DTC: B110000-RPDR

Fault code	Description
B110000	Internal electronic component fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 4.
Step 4 Diagnosis complete.

DTC: B16C343-RPDR

Fault code	Description
B16C343	RF Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

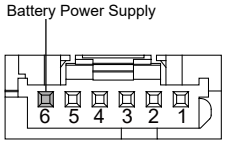
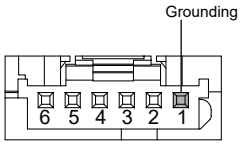
DTC: B111717-RPDR

Fault code	Description
B111717	Supply voltage too high



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the vital sign detection radar - rear.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the rear vital signs detection radar fuse RF18. Fuse specification: RF18 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness behind the vital signs detection radar.	
EL228 Rear Vital Signs Detection Radar  B10DMRPDR1211003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 6 of the wire harness conn ector EL228 of the rear vital signs detection radar and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Check the grounding wire harness behind the vital signs detection radar.	
EL228 Rear Vital Signs Detection Radar  B10DMRPDR1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the harness connector EL228 of the Rear Vital Signs Detection Radar and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D Confirm whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

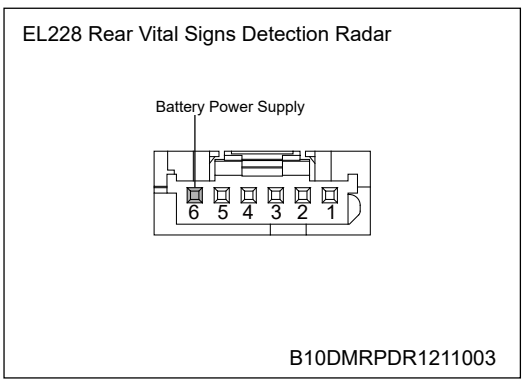
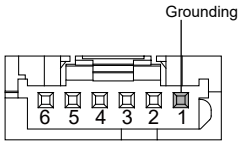
DTC: B111716-RPDR

Fault code	Description
B111716	Power supply voltage too low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the vital sign detection radar - rear.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the rear vital signs detection radar fuse RF18. Fuse specification: RF18 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness behind the vital signs detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 6 of the wire harness conn ector EL228 of the rear vital signs detection radar and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Check the grounding wire harness behind the vital signs detection radar.	
EL228 Rear Vital Signs Detection Radar  B10DMRPDR1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the harness connector EL228 of the Rear Vital Signs Detection Radar and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D Confirm whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B16C200-RPDR

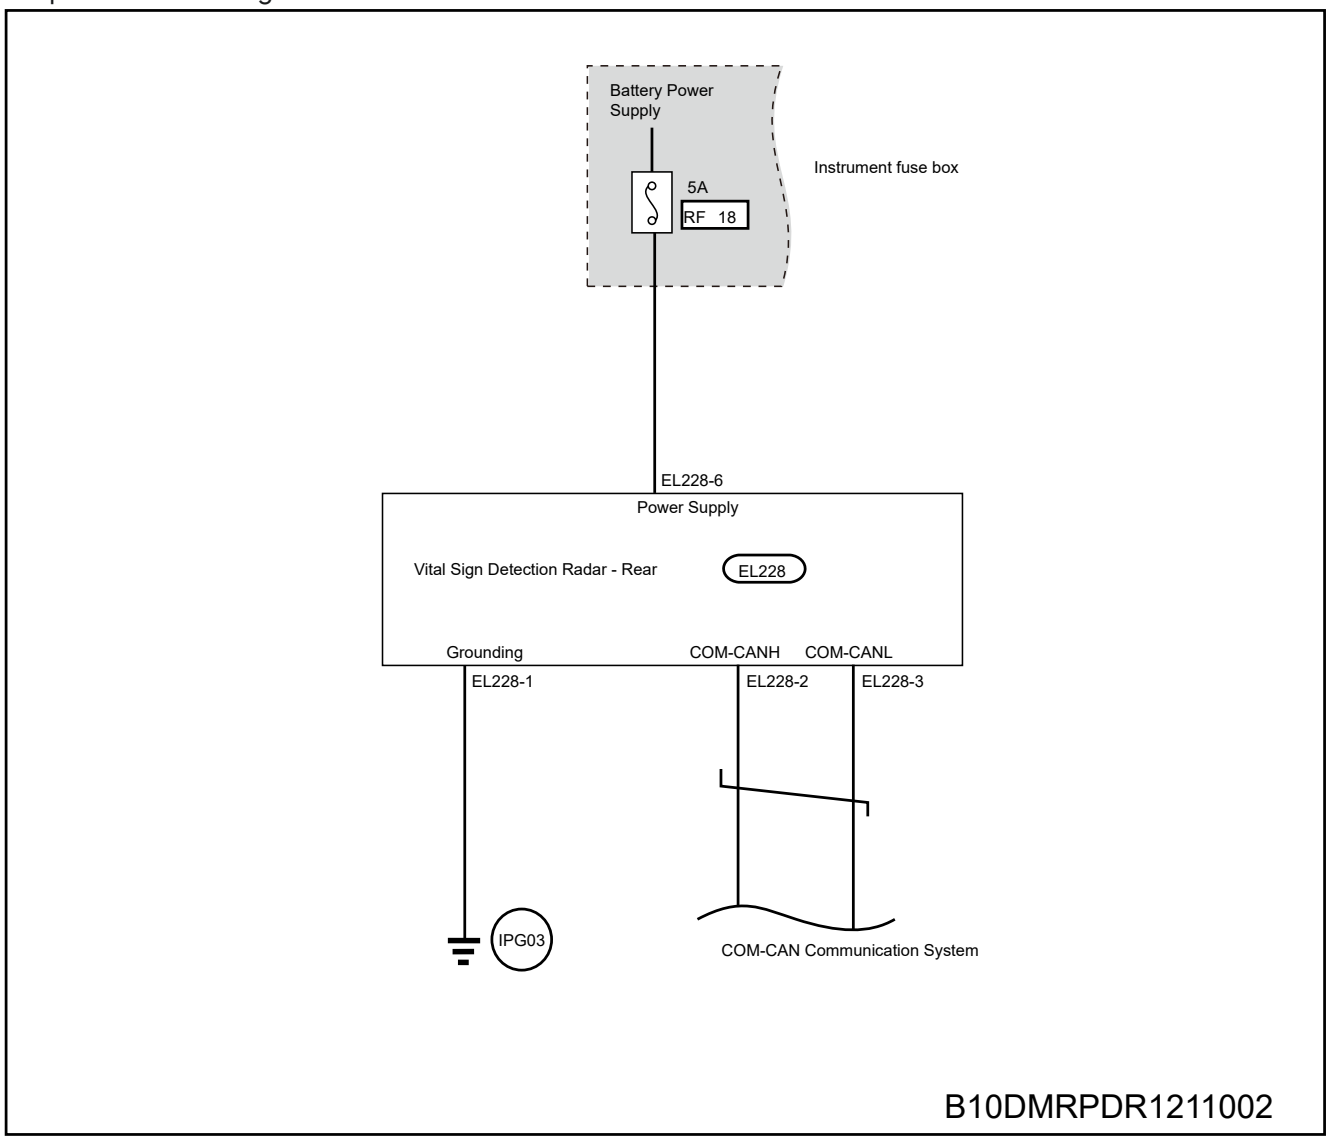
Fault code	Description
B16C200	Radar blindness fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the rear vital signs detection radar.
A Check whether the rear vital signs detection radar is obstr ucted by foreign objects.
Yes》》》 Remove the obstruction and re-detect.
No》》》 Go to step 3.
Step 3 Check the power supply and ground of the rear vital signs detection radar.
A Check whether the power supply ground of the rear vital signs detection radar is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the rear vital signs detection radar.
A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
Yes》》》 System normal.
Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B16C355-RPDR

Fault code	Description
B16C355	EOL Parameters Not Configured Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the end-of-line configuration.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to rewrite the end-of-line configuration. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

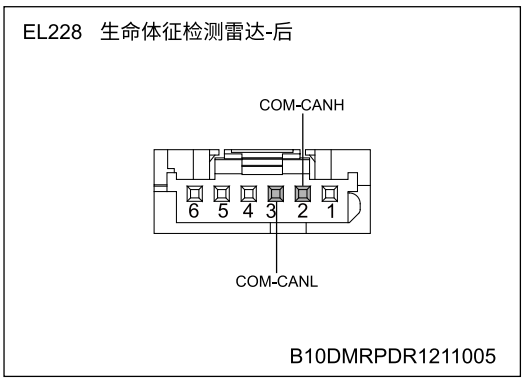
DTC: U007588-RPDR

Fault code	Description
U007588	CAN Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the rear vital sign detection radar is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 2 and body ground, and be tween terminal 3 and body ground, respectively, of the har ness connector EL228 for the rear vital signs detection rada r. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.

	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the rear vital signs detection radar.	

© 2026, All rights reserved

	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

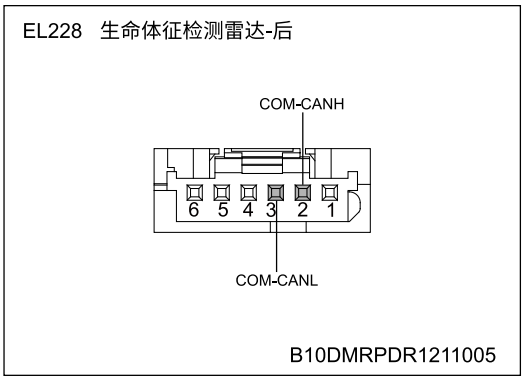
DTC: U136383-RPDR

Fault code	Description
U136383	Checksum error in controller communication message



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check vehicle fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the vehicle fault codes, and record them. C Check other systems for communication-related fault codes.
	Yes》》》 Prioritize the repair of other system-related faults.
	No》》》 Go to step 3.
Step 3 Check whether the CAN harness of the rear vital sign detection radar is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL228 behind the vital signs detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 and body ground, and between terminal 3 and body ground, respectively, of the harness connector EL228 for the rear vital signs detection radar. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the rear vital signs detection radar.	
	A Check whether the power supply ground of the rear vital signs detection radar is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the rear vital signs detection radar.	

© 2026, All rights reserved

	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

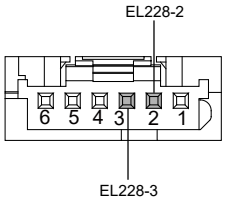
DTC: U166420-RPDR

Fault code	Description
U166420	Sleep Execution Exception - Radar Messages Not Stopped

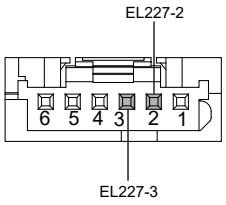
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN communication harness between the front vital sign detection radar and the rear vital sign detection radar.

EL227 Vital Sign Detection Radar - Front

B10DMRPDR1211007

EL228 Rear Vital Signs Detection Radar

B10DMRPDR1211008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL227 of the front vital signs detection radar.
C Disconnect the wiring harness connector EL228 behind the vital sign detection radar.
D Use a multimeter, set it to the resistance range, and measure whether the resistance between terminal 2 of the front vital signs detection radar wiring harness connector EL227 and terminal 2 of the rear vital signs detection radar wiring harness connector EL228 is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of wire harness connector EL227 for the front vital sign detection radar and terminal 3 of wire harness connector EL228 for the rear vital sign detection radar to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power supply and ground circuit of the front vital signs detection radar.
A Check whether the power and ground circuit of the front vital signs detection radar is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the front vital signs detection radar.
A Replace the front vital signs detection radar. B Replace the front and rear vital sign detection radar. Is the fault cleared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the rear vital signs detection radar.	
	A Replace the rear vital signs detection radar. B After replacing the rear vital signs detection radar, is the f ault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

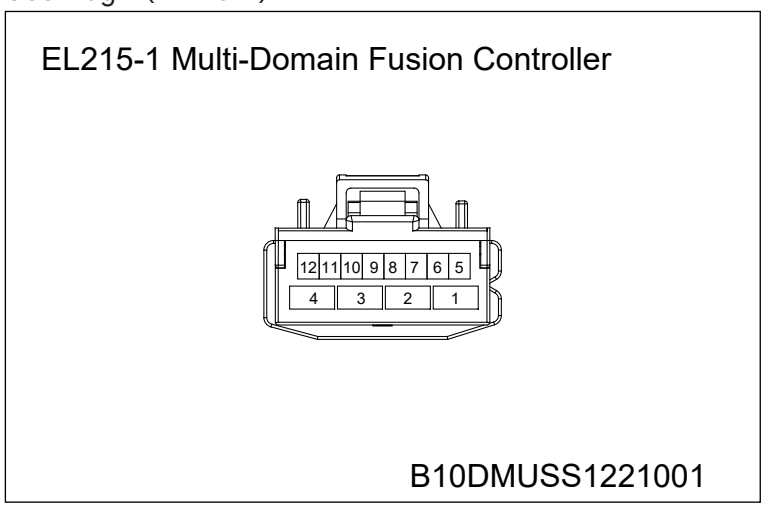
DIAGNOSTIC DESCRIPTION-USS

Fault codes can be read via the vehicle's OBD diagnostic port using a diagnostic tool. By utilizing the USS data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and an effective way to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-USS

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

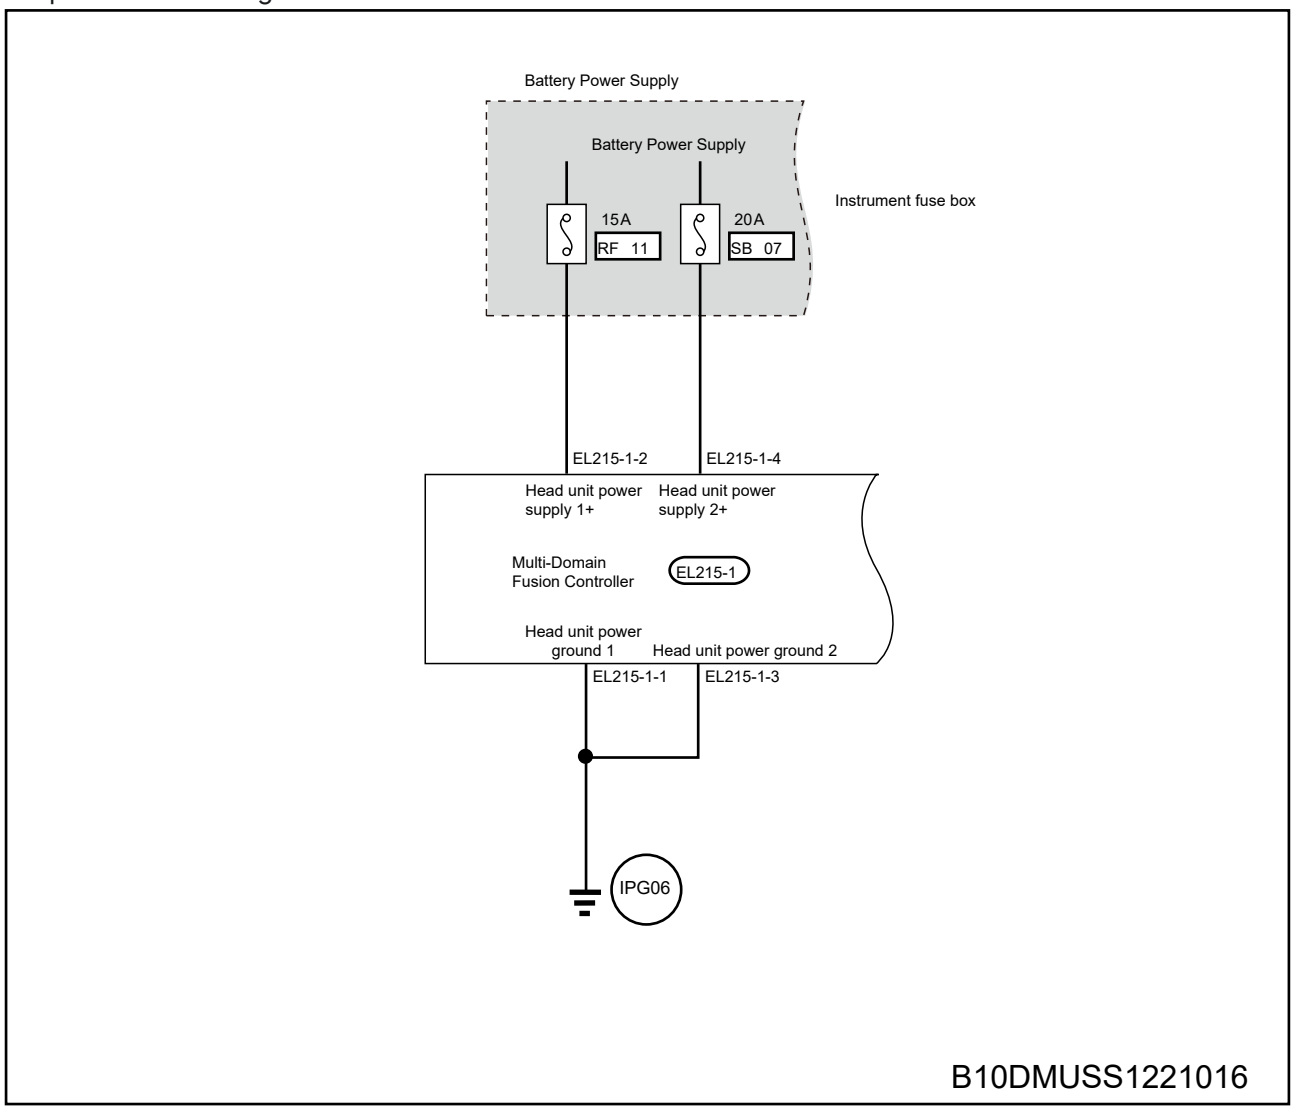
DIAGNOSTIC TROUBLE CODE LIST-USS

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
U142A00	Timestamp exception	Any of the following conditions is met: 1. Abnormal difference in input timestamp: Subscribe to chassis&func_manage&loc 2. Data update timeout; caused by 1ms/5ms tasks 3.Data publishing packet loss	1. Power cycle the vehicle and re-synchronize the time 2. Check whether the timestamp link is functioning properly.
U142B64	E2E verification failed	Any of the following conditions is met: 1. Data transmission channel failure between MCU and SOC 2. Data update timeout; caused by 1ms/5ms tasks 3.Data publishing packet loss 4. Data has been tampered with	1. Power cycle the vehicle and restart the process. 2.Check for packet loss on the Ethernet
U142C86	Abnormal chassis signal input	Any of the following conditions is met: 1. The number of invalid wheel speed pulses exceeds 10. 2. Wheel speed signal invalid value count exceeds 10 3.Steering wheel angle invalid value exceeds 10 times 4.The number of invalid vehicle speed signal values exceeds 10 5.Yaw rate invalid value exceeds 10 times	1.Check related signals for 0x182, 0x184, 0x18D, 0x233, 0x3B0, and 0xB6 2. Check XDC domain controller software 3.Replacement of Domain Controller

© 2026, All rights reserved



DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
		6.Invalid temperature signal count exceeds 10 7. The number of invalid gear signal values exceeds 10. 8. Parameter switching signal abnormality exceeds 10 times	
U142D83	CRC check failed	Verification failed for 3 consecutive frames	1. Power cycle the vehicle and restart the process. 2.Check for packet loss on the Ethernet
U142E82	Frame drop fault (duplicate frame error)	Received 3 consecutive duplicate frames	1. Power cycle the vehicle and restart the process. 2.Check for packet loss on the Ethernet
U142F82	USS drive data communication lost	No data received for 70ms	1. Power cycle the vehicle and restart the process. 2.Check for packet loss on the Ethernet
B140055	Failed to read Uss model configuration parameters	Failed to read raw partition configuration word	Re-run the vehicle electrical check and write the vehicle configuration code

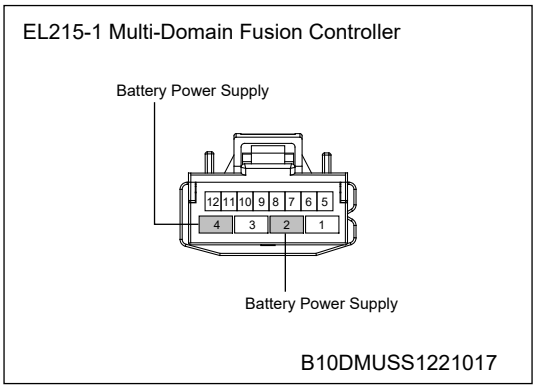
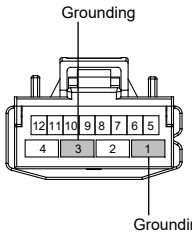
DTC: U142A00-USS

Fault code	Description
U142A00	Timestamp exception



1. Simplified Circuit Diagram



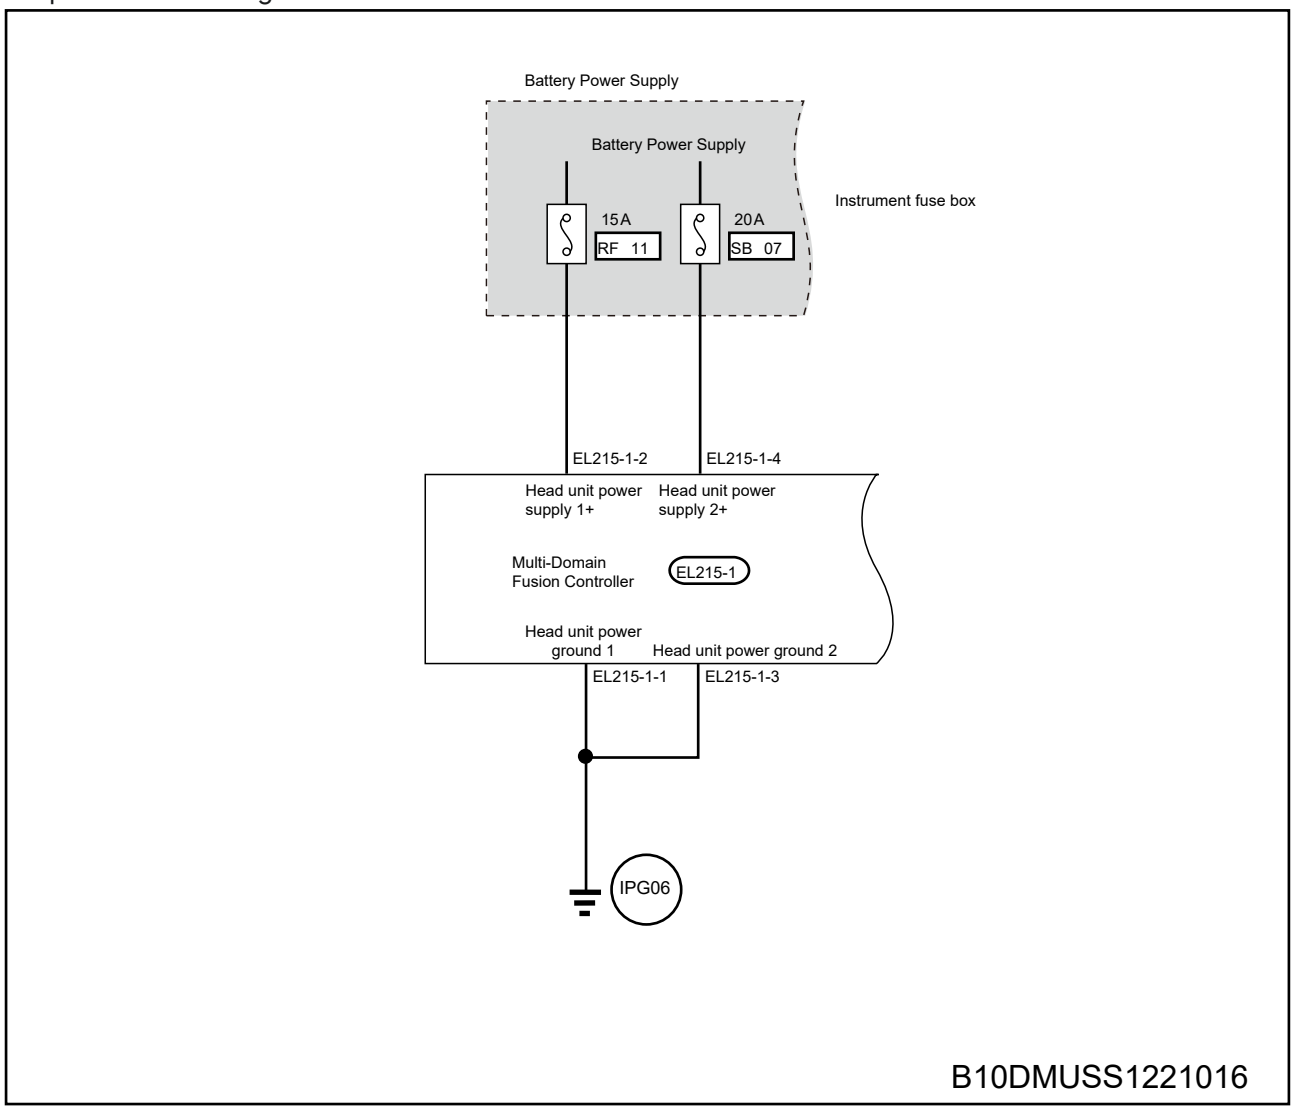
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Cycle the power.	
	A Cycle the power and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the software version of the multi-domain fusion controller.	
	A Check whether the software version of the Multi-Domain Fusion Controller is the latest.
	No》》》 Update the software to the latest version and recheck.
	Yes》》》 Go to step 4.
Step 4 Check the power supply harness of the multi-domain fusion controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 2 and 4 of the Multi-Do main Fusion Controller harness connector EL215-1 and the body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the grounding wire harness of the multi-domain fusion controller.	

