connector EL188-1 of the telematics host and the body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the E-CALL microphone.

A Replace the E-CALL microphone.
B After replacing the E-CALL microphone, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the telematics host.

© 2026, All rights reserved

	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.

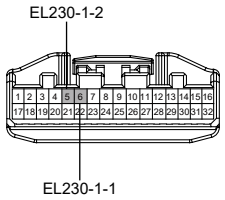
DTC: B151112-TBOX

Fault code	Description
B151112	MIC Short to 12V Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

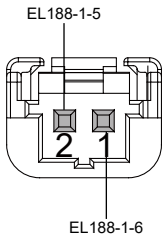
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the telematics host and the E-CALL microphone is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227063

EL230-1 E-CALL麦克风

B10DMTBOX1227064

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the wiring harness connector EL230-1 for the E-CALL microphone.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wiring harness connector EL188-1 of the telematics control unit and terminal 2 of wiring harness connector EL230-1 of the E-CALL microphone to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the wiring harness connector EL188-1 of the telematics host and terminal 1 of the wiring harness connector EL230-1 of the E-CALL microphone to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 5 and 6 of the wire harness connector EL188-1 of the telematics host and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the E-CALL microphone.

A Replace the E-CALL microphone.
B After replacing the E-CALL microphone, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

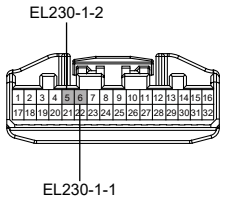
DTC: B151113-TBOX

Fault code	Description
B151113	MIC disconnection fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

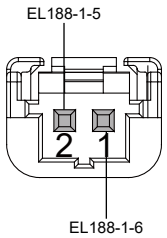
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the telematics host and the E-CALL microphone is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227063

EL230-1 E-CALL麦克风

B10DMTBOX1227064

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the wiring harness connector EL230-1 for the E-CALL microphone.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wiring harness connector EL188-1 of the telematics control unit and terminal 2 of wiring harness connector EL230-1 of the E-CALL microphone to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the wiring harness connector EL188-1 of the telematics host and terminal 1 of the wiring harness connector EL230-1 of the E-CALL microphone to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the E-CALL microphone.

A Replace the E-CALL microphone.
B After replacing the E-CALL microphone, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

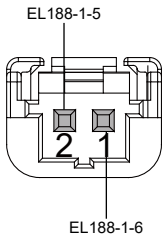
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the wiring harness between the telematics host and the E-CALL microphone is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227057

EL230 E-CALL麦克风

B10DMTBOX1227058

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C. Disconnect the wiring harness connector EL230 of the E-CALL microphone.
D Use a multimeter set to the resistance range to measure the resistance between terminal 5 of wiring harness connector EL188-1 of the telematics host and terminal 2 of wiring harness connector EL230 of the E-CALL microphone to check whether it is normal.
E Use a multimeter set to the resistance range, and measure the resistance between terminal 6 of the telematics host wire harness connector EL188-1 and terminal 1 of the E-CALL microphone wire harness connector EL230 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the E-CALL microphone.

A Replace the E-CALL microphone.
B After replacing the E-CALL microphone, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

DIAGNOSTIC TROUBLE CODE LIST-TBOXMCU

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B130082	SoC and MCU Communication Failure	Abnormal SOC operation	1.Restart the TBOX (disconnect and reconnect the negative battery terminal or the TBOX main connector) 2. Replace the TBOX
B130117	Built-in battery overvoltage fault (Detection required for eCall; not currently applicable in China)	Built-in battery abnormal	Replace the built-in battery
B130116	Built-in battery low voltage fault (requires detection if equipped with eCall; not currently applicable in China)	Built-in battery abnormal	Replace the built-in battery
B130217	Board internal main power supply overvoltage fault	1. Wiring harness connection error 2. Internal power supply system abnormality	1.Check the main connector harness connection 2. Restart the TBOX 3.Replace TBOX
B130216	Board-level main power supply undervoltage fault	1. Wiring harness connection error 2. Internal power supply system abnormality	1.Check the main connector harness connection 2. Restart the TBOX 3.Replace TBOX
B13031C	Abnormal AG35 supply voltage	Internal power supply system malfunction	1. Restart TBOX 2. Replace the TBOX
B13041C	Abnormal AG550 supply voltage (5G detection, not applicable to A12)	Internal power supply system malfunction	1. Restart TBOX 2. Replace the TBOX
B13051C	AG215 Abnormal Supply Voltage (5G Detection, Not Applicable to A12)	Internal power supply system malfunction	1. Restart TBOX 2. Replace the TBOX
B130644	FLASH Memory Fault	Flash memory damaged	1.Restart the TBOX (disconnect and reconnect the negative battery terminal or the main TBOX connector) 2. Replace the TBOX

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
U007388	A-CAN bus off fault	1. Abnormal wiring harness connection 2.TBOX internal fault	1.Check the wire harness connections 2. Power on again after powering off the vehicle 3.Replace TBOX
U007488	TBOX CAN1 Bus-Off Fault (Only for 043 TBOX)	1. Abnormal wiring harness connection 2.TBOX internal fault	1.Check the wire harness connections 2. Power on again after powering off the vehicle 3.Replace TBOX
B130773	The button remains closed for an extended period	1. Button harness wake up IN shorted to ground 2.Button does not pop up automatically after being pressed	1. Check whether the button springs back normally. 2. Check whether the wiring harness is shorted to ground
B130898	Built-in Ni-MH battery over-temperature fault (Detection required for eCall-equipped vehicles; not currently applicable in China)	Abnormal built-in battery temperature	Replace the built-in battery at room temperature
B130800	Built-in Ni-MH battery low temperature fault (requires detection if equipped with eCall; not currently applicable in China)	Abnormal built-in battery temperature	Replace the built-in battery at room temperature
B130818	Built-in Ni-MH battery internal resistance fault (requires detection if equipped with eCall; not currently applicable in China)	Built-in battery aging	Replace the built-in battery at room temperature
U137887	VIU Communication Lost	1.CAN network fault 2.VIU fault	1. Check the CAN network 2. Check VIU
U137882	VIU Life Signal Error	1.CAN network fault 2.VIU fault	1. Check the CAN network 2. Check VIU
U137883	VIU validation signal error	1.CAN network fault 2.VIU fault	1. Check the CAN network 2. Check VIU
U130D87	ICU Communication Lost	1.CAN network fault	1. Check the CAN network

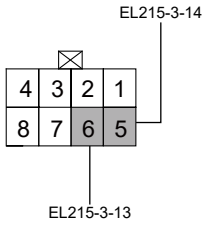
DTC: U130D82-TBOXMCU

Fault code	Description
U130D82	ICU Heartbeat Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

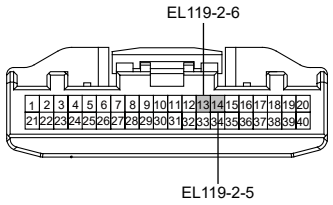
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



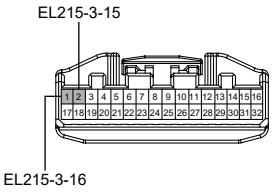
Step 2 Check whether the CAN harness between the instrument display screen and the multi-domain fusio n controller is normal.

EL119-2 Instrument Display

B10DMTBOX1227042

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227043

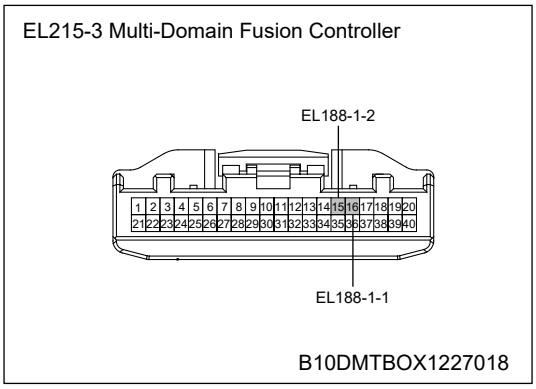


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the instrument display harness connector EL1 19-2.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of harness connector EL1 19-2 of the instrument display and terminal 14 of harness c onnector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL119-2 of the instrument display and terminal 13 of harne ss connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.



EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion cont roller to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect

© 2026, All rights reserved

	or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion con troller to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the power supply and ground circuit of the instrument display.	
	A Check whether the power and ground circuit of the instru ment display is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the instrument cluster display.	
	A Replace the instrument cluster display. B After replacing the instrument cluster display, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B13031C-TBOXMCU

Fault code	Description
B13031C	Abnormal AG35 supply voltage

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Restart the telematics host.	
	A Restart the telematics host. B Clear fault codes. C Read the fault codes again. D Check whether the same fault code is displayed.
	No 》》》 System normal.
	Yes 》》》 Go to step 3.
Step 3 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

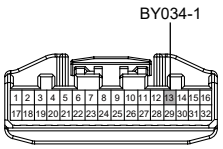
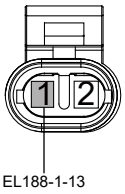
Yes》》》
Go to step 2.





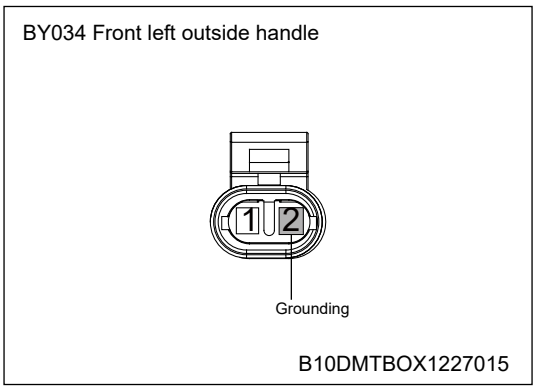
Step 2 Check the left front door outside handle.

	A Check the left front outside door handle for foreign objects causing jamming or damage.

Yes》》》 Remove foreign objects and replace if necessary.

No》》》
Go to step 3.

Step 3 Check whether the wiring harness between the telematics control unit and the left front exterior door handle is normal.



EL188-1 Telematics Main Unit  B10DMTBOX1227013 BY034 Front left outside handle  B10DMTBOX1227014	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector BY034 of the left front outside door handle. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of the telematics host wiring harness connector EL188-1 and terminal 1 of the left front door outside handle wiring harness connector BY034 to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the wire harness connector EL188-1 of the telematics host and the vehicle body ground to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the ground harness of the left front door outside handle.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BY034 for the le ft front outside door handle. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 2 of harness conn ector BY034 for the left front exterior door handle and the body ground is normal Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the left front exterior door handle.	
	A Replace the left front outer door handle. B After replacing the left front exterior door handle, is the f ault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