© 2026, All rights reserved



EL215-1 Multi-Domain Fusion Controller  B10DMUSS1221018	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C Use a multimeter, select the resistance range, and measure whether the resistance value between terminals 1 and 3 of the wiring harness connector EL215-1 of the multi-domain fusion controller and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

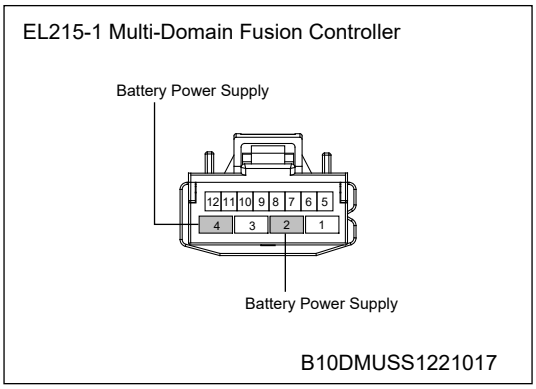
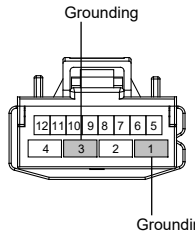
DTC: B140055-USS

Fault code	Description
B140055	Failed to read Uss model configuration parameters



1. Simplified Circuit Diagram



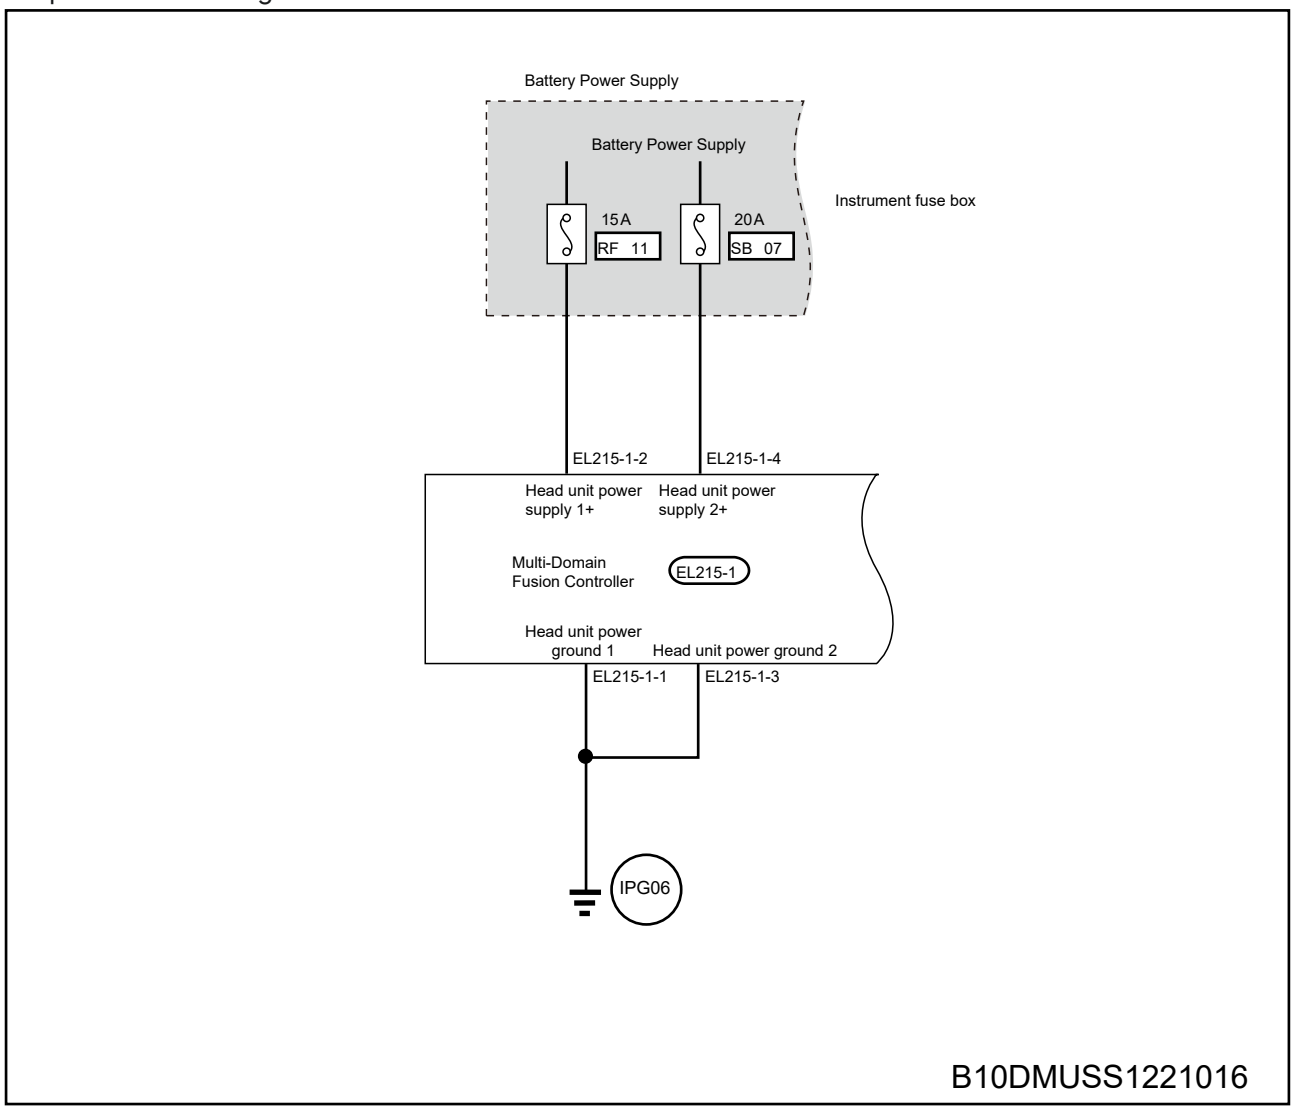
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the vehicle configuration information.	
	A. Connect the diagnostic tool to the OBD port. B. Power on the vehicle and rewrite the vehicle configuratio n information as prompted by the diagnostic tool. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the software version of the multi-domain fusion controller.	
	A Check whether the software version of the Multi-Domain Fusion Controller is the latest.
	No》》》 Update the software to the latest version and recheck.
	Yes》》》 Go to step 4.
Step 4 Check the power supply harness of the multi-domain fusion controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 2 and 4 of the Multi-Do main Fusion Controller harness connector EL215-1 and the body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the grounding wire harness of the multi-domain fusion controller.	

© 2026, All rights reserved



EL215-1 Multi-Domain Fusion Controller  B10DMUSS1221018	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C Use a multimeter, select the resistance range, and measure whether the resistance value between terminals 1 and 3 of the wiring harness connector EL215-1 of the multi-domain fusion controller and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

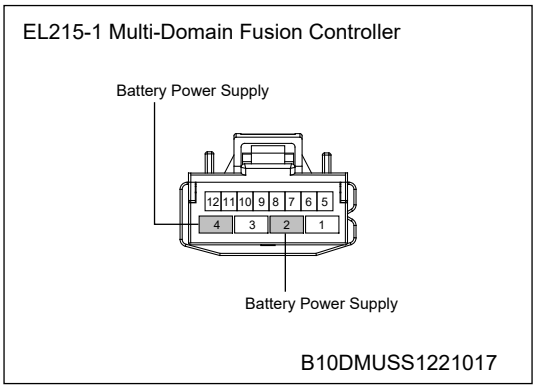
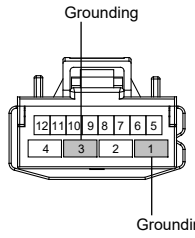
DTC: U142B64-USS

Fault code	Description
U142B64	E2E verification failed



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Cycle the power.	
	A Cycle the power and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the software version of the multi-domain fusion controller.	
	A Check whether the software version of the Multi-Domain Fusion Controller is the latest.
	No》》》 Update the software to the latest version and recheck.
	Yes》》》 Go to step 4.
Step 4 Check the power supply harness of the multi-domain fusion controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 2 and 4 of the Multi-Do main Fusion Controller harness connector EL215-1 and the body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the grounding wire harness of the multi-domain fusion controller.

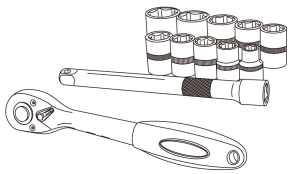
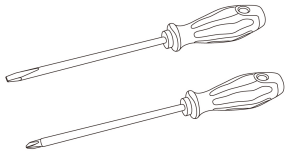
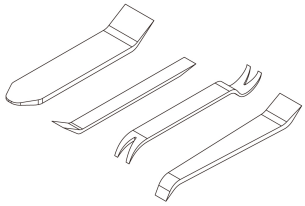
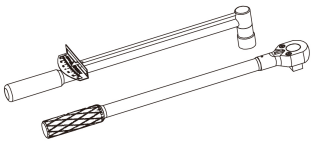
9.2.6 TECHNICAL PARAMETERS









TIGHTENING TORQUE TABLE

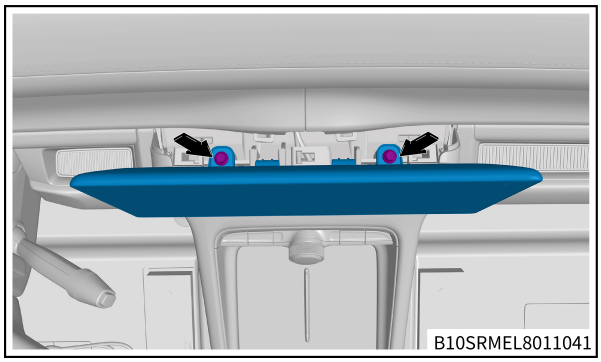
Fastener name	Torque (N·m)
Mounting screws for the telematics host	2±0.5
Central control display mounting bolt	6±1
Mounting bolt for the display bracket	5±1
Mounting bolt of the instrument display screen	5±1
Mounting screw of the instrument display screen	1.5±0.4
Mounting bolt of the multi-domain fusion controller	9±1
Fixing screw for the DMS camera assembly	0.6±0.1

© 2026, All rights reserved

9.2.7 MAINTENANCE TOOLS

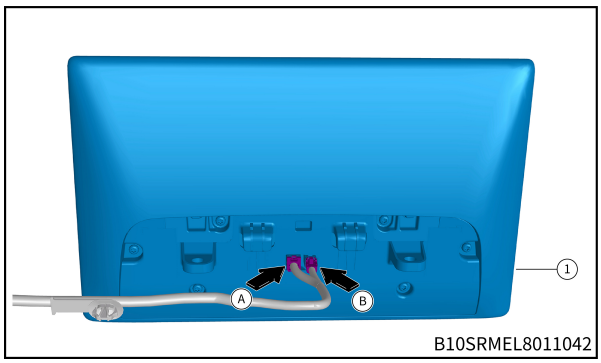
GENERAL TOOLS

Serial No.	Tool name	Tool Outline Drawing	Description
1	Socket wrench		Removal and Installation of Fixing Bolt
2	Screwdriver		Removal and installation of t he fixing screw
3	Interior trim removal tool		Remove interior trim panels, clips, etc.
4	Torque wrench		Tighten the bolt torque to th e standard value.



© 2026, All rights reserved

9.2.8 SERVICE AND REPAIR GUIDANCE



CENTRAL CONTROL DISPLAY

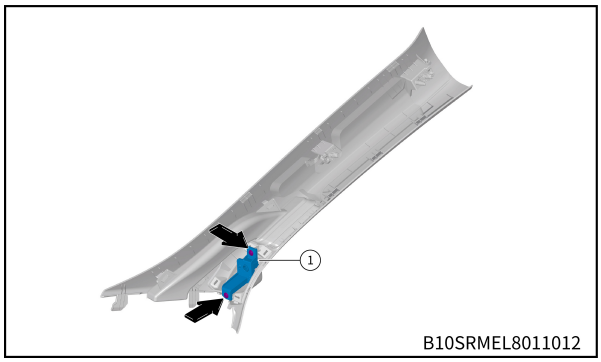
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the screen trim cover assembly.
   See:Screen trim cover assembly (page 5421)
4. Remove the center display screen.

a. Unscrew the 2 fixing bolts -arrow- connecting the central control display to the instrument cluster assembly.
Recommended tool: 8mm socket
Torque: 6±1N m

b. Disconnect the 2 connectors between the instrument wiring harness and the central control display screen -Arrow A-, -Arrow B-, and remove the central control display screen ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the central control display screen is working properly.

© 2026, All rights reserved

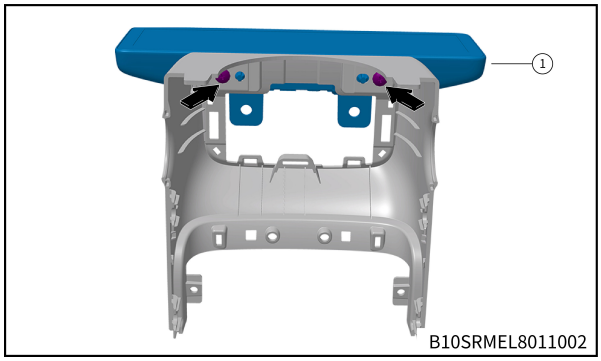
DMS CAMERA ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
4. Remove the DMS camera assembly.

a. Unscrew the 2 fixing screws -arrow- of the DMS camera assembly, and remove the DMS camera assembly ①.
Recommended tool: Phillips screwdriver
Torque: 0.6±0.1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the DMS camera assembly is functioning properly.

© 2026, All rights reserved

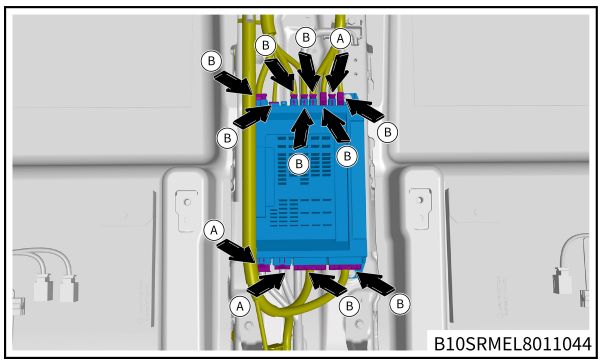
INSTRUMENT DISPLAY SCREEN

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the combination instrument cover.
   See:Combination instrument cover (page 5420)
4. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
5. Remove the instrument display screen.

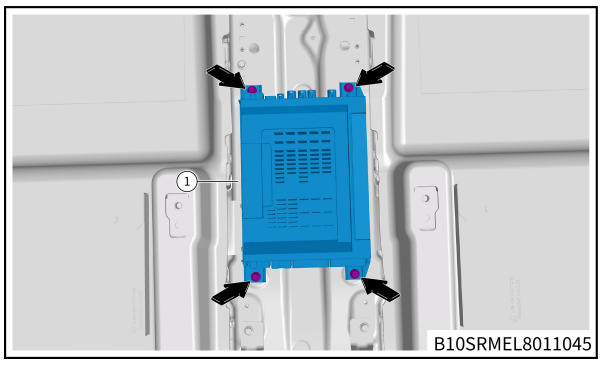
a. Unscrew the 2 fixing screws -arrow- of the instrument display screen, and remove the instrument display screen ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP



1. Perform the installation in reverse order, while noting the following:
   a. After installation, check that the instrument display screen is working properly.

© 2026, All rights reserved



MULTI-DOMAIN FUSION CONTROLLER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the left/right front seat assembly.
   See:Front left seat assembly (page 6267)
5. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
6. Remove the multi-domain fusion controller.

a. Disconnect the 3 connectors between the floor wiring harness and the Multi-Domain Fusion Controller - Arrow A -, disconnect the 9 connectors between the instrument wiring harness and the Multi-Domain Fusion Controller - Arrow B -, and move the wiring harness aside.

b. Unscrew the 4 mounting bolts -arrow- of the Multi-Domain Fusion Controller, and remove the Multi-Domain Fusion Controller ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Operation steps before removing the old part:
      - 1. Upload the calibration data for the blind spot camera/driving camera. The diagnostic tool operation is: Corresponding vehicle model - System diagnostics - ADDC module - Routine control - Data cloning - Upload calibration data - Blind spot camera/driving camera (If the upload fails after multiple attempts, you may abort the upload and perform the relevant calibration later).
      - 2. Upload the surround view camera calibration data. Diagnostic tool operation: Corresponding Vehicle Model - System Diagnosis - ICHS Module - Routine Control - Data Cloning - Upload Calibration Data - Surround View Camera (if the upload fails after multiple attempts, you may abort the upload and perform the relevant calibration later).
   b. Procedure for Replacing with a New Part:
      - 1. Read the last boot application identifier in the version information to determine whether software flashing is required (Note: Flashing is required if the Boot8APP differentiation identifier is "reserved").

© 2026, All rights reserved

- 2.For background USB drive update, first update the VIU, then the cockpit system, and finally the ADAS (LiDAR-equipped version).

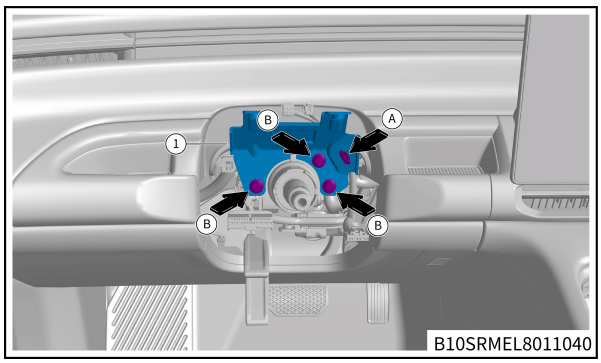
  ATTENTION

  - If the IVI screen goes black, perform IMMO injection.
  - When the central control screen turns on and the instrument cluster screen remains blank, this is a normal phenomenon.

- 3. Write the VIN to the VIU module. Diagnostic tool operation: Vehicle Model - System Diagnostics - VIU Module - Data Writing - Write VIN.
- 4. Write the VIN to the ICHS module. Diagnostic scanner operation: Corresponding vehicle model - System diagnostics - ICHS module - Data writing - Write VIN.
- 5. Write the ICHS module configuration. Diagnostic tool operation: Corresponding vehicle model - System Diagnosis - ICHS Module - End-of-Line Configuration - Write End-of-Line Configuration.
- 6. Refresh the AutoNavi code. Diagnostic tool operation: Corresponding vehicle model - System Diagnostics - ICHS module - Routine Control - Refresh AutoNavi code (wait for the routine to complete - approx. 1 minute).
- 7. Server registration. Diagnostic tool operation: Corresponding vehicle model - System diagnosis - ICHS module - Routine control - Server registration.
- 8.IMMO injection. Key writing - Diagnostic tool operation: Corresponding vehicle model - IMMO key injection.

  ATTENTION

  Sleep after locking. Sleep after locking for 30 minutes.



- 9. The technical manager checks the backend to verify whether the STR switch is enabled (if the vehicle model on the customer's mobile app is not synchronized, please turn off the STR switch and perform Step 7 and Step 8. After completing these steps and synchronizing the vehicle model information, turn on the STR switch).
- 10. If fault code B141A41 is present: Name: Flash Read Data Verification (CRC Check) Failed, perform the USS module routine control operation (Corresponding Vehicle Model - System Diagnostics - USS Module - Routine Control - USS Drive Vehicle Model Configuration Download).
- 11. Calibrate the radar and camera that failed the End-of-Line test (in case of data download failure).
  See:IMU Calibration (page 9114)
  See:Forward-Facing Monocular Camera Calibration (page 9118)
  See:Surround View Camera Calibration (page 9123)
  See:Forward Collision Avoidance Radar Calibration (page 9432)
  See:Blind Spot Detection Radar Calibration (page 9434)

© 2026, All rights reserved

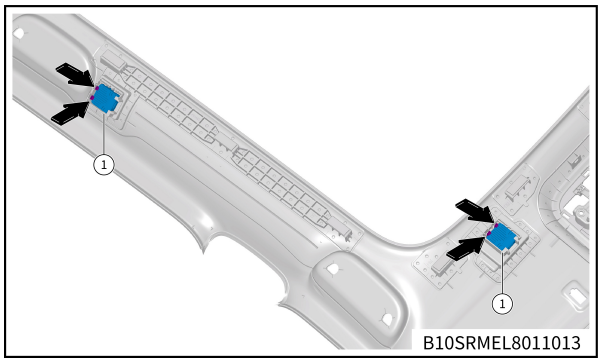
DISPLAY SCREEN BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
4. Remove the lower steering column cover assembly.
   See:Steering Column Lower Cover Assembly (page 5432)
5. Remove the combination switch.
   See:Combination switch (page 8635)
6. Remove the display bracket.

a. Unclip the 1 retaining clip on the instrument wiring harness -arrow A-, and unscrew the 3 retaining bolts on the display bracket -arrow B-.
   Recommended tool: 8mm socket
   Torque: 5±1N m
b. Remove the display bracket ①.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

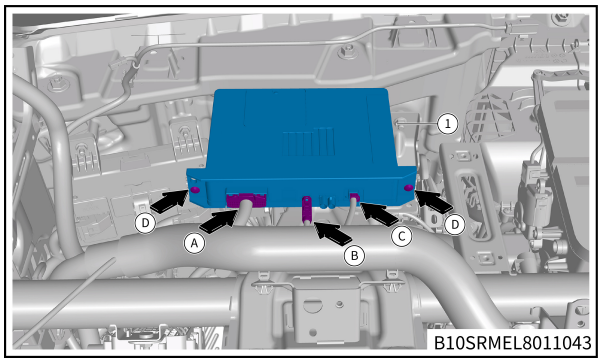
VITAL SIGNS DETECTION RADAR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the headliner assembly.
   See:Headliner assembly (Panoramic roof) (page 5528)
4. Remove the vital sign detection radar.

a. Disengage the 4 retaining clips - arrow - of the vital sign detection radar mounting bracket, and remove the vital sign detection radar ①.

SETUP



1. Perform the installation in reverse order, while noting the following:
   a. After installation, check that the vital signs detection radar is functioning properly.

© 2026, All rights reserved

TELEMATICS CONTROL UNIT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the telematics control unit.

a. Disconnect the 3 connectors between the telematics control unit and the instrument cluster wiring harness: -Arrow A-, -Arrow B-, -Arrow C-.
b. Unscrew the 2 fixing screws - arrow D - between the telematics box and the instrument cluster assembly, and remove the telematics box ①.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the telematics control unit is functioning properly.
   b. To replace the telematics control unit, perform the following operations:
      - To upgrade the T-BOX software version, operate the diagnostic tool as follows: Select the corresponding vehicle model - Controller Upgrade - Single Component Upgrade - Internet of Vehicles (T-BOX). (Note: If the T-BOX is in factory mode and the MCU of the new part is FCT, the MCU must be upgraded first, followed by the SOC;)
      - To write the VIN, the diagnostic tool operation is as follows:
        - Select Corresponding Vehicle Model - System Diagnostics - Telematics (T-BOX) - TBOX-SOC - Data Write - Write VIN
        - Select Corresponding Vehicle Model - System Diagnosis - Telematics (T-BOX) - TBOX-MCU - Data Write - Write VIN
      - Write configuration, the diagnostic tool operation is as follows:
        - Select Corresponding Vehicle Model-System Diagnosis-Telematics (T-BOX)-TBOX-SOC-Data Write-End-of-Line Configuration-Select Configuration-Write
        - Select Corresponding Vehicle Model - System Diagnosis - Telematics (T-BOX) - TBOX-MCU - Data Write - End-of-Line Configuration - Select Configuration - Write (Note: The MCU needs to be restarted for the end-of-line configuration to take effect after writing.)
      - BLE version confirmation. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnosis - Internet of Vehicles (T-BOX) - TBOX - BLE - Zhi Ling Single Part Upgrade (version must be above 1.00.18).
      - Register the server. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Cockpit Host (ICHS) - Routine Control - Server Registration.
      - Digital key registration. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Cockpit Host (ICHS) - Routine Control - Digital Key Registration (For vehicles that have

© 2026, All rights reserved

activated the digital key, temporary authorization must be granted after replacing the TBOX to perform digital key registration. Please consult the regional technical manager for authorization activation).

- Write the immobilizer code. Diagnostic scanner operation: Select the corresponding vehicle model – IMMO key injection.
- NFC Card Learning:
  - Using old card: Select the corresponding vehicle model – System Diagnosis – Telematics (T-BOX) – TBOX-MCU – Routine Control – Initialize NFC Card; Select the corresponding vehicle model – System Diagnosis – Telematics (T-BOX) – TBOX MCU – Routine Control – NFC Key Issuance.
  - Use new card: Select the corresponding vehicle model – System Diagnosis – Telematics (T-BOX) – TBOX-MCU – Routine Control – NFC Key Issuance.
- Lock and unlock via NFC card swipe to verify that the NFC card swipe function is working properly.
- Factory reset. After performing a factory reset on the IVI and waiting for it to restart, use the NFC card to power off the vehicle. Wait for 3 minutes until the vehicle is completely powered off. Then, use the NFC card to power on the vehicle and check whether the mobile phone Bluetooth key status is displayed as available.
- After completing the above operations, restart the infotainment system: tap apps such as iQIYI, User Manual, and Weather on the screen, check the configuration results, and if all network connections are normal, the configuration is successful.

ATTENTION

After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

© 2026, All rights reserved

9.3 ACCESSORY SWITCH SYSTEM

9.3.1 OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

1. Window control switch
   - The window control switches of this model consist of one driver's master window control switch and three individual door window control switches. All power windows can be operated via the respective window control switches.
   - The power window system mainly consists of the power window switch, power window motor, controller, door glass, and regulator bracket assembly.
2. Remote Key Window Control
   a. After the vehicle is locked, if any window is not fully closed, press and hold the lock button on the remote key to roll up all windows. Release the lock button, and the windows will stop rolling up.
   b. After the vehicle is locked, press and hold the unlock button on the remote key, and all windows will roll down. Release the unlock button, and the windows will stop rolling down.

   > NOTE
   >
   > Press and hold the lock button on the remote key, and all four windows will close or ventilate according to the settings on the central control screen.

3. Unlock/Lock Doors with Remote Key
   a. Press the unlock button on the remote key to unlock all doors. Meanwhile, the exterior rearview mirrors will automatically unfold, and the turn signal lights will flash twice.
   b. Press the lock button on the remote key to lock all doors. The exterior rearview mirrors will automatically fold in, and the turn signal lights will flash once.

   > NOTE
   >
   > If none of the four doors is opened, the vehicle will automatically relock after 60 seconds.

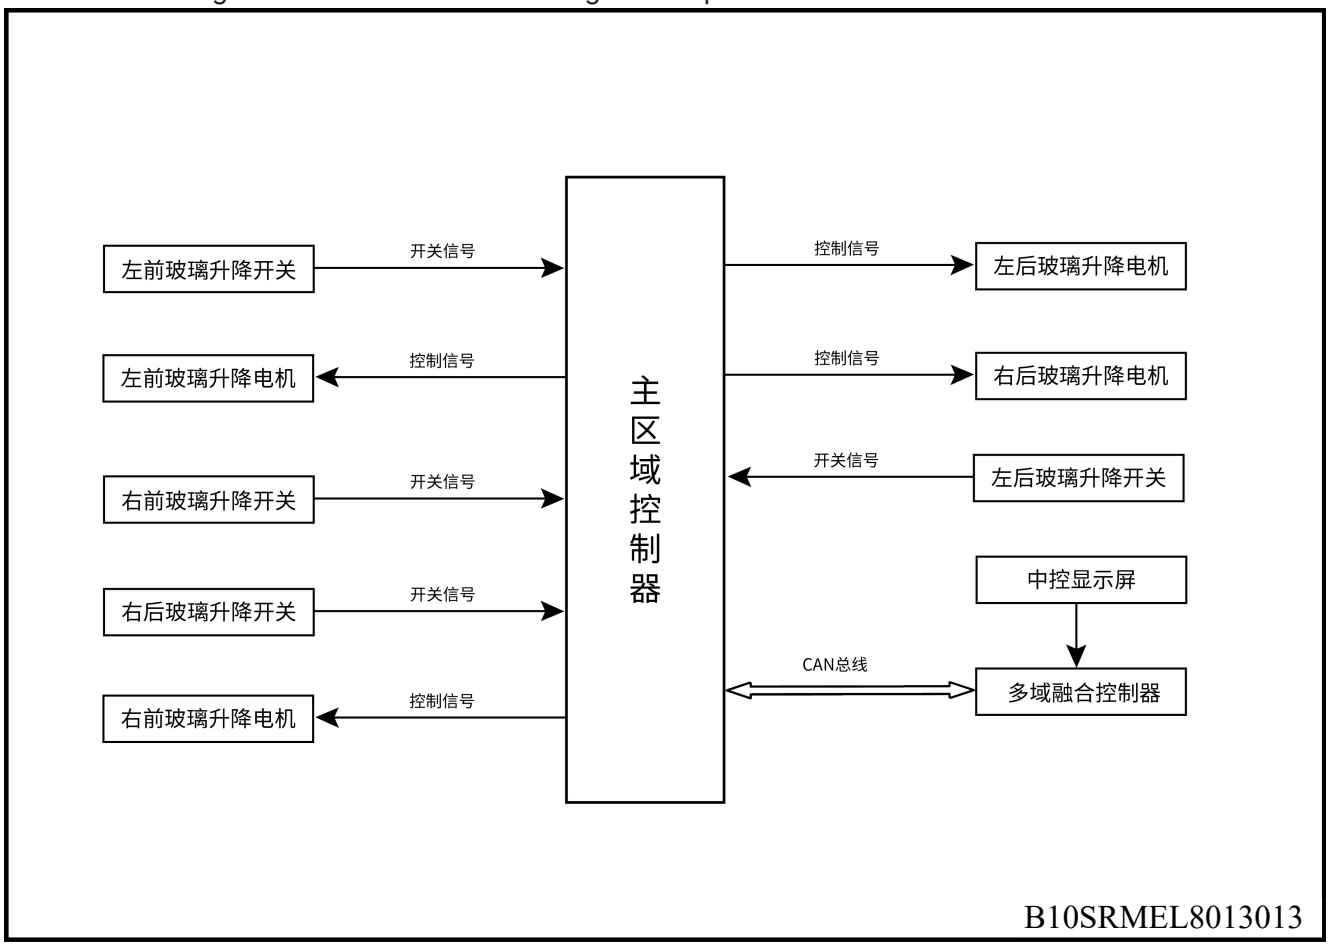
9.3.2 STRUCTURE AND PRINCIPLE INTRODUCTION



STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

- The window control switches of this model consist of one driver's master window control switch and three individual door window control switches. All power windows can be operated via the respective window control switches.
- The power window system mainly consists of the power window switch, power window motor, controller, door glass, and regulator bracket assembly.