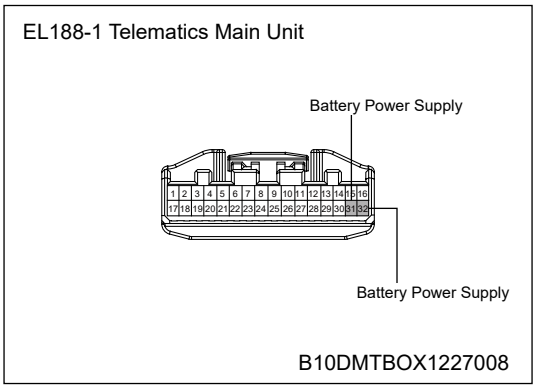
DTC: B130216-TBOXMCU

Fault code	Description
B130216	Board-level main power supply undervoltage fault

1. Simplified Circuit Diagram



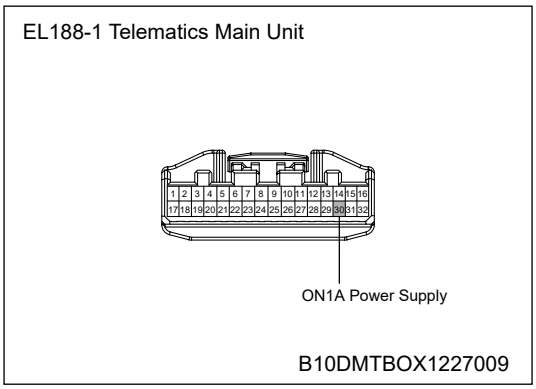
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the wiring harness connector of the telematics host.	
	A Check the wiring harness connector of the telematics con trol unit for water ingress, looseness, or pushed-out termin als.
	Yes》》》 Repair or replace the wiring harness or connector.
	No》》》 Go to step 4.
Step 4 Check the power supply fuse of the telematics control unit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the telematics control unit fuse RF14. Fuse specification: RF14 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the battery power supply of the telematics host.	

© 2026, All rights reserved

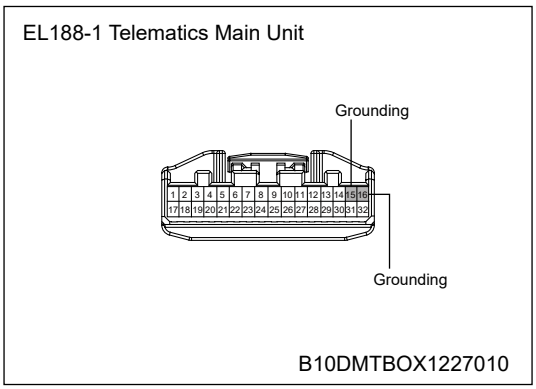


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminals 31 and 32 of the wire harness connector EL188-1 of the telematics host and the body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ON1A power supply of the telematics control unit.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 30 of the wire harness connector EL188-1 for the telematics host and the vehicle body ground to check whether it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Inspect and repair the ON1A power supply.

Yes 》》》
Go to step 7.

Step 7 Check the grounding wire harness of the telematics host.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Use a multimeter, select the resistance range, and measure the resistance between terminals 15 and 16 of the wiring harness connector EL188-1 of the telematics host and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to Step 9.	
Step 9 Diagnosis complete.

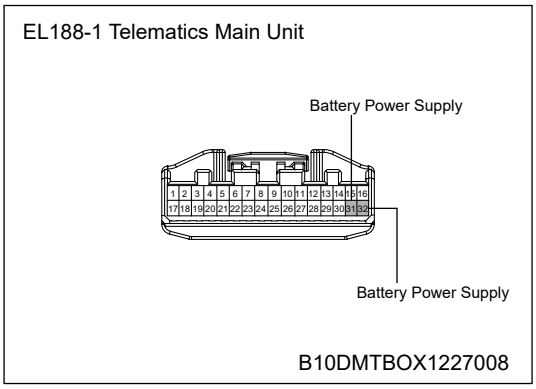
DTC: B130217-TBOXMCU

Fault code	Description
B130217	Board internal main power supply overvoltage fault

1. Simplified Circuit Diagram



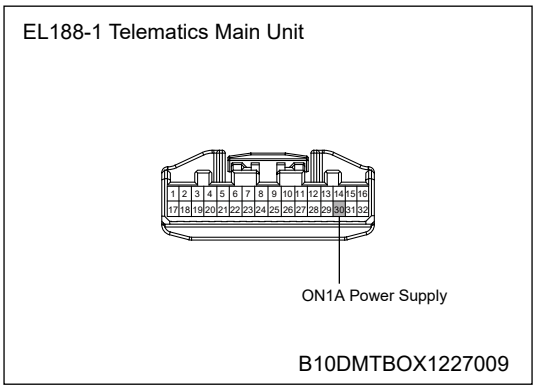
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the wiring harness connector of the telematics host.	
	A Check the wiring harness connector of the telematics con trol unit for water ingress, looseness, or pushed-out termin als.
	Yes》》》 Repair or replace the wiring harness or connector.
	No》》》 Go to step 4.
Step 4 Check the power supply fuse of the telematics control unit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the telematics control unit fuse RF14. Fuse specification: RF14 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the battery power supply of the telematics host.	

© 2026, All rights reserved

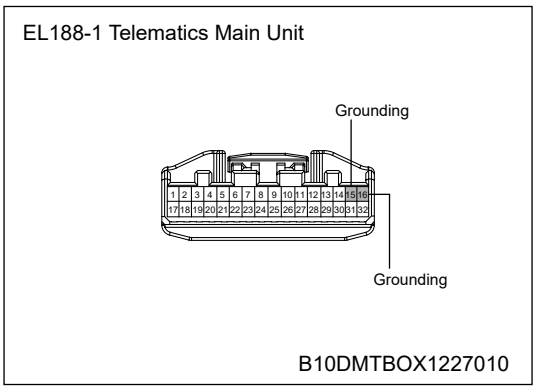


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 31 and 32 of the wire har ness connector EL188-1 of the telematics host and the bod y ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard val ue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ON1A power supply of the telematics control unit.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C. Connect the negative terminal of the battery to power on the vehicle.
D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 30 of the wire harness con nector EL188-1 for the telematics host and the vehicle body ground to check whether it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard val ue.

No 》》》 Inspect and repair the ON1A power supply.

Yes 》》》
Go to step 7.

Step 7 Check the grounding wire harness of the telematics host.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Use a multimeter, select the resistance range, and measure the resistance between terminals 15 and 16 of the wiring harness connector EL188-1 of the telematics host and the body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 8.	
Step 8 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to Step 9.	
Step 9 Diagnosis complete.

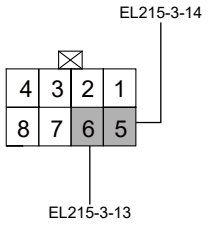
DTC: U130D83-TBOXMCU

Fault code	Description
U130D83	ICU Checksum Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

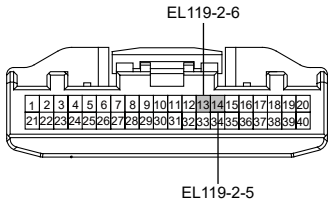
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



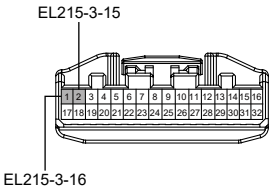
Step 2 Check whether the CAN harness between the instrument display screen and the multi-domain fusio n controller is normal.

EL119-2 Instrument Display

B10DMTBOX1227042

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227043

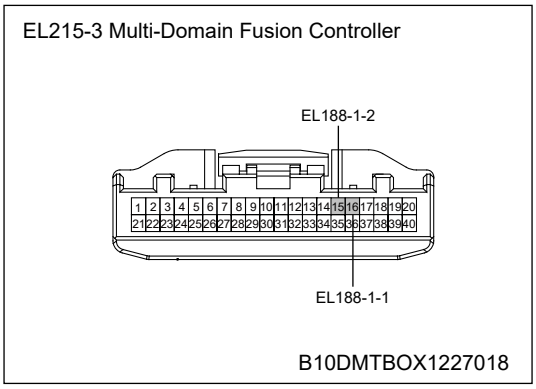


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the instrument display harness connector EL1 19-2.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of harness connector EL1 19-2 of the instrument display and terminal 14 of harness c onnector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL119-2 of the instrument display and terminal 13 of harne ss connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.



EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion cont roller to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect

© 2026, All rights reserved

	or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion con troller to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the power supply and ground circuit of the instrument display.	
	A Check whether the power and ground circuit of the instru ment display is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the instrument cluster display.	
	A Replace the instrument cluster display. B After replacing the instrument cluster display, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

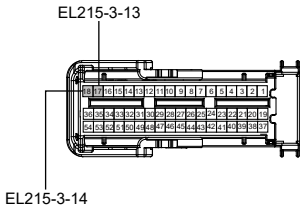
DTC: U130E82-TBOXMCU

Fault code	Description
U130E82	ACU Alive Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

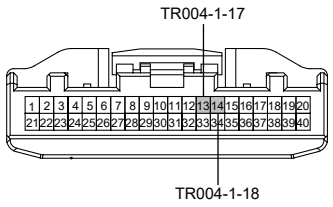
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



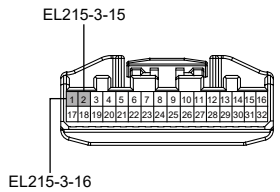
Step 2 Check whether the CAN harness between the airbag control module assembly and the multi-domain fusion controller is normal.

TR004-1 Airbag Control Module Assembly

B10DMTBOX1227023

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227024

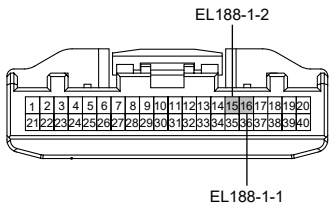


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.