Operation

- When the power window switch is operated, the Main Zone Controller receives the hardwire signal from the switch and directly drives the power window motor. When the power window switch is turned off, the Main Zone Controller stops driving the power window motor. Meanwhile, upon receiving a power window drive request from other relevant systems via CAN communication, the Main Zone Controller controls the power window according to the relevant control strategies to implement the related functions.

- Remote Key Window Control
  a. After the vehicle is locked, if any window is not fully closed, press and hold the lock button on the remote key to roll up all windows. Release the lock button, and the windows will stop rolling up.
  b. After the vehicle is locked, press and hold the unlock button on the remote key, and all windows will roll down. Release the unlock button, and the windows will stop rolling down.

© 2026, All rights reserved

NOTE

Press and hold the lock button on the remote key, and all four windows will close or ventilate according to the settings on the central control screen.

- Unlock/Lock Doors with Remote Key
  a. Press the unlock button on the remote key to unlock all doors. Meanwhile, the exterior rearview mirrors will automatically unfold, and the turn signal lights will flash twice.
  b. Press the lock button on the remote key to lock all doors. The exterior rearview mirrors will automatically fold in, and the turn signal lights will flash once.

NOTE

If none of the four doors is opened, the vehicle will automatically relock after 60 seconds.

- Power Liftgate System Operation
  a. Press and hold the liftgate open/close button on the remote key for 2 seconds to open or close the liftgate.
  b. The liftgate can be opened or closed via the Bluetooth key function in the Leapmotor APP.
  c. When the vehicle is stopped and all doors are unlocked, if the power liftgate is closed, press the exterior liftgate switch to open the liftgate.
  d. When the vehicle is stationary and the power liftgate is open, press the inside liftgate switch to close the liftgate.
  e. During the opening or closing of the power liftgate, pressing the inside liftgate switch will pause the liftgate operation.
  f. After the power liftgate is opened, manually open the liftgate to the desired height, press and hold the switch inside the liftgate to set the current height as the liftgate opening height, and the buzzer will sound continuously, indicating that the height setting is successful.

NOTE

Press and hold the liftgate unlock button at the bottom of the central control screen to unlock the liftgate.

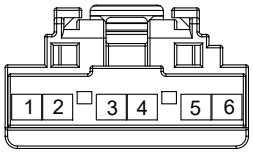
9.3.5 FAULT DIAGNOSIS

DIAGNOSTIC DESCRIPTION – TCM

Fault codes can be read through the vehicle's OBD diagnostic connector using a diagnostic tool. By utilizing the TCM data list, switch and sensor values can be read from the data list displayed on the diagnostic tool without removing any parts. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved

VISUAL INSPECTION-TCM



1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST - TCM

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
P060141	Internal control module memory checksum error system internal fault general checksum fault	EGSM is not functioning properly	Hardware failure, replace and return to factory for inspection.
P084F11	Park/Neutral Switch Output Circuit General Electrical Failure Circuit Short to Ground	Parking button short to ground, at least one connector pin short to ground	Hardware failure, check wiring connections
P084F15	Park/Neutral Switch Output Circuit General Electrical Fault Circuit Short to Battery or Open Circuit	Parking button short to source, at least one connector pin short to ground	Hardware failure, check wiring connections
P084F1C	Park/Neutral Switch Output Circuit General Electrical Fault Circuit Voltage Out of Range	The parking button voltage exceeds the allowable value, the circuit is open, or other factors affect the voltage value.	Hardware failure, check wiring connections
P084F9A	Park/Neutral Switch Output Circuit Component Malfunction or System Operating Conditions	Parking button signal comparison failed (Button status mismatch) Button status mismatch	Check the PARK button connection (MC1 and MC2)
P084F9E	Park/Neutral Switch Output Circuit Component Fault Persists	Parking button stuck Parking button stuck (pressed)	Button stuck, scroll ring button
P106A54	Gear shift lever position sensor system programming failed missing calibration	Angle_P and Angle_N are invalid gear angles.	Check whether RND is calibrated, and whether this wheel is installed
P106A84	Gear lever position sensor (- difference between calculations of critical and redundant parts, and the difference exceeds the allowable tolerance of 0.75 degrees)	Position sensor magnetic field too low missing magnet	Check whether RND is calibrated, and whether this wheel is installed

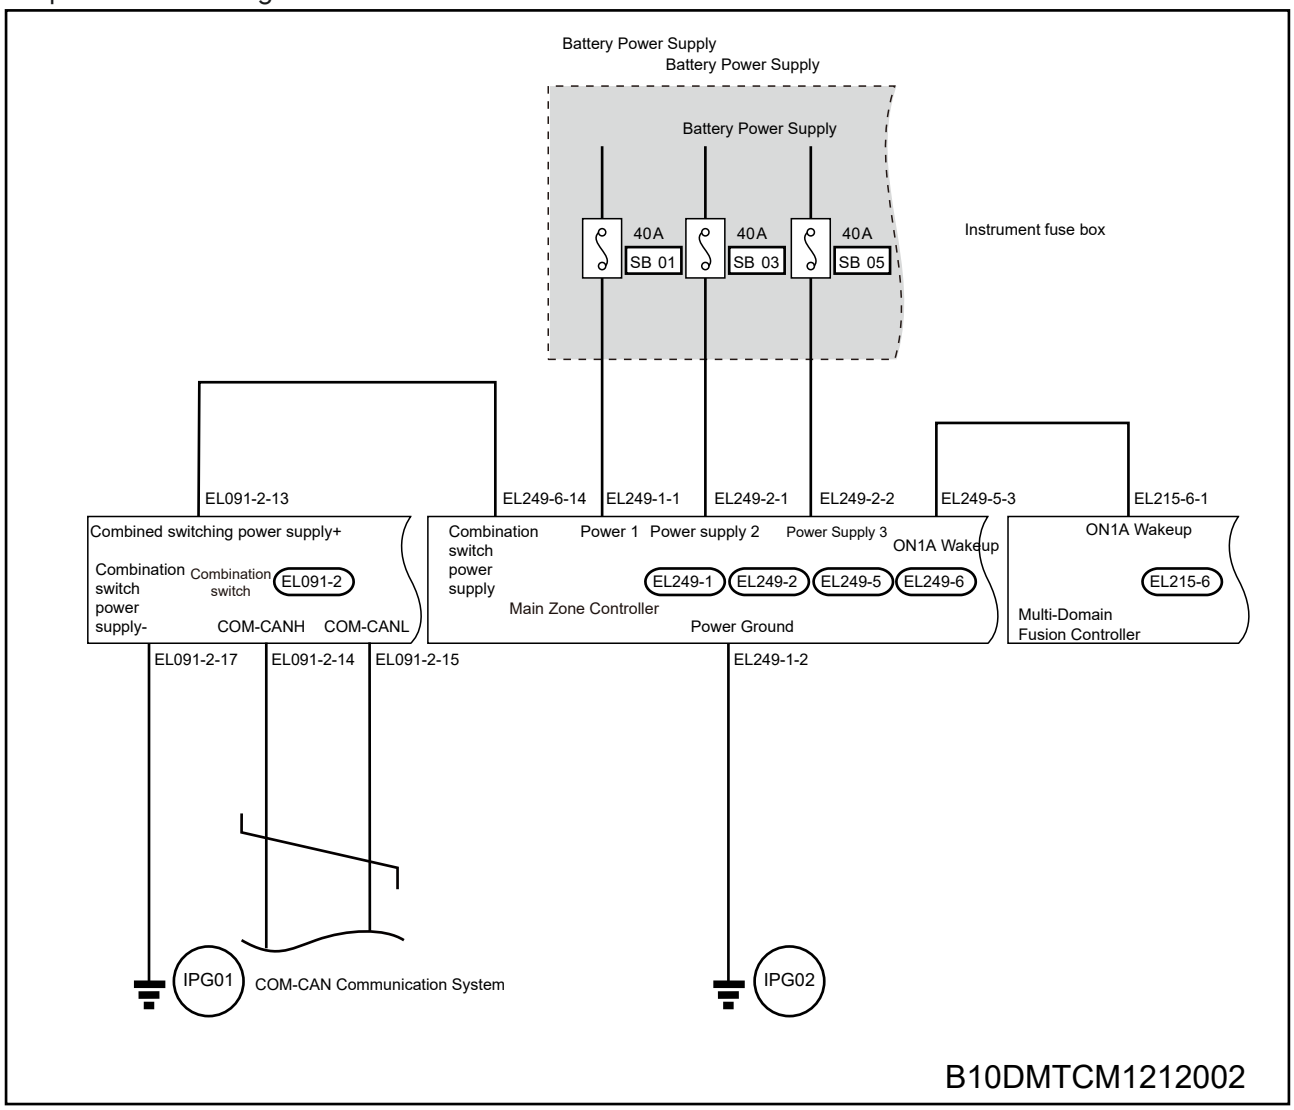
© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
P106A85	Gear lever position sensor reports MAGL critical angle monitoring error	Gear sensor internal error	Check whether RND is calibrated, and whether this wheel is installed
P106A9A	Gear selector position sensor reports MAGL redundant angle monitoring error.	Gear sensor internal error	Check whether RND is calibrated, and whether this wheel is installed
U1C4588	CAN Bus #2 Bus Signal/Message Fault Bus Off	CAN communication will be invalid (i.e., the lever release button status will not be transmitted) the illumination intensity will be set to the last known value all gear indicator LEDs will be turned off, all backlight LEDs will be illuminated.	Check the voltage values of CAN_H and CAN_L
U240057	Software system programming fault Invalid/incompatible software components	EGSM Software and Device Mismatch	Check software version
U2E0368	ECU Power Supply Overvoltage Algorithm-Based Fault Event Information	Low power supply voltage / Unstable internal ADC voltage	Check KL30 voltage
U2E0468	Algorithm-Based Fault Event Information for Low ECU Power Supply Voltage	Master Clock Failure, ECU Internal Failure	Check KL30 voltage
U300362	Fault Signal Comparison Fault Based on Power Supply Voltage Algorithm	EGSM power supply and battery voltage mismatch	Check the check voltage detected by the ECU and the voltage transmitted by the bus.
B190115	Low beam switch short to power or open	Low beam, ADC sampling detects a short to power or an open circuit.	Hardware failure, check wiring connections
B19011C	Low beam switch voltage value out of range	Low beam, ADC sampling detects an invalid voltage value	Hardware failure, check wiring connections

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B190214	High beam switch ground short to ground	High beam, ADC sampling detects short to ground	Hardware failure, check wiring connections
B190215	High beam switch short to power or open circuit	High beam, ADC sampling detects short to power or open circuit.	Hardware failure, check wiring connections
B19021C	High beam switch voltage value out of range	High beam, ADC sampling detects an invalid voltage value	Hardware failure, check wiring connections
B190314	Fog lamp switch GND short to ground	Fog lamp, ADC sampling detects short to ground	Hardware failure, check wiring connections
B190315	Fog light switch short to power or open circuit	Fog lamp, ADC sampling detects short to power or open circuit	Hardware failure, check wiring connections
B19031C	Fog light switch voltage value is out of range	Fog light, ADC sampling detects an invalid voltage value	Hardware failure, check wiring connections
B190414	GND front wiper mode switch short to ground	Front wiper, ADC sampling detects short to ground	Hardware failure, check wiring connections
B190415	Front wiper mode switch short to power or open circuit	Front wiper, ADC sampling detects a short to power or an open circuit	Hardware failure, check wiring connections
B19041C	Front wiper mode switch voltage value is out of range	Front wiper, ADC sampling detects an invalid voltage value	Hardware failure, check wiring connections
B190514	Rear wiper mode switch shorted to ground	Rear wiper, ADC sampling detects short to ground	Hardware failure, check wiring connections
B190515	Rear wiper mode switch short to power or open	Rear wiper, ADC sampling detects short to power or open circuit	Hardware failure, check wiring connections

© 2026, All rights reserved



DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B19051C	Rear wiper mode switch voltage value is out of range	Rear wiper, ADC sampling detects an invalid voltage value	Hardware failure, check wiring connections
B190614	GND Wiper Intermittent Switch Short to Ground	Intermittent wiper, short to ground detected by ADC sampling	Hardware failure, check wiring connections
B190615	Wiper intermittent switch short to power or open circuit	Intermittent wiper, ADC sampling detects short to power or open circuit.	Hardware failure, check wiring connections

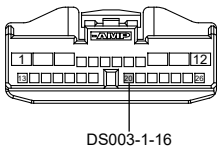
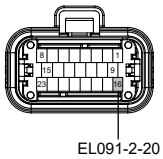
DTC: P084F9E-TCM

Fault code	Description
P084F9E	Park/Neutral Switch Output Circuit Component Fault Persists





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the combination switch.	
	A Check whether the Park button on the combination switch is corroded by water ingress or jammed by foreign objects.
Yes》》》 Remove foreign objects; replace the combination switch if necessary.	
No》》》 Go to step 3.	
Step 3 Check the wiring harness between the combination switch and the controller assembly.	
EL091-2 Combination Switch  B10DMTCM1212009 DS003-1 Controller Assembly  B10DMTCM1212010	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector DS003-1 of the controller assembly. C Disconnect the harness connector EL091-2 of the combination switch. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 16 of the wiring harness connector DS003-1 of the controller assembly and terminal 20 of the wiring harness connector EL091-2 of the combination switch to check if the resistance is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measure the resistance between terminal 20 of the combination switch harness connector EL091-2 and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 20 of the combination switch harness connector EL091-2 and the body ground to check if it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》

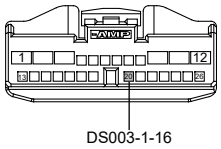
DTC: P084F9A-TCM

Fault code	Description
P084F9A	Park/Neutral Switch Output Circuit Component Malfunction or System Operating Conditions

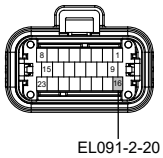
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the combination switch and the controller assembly.

EL091-2 Combination Switch

B10DMTCM1212009

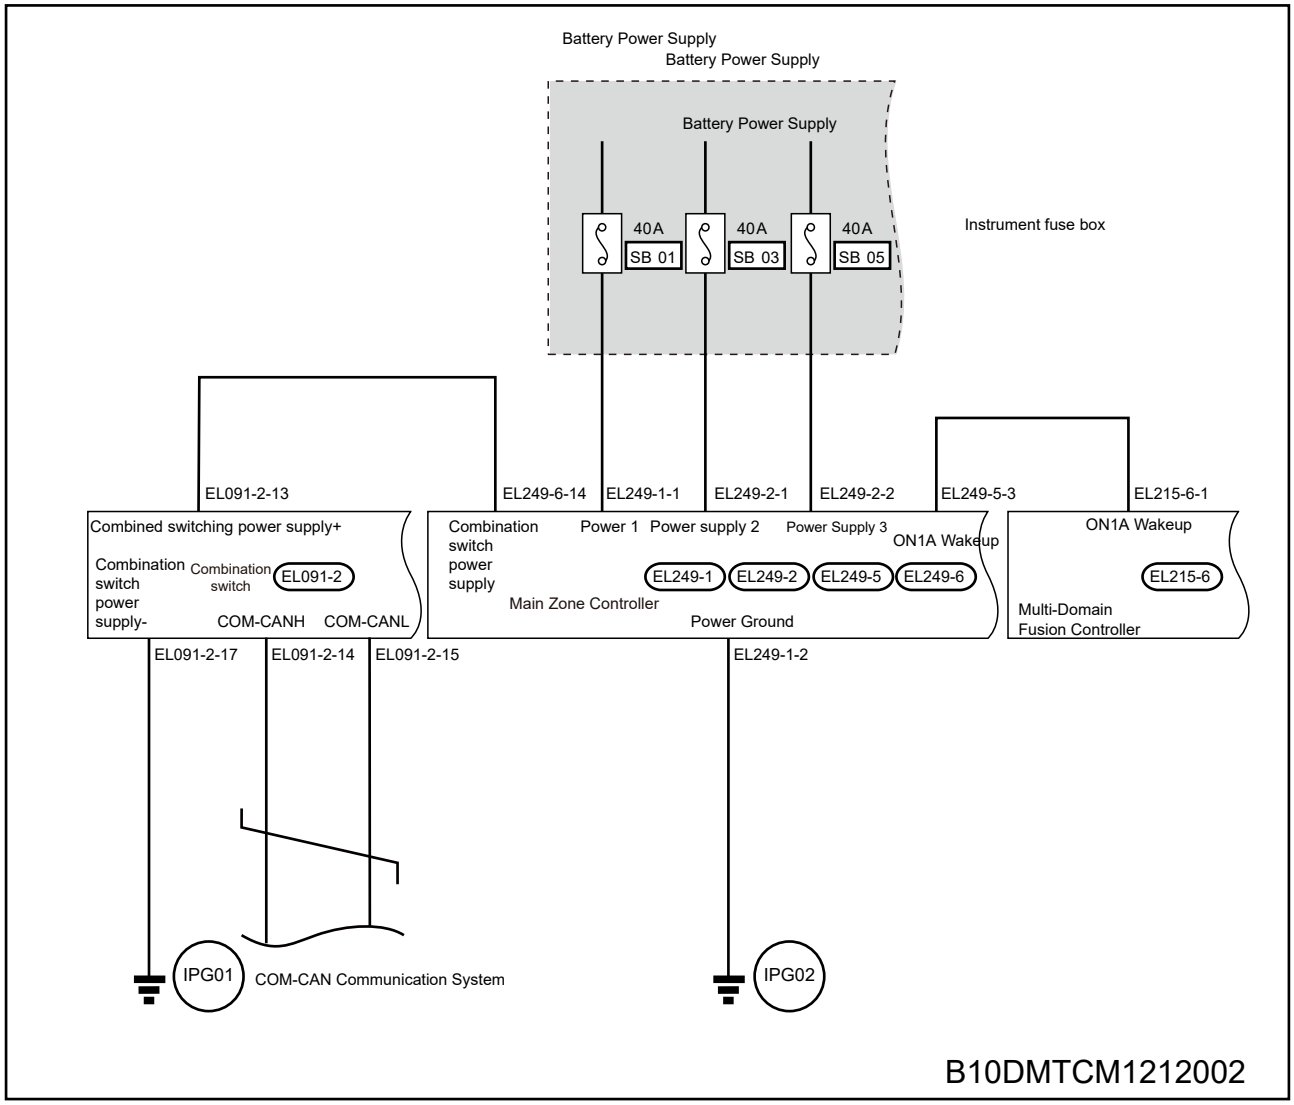
DS003-1 Controller Assembly

B10DMTCM1212010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector DS003-1 of the co ntroller assembly.
C Disconnect the harness connector EL091-2 of the combin ation switch.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of the wiring harnes s connector DS003-1 of the controller assembly and termin al 20 of the wiring harness connector EL091-2 of the combi nation switch to check if the resistance is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 20 of the combination sw itch harness connector EL091-2 and the body ground to ch eck if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 20 of the combination swit ch harness connector EL091-2 and the body ground to che ck if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the combination switch.
A Check whether the power ground circuit of the combinati on switch is normal.
No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 4.

© 2026, All rights reserved



Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

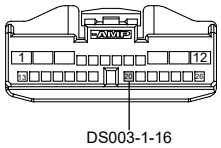
DTC: P084F1C-TCM

Fault code	Description
P084F1C	Park/Neutral Switch Output Circuit General Electrical Fault Circuit Voltage Out of Range

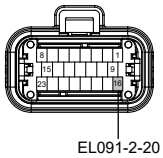
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the combination switch and the controller assembly.

EL091-2 Combination Switch

B10DMTCM1212009

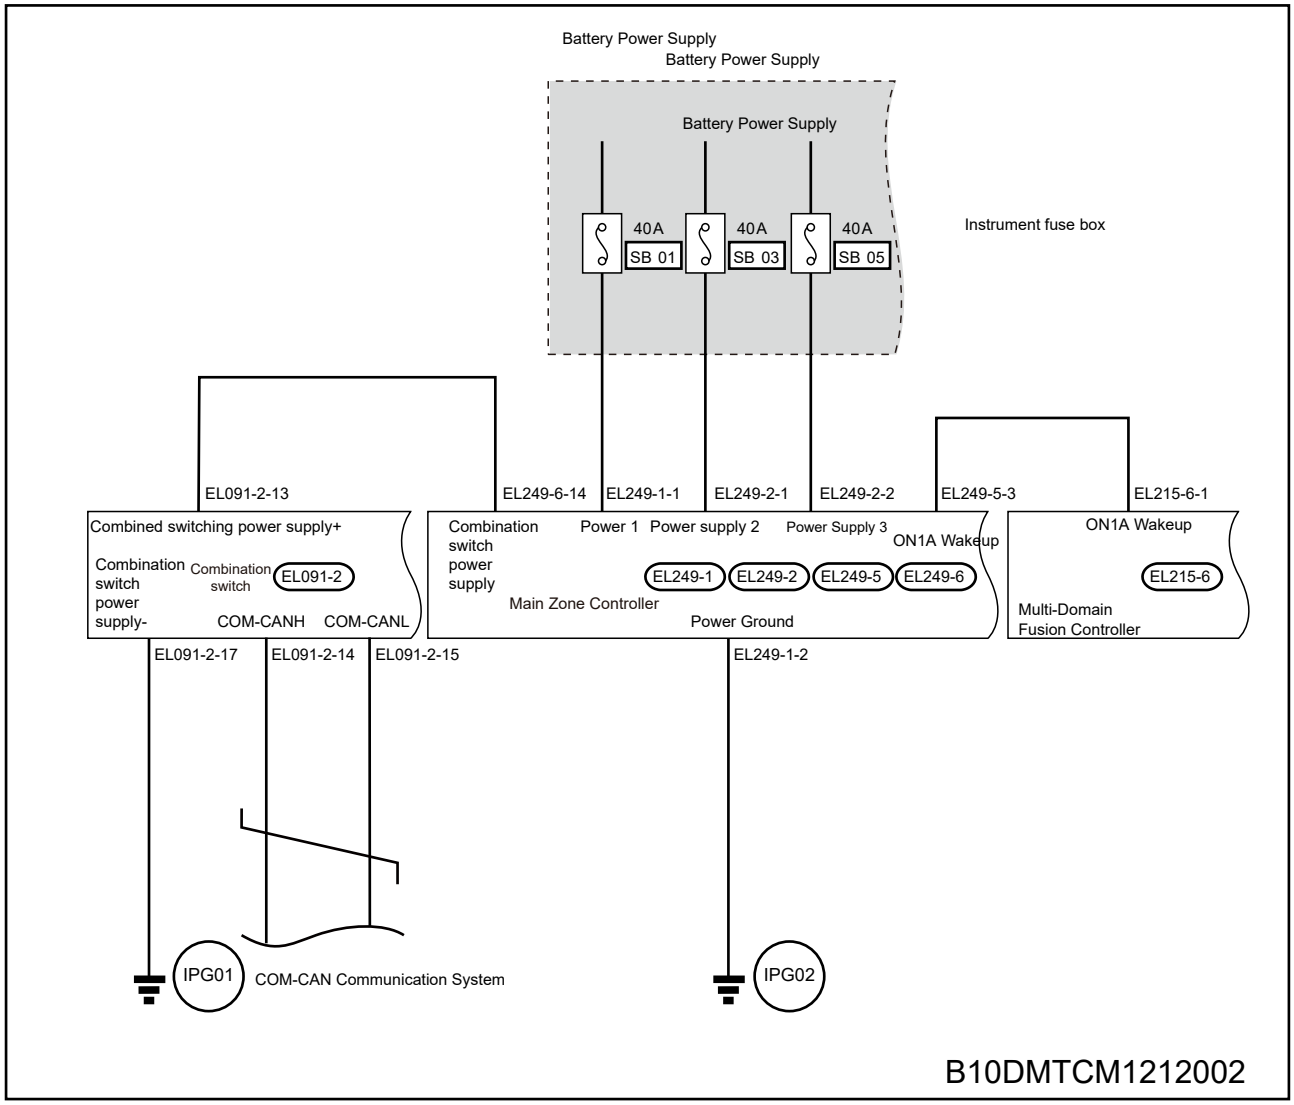
DS003-1 Controller Assembly

B10DMTCM1212010

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector DS003-1 of the co ntroller assembly.
C Disconnect the harness connector EL091-2 of the combin ation switch.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of the wiring harnes s connector DS003-1 of the controller assembly and termin al 20 of the wiring harness connector EL091-2 of the combi nation switch to check if the resistance is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 20 of the combination sw itch harness connector EL091-2 and the body ground to ch eck if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 20 of the combination swit ch harness connector EL091-2 and the body ground to che ck if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the combination switch.
A Check whether the power ground circuit of the combinati on switch is normal.
No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 4.

© 2026, All rights reserved



Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

pre smoothly over time.","type":"limit_burst_rate","param":"","code":"limit_burst_rate"}}

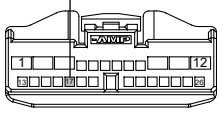
EL091-2-13

B10DMTCM1212005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector EL091-2 of the combin ation switch.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 14 of harness connecto r EL249-6 of the main zone controller and terminal 13 of ha rness connector EL091-2 of the combination switch to chec k if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.

Step 5 Check the ground harness of the combination switch.

EL091-2 Combination Switch

Combination switch ground

B10DMTCM1212006

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combin ation switch.
C Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 17 of the harness connector EL091-2 of the combination switch and t he vehicle body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 6.

Step 6 Check the power ground circuit of the main zone controller.

A Check whether the power ground circuit of the main zone controller is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the combination switch.	
	Replace the combination switch. B After replacing the combination switch, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

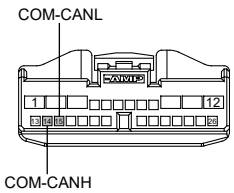
DTC: U1C4588-TCM

Fault code	Description
U1C4588	CAN Bus #2 Bus Signal/Message Fault Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the combination switch is working properly.	
EL091-2 Combination Switch  B10DMTCM1212007	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL091-2 of the combin ation switch. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage values between terminal 14 and the vehicle body ground, and between terminal 15 and the vehicle bod y ground, of the harness connector EL091-2 of the combina tion switch. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground of the combination switch.	
	A Check whether the power ground of the combination swit ch is normal.
	No》》》 Repair or replace the wiring harness.

9.3.8 SERVICE AND REPAIR GUIDANCE

FRONT USB PORT

REMOVAL PROCEDURE

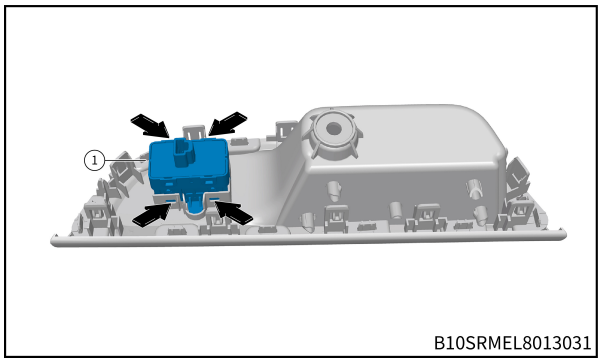
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the USB mounting plate.
   See:USB Mounting Plate (page 5474)
4. Remove the front USB.

a. Release the 4 retaining clips of the front USB -arrow-, and remove the front USB ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the front USB ports to ensure they are working properly.

© 2026, All rights reserved



SINGLE DOOR WINDOW CONTROL SWITCH

NOTE

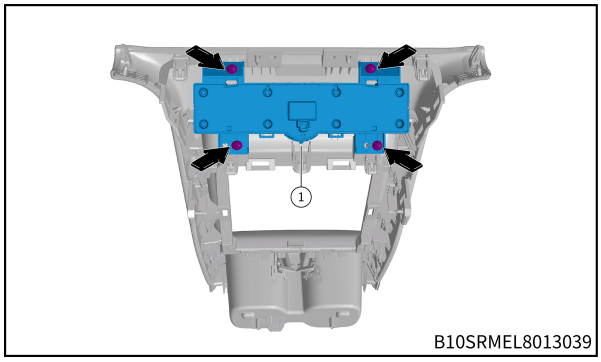
This chapter describes the removal and installation of the window control switch for the rear left door. For the removal and installation of the window control switches for the front right and rear right doors, refer to the rear left door.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door switch panel assembly.
   See:Rear left door switch panel assembly (page 5366)
4. Remove the door window control switch.