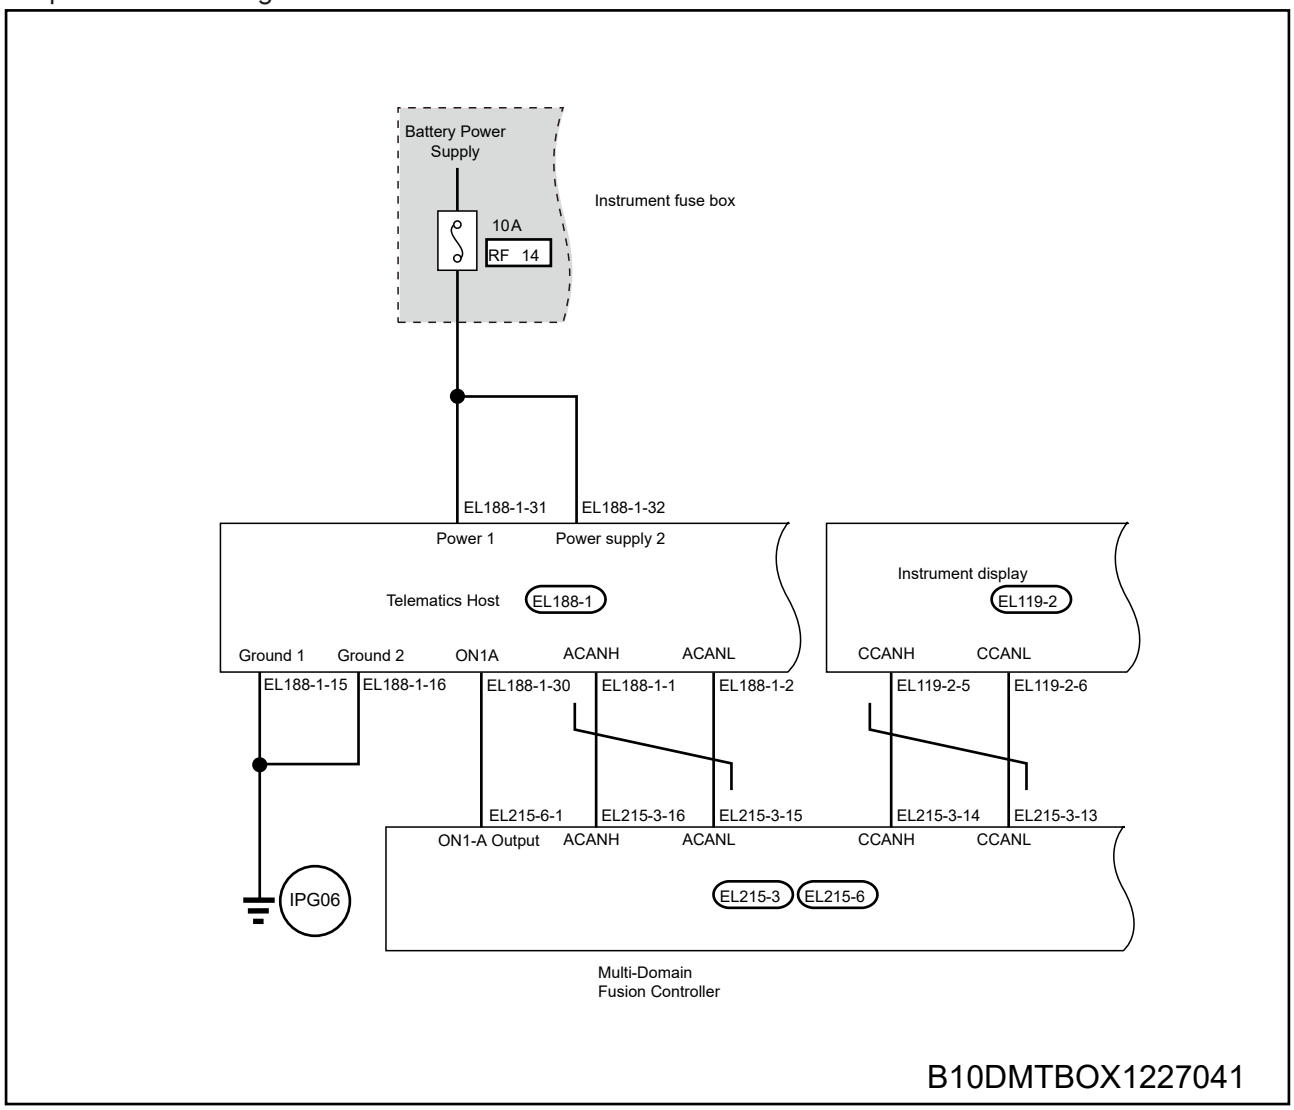


EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 2 of wiring harness connect

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMTBOX1227018	or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion con troller to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power supply and ground circuit of the airbag control module assembly.	
	A. Check whether the power supply and ground circuit of th e airbag control module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

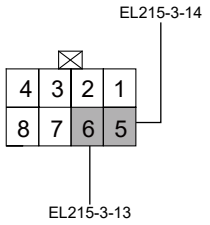
Fault code	Description
U130D87	ICU Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

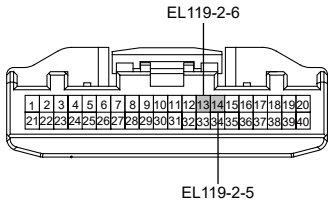
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



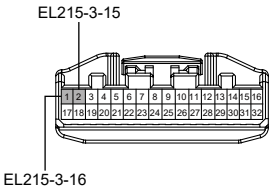
Step 2 Check whether the CAN harness between the instrument display screen and the multi-domain fusio n controller is normal.

EL119-2 Instrument Display

B10DMTBOX1227042

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227043

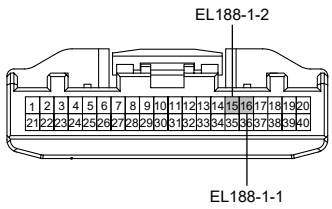


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the instrument display harness connector EL1 19-2.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of harness connector EL1 19-2 of the instrument display and terminal 14 of harness c onnector EL215-3 of the Multi-Domain Fusion Controller to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL119-2 of the instrument display and terminal 13 of harne ss connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.



EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion cont roller to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect

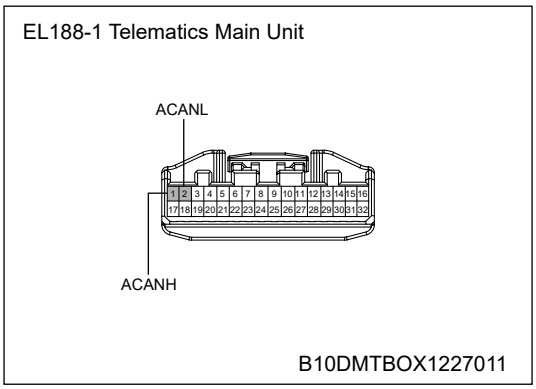
DTC: U007388-TBOXMCU

Fault code	Description
U007388	A-CAN bus off fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
	No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes 》 》 》 Go to step 3.
Step 3 Check whether the CAN wiring harness of the T-Box is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 and the vehicle body ground, and between terminal 2 and the vehicle body ground, at the wiring harness connector EL188-1 of the Internet of Vehicles host. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: U1F8300-TBOXMCU

Fault code	Description
U1F8300	Q&A handshake with VIU failed

1. Simplified Circuit Diagram

2. Diagnostic Steps

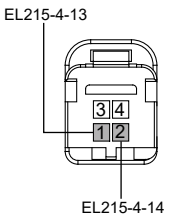
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

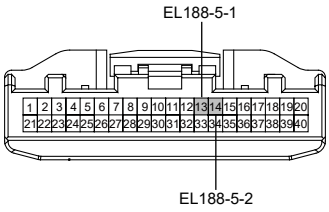
Step 2 Power-off and power-on test.



A Power cycle and check whether the fault is cleared?

Yes》》》 System normal.

No》》》
Go to step 3.



Step 3 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is nor mal.

EL188-5 Telematics Host

B10DMTBOX1227030

EL215-4 Multi-Domain Fusion Controller

B10DMTBOX1227031

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-5 of the t elematics host.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter set to the resistance range to measure whether the resistance between terminal 1 of wiring harnes s connector EL188-5 of the telematics host and terminal 13 of wiring harness connector EL215-4 of the multi-domain f usion controller is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of wiring harness con nector EL188-5 of the telematics host and terminal 14 of wi ring harness connector EL215-4 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

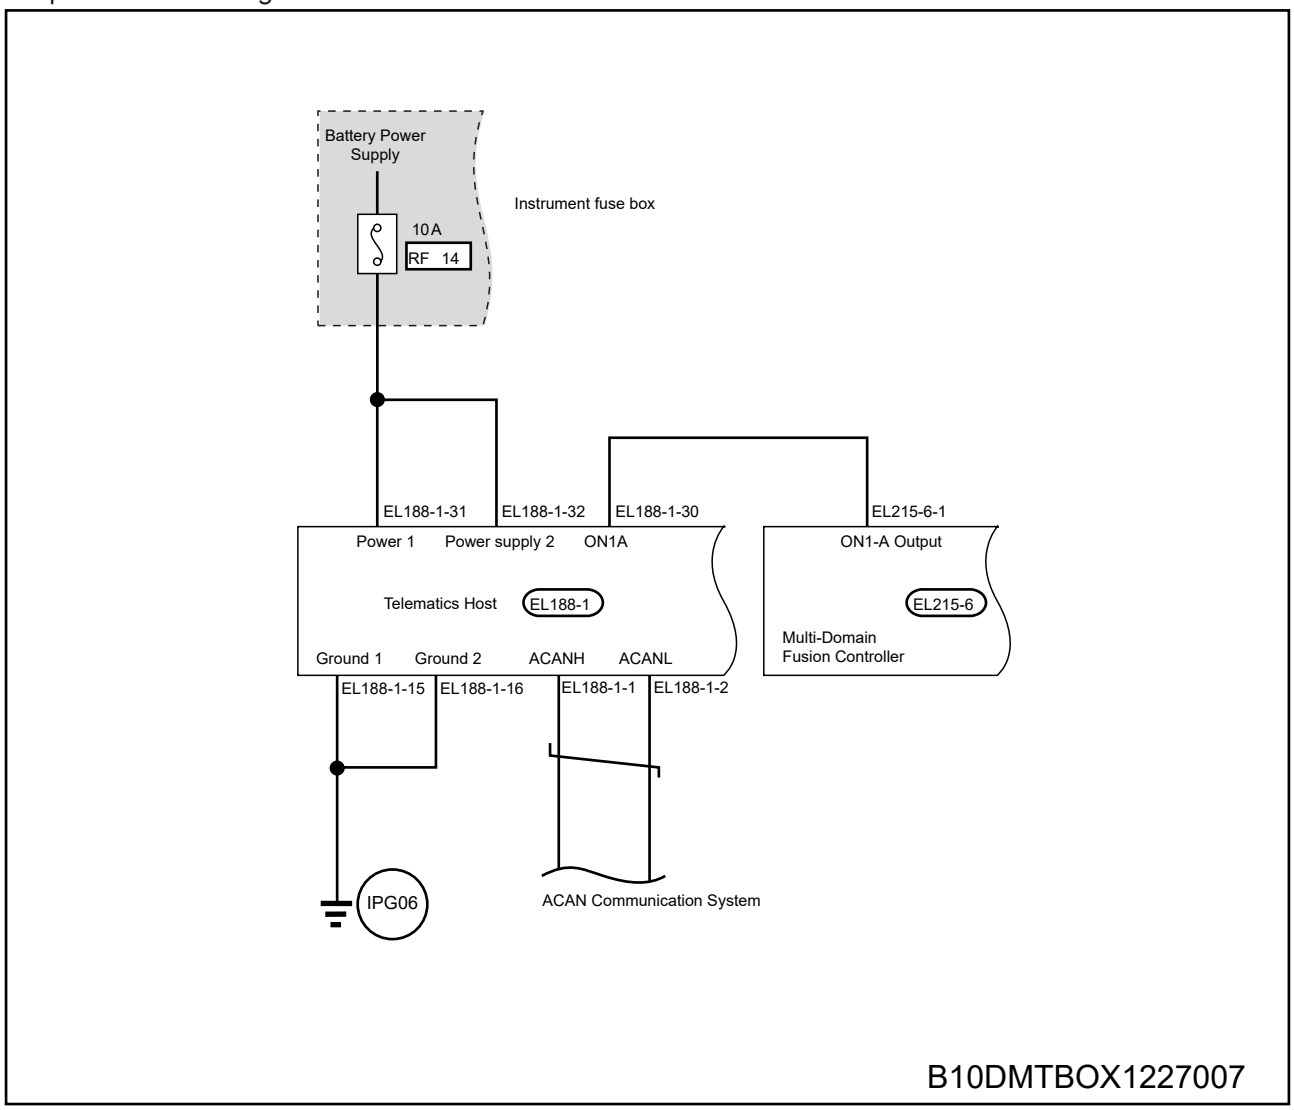
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 5.

© 2026, All rights reserved



Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U1F0000-TBOXMCU

Fault code	Description
U1F0000	VIN not entered in Q&A

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the VIN in the telematics control unit.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and use a diagnostic tool to rewrite the VIN of the telematics host. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

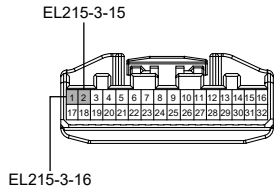
DTC: U137883-TBOXMCU

Fault code	Description
U137883	VIU validation signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

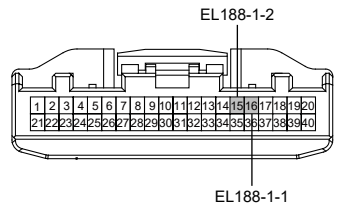
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227017

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion cont roller to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion con troller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply and ground circuit of the multi-domain fusion controller.

A Check whether the power supply and ground circuit of th e multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: U1FC300-TBOXMCU

Fault code	Description
U1FC300	Q&A and VIU handshake timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

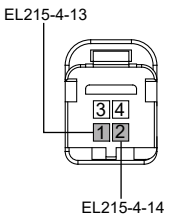
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

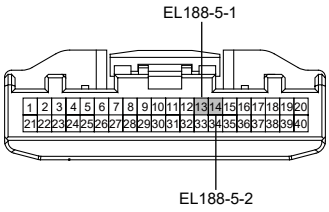
Step 2 Power-off and power-on test.