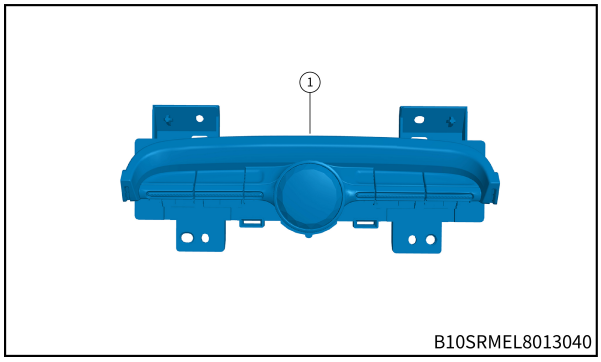
a. Release the 4 retaining clips -arrow- of the single door window control switch, and remove the single door window control switch ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After replacing the module, the module must be matched.
   b. After installation, check that the single door glass control switch assembly operates normally.

© 2026, All rights reserved



CENTER CONSOLE SWITCH

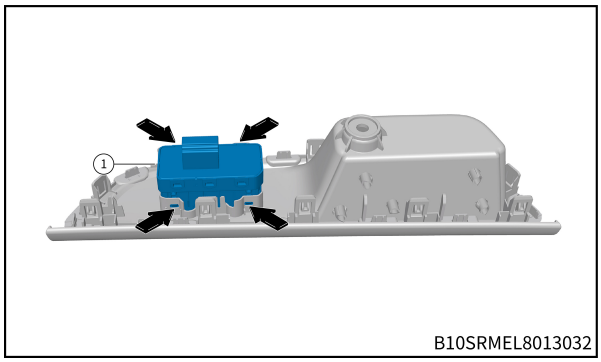
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the center console switch.

a. Unscrew the 4 fixing screws of the center console switch - arrow -.
Recommended tool: Phillips screwdriver

b. Remove the center console switch ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the center console switches function properly.

© 2026, All rights reserved

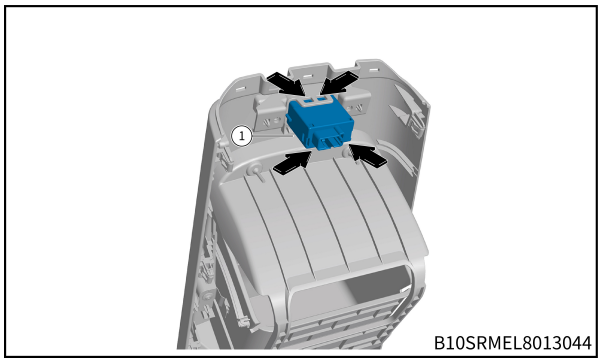
DRIVER'S WINDOW CONTROL SWITCH

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door switch panel assembly.
   See:Front left door switch panel assembly (page 5356)
4. Remove the driver's power window control switch.

a. Release the 4 retaining clips -arrows- of the driver's side power window control switch, and remove the driver's side power window control switch ①.
   Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After replacing the module, the module must be matched.
   b. After installation, verify that the driver's side window control switch assembly operates normally.

© 2026, All rights reserved

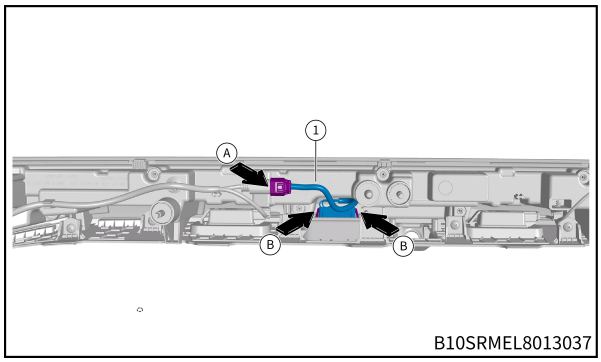
REAR USB

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear panel assembly of the center console.
   See:Center console rear panel assembly (page 5476)
4. Remove the rear USB.

a. Disengage the 4 retaining clips of the rear USB - arrows -, and remove the rear USB ①.
Recommended tool: Interior trim removal tool

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the rear USB ports to ensure they are working properly.

© 2026, All rights reserved

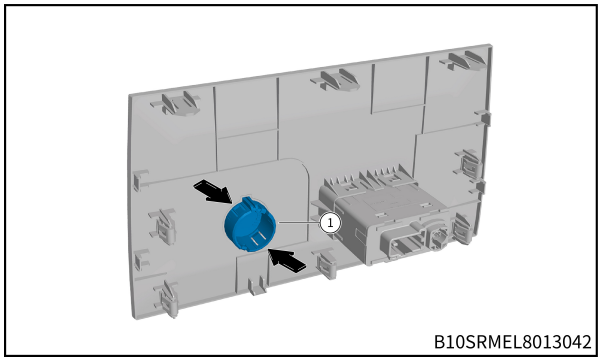
LIFTGATE MICRO SWITCH

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9457)
4. Remove the liftgate microswitch.

a. Disconnect the 1 connector of the liftgate microswitch -arrow A-, and release the 2 retaining clips of the liftgate microswitch -arrow B-.
b. Remove the liftgate microswitch ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the liftgate microswitch operates properly.

© 2026, All rights reserved

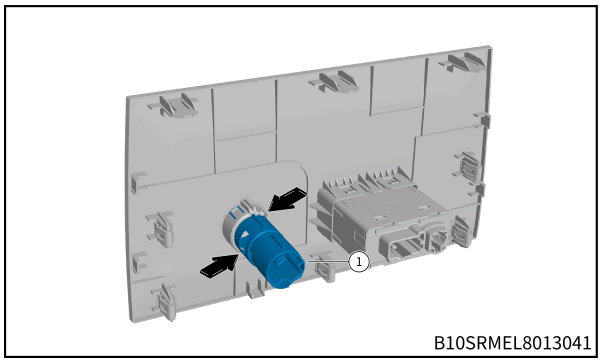
AUXILIARY POWER BRACKET

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the USB mounting plate.
   See:USB Mounting Plate (page 5474)
4. Remove the backup power supply.
   See:Backup power (page 8632)
5. Remove the backup power supply bracket.

a. Release the 2 retaining clips of the auxiliary power supply bracket -arrow-, and remove the auxiliary power supply bracket ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the backup power supply to ensure it is functioning properly.

© 2026, All rights reserved

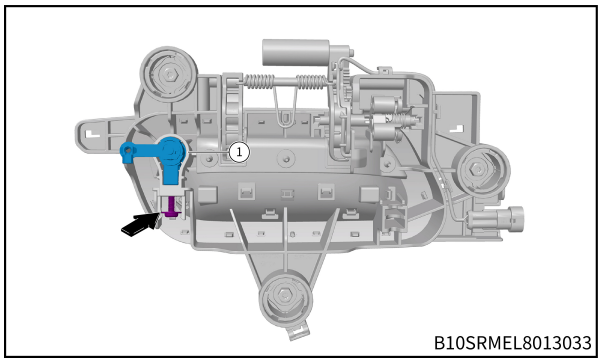
BACKUP POWER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the USB mounting plate.
   See:USB Mounting Plate (page 5474)
4. Remove the backup power supply.

a. Release the 2 retaining clips of the backup power supply -arrow-, and remove the backup power supply ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the backup power supply to ensure it is functioning properly.

© 2026, All rights reserved

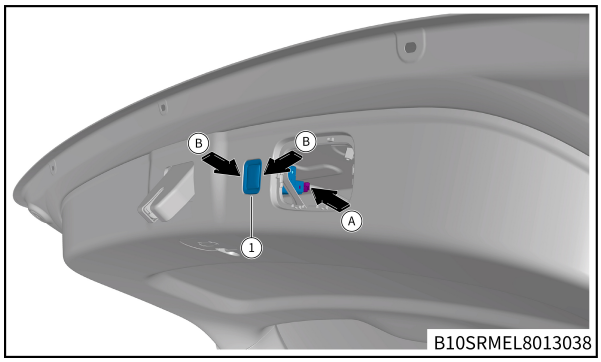
MECHANICAL LOCK CYLINDER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the outside handle of the front left door.
   See:Front left exterior door handle (page 6563)
4. Remove the mechanical lock cylinder assembly.

a. Unscrew the 1 fixing bolt -arrow- of the mechanical lock cylinder assembly, and remove the mechanical lock cylinder assembly ①.
Recommended tool: T20 Torx wrench
Torque: 2±1N m

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

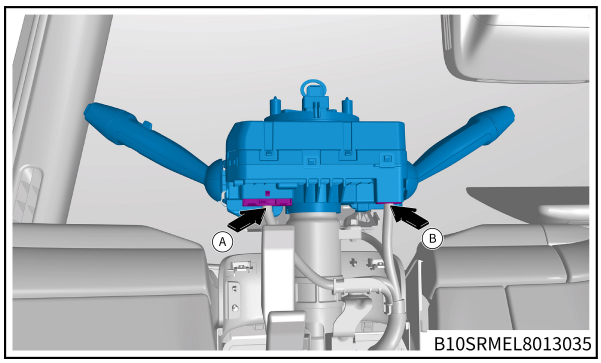
POWER TRUNK LID SWITCH

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the liftgate handle assembly.
   See:Tailgate handle assembly (page 5375)
4. Remove the power liftgate switch.

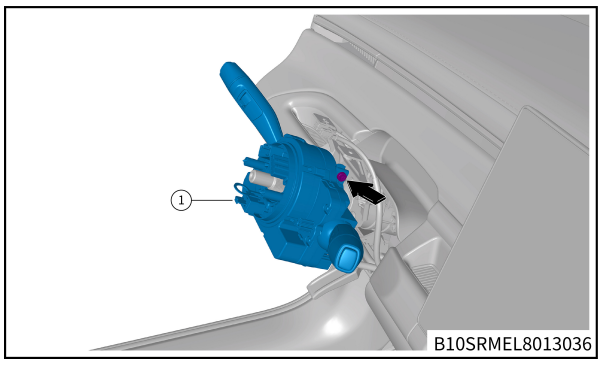
a. Disconnect the 1 connector of the power liftgate switch -arrow A-, and release the 2 retaining clips of the power liftgate switch -arrow B-.
b. Remove the power liftgate switch ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the power liftgate switch operates normally.

© 2026, All rights reserved



COMBINATION SWITCH

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the steering wheel assembly.
   See:Steering wheel assembly (page 6233)
4. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
5. Remove the lower steering column cover assembly.
   See:Steering Column Lower Cover Assembly (page 5432)
6. Remove the combination switch.

a. Disconnect the 2 connectors of the combination switch - arrow A - and - arrow B -.

b. Unscrew the 1 fixing bolt of the combination switch -arrow-, and remove the combination switch ①.
Recommended tool: T30 Torx socket wrench
Torque: 6±1N m

> **ATTENTION**
>
> After removal, do not rotate the clock spring.

SETUP

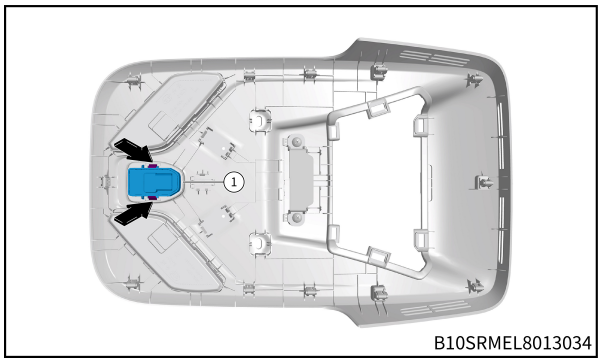
1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the controller requires the use of a diagnostic tool to perform the following operations:

> **ATTENTION**
>
> After installing the controller, first read its software version. If the new version is higher than or equal to the old version, it can be used normally. If the new version is lower than the old version, the controller software must first be updated to the original vehicle version or the corresponding OTA version.

© 2026, All rights reserved

- Write VIN: Select the corresponding vehicle model - System Diagnosis - Combination Switch (TCM) - Data Writing - Write VIN.

> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.



- Before installation, check whether the clock spring is in the correct position.
- When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
- After installation, check whether the relevant electrical components function properly.

© 2026, All rights reserved

OVERHEAD CONSOLE

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
4. Remove the overhead switch assembly.

a. Release the 2 retaining clips -arrow- of the overhead console switch assembly, and remove the overhead console switch assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. When connecting the wiring harness, check whether the pins of the wiring harness connector are damaged. If any damage is found, replace the wiring harness with a new one.
   b. After installation, check whether the relevant electrical components function properly.

© 2026, All rights reserved

9.4 INTELLIGENT DRIVING ASSISTANCE SYSTEM

9.4.1 OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

1. Forward-facing monocular camera
   The forward-facing monocular camera is installed on the upper part of the windshield, and no obstructions are allowed within the field of view of the camera sensor. A forward-facing monocular camera is installed at the top of the windshield to detect the surrounding environment and objects. The maximum recognition distance for unobstructed pedestrians is approximately 80m (under ideal environmental conditions such as lighting), and the minimum pedestrian detection height of the camera is 0.8m.
   The forward-facing monocular camera must be calibrated in the following cases:
   a. The front windshield or camera has been removed and replaced.
   b. The bracket has been removed and the forward-facing monocular camera has been replaced.

   ATTENTION

   - Poor lighting conditions, nighttime, glare, and heavy rain may affect the front monocular camera, causing interruption or degraded performance of systems such as Adaptive Cruise Control and Forward Collision Warning, and in severe cases, resulting in the complete deactivation of these functions.
   - The camera cannot detect low-lying pedestrians.
   - Before driving, please ensure there are no obstructions in the camera area.
   - Keep the field of view of the front monocular camera clear.

2. Reverse Radar System
   The parking radar system uses rear ultrasonic sensors to transmit and receive ultrasonic waves reflected by obstacles to calculate the distance between the vehicle and the obstacles.

   ATTENTION

   - Always keep the surface of the reverse ultrasonic sensor clean. When cleaning the surface of the reverse ultrasonic sensor, use a soft, damp cloth to avoid scratching the surface.
   - The parking radar system cannot replace the driver's observation of the surroundings. The driver should remain attentive and safely reverse and adjust the parking position according to actual conditions.
   - When reversing in narrow spaces or uphill, the reversing ultrasonic sensors may fail to detect railings, trees, or slopes, which is normal.

3. Panoramic image
   The 360° Surround View System can display 360° seamlessly stitched real-time images of the vehicle's surroundings on the central control screen, helping to identify blind spots around the vehicle and assisting the driver in parking the vehicle more intuitively and safely. The front-view camera is located above the front grille, capturing the front area of the vehicle; the rear-view camera is located next to the license plate

© 2026, All rights reserved

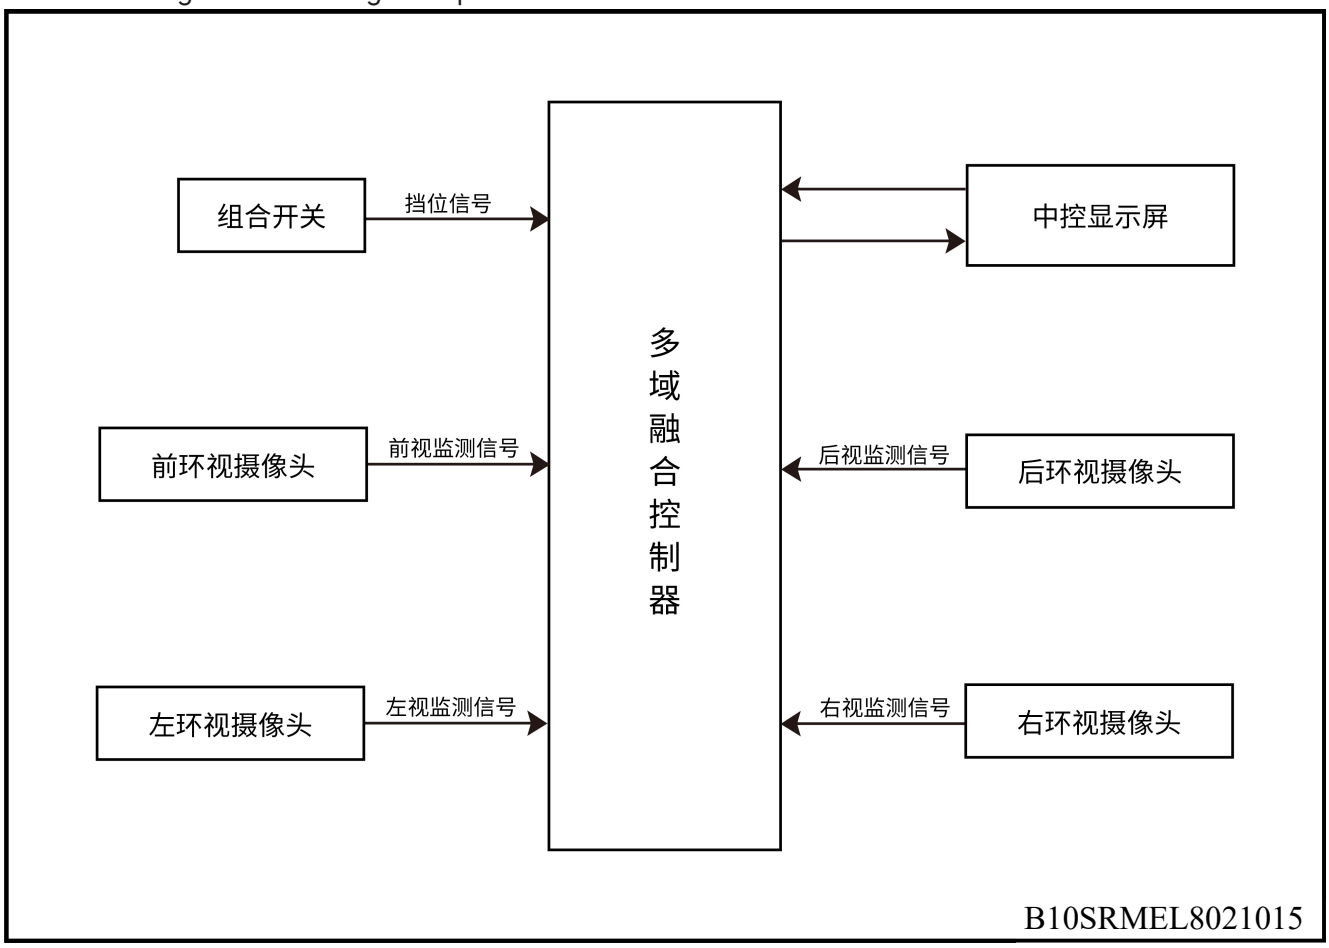
lamp, capturing the rear area of the vehicle; and the left and right cameras are located at the bottom outer side of the left and right exterior rearview mirrors, capturing the side areas of the vehicle.

> **ATTENTION**
>
> The driver should not rely excessively on the 360° Surround View system, but should check the vehicle's surroundings and make correct judgments in conjunction with the 360° Surround View system.

Panoramic Imaging System Operation:

a. After the vehicle is started, when the vehicle speed is less than 30km/h, the driver touches the 360° surround view button icon, and the central control screen displays the panoramic image interface.
b. Touch the "2D/3D Switch" icon, and the video interface switches to the "360° Surround View System Display".
c. Touch the "3D Video Directional Adjustment Switch" in the "Directional Adjustment Area" (Front, Rear, Left, Right, Front Left, Front Right, Rear Left, Rear Right), and the system will display the 3D image from the corresponding perspective according to the specific command.

> **ATTENTION**
>
> If the 360° panoramic view system malfunctions, please drive with caution and promptly contact a Leapmotor Service Center or authorized service store for inspection and repair.



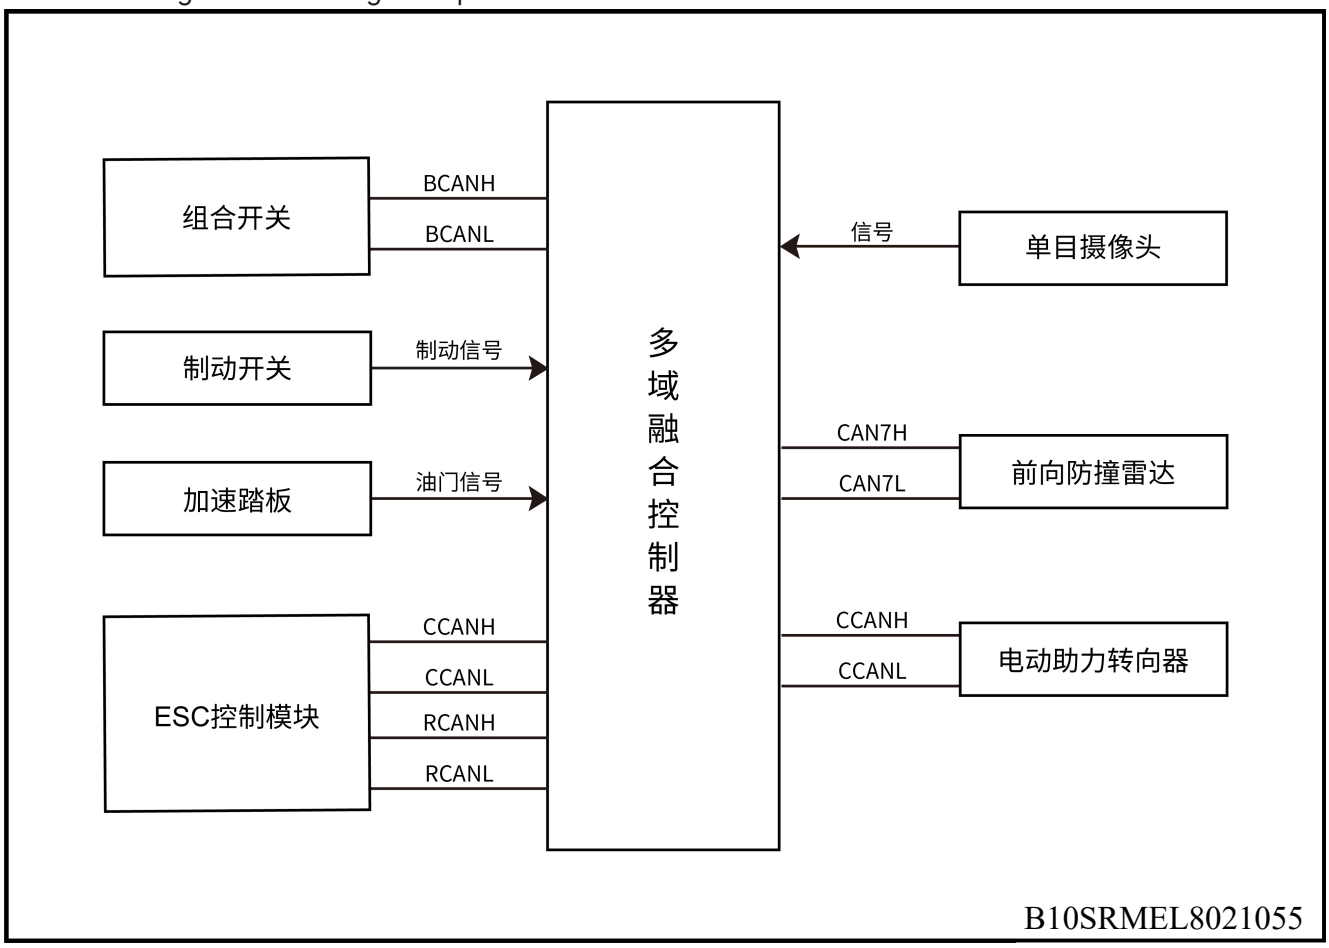
© 2026, All rights reserved

9.4.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

360° Surround View System:

1. System Overview:
   - The 360° Surround View System displays 360-degree seamlessly stitched real-time images of the vehicle's surroundings on the central control screen, helping to identify blind spots around the vehicle and assisting the driver in parking the vehicle more intuitively and safely.
2. System Composition:
   - The panoramic imaging system mainly consists of the rear surround-view camera, front surround-view camera, left and right surround-view cameras, multi-domain fusion controller, central control screen, instrument cluster, and gear selector switch.
3. Schematic Diagram of Working Principle:



Forward Collision Warning System:

1. System Overview:
   - The Forward Collision Warning System uses the forward collision radar and monocular camera to detect the relative distance, position, and speed between the preceding vehicle and the host vehicle in the same lane. By integrating other driver operations (such as pressing the brake pedal or accelerator pedal), it assesses the pre-collision risk, warns the driver when necessary, and promptly alerts the driver to take measures to avoid or mitigate a collision when a collision risk is detected.

© 2026, All rights reserved

2. The system consists of a multi-domain fusion controller, a monocular camera, a forward collision avoidance radar, an ESC control module, and an EPS controller.
3. Schematic Diagram of Working Principle:

4. The Forward Collision Warning System will not function under the following conditions:
   - The Forward Collision Warning System is turned off.
   - The steering wheel angle is greater than 30°.
   - While depressing the brake pedal or within 3s after releasing the brake pedal.
   - The road turning radius is less than 200m.
   - Dense fog, heavy rain, or heavy snow.
   - The monocular camera is obstructed by foreign objects.
   - Forward Collision Warning system fault. (The system fault icon will only be displayed on the instrument cluster after this function is enabled.)

Blind Spot Detection Warning System:

1. System Overview:
   - Two rear corner radars monitor the rear area. When a vehicle is in the blind spot or traveling at a high speed in an adjacent lane, the system will alert the driver. The warning lights are installed on the outside of the exterior rearview mirrors.
2. System Composition:
   - The system consists of a blind spot radar, a multi-domain fusion controller, and other components.