A Power cycle and check whether the fault is cleared?

Yes》》》 System normal.

No》》》
Go to step 3.



Step 3 Check whether the wiring harness between the T-Box and the multi-domain fusion controller is nor mal.

EL188-5 Telematics Host

B10DMTBOX1227030

EL215-4 Multi-Domain Fusion Controller

B10DMTBOX1227031

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-5 of the t elematics host.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter set to the resistance range to measure whether the resistance between terminal 1 of wiring harnes s connector EL188-5 of the telematics host and terminal 13 of wiring harness connector EL215-4 of the multi-domain f usion controller is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of wiring harness con nector EL188-5 of the telematics host and terminal 14 of wi ring harness connector EL215-4 of the multi-domain fusion controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

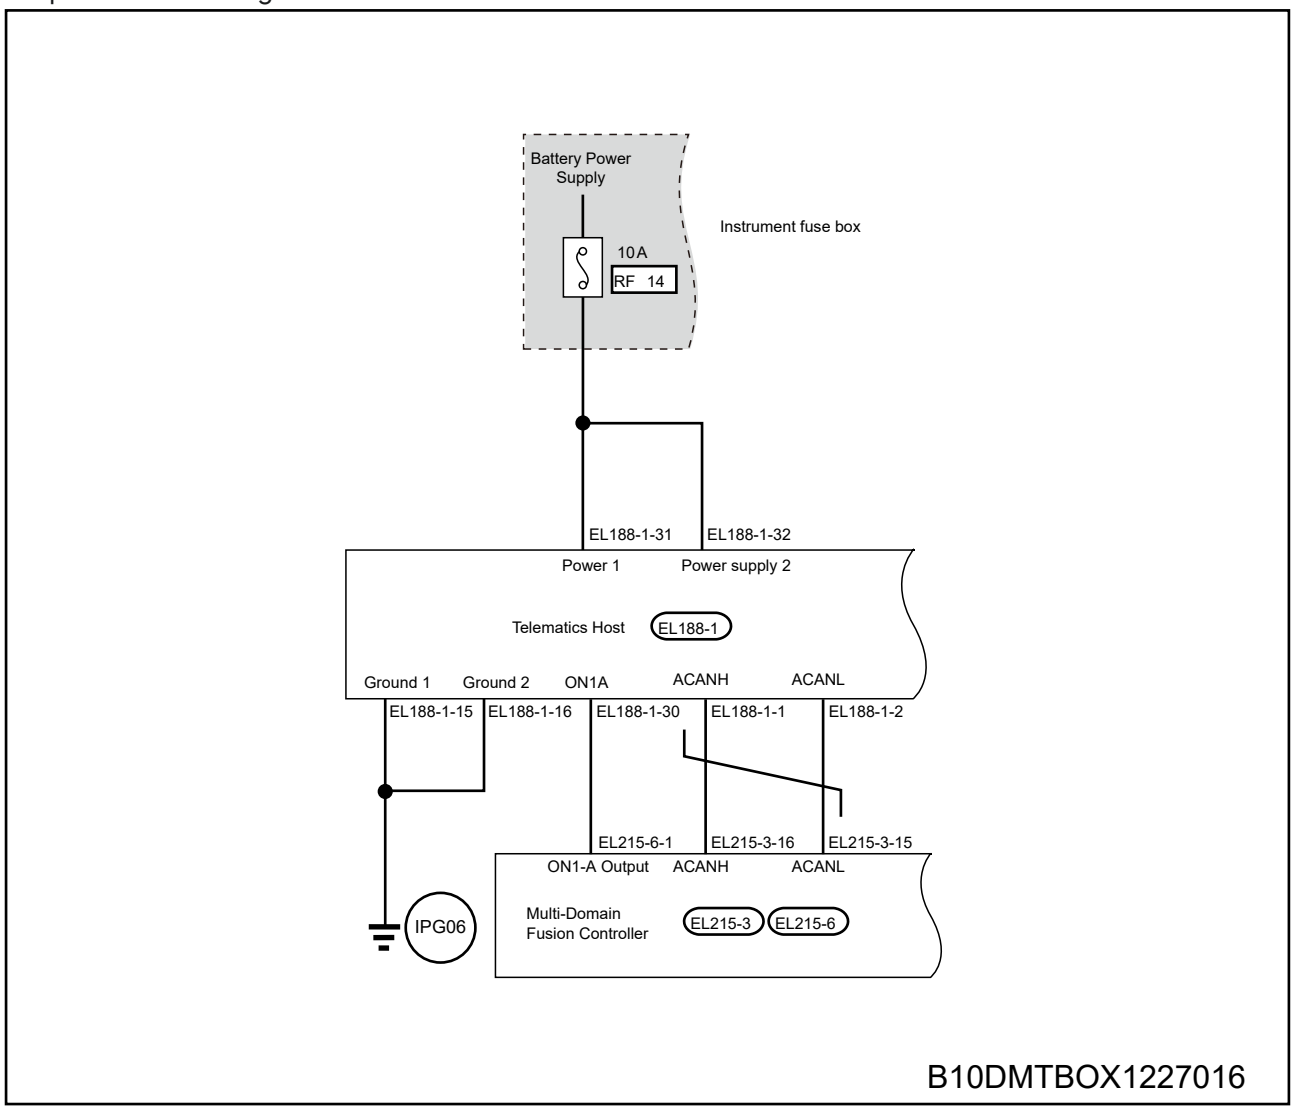
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 5.

© 2026, All rights reserved



Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

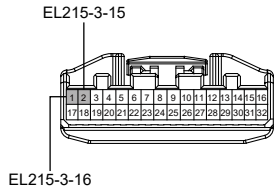
DTC: U137882-TBOXMCU

Fault code	Description
U137882	VIU Life Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

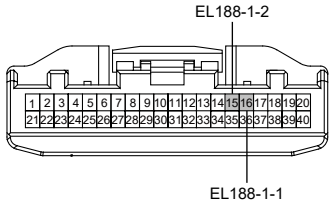
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.