Rear Cross Traffic Warning System:

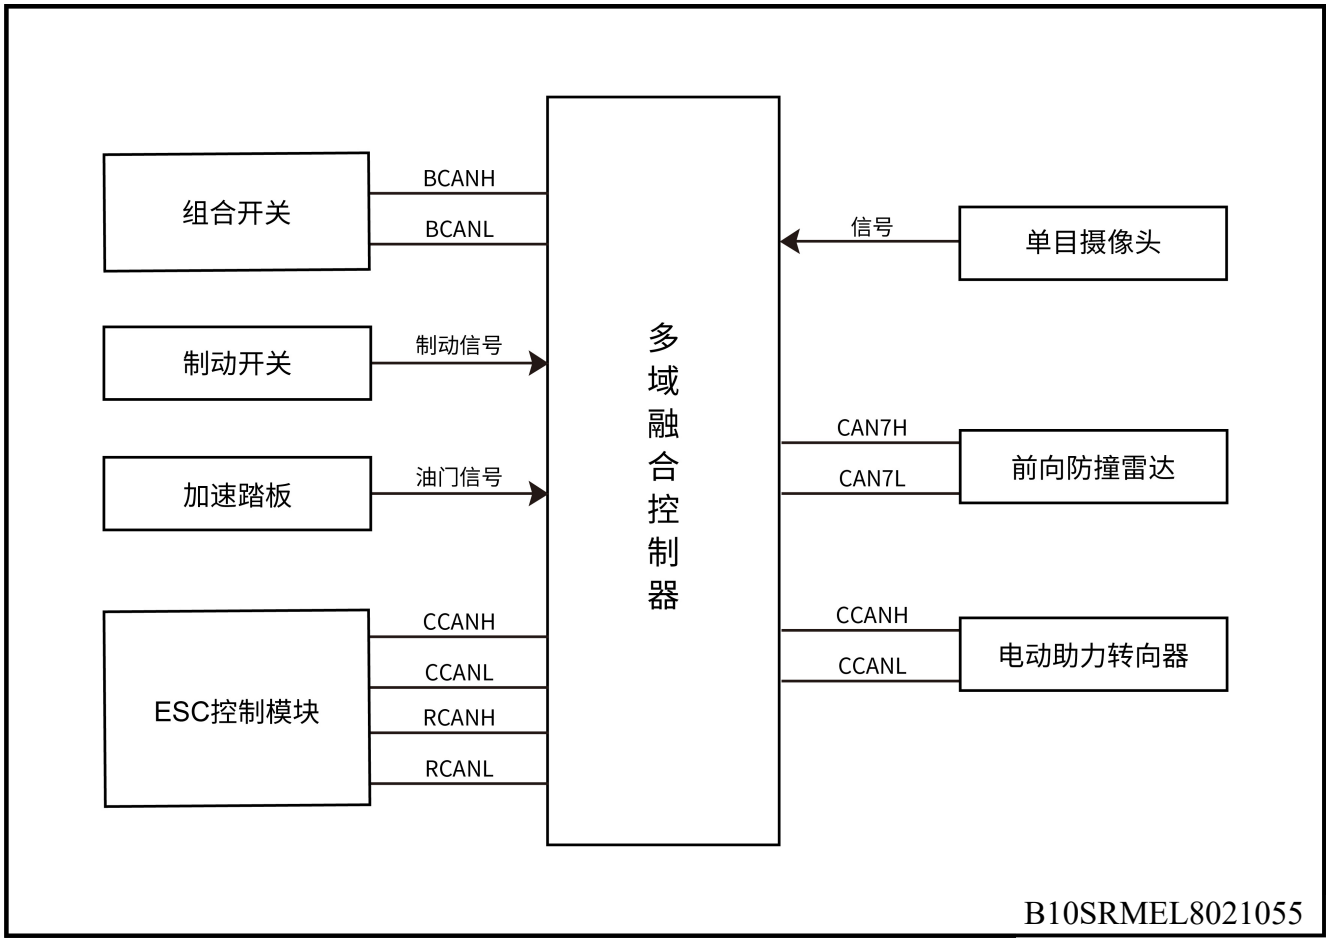
1. System Overview:

© 2026, All rights reserved

    - Rear Cross Traffic Alert system, abbreviated as "RCTA". When the vehicle is reversing, if the system detects approaching vehicles from both sides at the rear, the blind spot indicator lights on the exterior rearview mirrors will flash, and the instrument cluster will simultaneously provide an alert.
2. The system consists of blind spot radar, multi-domain fusion controller, ESC control module, and other components.

Rear Collision Warning System:

1. System Overview:
    - The Rear Collision Warning system, abbreviated as "RCW", will issue an alarm message on the instrument cluster and turn on the hazard warning lights to remind following vehicles to slow down or maintain a safe following distance when the vehicle is in motion and a vehicle is detected approaching rapidly from behind, posing a risk of a rear-end collision.
2. The system consists of blind spot radar, multi-domain fusion controller, ESC control module, and other components.

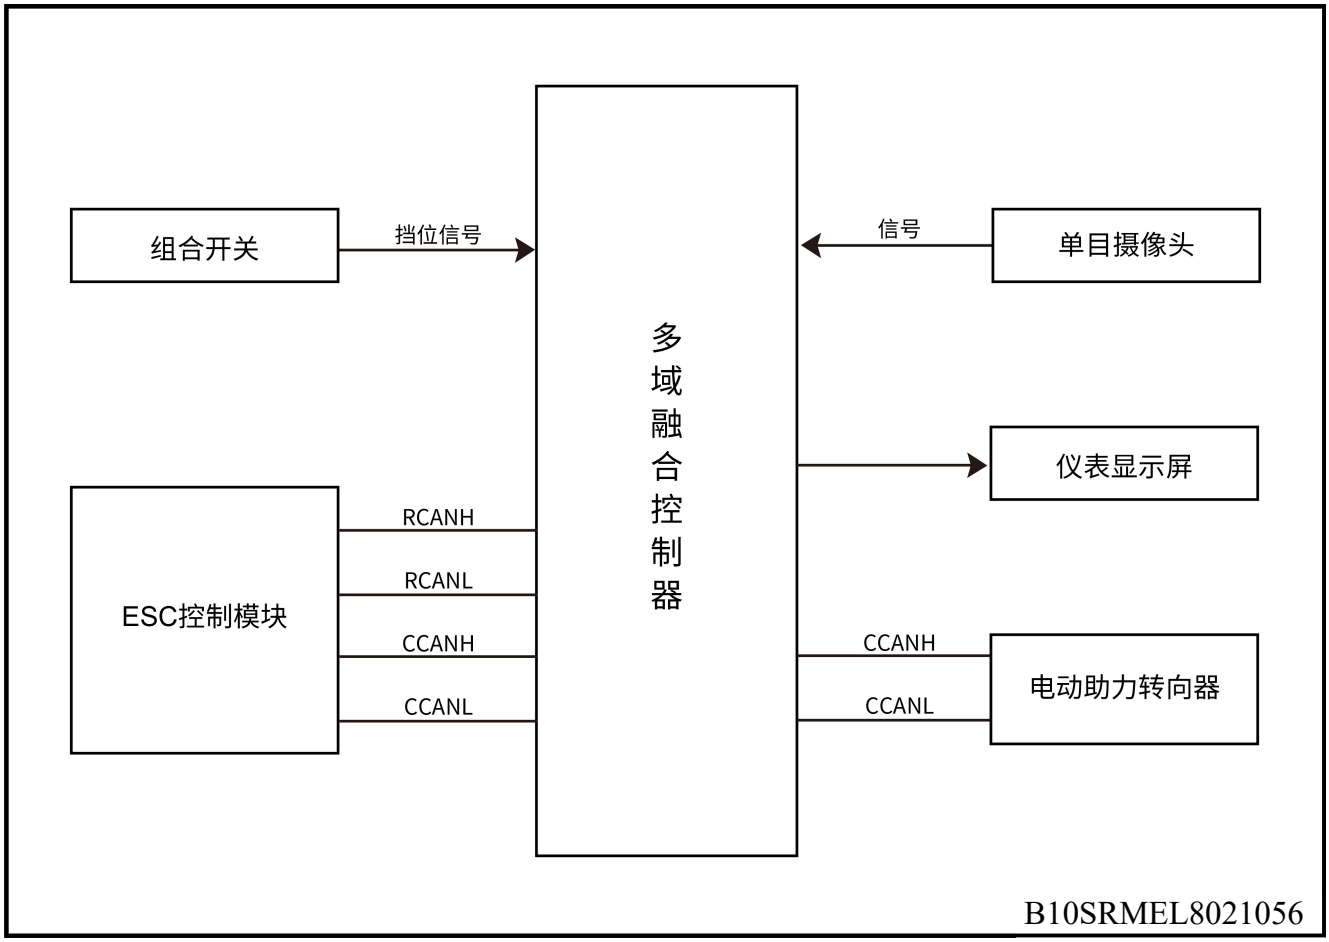


Door Open Warning System:

1. System Overview:
    - The Door Open Warning system, abbreviated as "DOW", detects when other vehicles enter the blind spot area while the vehicle is stationary. If the driver intends to open the door at this time, the system will issue an alarm warning through the warning indicator lights installed on the exterior rearview mirrors on both sides of the vehicle.
    - Basic conditions for system use: The gear is not in the R position, and the vehicle speed is 0.
2. The system consists of 2 rear blind spot radars, a multi-domain fusion controller, an ESC control module, and other components.

Automatic Emergency Braking System:

1. System Overview:
    - The Automatic Emergency Braking system, abbreviated as "AEB", monitors the distance and relative speed of targets ahead. When the driver brakes too late, applies insufficient braking force, or takes no braking action at all, the system will take measures to assist the driver in avoiding or mitigating a collision.
    - The Automatic Emergency Braking system only operates when the vehicle speed is between approximately 10~80 km/h. When the vehicle speed does not exceed 40 km/h, it can bring the vehicle to a complete stop; when the vehicle speed exceeds 40 km/h, it can only reduce the vehicle speed by 40 km/h, thereby mitigating the collision.
2. The system consists of a monocular camera, forward collision avoidance radar, multi-domain fusion controller, ESC control module, EPS controller, and other components.
3. Schematic Diagram of Working Principle:

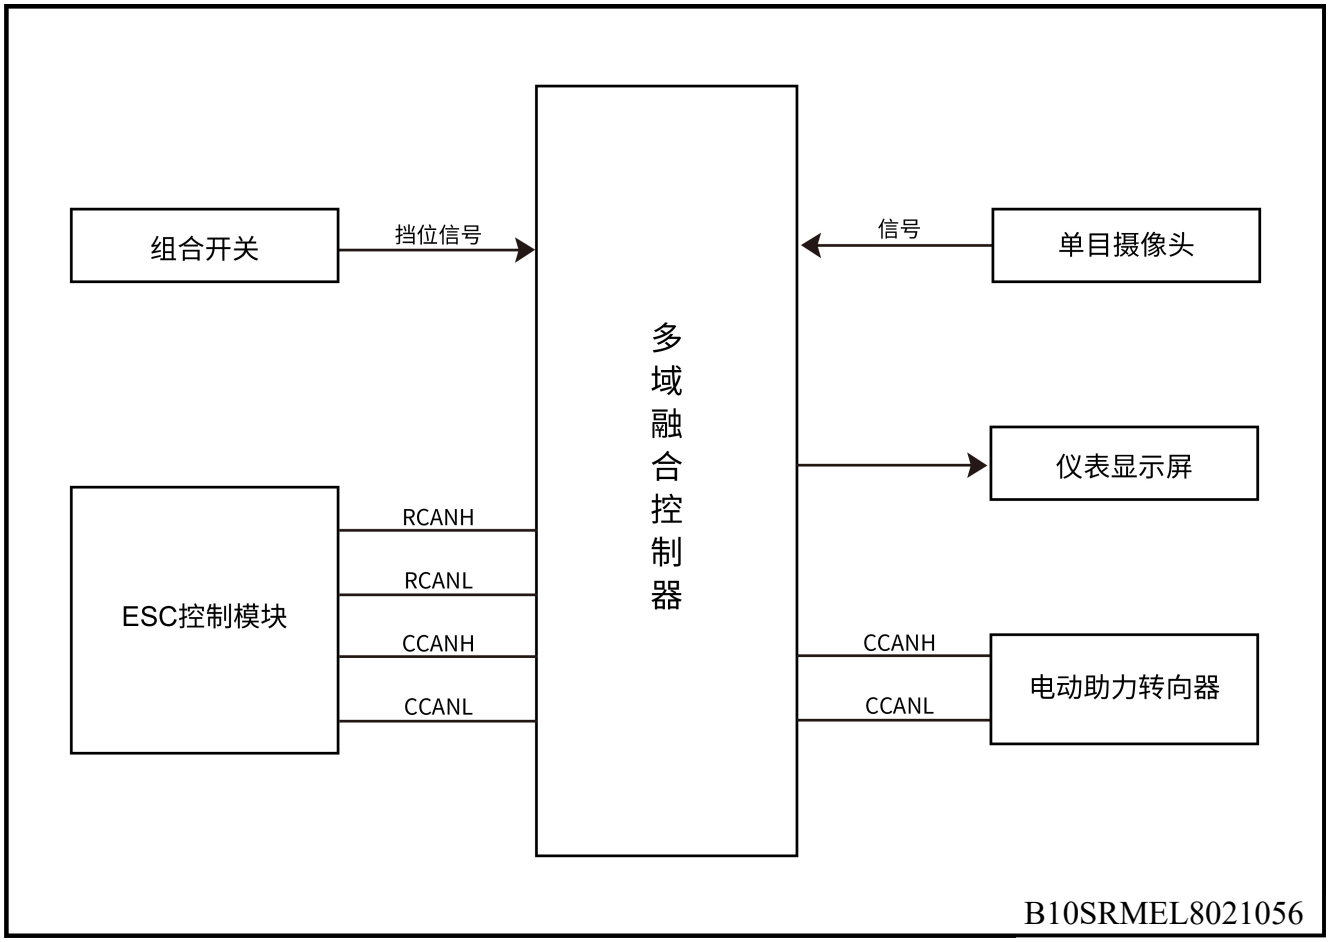


© 2026, All rights reserved

Lane Departure Warning System:

1. System Overview:
   - The Lane Departure Warning system, abbreviated as "LDW", operates when the vehicle speed is greater than 60 km/h. If the vehicle departs from the lane and crosses the lane marking without any steering intervention from the driver, the instrument cluster (ICU) will sound an alarm and display an image of the crossed lane line to warn the driver to drive safely.
2. The system consists of a monocular camera, a multi-domain fusion controller, an ESC control module, and an EPS controller.
3. Schematic Diagram of Working Principle:

© 2026, All rights reserved



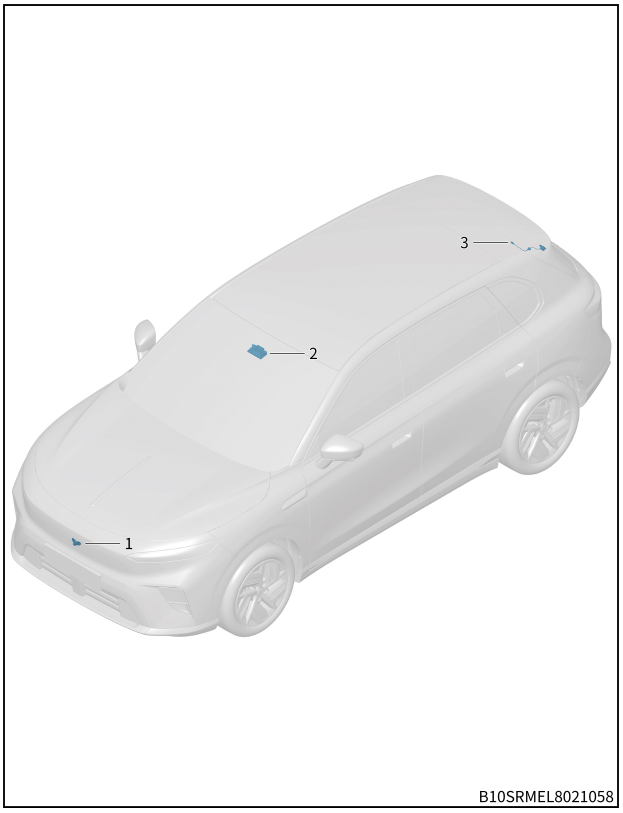
4. The Lane Departure Warning system will not function under the following conditions:
   - The Lane Departure Warning system is turned off.
   - Vehicle speed is below 60 km/h.
   - Lane markings on the road are unclear.
   - Turning, making a U-turn, or driving on winding roads with sharp curves.
   - Road turning radius less than 200m
   - Dense fog, heavy rain, or heavy snow.
   - The monocular camera is obstructed by foreign objects.
   - Monocular camera malfunction. (A warning chime sounds from the instrument cluster, and the lane departure fault indicator illuminates.)

Lane Centering Assist System:

1. System Overview:
   - The Lane Centering Assist system, abbreviated as "LCC", uses FCS video data to detect the lane status in the forward direction of the vehicle, and commands the EPS controller through internal algorithms to control the vehicle's driving posture, thereby keeping the vehicle driving in the center of the lane.
2. The system consists of a monocular camera, a multi-domain fusion controller, an ESC control module, and an EPS controller.
3. Schematic Diagram of Working Principle:

© 2026, All rights reserved

4. The Lane Keeping System will not operate under the following conditions:
   - The Lane Keeping Assist System is turned off.
   - Vehicle speed is below 60 km/h.
   - Lane markings on the road are unclear.
   - Turning, making a U-turn, or driving on winding roads with sharp curves.
   - Road turning radius less than 200m
   - Dense fog, heavy rain, or heavy snow.
   - The monocular camera is obstructed by foreign objects.
   - Monocular camera failure.



Intelligent Cruise Assist:

1. System Overview:
   - This system is a combined function of Adaptive Cruise Control (ACC) and Lane Centering Assist (LCC). When Lane Centering Assist (LCC) is activated, Intelligent Cruise Assist (ICA) engages.
2. The system consists of a monocular camera, forward collision avoidance radar, multi-domain fusion controller, ESC control module, EPS controller, and other components.

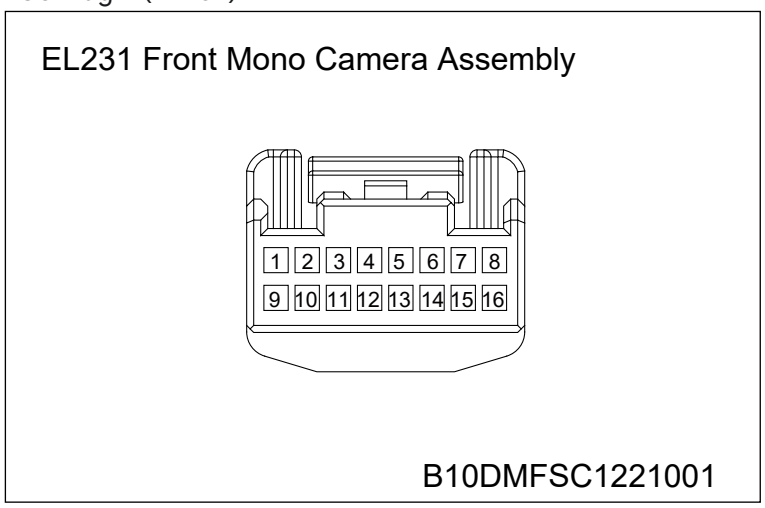
9.4.4 FAULT DIAGNOSIS

DIAGNOSTIC DESCRIPTION-FSC

Fault codes can be read through the vehicle's OBD diagnostic port using a diagnostic tool. By utilizing the FSC data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without removing any parts. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-FSC

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST-FSC

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
U300616	Control module input voltage low	Low battery voltage, DC/DC not working	Check the camera power supply voltage
U300617	High Control Module Input Voltage	High battery voltage, DC/DC malfunction	Check the camera power supply voltage
C12024B	ECU Temperature Out of Range	EyeQ image chip or PCB temperature exceeds the limit	Replace the monocular camera, or lock the vehicle and cut off power to physically cool down the monocular camera.
C120B07	Internal System Fault	Unrecoverable fault caused by hardware failure or software defect	Replace the monocular camera
C120782	FSC startup error	Camera hardware failure	Replace the camera
C120882	FSC Functional Safety Error	Camera hardware failure	Replace the camera
C120982	FSC function module service error	Camera hardware failure	Replace the camera
C120347	Camera uncalibrated	Camera not calibrated	Perform static or dynamic calibration
C120047	Calibration failed	Camera calibration failed, such as when the calibration result exceeds the permissible range, etc.	Perform static or dynamic camera calibration again
C120197	Camera Obstruction	EyeQ detects that the camera is blocked.	Check the camera lens and windshield for any obstructions.
C120644	FCS Software Mismatch	EyeQ software version does not match the MCU version, or the MCU software version does n	Update software or replace the camera

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
		ot match the calibration file version	
U1F0000	VIN not written	VIN not written	Re-run electrical inspection or rewrite the VIN
U1F8000	HPC cybersecurity handshake failed	QA handshake failure	Lock the vehicle and cycle the power, or re-run the diagnostic scan, or replace the camera.
U1FC000	HPC Cybersecurity Handshake Timeout	QA Handshake Timeout	Lock the vehicle and cycle the power, or re-run the diagnostic scan, or replace the camera.
U007388	Control CAN bus shut down (Chassis CAN)	CAN bus open or shorted to power/ground	Check the wiring harness
C160054	Configuration word not written	Configuration word not written	Write the configuration word and reset.
C160155	Configuration word write error	Configuration word written incorrectly (full function or defined partial functions)	The reconfiguration word is written correctly, and reset.
U150100	Message Fault ACU_0x233	1. ACU_233(0x233) message node lost 2.CAN Harness 3. Invalid signal received from the node	1. Check the network connection status 2. Check the transmission status of the ACU_233(0x233) node 3.Check the wiring harness 4. Check the status of related nodes
U151000	Message fault ACU_2A3(0x2A3)	1. ACU_2A3(0x2A3) message node lost 2.CAN Harness 3. Invalid signal received from the node	1. Check the network connection status 2. Check the transmission status of the ACU_2A3(0x2A3) node 3.Check the wiring harness 4. Check the status of related nodes

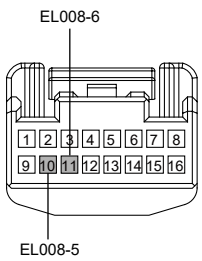
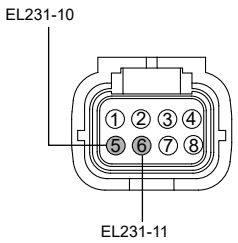
DTC: B160154-FSC

Fault code	Description
B160154	Front radar not calibrated



1. Simplified Circuit Diagram



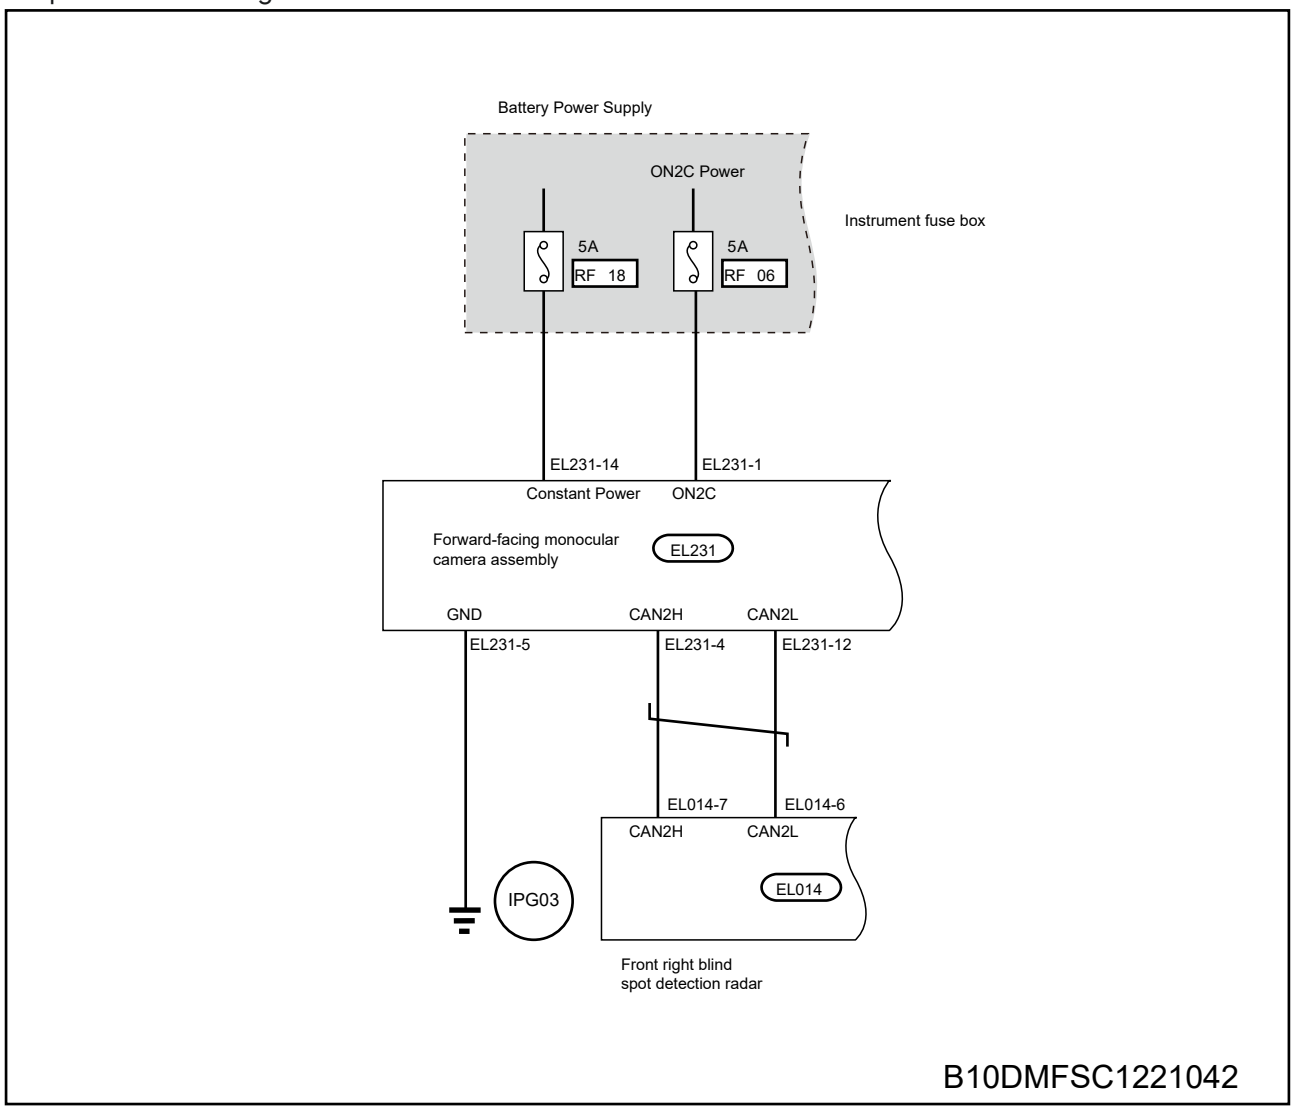
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the forward collision avoidance radar.	
	A Check the surface of the forward collision avoidance rada r for foreign object obstruction or improper installation.
	Yes》》》 Reinstall or remove the obstruction and clean the radar surface.
	No》》》 Go to step 3.
Step 3 Perform the forward collision avoidance radar calibration procedure.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to perform the forward collision avoidance radar calibration procedure. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 4.
Step 4 Check the CAN wiring harness between the front monocular camera assembly and the forward collisi on avoidance radar.	
EL231 Front Mono Camera Assembly  B10DMFSC1221034	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C Disconnect the wiring harness connector EL008 for the fo rward collision avoidance radar. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of harness connect or EL231 of the forward-facing monocular camera assembl y and terminal 5 of harness connector EL008 of the forward collision avoidance radar to check if the resistance value is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 11 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 6 of the wire harness connector EL0 08 of the forward collision avoidance radar to check wheth er it is normal.

© 2026, All rights reserved



EL008 Forward Collision Avoidance Radar  B10DMFSC1221035	Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the power supply and ground circuit of the forward collision avoidance radar.	
	Check whether the power supply and ground circuit of the forward collision avoidance radar is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 7.	
Step 7 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: B161254-FSC

Fault code	Description
B161254	Front right radar calibration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

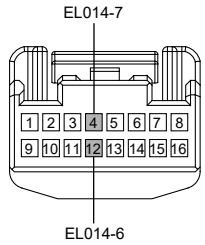
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

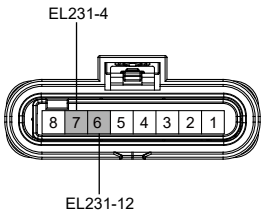
Step 2 Perform the right front blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diagnostic tool to perform the calibration procedure for the right front blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221043

EL014 Front right blind spot detection radar

B10DMFSC1221039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C. Disconnect the harness connector EL014 of the right front blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measure the resistance value between terminal 4 of the harness connector EL231 of the forward-facing monocular camera assembly and terminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of the front monocular camera assembly harness connector EL231 and terminal 6 of the right front blind spot monitoring radar harness connector EL014 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front right blind spot monitoring radar.

© 2026, All rights reserved

	A. Check whether the power ground circuit of the right fron t blind spot monitoring radar is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the right front blind spot detection radar.	
	A Replace the right front blind spot detection radar. B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleare d?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the right front blind spo t monitoring radar.	
EL231 Front Mono Camera Assembly  B10DMFSC1221043 EL014 Front right blind spot detection radar  B10DMFSC1221039	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C. Disconnect the harness connector EL014 of the right fro nt blind spot monitoring radar. D Use a multimeter, select the resistance range, and measur e the resistance value between terminal 4 of the harness co nnector EL231 of the forward-facing monocular camera ass embly and terminal 7 of the harness connector EL014 of th e right front blind spot monitoring radar to check if it is nor mal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the front monocula r camera assembly harness connector EL231 and terminal 6 of the right front blind spot monitoring radar harness conn ector EL014 to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the front right blind spot monitoring radar.	
	A. Check whether the power ground circuit of the right fron t blind spot monitoring radar is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the right front blind spot detection radar.	
	A Replace the right front blind spot detection radar. B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleare d?

© 2026, All rights reserved

Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

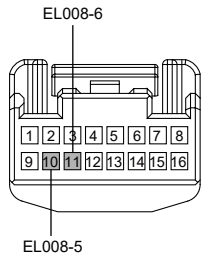
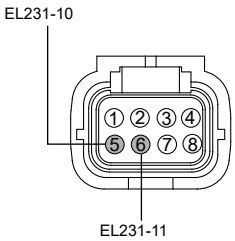
Step 2 Perform the forward collision avoidance radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diag nostic tool to perform the forward collision avoidance radar calibration procedure.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the front monocular camera assembly and the forward collisi on avoidance radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221034

EL008 Forward Collision Avoidance Radar

B10DMFSC1221035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the wiring harness connector EL008 for the fo rward collision avoidance radar.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of harness connect or EL231 of the forward-facing monocular camera assembl y and terminal 5 of harness connector EL008 of the forward collision avoidance radar to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 11 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 6 of the wire harness connector EL0 08 of the forward collision avoidance radar to check wheth er it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

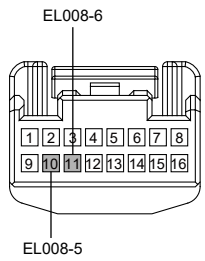
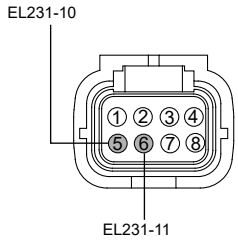
DTC: B160387-FSC

Fault code	Description
B160387	Front radar message timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Update the software for the forward collision avoidance radar and front-view monocular camera ass embly.	
	A. Connect the diagnostic tool to the OBD port. B. Power on the vehicle, and follow the prompts on the dia gnostic tool to update the software for the forward collisio n avoidance radar and the front monocular camera assembl y. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》 》 》 System normal.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the CAN wiring harness between the front monocular camera assembly and the forward collisi on avoidance radar.	
EL231 Front Mono Camera Assembly  B10DMFSC1221034 EL008 Forward Collision Avoidance Radar  B10DMFSC1221035	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C Disconnect the wiring harness connector EL008 for the fo rward collision avoidance radar. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of harness connect or EL231 of the forward-facing monocular camera assembl y and terminal 5 of harness connector EL008 of the forward collision avoidance radar to check if the resistance value is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 11 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 6 of the wire harness connector EL0 08 of the forward collision avoidance radar to check wheth er it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》

DTC: B161196-FSC

Fault code	Description
B161196	Front right corner radar operating mode abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

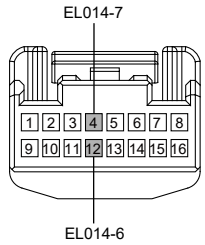
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

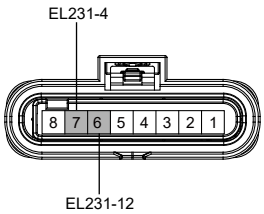
Step 2 Perform the right front blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diagnostic tool to perform the calibration procedure for the right front blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221043

EL014 Front right blind spot detection radar

B10DMFSC1221039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C. Disconnect the harness connector EL014 of the right front blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measure the resistance value between terminal 4 of the harness connector EL231 of the forward-facing monocular camera assembly and terminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of the front monocular camera assembly harness connector EL231 and terminal 6 of the right front blind spot monitoring radar harness connector EL014 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front right blind spot monitoring radar.

© 2026, All rights reserved

	A. Check whether the power ground circuit of the right fron t blind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the right front blind spot detection radar.	
	A Replace the right front blind spot detection radar. B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleare d?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

Fault code	Description
B162196	Rear right corner radar operating mode abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

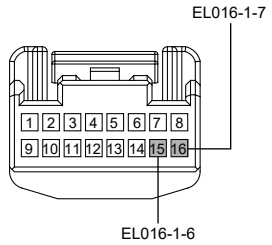
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

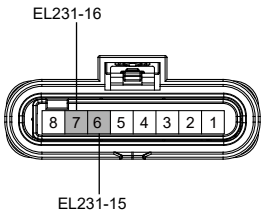
Step 2 Perform the calibration procedure for the right rear blind spot detection radar.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and follow the prompts on the diag nostic tool to perform the right rear blind spot detection ra dar calibration procedure.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the front monocular camera assembly and the right rear blin d spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221022

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMFSC1221023

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL016-1 of the right re ar blind spot monitoring radar.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 16 of the harness connector EL231 of the front monocular camera assembly and terminal 7 of the harness connector EL016-1 of the rig ht rear blind spot monitoring radar is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of the harness connec tor EL231 of the front monocular camera assembly and ter minal 6 of the harness connector EL016-1 of the right rear blind spot monitoring radar to check whether the resistanc e value is normal
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the right rear blind spot monitoring radar power ground circuit.

© 2026, All rights reserved

	A Check whether the power ground circuit of the right rear blind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.

DTC: B163483-FSC

Fault code	Description
B163483	Front Left Radar Message Checksum Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

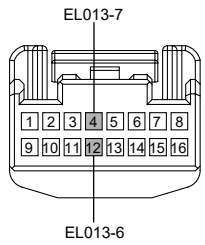
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

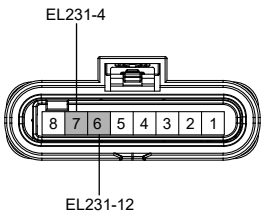
Step 2 Update the software for the left front blind spot monitoring radar and the front-view monocular ca mera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and update the software for the left front blind spot monitoring radar and the front monocular c amera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the forward-facing monocular camera assembly and the left front blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221045

EL013 Front left blind spot detection radar

B10DMFSC1221038

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL013 of the front left blind spot monitoring radar.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of harness connector EL231 of the front monocular camera assembly and termin al 7 of harness connector EL013 of the left front blind spot monitoring radar to check whether the resistance value is n ormal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 12 of wire harness con nector EL231 for the front monocular camera assembly and terminal 6 of wire harness connector EL013 for the left fron t blind spot monitoring radar to check whether the resistan ce value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

© 2026, All rights reserved

Step 4 Check the power ground circuit of the front left blind spot monitoring radar.	
	A Check whether the power ground circuit of the front left blind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared ?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the ambient temperature around the vehicle.

	A Check whether the vehicle is exposed to direct sunlight o r whether the ambient temperature is excessively high?

Yes》》》 Move the vehicle to a shaded area to cool down, then re-inspect.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the forward-facing monocular camera assembly and the left front blind spot monitoring radar.

EL231 Front Mono Camera Assembly  B10DMFSC1221045 EL013 Front left blind spot detection radar  B10DMFSC1221038	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C Disconnect the harness connector EL013 of the front left blind spot monitoring radar. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of harness connector EL231 of the front monocular camera assembly and termin al 7 of harness connector EL013 of the left front blind spot monitoring radar to check whether the resistance value is n ormal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 12 of wire harness con nector EL231 for the front monocular camera assembly and terminal 6 of wire harness connector EL013 for the left fron t blind spot monitoring radar to check whether the resistan ce value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front left blind spot monitoring radar.

	A Check whether the power ground circuit of the front left blind spot monitoring radar is normal.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B164254-FSC

Fault code	Description
B164254	Rear left radar calibration error

1. Simplified Circuit Diagram

2. Diagnostic Steps

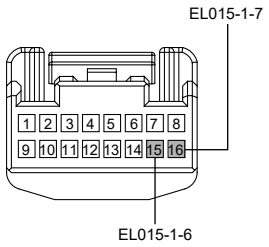
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

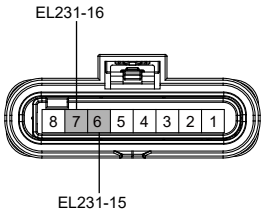
Step 2 Execute the left rear blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and follow the prompts on the diag nostic tool to perform the calibration procedure for the left rear blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the left rear blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221019

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMFSC1221020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL015-1 of the rear lef t blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of wire harness conne ctor EL231 of the front monocular camera assembly and ter minal 7 of wire harness connector EL015-1 of the left rear blind spot monitoring radar to check whether it is normal.
E. Use a multimeter set to the resistance range to measure whether the resistance between terminal 15 of the wiring h arness connector EL231 for the front monocular camera as sembly and terminal 6 of the wiring harness connector EL0 15-1 for the left rear blind spot monitoring radar is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the left rear blind spot monitoring radar.

© 2026, All rights reserved

	A Check whether the power ground circuit of the left rear b lind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the left rear blind spot detection radar.	
	A Replace the left rear blind spot monitoring radar. B After replacing the left rear blind spot detection radar an d performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

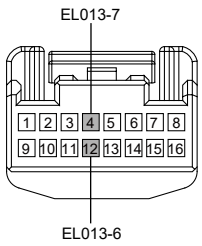
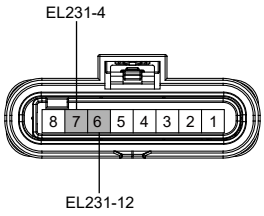
DTC: B163697-FSC

Fault code	Description
B163697	Front left radar blocked





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the front left blind spot detection radar.	
	A Check the surface of the front left blind spot monitoring radar for foreign objects.
Yes》》》 Remove obstructions and clean the radar surface.	
No》》》 Go to step 3.	
Step 3 Check the CAN harness between the forward-facing monocular camera assembly and the left front blind spot monitoring radar.	
EL231 Front Mono Camera Assembly  B10DMFSC1221045 EL013 Front left blind spot detection radar  B10DMFSC1221038	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C Disconnect the harness connector EL013 of the front left blind spot monitoring radar. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of harness connector EL231 of the front monocular camera assembly and terminal 7 of harness connector EL013 of the left front blind spot monitoring radar to check whether the resistance value is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of wire harness connector EL231 for the front monocular camera assembly and terminal 6 of wire harness connector EL013 for the left front blind spot monitoring radar to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the front left blind spot monitoring radar.	
	A Check whether the power ground circuit of the front left blind spot monitoring radar is normal.
No》》》 Repair or replace the wiring harness.	

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

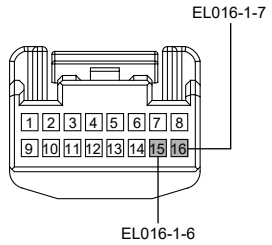
DTC: B162798-FSC

Fault code	Description
B162798	Rear right radar temperature too high

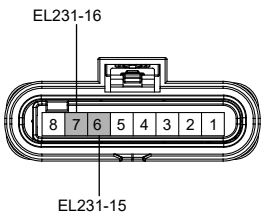
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the ambient temperature around the vehicle.
A Check whether the vehicle is exposed to direct sunlight o r whether the ambient temperature is excessively high?
Yes》》》 Move the vehicle to a shaded area to cool down, then re-inspect.
No》》》 Go to step 3.
Step 3 Check the CAN wiring harness between the front monocular camera assembly and the right rear blin d spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221022

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMFSC1221023

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL016-1 of the right re ar blind spot monitoring radar.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 16 of the harness connector EL231 of the front monocular camera assembly and terminal 7 of the harness connector EL016-1 of the rig ht rear blind spot monitoring radar is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of the harness connec tor EL231 of the front monocular camera assembly and ter minal 6 of the harness connector EL016-1 of the right rear blind spot monitoring radar to check whether the resistanc e value is normal
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Check the right rear blind spot monitoring radar power ground circuit.
A Check whether the power ground circuit of the right rear blind spot monitoring radar is normal.
No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleare d?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: B163582-FSC

Fault code	Description
B163582	Front left radar message rolling counter fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

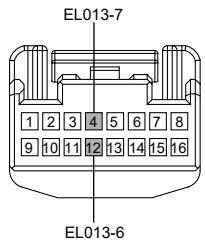
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

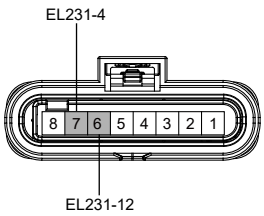
Step 2 Update the software for the left front blind spot monitoring radar and the front-view monocular ca mera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and update the software for the left front blind spot monitoring radar and the front monocular c amera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the forward-facing monocular camera assembly and the left front blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221045

EL013 Front left blind spot detection radar

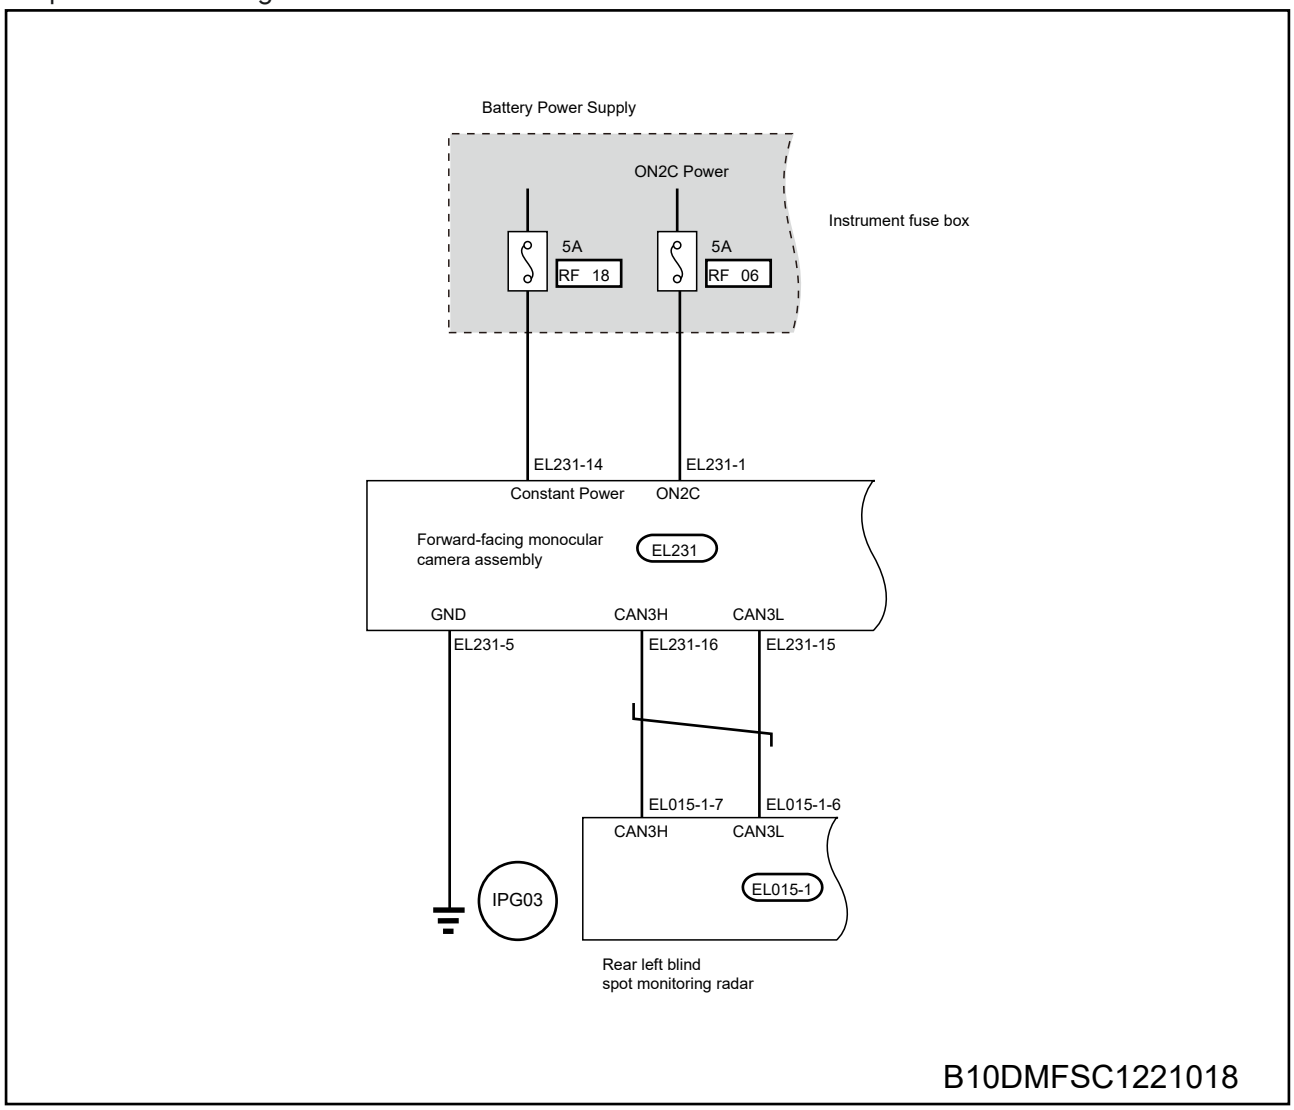
B10DMFSC1221038

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL013 of the front left blind spot monitoring radar.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of harness connector EL231 of the front monocular camera assembly and termin al 7 of harness connector EL013 of the left front blind spot monitoring radar to check whether the resistance value is n ormal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 12 of wire harness con nector EL231 for the front monocular camera assembly and terminal 6 of wire harness connector EL013 for the left fron t blind spot monitoring radar to check whether the resistan ce value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

© 2026, All rights reserved



Step 4 Check the power ground circuit of the front left blind spot monitoring radar.	
	A Check whether the power ground circuit of the front left blind spot monitoring radar is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

B164196	Rear left corner radar operating mode abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

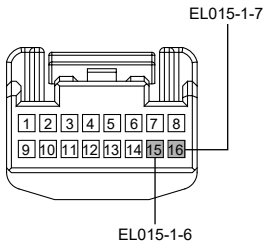
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

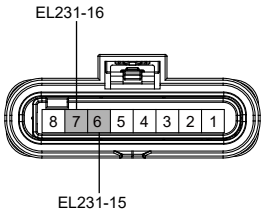
Step 2 Execute the left rear blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and follow the prompts on the diag nostic tool to perform the calibration procedure for the left rear blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the left rear blind spot monitoring radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221019

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMFSC1221020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL015-1 of the rear lef t blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of wire harness conne ctor EL231 of the front monocular camera assembly and ter minal 7 of wire harness connector EL015-1 of the left rear blind spot monitoring radar to check whether it is normal.
E. Use a multimeter set to the resistance range to measure whether the resistance between terminal 15 of the wiring h arness connector EL231 for the front monocular camera as sembly and terminal 6 of the wiring harness connector EL0 15-1 for the left rear blind spot monitoring radar is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the left rear blind spot monitoring radar.

© 2026, All rights reserved

	A Check whether the power ground circuit of the left rear b lind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.

DTC: C120197-FSC

Fault code	Description
C120197	Camera Obstruction

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Inspect the front monocular camera assembly.	
	A Check whether the front monocular camera assembly is obstructed by foreign objects.
	Yes 》》》 Remove the obstruction and re-detect.
	No 》》》 Go to step 3.
Step 3 Check the power ground of the front monocular camera assembly.	
	A. Check whether the power ground of the forward-facing monocular camera assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: U007588-FSC

Fault code	Description
U007588	Control CAN Bus Shutdown (ACANFD2 CAN)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

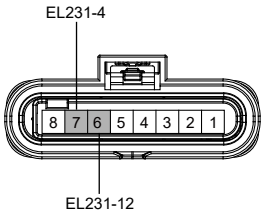
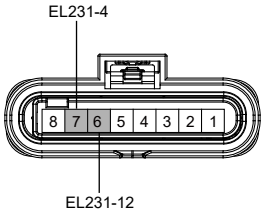
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the forward-facing monocular camera assembly and the front blind spot monitoring radar.

EL231 Front Mono Camera Assembly



B10DMFSC1221037

EL013 Front left blind spot detection radar

B10DMFSC1221038

EL014 Front right blind spot detection radar

B10DMFSC1221039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL013 of the front left blind spot monitoring radar.
D Disconnect the harness connector EL014 of the front right blind spot monitoring radar.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of harness connector EL231 for the front monocular camera assembly and terminal 7 of harness connector EL013 for the left front blind spot monitoring radar to check whether it is normal.
F Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of harness connector EL231 of the front monocular camera assembly and terminal 6 of harness connector EL013 of the left front blind spot monitoring radar to check whether it is normal.
G Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of wire harness connector EL231 of the front monocular camera assembly and terminal 7 of wire harness connector EL014 of the right front blind spot monitoring radar to check whether the resistance value is normal.
H Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 6 of the wire harness connector EL014 of the right front blind spot monitoring radar to check whether it is normal.
Resistance standard value: Less than 1 Ω
I Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 and terminal 12 of the harness connector EL231 of the front monocular camera assembly is normal.
Standard resistance value: 10kΩ or higher
J Use a multimeter, set it to the resistance range, and check whether the resistance between terminals 4 and 12 of the harness connector EL231 for the front monocular camera assembly and the body ground is normal.
Standard resistance value: 10kΩ or higher

© 2026, All rights reserved

	K Check whether the resistance value meets the standard v alue. L Connect the negative terminal of the battery, and power on the vehicle. M Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 4 and 12 of the harness connector EL231 of the front monocular camera assembly and the body ground to check whether it is normal. Voltage standard value: 0V N Check whether the voltage value meets the standard val ue.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Check the power and ground circuits of the front left blind spot monitoring radar and the front right blind spot monitoring radar.	
	A Check whether the power and ground circuits of the left f ront blind spot monitoring radar and the right front blind s pot monitoring radar are normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the front left blind spot monitoring radar or the front right blind spot monitoring radar.	
	A Replace the front left blind spot monitoring radar or the f ront right blind spot monitoring radar. B. After replacing the left front or right front blind spot mo nitoring radar and performing the calibration procedure, is t he fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the front monocular camera assembly and the forward collisi on avoidance radar.

EL231 Front Mono Camera Assembly

B10DMFSC1221034

EL008 Forward Collision Avoidance Radar

B10DMFSC1221035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the wiring harness connector EL008 for the fo rward collision avoidance radar.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 of harness connect or EL231 of the forward-facing monocular camera assembl y and terminal 5 of harness connector EL008 of the forward collision avoidance radar to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 11 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 6 of the wire harness connector EL0 08 of the forward collision avoidance radar to check wheth er it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 10 and terminal 11 of t he harness connector EL231 of the front monocular camera assembly to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Use a multimeter, select the resistance range, and measur e the resistance between terminals 10 and 11 of the harnes s connector EL231 of the forward-facing monocular camer a assembly and the body ground to check whether it is nor mal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 10 and 11 of harness con nector EL231 for the front monocular camera assembly and the body ground to check whether the voltage is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	K Confirm whether the voltage value meets the standard va lue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Check the power supply and ground circuit of the forward collision avoidance radar.	
	Check whether the power supply and ground circuit of the forward collision avoidance radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

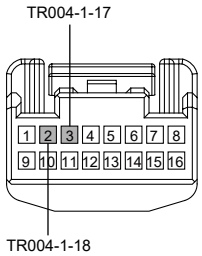
DTC: U151000-FSC

Fault code	Description
U151000	Message fault ACU_2A3(0x2A3)

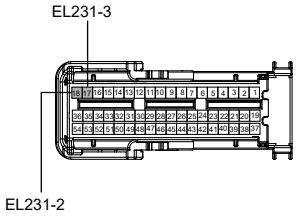
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the airbag control module assembly.

EL231 Front Mono Camera Assembly

B10DMFSC1221010

TR004-1 Airbag Control Module Assembly

B10DMFSC1221011

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector TR004-1 of the airbag control module assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of the wire harness connector EL231 of the forward-facing monocular camera assembly and terminal 18 of the wire harness connector TR004-1 of the airbag control module assembly to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector EL231 of the front monocular camera assembly and terminal 17 of harness connector TR004-1 of the airbag control module assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.
A Check whether the power supply and ground circuit of the airbag control module assembly is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replacement of airbag control module assembly
A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the smart integrated bra king system assembly.

EL231 Front Mono Camera Assembly

B10DMFSC1221013

CH024 Intelligent Integrated Brake System Assembly

B10DMFSC1221014

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-f acing monocular camera assembly.
C Disconnect the wiring harness connector CH024 of the int elligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 2 of the wire har ness connector EL231 of the front monocular camera asse mbly and terminal 39 of the wire harness connector CH024 of the intelligent integrated braking system assembly is nor mal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of harness connector E L231 of the forward monocular camera assembly and termi nal 40 of harness connector CH024 of the intelligent integra ted brake system assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

	A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse for the front monocular camera assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses RF18 and RF06 for the front mono camera assembly. Fuse specifications: RF18 5A, RF06 5A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the power circuit of the forward-facing monocular camera assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 14 of the harness connector EL231 of the front monocular camera assembly and the body ground to check whether the voltage is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the front monocular camera assembly.	
EL231 Front Mono Camera Assembly  B10DMFSC1221004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-f acing monocular camera assembly. C Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of the harness connector EL231 of the front monocular camera assembly and body gr ound to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.

A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Replacement of Intelligent Integrated Brake System Assembly.

A Replace the intelligent integrated brake system assembly.
B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

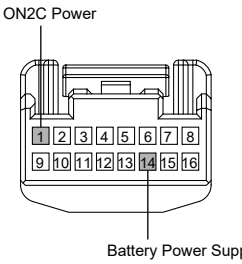
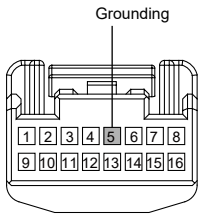
DTC: U300617-FSC

Fault code	Description
U300617	High Control Module Input Voltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front monocular camera assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses RF18 and RF06 for the front mono camera assembly. Fuse specifications: RF18 5A, RF06 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power circuit of the forward-facing monocular camera assembly.	
EL231 Front Mono Camera Assembly  B10DMFSC1221003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 14 of the harness connector EL231 of the front monocular camera assembly and the body ground to check whether the voltage is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the front monocular camera assembly.	
EL231 Front Mono Camera Assembly  B10DMFSC1221004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231 of the forward-f acing monocular camera assembly. C Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of the harness connector EL231 of the front monocular camera assembly and body gr ound to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: U1F0000-FSC

Fault code	Description
U1F0000	VIN not written

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the vehicle VIN.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and rewrite the vehicle VIN accordi ng to the prompts of the diagnostic instrument. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power ground of the front monocular camera assembly.	
	A. Check whether the power ground of the forward-facing monocular camera assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

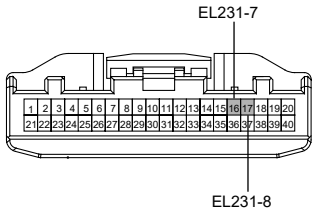
Yes》》》
Go to step 2.



Step 2 Check the Ethernet wiring harness between the front monocular camera assembly and the multi-do main fusion controller.