EL188-1 Telematics Main Unit

B10DMTBOX1227017

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion cont roller to check if it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 2 of wiring harness connect or EL188-1 on the telematics host and terminal 15 of wiring harness connector EL215-3 on the multi-domain fusion con troller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply and ground circuit of the multi-domain fusion controller.

A Check whether the power supply and ground circuit of th e multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

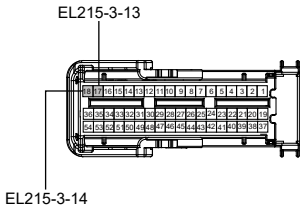
DTC: U130E83-TBOXMCU

Fault code	Description
U130E83	ACU Verification Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

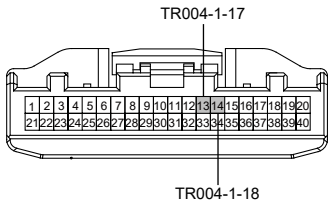
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



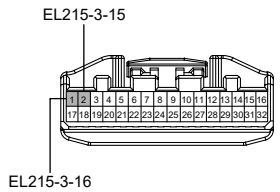
Step 2 Check whether the CAN harness between the airbag control module assembly and the multi-domain fusion controller is normal.

TR004-1 Airbag Control Module Assembly

B10DMTBOX1227023

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227024

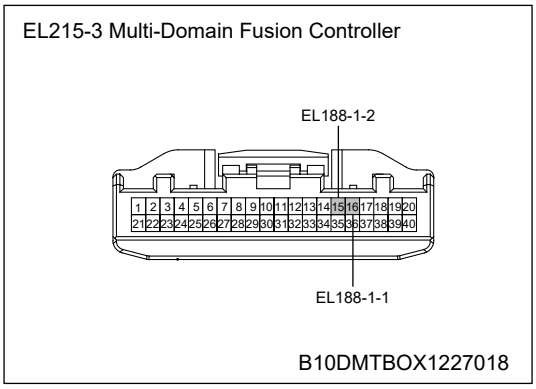


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.



EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 2 of wiring harness connect

May be caused by an intermittent fault. Check for intermittent faults.

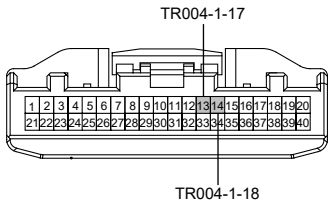
Yes》》》
Go to step 2.



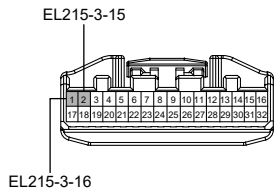
Step 2 Check whether the CAN harness between the airbag control module assembly and the multi-domain fusion controller is normal.

TR004-1 Airbag Control Module Assembly

B10DMTBOX1227023

EL215-3 Multi-Domain Fusion Controller

B10DMTBOX1227024

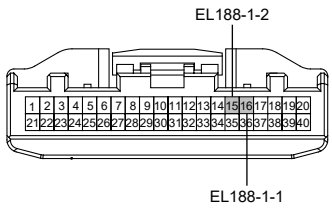


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the harness connector TR004-1 of the airbag control module assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the telematics host and the multi-domain fusion controller is normal.



EL188-1 Telematics Main Unit

B10DMTBOX1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL188-1 of the T-Box and terminal 16 of the wire harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 2 of wiring harness connect

	Yes》》》 Go to step 2.
Step 2 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

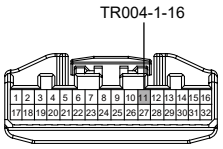
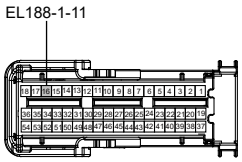
DTC: B130938-TBOXMCU

Fault code	Description
B130938	Abnormal SRS output signal frequency





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check whether the wiring harness between the telematics host and the airbag control module assembly is normal.	
EL188-1 Telematics Main Unit  B10DMTBOX1227036 TR004-1 Airbag Control Module Assembly  B10DMTBOX1227037	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 11 of the wire harness connector EL188-1 of the telematics host and terminal 16 of the wire harness connector TR004-1 of the airbag control module assembly to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power supply and ground circuit of the airbag control module assembly.	
	A. Check whether the power supply and ground circuit of the airbag control module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B130898-TBOXMCU

Fault code	Description
B130898	Built-in Ni-MH battery overheating fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply and grounding of the telematics host.	
	A Check whether the power supply and ground of the telematics host are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 4.
Step 4 Diagnosis complete.

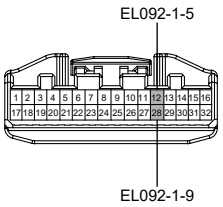
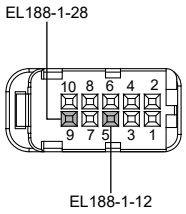
DTC: B130A12-TBOXMCU

Fault code	Description
B130A12	E-CALL button short to power





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the overhead switch assembly and the telematics host.	
EL188-1 Telematics Main Unit  B10DMTBOX1227045 EL092-1 Overhead Switch Assembly  B10DMTBOX1227046	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector EL092-1 from the overhead console switch assembly. D Using a multimeter set to the resistance range, measure the resistance between terminal 5 of harness connector EL092-1 for the overhead console switch assembly and terminal 12 of harness connector EL188-1 for the telematics control unit to check if the resistance is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 9 of the wire harness connector EL092-1 of the overhead switch assembly and terminal 28 of the wire harness connector EL188-1 of the telematics host to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 12 and 28 of the wiring harness connector EL188-1 of the telematics host and the vehicle body ground to check whether it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