EL231 Front Mono Camera Assembly

B10DMFSC1221031

EL215-4 Multi-Domain Fusion Controller

B10DMFSC1221032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 8 of harness co nnector EL231 of the front monocular camera assembly an d terminal 17 of harness connector EL215-4 of the multi-d omain fusion controller is normal.
E. Use a multimeter, select the resistance range, and measu re whether the resistance value between terminal 7 of the wire harness connector EL231 of the front monocular came ra assembly and terminal 16 of the wire harness connector EL215-4 of the multi-domain fusion controller is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power supply ground circuit of the m ulti-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

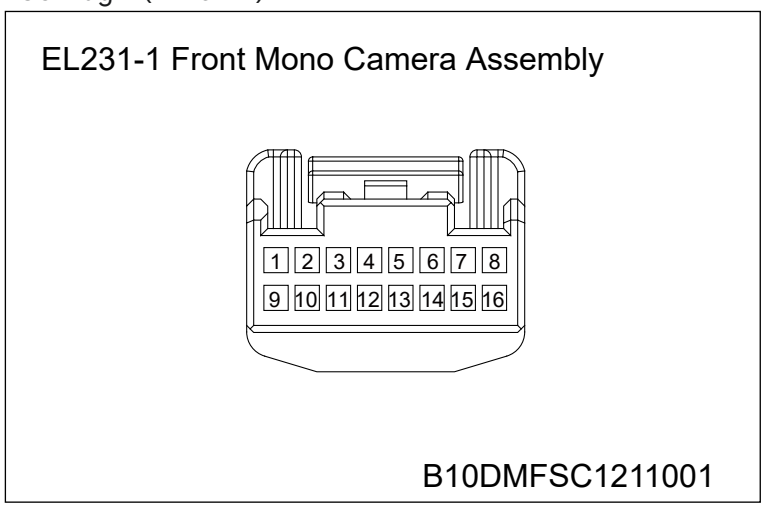
DIAGNOSTIC DESCRIPTION-FSC

Fault codes can be read through the vehicle's OBD diagnostic port using a diagnostic tool. By utilizing the FSC data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without removing any parts. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-FSC

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC: B160483-FSC

Fault code	Description
B160483	Front Radar Checksum Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

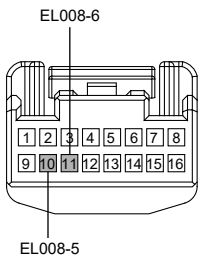
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

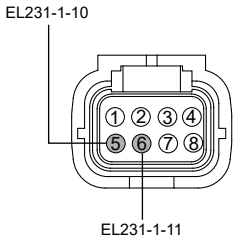
Step 2 Update the software for the forward collision avoidance radar and front-view monocular camera assembly.



A. Connect the diagnostic tool to the OBD port.
B. Power on the vehicle, and follow the prompts on the diagnostic tool to update the software for the forward collision avoidance radar and the front monocular camera assembly.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the front monocular camera assembly and the forward collision avoidance radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211034

EL008 Forward Collision Avoidance Radar

B10DMFSC1211035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the wiring harness connector EL008 for the forward collision avoidance radar.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 10 of the harness connector EL231-1 of the front monocular camera assembly and terminal 5 of the harness connector EL008 of the forward collision avoidance radar to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 11 of the harness connector EL231-1 of the front monocular camera assembly and terminal 6 of the harness connector EL008 of the forward collision avoidance radar to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Check the power supply and ground circuit of the forward collision avoidance radar.	
	Check whether the power supply and ground circuit of the forward collision avoidance radar is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B161582-FSC

Fault code	Description
B161582	Front right radar message rolling counter fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

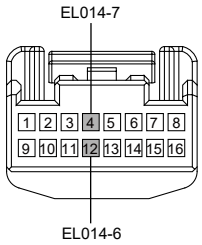
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

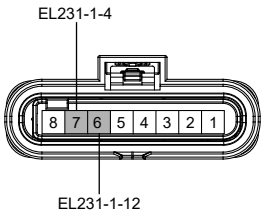
Step 2 Update the software for the right front blind spot monitoring radar and the front-view monocular ca mera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and update the software of the righ t-front blind spot monitoring radar and the forward-facing monocular camera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spo t monitoring radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211043

EL014 Front right blind spot detection radar

B10DMFSC1211039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C. Disconnect the harness connector EL014 of the right fro nt blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of the harness connect or EL231-1 of the front monocular camera assembly and te rminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check whether it is normal.
E Using a multimeter, select the resistance range and meas ure the resistance between terminal 12 of harness connect or EL231-1 for the front monocular camera assembly and t erminal 6 of harness connector EL014 for the right front bli nd spot monitoring radar to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMFSC1211023

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL016-1 of the right rear blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 16 of the wiring harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 7 of the wiring harness connector EL016-1 of the right rear blind spot monitoring radar is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 15 of harness connector EL231-1 of the front monocular camera assembly and terminal 6 of harness connector EL016-1 of the right rear blind spot monitoring radar to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the right rear blind spot monitoring radar power ground circuit.	
	A Check whether the power ground circuit of the right rear blind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B161697-FSC

Fault code	Description
B161697	Front right radar blocked

1. Simplified Circuit Diagram

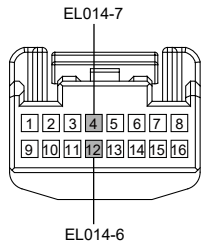
2. Diagnostic Steps

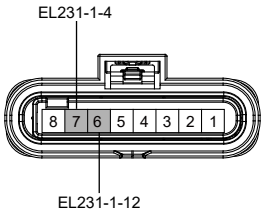
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the right front blind spot detection radar.

	A Check whether the surface of the right front blind spot monitoring radar is blocked by foreign objects.

Yes》》》 Remove obstructions and clean the radar surface.

No》》》
Go to step 3.

Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spot monitoring radar.

EL231-1 Front Mono Camera Assembly  B10DMFSC1211043 EL014 Front right blind spot detection radar  B10DMFSC1211039	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231-1 of the front view monocular camera assembly. C. Disconnect the harness connector EL014 of the right front blind spot monitoring radar. D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the harness connector EL231-1 of the front monocular camera assembly and terminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check whether it is normal. E Using a multimeter, select the resistance range and measure the resistance between terminal 12 of harness connector EL231-1 for the front monocular camera assembly and terminal 6 of harness connector EL014 for the right front blind spot monitoring radar to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front right blind spot monitoring radar.

	A. Check whether the power ground circuit of the right front blind spot monitoring radar is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the right front blind spot detection radar.	
	A Replace the right front blind spot detection radar. B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

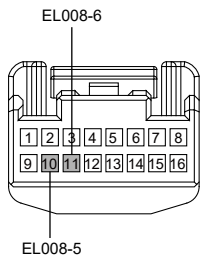
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

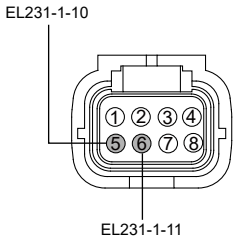
Step 2 Update the software for the forward collision avoidance radar and front-view monocular camera assembly.



A. Connect the diagnostic tool to the OBD port.
B. Power on the vehicle, and follow the prompts on the diagnostic tool to update the software for the forward collision avoidance radar and the front monocular camera assembly.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN wiring harness between the front monocular camera assembly and the forward collision avoidance radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211034

EL008 Forward Collision Avoidance Radar

B10DMFSC1211035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the wiring harness connector EL008 for the forward collision avoidance radar.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 10 of the harness connector EL231-1 of the front monocular camera assembly and terminal 5 of the harness connector EL008 of the forward collision avoidance radar to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 11 of the harness connector EL231-1 of the front monocular camera assembly and terminal 6 of the harness connector EL008 of the forward collision avoidance radar to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

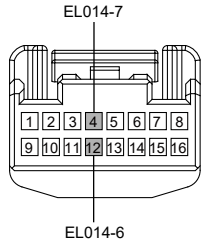
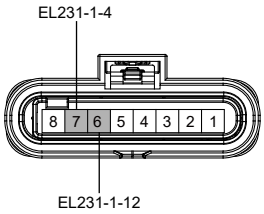
Step 2 Perform the right front blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diagnostic tool to perform the calibration procedure for the right front blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spot monitoring radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211043

EL014 Front right blind spot detection radar

B10DMFSC1211039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C. Disconnect the harness connector EL014 of the right front blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the harness connector EL231-1 of the front monocular camera assembly and terminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check whether it is normal.
E Using a multimeter, select the resistance range and measure the resistance between terminal 12 of harness connector EL231-1 for the front monocular camera assembly and terminal 6 of harness connector EL014 for the right front blind spot monitoring radar to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front right blind spot monitoring radar.

© 2026, All rights reserved

	A. Check whether the power ground circuit of the right fron t blind spot monitoring radar is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the right front blind spot detection radar.	
	A Replace the right front blind spot detection radar. B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleare d?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: B161798-FSC

Fault code	Description
B161798	Front right radar temperature too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

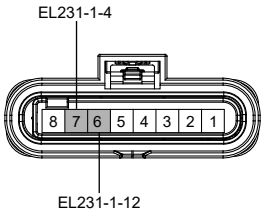
Yes》》》
Go to step 2.

Step 2 Check the ambient temperature around the vehicle.

	A Check whether the vehicle is exposed to direct sunlight o r whether the ambient temperature is excessively high?

Yes》》》 Move the vehicle to a shaded area to cool down, then re-inspect.

No》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the right front blind spo t monitoring radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211043

EL014 Front right blind spot detection radar

B10DMFSC1211039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C. Disconnect the harness connector EL014 of the right fro nt blind spot monitoring radar.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of the harness connect or EL231-1 of the front monocular camera assembly and te rminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check whether it is normal.
E Using a multimeter, select the resistance range and meas ure the resistance between terminal 12 of harness connect or EL231-1 for the front monocular camera assembly and t erminal 6 of harness connector EL014 for the right front bli nd spot monitoring radar to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front right blind spot monitoring radar.

	A. Check whether the power ground circuit of the right fron t blind spot monitoring radar is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

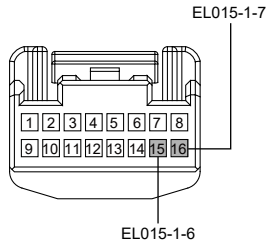
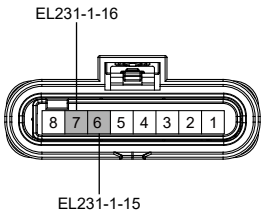
Step 2 Execute the left rear blind spot detection radar calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and follow the prompts on the diag nostic tool to perform the calibration procedure for the left rear blind spot detection radar.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the CAN harness between the front monocular camera assembly and the left rear blind spot monitoring radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211019

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMFSC1211020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL015-1 of the rear lef t blind spot monitoring radar.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 16 of the wire har ness connector EL231-1 of the front monocular camera ass embly and terminal 7 of the wire harness connector EL015-1 of the left rear blind spot monitoring radar is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of the wire harness co nnector EL231-1 of the front monocular camera assembly a nd terminal 6 of the wire harness connector EL015-1 of the left rear blind spot monitoring radar to check whether the r esistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the left rear blind spot monitoring radar.

© 2026, All rights reserved

	A Check whether the power ground circuit of the left rear b lind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the left rear blind spot detection radar.	
	A Replace the left rear blind spot monitoring radar. B After replacing the left rear blind spot detection radar an d performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B163483-FSC

Fault code	Description
B163483	Front Left Radar Message Checksum Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
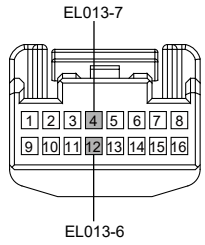
Go to step 2.

Step 2 Update the software for the left front blind spot monitoring radar and the front-view monocular ca mera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and update the software for the left front blind spot monitoring radar and the front monocular c amera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
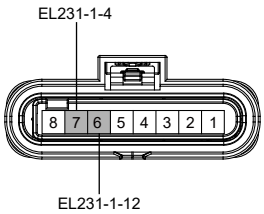
Go to step 3.



Step 3 Check the CAN harness between the forward-facing monocular camera assembly and the left front blind spot monitoring radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211045

EL013 Front left blind spot detection radar

B10DMFSC1211038

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL013 of the front left blind spot monitoring radar.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 4 of harness connector EL2 31-1 of the front monocular camera assembly and terminal 7 of harness connector EL013 of the left front blind spot m onitoring radar to check whether it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of the front monocula r camera assembly harness connector EL231-1 and termina l 6 of the left front blind spot monitoring radar harness con nector EL013 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the front left blind spot monitoring radar.

© 2026, All rights reserved

	A Check whether the power ground circuit of the front left blind spot monitoring radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

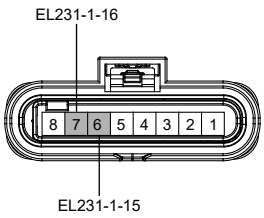
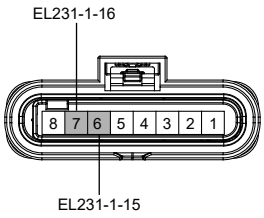
Yes 》 》 》
Go to step 2.



Step 2 Check the CAN harness between the front monocular camera assembly and the rear blind spot moni toring radar.

EL231-1 Front Mono Camera Assembly



B10DMFSC1211041

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMFSC1211020

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMFSC1211023

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL015-1 of the rear lef t blind spot monitoring radar.
D Disconnect the wire harness connector EL016-1 of the ri ght rear blind spot monitoring radar.
E Use a multimeter set to the resistance range, and measur e the resistance between terminal 16 of harness connector EL231-1 for the front monocular camera assembly and ter minal 7 of harness connector EL015-1 for the left rear blind spot monitoring radar to check whether the resistance valu e is normal.
F Use a multimeter set to the resistance range to measure t he resistance between terminal 15 of the front monocular c amera assembly harness connector EL231-1 and terminal 6 of the left rear blind spot monitoring radar harness connect or EL015-1 to check if it is normal.
G Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 16 of harness co nnector EL231-1 for the front monocular camera assembly and terminal 7 of harness connector EL016-1 for the right r ear blind spot monitoring radar is normal.
H Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of the wire harness co nnector EL231-1 of the front monocular camera assembly a nd terminal 6 of the wire harness connector EL016-1 of the right rear blind spot monitoring radar to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
I Use a multimeter, select the resistance range, and measur e the resistance between terminals 15 and 16 of the wire h arness connector EL231-1 of the front monocular camera a ssembly to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
J Use a multimeter, select the resistance range, and check whether the resistance between terminals 15 and 16 of the harness connector EL231-1 of the front monocular camera assembly and the body ground is normal.
Standard resistance value: 10kΩ or higher

© 2026, All rights reserved

	K Check whether the resistance value meets the standard v alue. L Connect the negative terminal of the battery, and power on the vehicle. M Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 15 and 16 of the wire ha rness connector EL231-1 for the front monocular camera a ssembly and the body ground to check whether the voltage is normal. Voltage standard value: 0V N Check whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Check the power ground circuit of the left rear blind spot monitoring radar and the right rear blind s pot monitoring radar.	
	A Check whether the power and ground circuits of the left r ear blind spot monitoring radar and the right rear blind spo t monitoring radar are normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the rear left blind spot monitoring radar or the rear right blind spot monitoring radar.	
	A Replace the left rear blind spot monitoring radar or the ri ght rear blind spot monitoring radar. B Replace the left rear blind spot monitoring radar or the ri ght rear blind spot monitoring radar and perform the calibr ation procedure. Is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

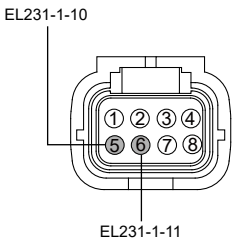
Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the front monocular camera assembly and the forward collisi on avoidance radar.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211034

EL008 Forward Collision Avoidance Radar

B10DMFSC1211035

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the wiring harness connector EL008 for the fo rward collision avoidance radar.
D. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 10 of the harness con nector EL231-1 of the front monocular camera assembly an d terminal 5 of the harness connector EL008 of the forward collision avoidance radar to check whether the resistance v alue is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 11 of the harness conn ector EL231-1 of the front monocular camera assembly and terminal 6 of the harness connector EL008 of the forward c ollision avoidance radar to check whether the resistance val ue is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance value between terminal 10 and terminal 11 of the harness connector EL231-1 of the front monocular c amera assembly to check whether it is normal.
Standard resistance value: 10kΩ or higher
G. Use a multimeter, select the resistance range, and measu re whether the resistance between terminals 10 and 11 of t he harness connector EL231-1 of the front monocular cam era assembly and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 10 and 11 of the wiring h arness connector EL231-1 for the forward-facing monocul ar camera assembly and the body ground to check whether the voltage is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	K Confirm whether the voltage value meets the standard va lue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Check the power supply and ground circuit of the forward collision avoidance radar.	
	Check whether the power supply and ground circuit of the forward collision avoidance radar is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replacement of forward collision radar.	
	A Replacement of the forward collision radar. B After replacing the forward collision radar and performin g the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.

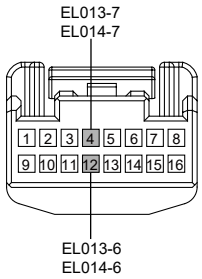
DTC: U007588-FSC

Fault code	Description
U007588	Control CAN Bus Shutdown (ACANFD2 CAN)

1. Simplified Circuit Diagram

2. Diagnostic Steps

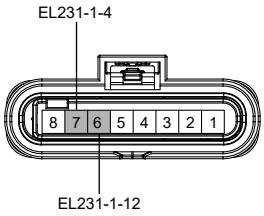
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

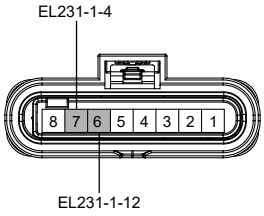
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the forward-facing monocular camera assembly and the front blind spot monitoring radar.

EL231-1 Front Mono Camera Assembly



B10DMFSC1211037

EL013 Front left blind spot detection radar

B10DMFSC1211038

EL014 Front right blind spot detection radar

B10DMFSC1211039

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL013 of the front left blind spot monitoring radar.
D Disconnect the harness connector EL014 of the front right blind spot monitoring radar.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the harness connector EL231-1 of the front monocular camera assembly and terminal 7 of the harness connector EL013 of the left front blind spot monitoring radar to check if it is normal.
F Use a multimeter, set it to the resistance range, and measure the resistance between terminal 12 of the harness connector EL231-1 of the front monocular camera assembly and terminal 6 of the harness connector EL013 of the left front blind spot monitoring radar to check if it is normal.
G Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the harness connector EL231-1 of the front monocular camera assembly and terminal 7 of the harness connector EL014 of the right front blind spot monitoring radar to check whether the resistance value is normal.
H Use a multimeter, select the resistance range, and measure the resistance between terminal 12 of harness connector EL231-1 of the front monocular camera assembly and terminal 6 of harness connector EL014 of the right front blind spot monitoring radar to check if it is normal.
Resistance standard value: Less than 1 Ω
I. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 and terminal 12 of the wire harness connector EL231-1 of the front monocular camera assembly is normal.
Standard resistance value: 10kΩ or higher
J Use a multimeter, set it to the resistance range, and check whether the resistance between terminals 4 and 12 of the harness connector EL231-1 for the front monocular camera assembly and the body ground is normal.
Standard resistance value: 10kΩ or higher

© 2026, All rights reserved

	K Check whether the resistance value meets the standard v alue. L Connect the negative terminal of the battery, and power on the vehicle. M Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 4 and 12 of the harness connector EL231-1 of the front monocular camera assembl y and the body ground to check whether it is normal. Voltage standard value: 0V N Check whether the voltage value meets the standard val ue.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Check the power and ground circuits of the front left blind spot monitoring radar and the front right blind spot monitoring radar.	
	A Check whether the power and ground circuits of the left f ront blind spot monitoring radar and the right front blind s pot monitoring radar are normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the front left blind spot monitoring radar or the front right blind spot monitoring radar.	
	A Replace the front left blind spot monitoring radar or the f ront right blind spot monitoring radar. B. After replacing the left front or right front blind spot mo nitoring radar and performing the calibration procedure, is t he fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》

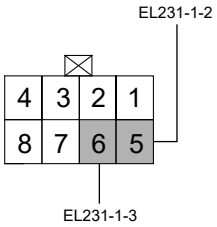
Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the front-view monocular camera assembly and the instrument display screen.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211028

EL119-2 Instrument Display

B10DMFSC1211029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the instrument display harness connector EL119-2.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of the wire harness connector EL231-1 of the forward monocular camera assembly and terminal 5 of the wire harness connector EL119-2 of the instrument display to check whether the resistance value is normal.
E. Use a multimeter, select the resistance setting, and measure the resistance between terminal 3 of harness connector EL231-1 of the front monocular camera assembly and terminal 6 of harness connector EL119-2 of the instrument display to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the instrument display.

A Check whether the power ground circuit of the instrument display is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the instrument cluster display.

A Replace the instrument cluster display.
B After replacing the instrument cluster display, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

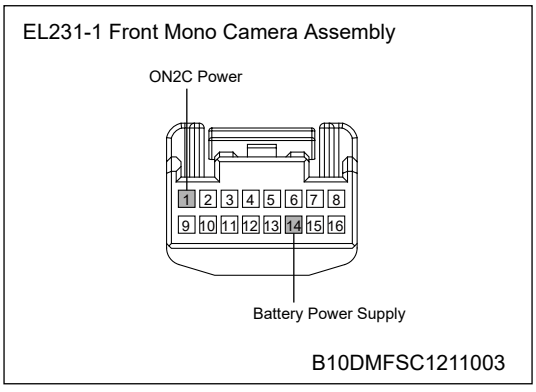
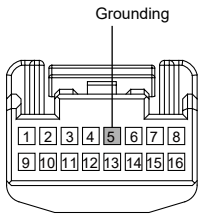
DTC: U300616-FSC

Fault code	Description
U300616	Control module input voltage low



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front monocular camera assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses RF18 and RF06 for the front mono camer a assembly. Fuse specifications: RF18 5A, RF06 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power circuit of the forward-facing monocular camera assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 1 and 14 of the har ness connector EL231-1 of the front-view monocular camer a assembly and the body ground is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ground wire harness of the front monocular camera assembly.	
EL231-1 Front Mono Camera Assembly  B10DMFSC1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the harness connect or EL231-1 of the forward-facing monocular camera assem bly and the body ground to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

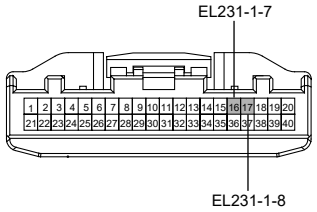
Yes》》》
Go to step 2.



Step 2 Check the Ethernet wiring harness between the front monocular camera assembly and the multi-domain fusion controller.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211031

EL215-4 Multi-Domain Fusion Controller

B10DMFSC1211032

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 8 of the wire harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 17 of the wire harness connector EL215-4 of the multi-domain fusion controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 7 of harness connector EL231-1 of the front monocular camera assembly and terminal 16 of harness connector EL215-4 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power supply ground circuit of the multi-domain fusion controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the airbag control module assembly.	
EL231-1 Front Mono Camera Assembly  B10DMFSC1211010 TR004-1 Airbag Control Module Assembly  B10DMFSC1211011	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231-1 of the front view monocular camera assembly. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of the wiring harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 18 of the wiring harness connector TR004-1 of the airbag control module assembly is normal. E Use a multimeter set to the resistance range to measure whether the resistance between terminal 3 of the wire harness connector EL231-1 of the front monocular camera assembly and terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power supply and ground circuit of the airbag control module assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the front monocular camera assembly and p erforming the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

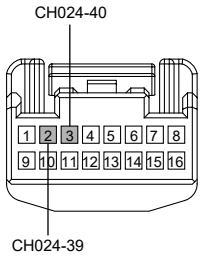
DTC: U151800-FSC

Fault code	Description
U151800	Message Fault IBC_185(0x185)

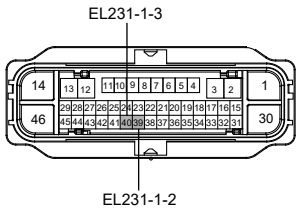
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the smart integrated bra king system assembly.

EL231-1 Front Mono Camera Assembly

B10DMFSC1211013

CH024 Intelligent Integrated Brake System Assembly

B10DMFSC1211014

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the wiring harness connector CH024 of the int elligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 2 of harness con nector EL231-1 of the front monocular camera assembly an d terminal 39 of harness connector CH024 of the intelligent integrated brake system assembly is normal.
E. Use a multimeter set to the resistance range to measure whether the resistance between terminal 3 of the wire harn ess connector EL231-1 of the forward-facing monocular ca mera assembly and terminal 40 of the wire harness connect or CH024 of the intelligent integrated brake system assembl y is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power supply and ground circuit of the intelligent integrated brake system assembly.
A Check whether the power supply and ground circuit of th e intelligent integrated brake system assembly is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replacement of Intelligent Integrated Brake System Assembly.
A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system a ssembly, is the fault eliminated?
Yes》》》 System normal.

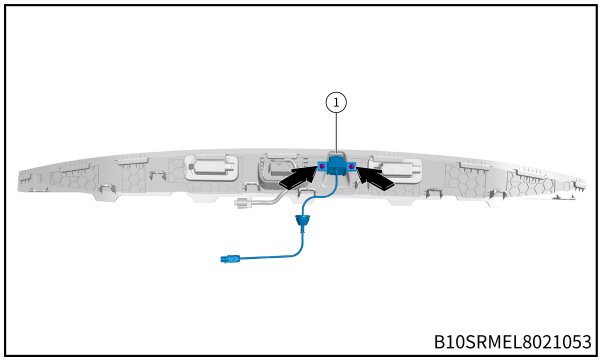
9.4.7 SERVICE AND REPAIR GUIDANCE

IMU CALIBRATION

IMU CALIBRATION

1. IMU Calibration Preparation
   a. The following tools are required for IMU calibration: diagnostic tool.
   b. For vehicles to be calibrated, the tire pressure must be at the standard pressure.
   c. During IMU calibration, the vehicle must remain unloaded, the ground must be level, and the level angle must not exceed 1°.
2. IMU Calibration Procedure
   a. With the vehicle stationary, connect the diagnostic scanner and follow the path below:
      - Select the corresponding vehicle model-System Diagnosis-Cockpit Host (ICHS)-Routine Control-IMU Calibration.



> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

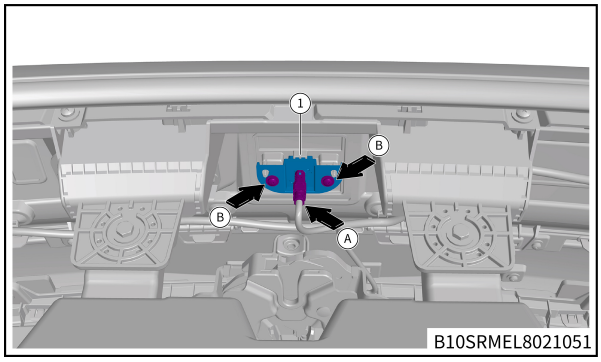
REAR SURROUND VIEW CAMERA ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9457)
4. Remove the lower trim panel of the rear full-width lamp.
   See:Rear full-width lamp lower trim panel (page 5314)
5. Remove the rear surround view camera assembly.

a. Unscrew the 2 mounting screws -arrow- of the rear surround-view camera assembly, and remove the rear surround-view camera assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1±0.2N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the rear surround-view camera assembly.
      See:Surround View Camera Calibration (page 9123)
   b. After calibration is completed, check that the rear surround-view camera assembly is functioning properly.

© 2026, All rights reserved

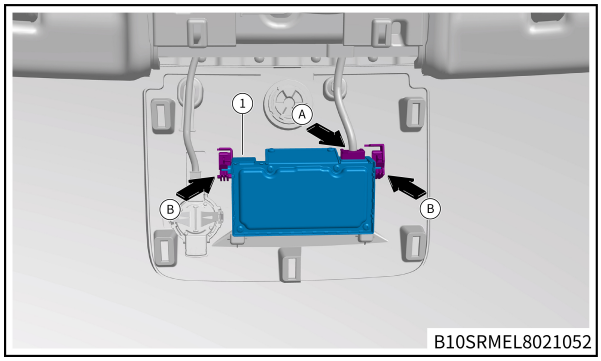
FRONT SURROUND VIEW CAMERA ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front surround-view camera assembly.

a. Disconnect 1 connector of the front surround view camera assembly -Arrow A-, and unscrew the 2 mounting screws of the front surround view camera assembly -Arrow B-.
   Recommended tool: T20 Torx wrench
   Torque: 1±0.2N m
b. Remove the front surround view camera assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the front surround-view camera assembly.
      See:Surround View Camera Calibration (page 9123)
   b. After calibration is completed, check that the front surround-view camera assembly is functioning properly.

© 2026, All rights reserved

FRONT-VIEW MONOCULAR CAMERA ASSEMBLY

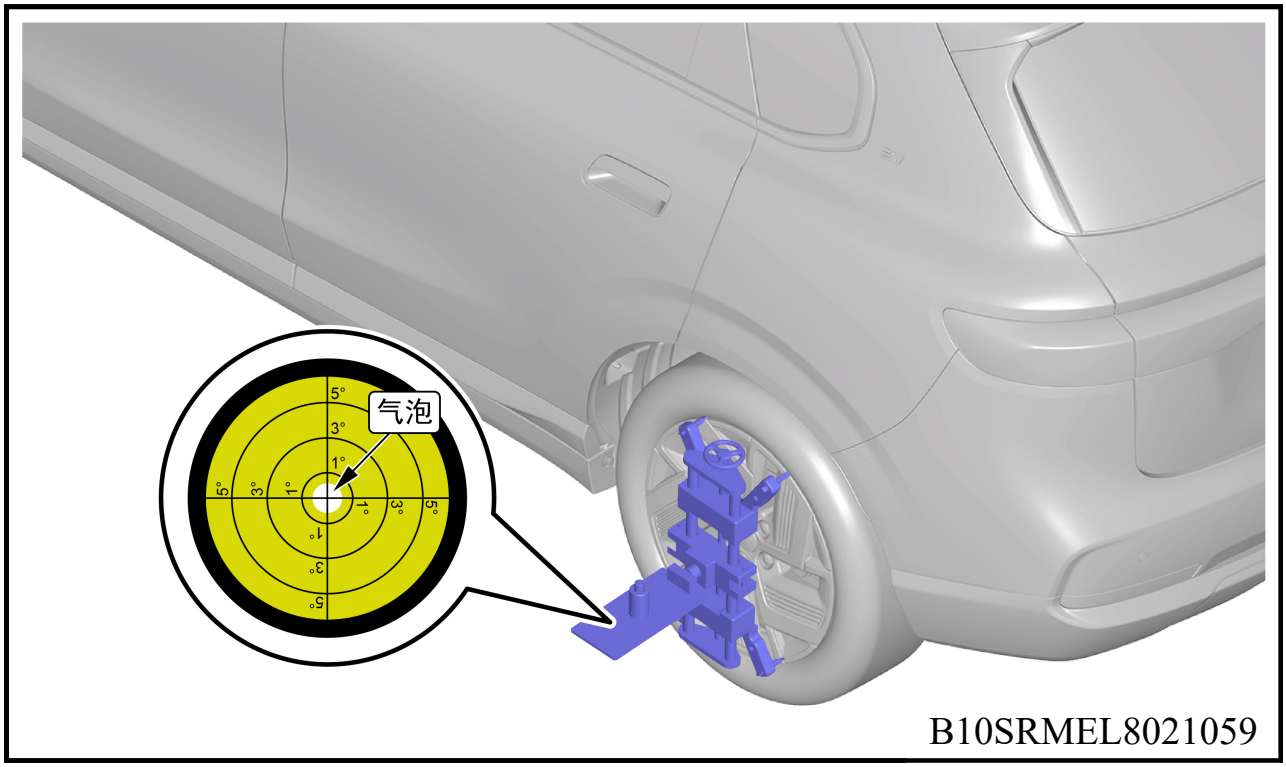
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular lower cover assembly.
   See:Monocular lower cover assembly (page 5390)
4. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
5. Remove the front monocular camera assembly.

a. Disconnect the 1 connector of the forward-facing monocular camera assembly -Arrow A-, and release the 2 retaining clips of the forward-facing monocular camera assembly -Arrow B-.
b. Remove the front monocular camera assembly ①.

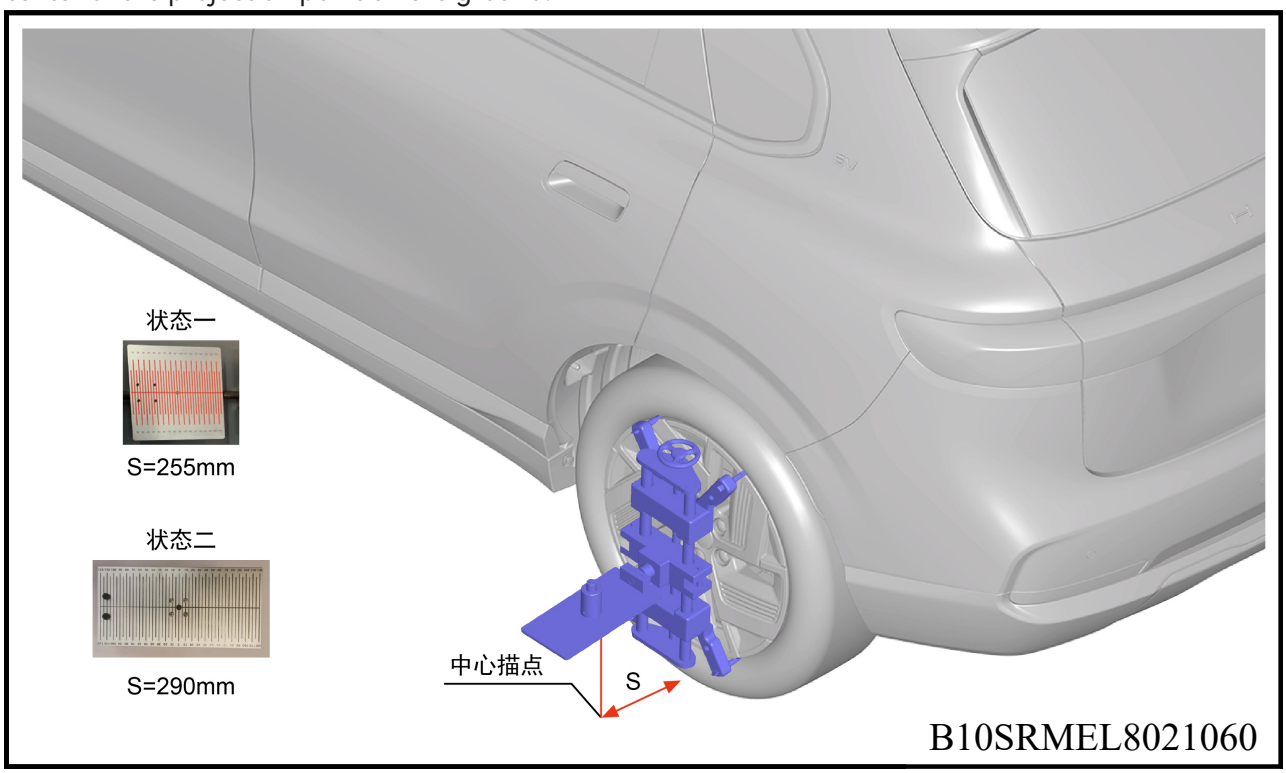
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the forward-facing monocular camera assembly.
      See:Forward-Facing Monocular Camera Calibration (page 9118)
   b. After calibration is completed, check that the front monocular camera assembly is working properly.



© 2026, All rights reserved

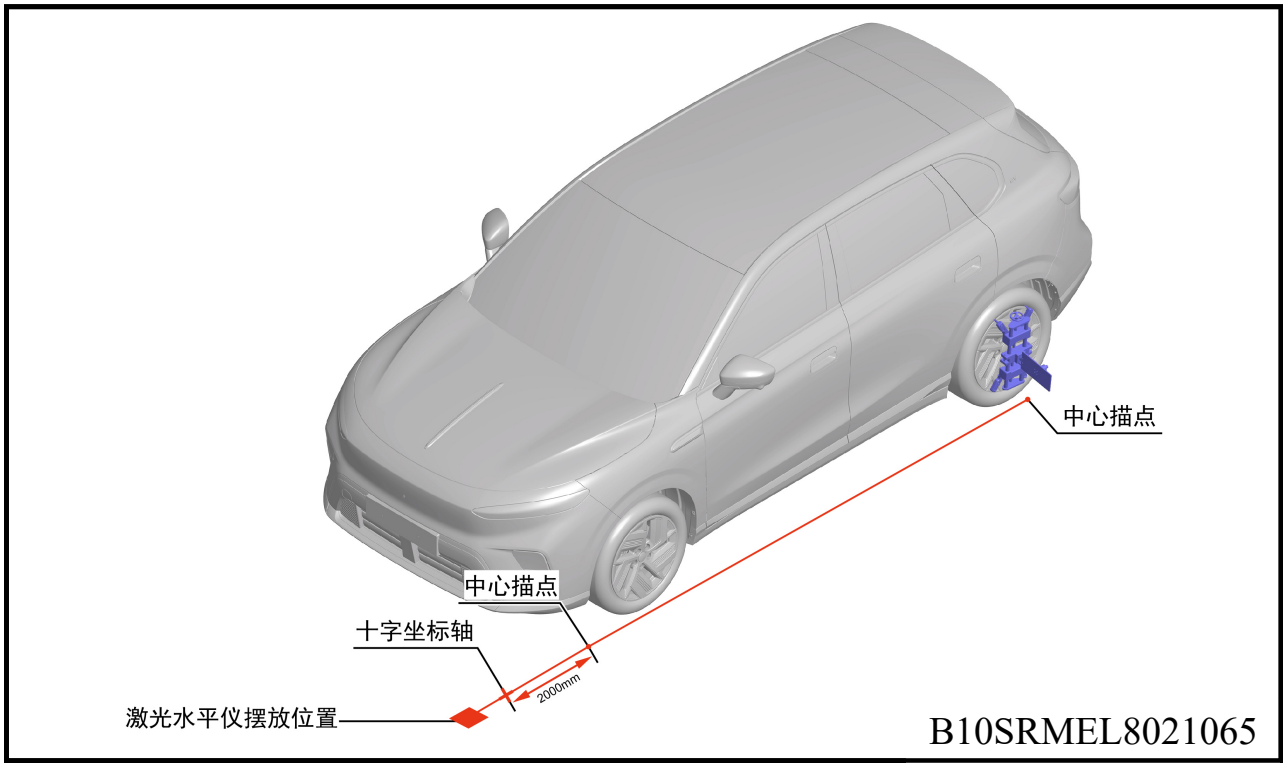
FORWARD-FACING MONOCULAR CAMERA CALIBRATION



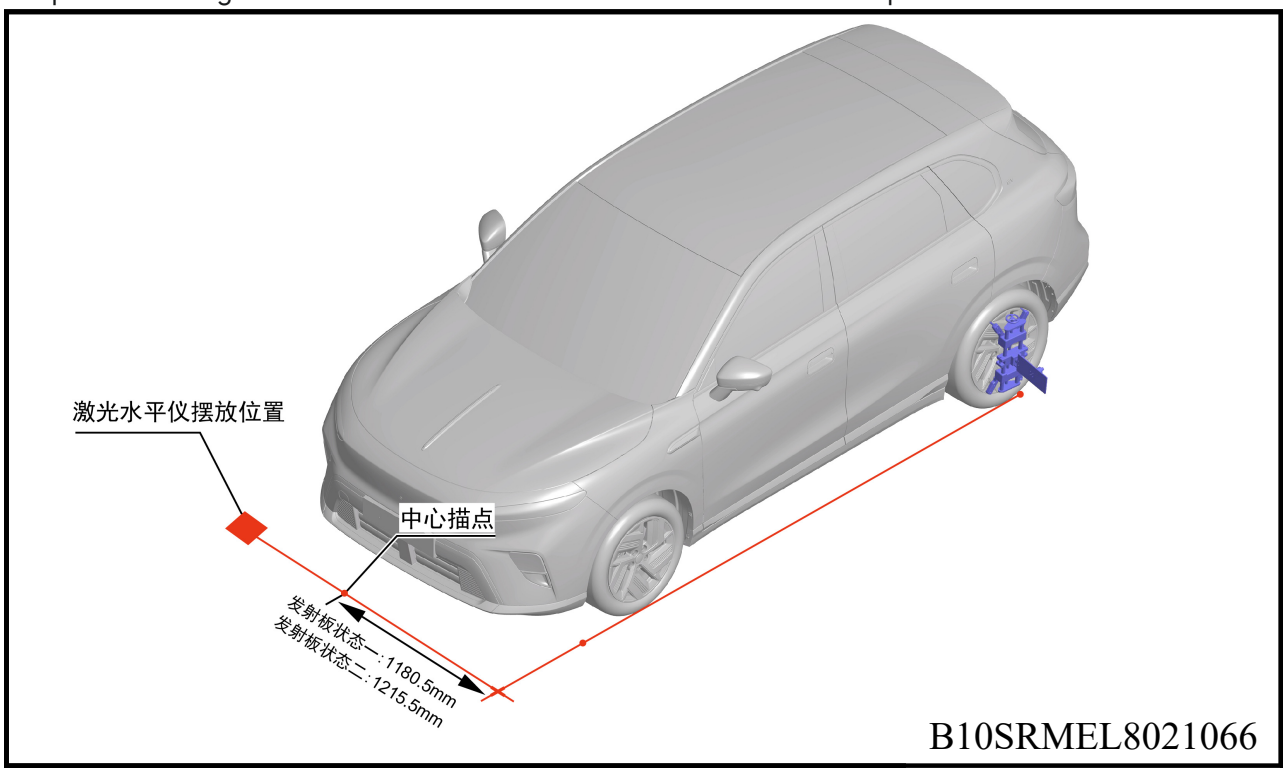
FORWARD-FACING MONOCULAR CAMERA CALIBRATION PROCEDURE

1. Camera Calibration Preparation
   a. The following tools are required for camera calibration:
      - Radar and Front Camera Calibration Bracket
      - Tire Clamp
      - Laser emitting assembly
      - Laser level
      - Tape measure
      - Try square
      - Marker pen
      - Diagnostic instrument
   b. For vehicles to be calibrated, the tire pressure must be at the standard pressure.
   c. Vehicle headlights off (for calibration, especially the camera).
   d. Before calibration, the vehicle has already undergone wheel alignment.
   e. Vehicle speed is 0, vehicle is powered on (for static calibration).
   f. Vehicle unladen (for static calibration).
   g. Driver and front passenger doors closed.
   h. There is no significant height deviation or other abnormalities in the front and rear suspension.
   i. The front lens glass of the camera is clear and free from interference such as foreign objects, standing water, fog, and glare.
   j. Calibration site: The site must be flat, well-lit, evenly illuminated, and free from direct strong light.
2. Camera Calibration Tool Adjustment Steps
   a. Park the vehicle in the calibration area and center the steering wheel.
   b. Install the tire clamps on the rear wheel hubs on both sides of the vehicle, and ensure they are securely installed.
   c. Install the laser transmitter assembly (without the extension sleeve), rotate the laser transmitter assembly to center the bubble on its universal spirit level, and tighten the locking pin of the tire clamp.

© 2026, All rights reserved



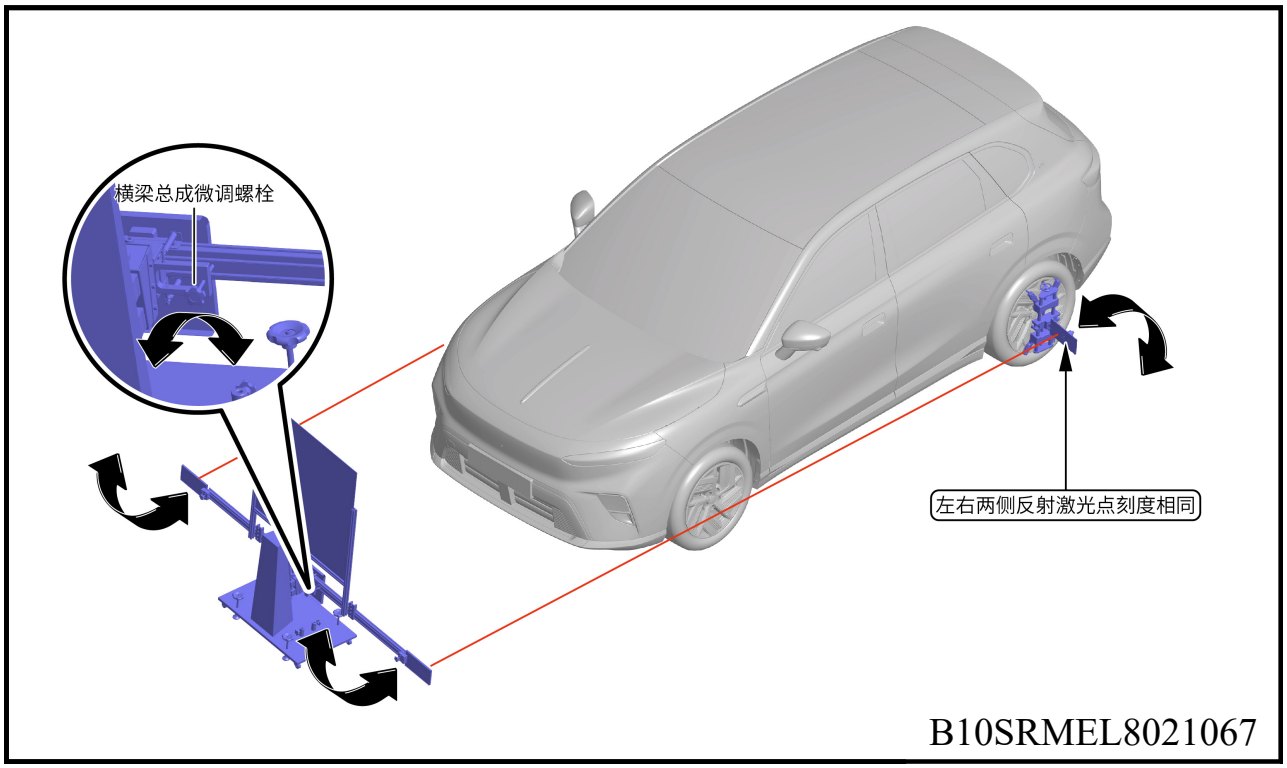
d. Turn on the laser light on the laser emitting assembly. The point where the laser light shines on the ground is the projection point of the rear wheel axle center on the ground. Use a marker to mark the center of the projection point on the ground.



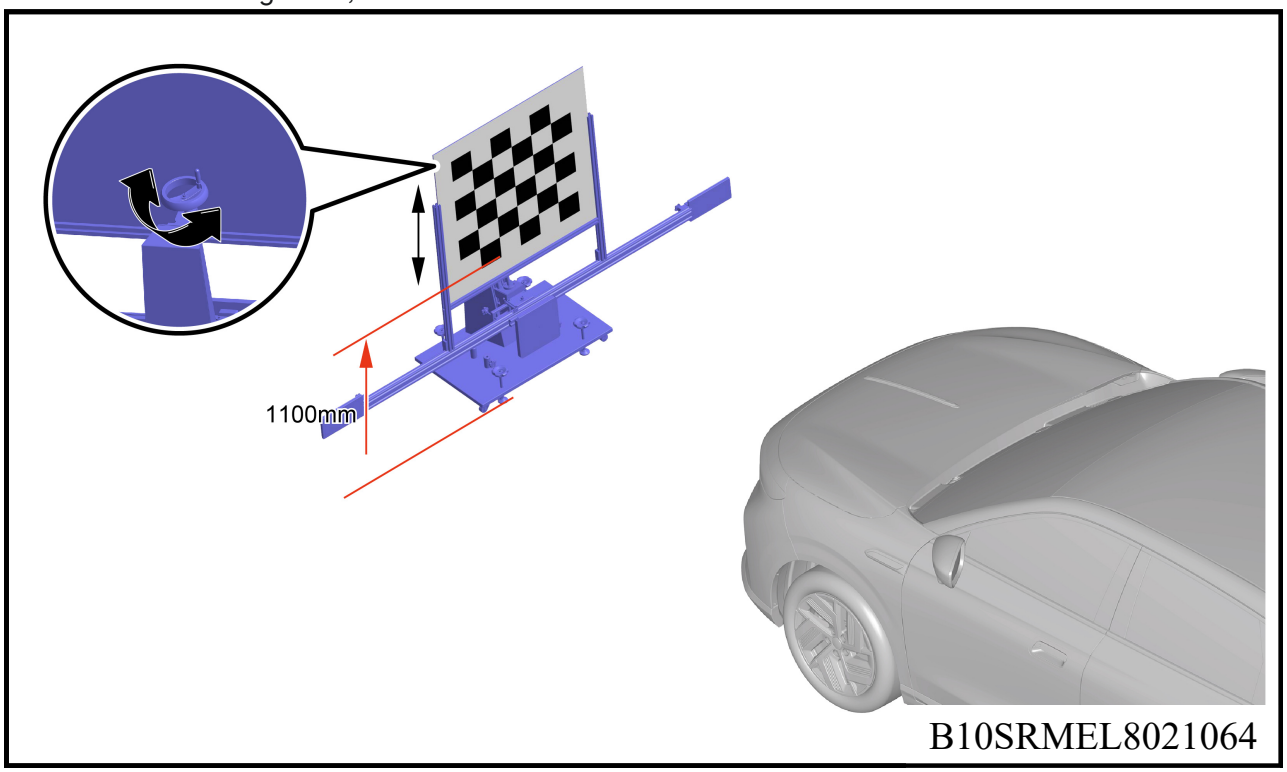
e. Rotate the laser emitter assembly to project the laser dot to a position approximately flush with the front bumper, and use a marker to mark the center of the projected point on the ground.

f. Use a laser level to draw a line connecting the two marked points above, with the projection point at the front bumper as the starting point. Measure a distance of 2000 mm along the line toward the front of the vehicle, and mark the point with a marker pen (in a crosshair shape, which can be positioned using a right-angle caliper).

© 2026, All rights reserved



g. As shown in the figure, use a laser level to project a straight line on the right front side of the vehicle, aligning it with the other side of the cross coordinate axis. Measure the distance from the origin of the cross coordinate axis towards the right side of the vehicle (Transmitter board status 1: 1180.5mm; Transmitter board status 2: 1215.5mm), and mark the point again with a marker. Then, move the radar and front camera calibration bracket assembly near the marked point in front of the vehicle, and adjust the position to align the center of the calibration board with the marked point.



h. Shine the laser beams from the laser emitting components on both sides onto the mirror surface of the laser reflector, adjust the angle of the laser reflector to reflect the laser beams back onto the laser emitting components, and adjust the fine adjustment bolts on the crossbeam of the radar and front

© 2026, All rights reserved

camera calibration bracket to ensure that the position scales of the reflection points on the laser emitting boards on both sides are consistent.

i. Gently turn the handwheel of the radar and front camera calibration bracket to adjust the calibration board, and use a tape measure to measure the distance from the lower edge of the black block on the checkerboard to the ground, which should be 1.1m.

j. After adjusting the forward-facing monocular camera calibration tool, connect the diagnostic scanner and follow the path below:
   - Select the corresponding vehicle model - System Diagnosis - Forward Monocular Main Control System (FSC) - Data Writing - Write VIN Code.

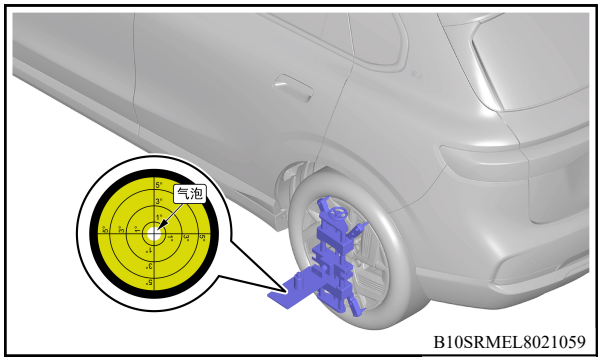
© 2026, All rights reserved

- Select the corresponding vehicle model - System Diagnosis - Forward Monocular Master Control System (FSC) - End-of-Line Configuration - Write the corresponding parameters.
- Select the corresponding vehicle model-System Diagnosis-Forward Single-Camera Master Control System (FSC)-Routine Control-After-sales Calibration.

ATTENTION

After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

3. Precautions for Storage of the Forward-Facing Monocular Camera Calibration Tool
   a. After use, please store the forward-facing monocular camera calibration tool properly in a dry, clean place away from direct sunlight; if not used frequently, it is recommended to carefully disassemble and store it in its original condition as received.
   b. The laser reflector assembly and the laser transmitter assembly shall be placed in the corresponding holes of the base assembly and secured with locking bolts to prevent loosening.
   c. The calibration board assembly for the forward-facing monocular camera should be kept dust-free, stored properly, and protected from damage.



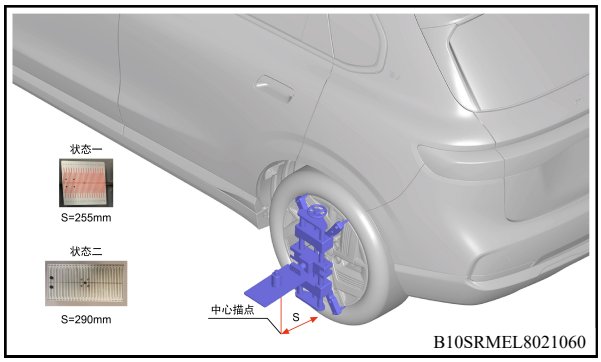
© 2026, All rights reserved

SURROUND VIEW CAMERA CALIBRATION

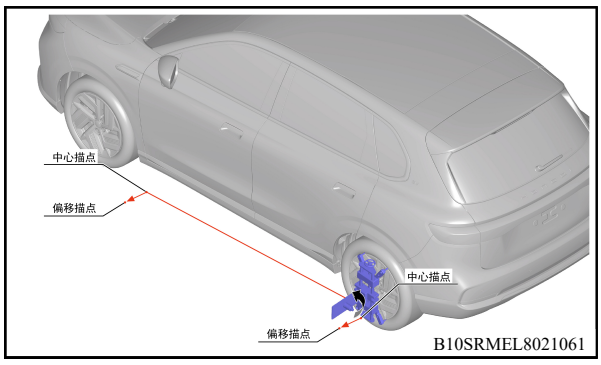
SURROUND-VIEW CAMERA CALIBRATION PROCEDURE

1. Camera Calibration Preparation
   a. The following tools are required for camera calibration:
      - Camera Calibration Cloth No. 1
      - Tire Clamp
      - Laser emitting assembly
      - Laser level
      - Tape measure
      - Marker pen
      - Diagnostic instrument
   b. For vehicles to be calibrated, the tire pressure must be at the standard pressure.
   c. Vehicle headlights off (for calibration, especially the camera).
   d. Before calibration, the vehicle has already undergone wheel alignment.
   e. Vehicle speed is 0, vehicle is powered on (for static calibration).
   f. Vehicle unladen (for static calibration).
   g. Driver and front passenger doors closed.
   h. There is no significant height deviation or other abnormalities in the front and rear suspension.
   i. The front lens glass of the camera is clear and free from interference such as foreign objects, standing water, fog, and glare.
   j. Calibration site: The site must be flat, well-lit, evenly illuminated, and free from direct strong light.
2. Camera Calibration Tool Adjustment Steps
   a. Site requirements:
      - Ground flatness requirement for the calibration cloth placement area and vehicle parking area: ±5mm;
      - Ground inclination requirement for the calibration cloth placement area and vehicle parking area: ≤±1°;
      - Calibration site length: ≥9 m;
      - Calibration site width: ≥5 m.
   b. Environmental requirements:
      - Flicker-free light source; it is recommended that the illuminance on the surface of the calibration cloth be within the range of 300 to 800 lux, and there should be no reflection on the ground;
      - The image of the light source projected through the calibration target has no bright or dark areas, avoiding the impact of daylight variations on the light source; if this cannot be avoided, use a sunshade;
      - Once calibration begins, no one other than the driver or any unrelated objects shall be present around the calibration target.
3. Camera Static Calibration Tool Adjustment Steps

© 2026, All rights reserved

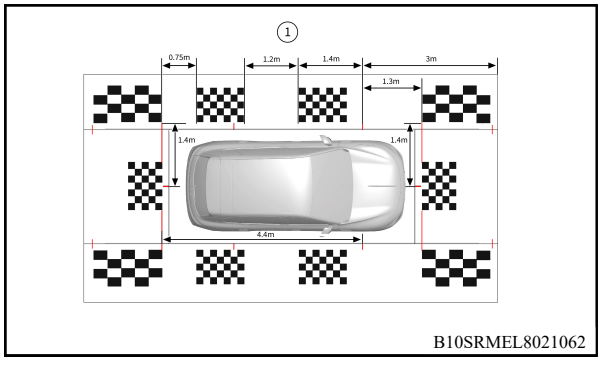


a. Park the vehicle in the calibration area and center the steering wheel.



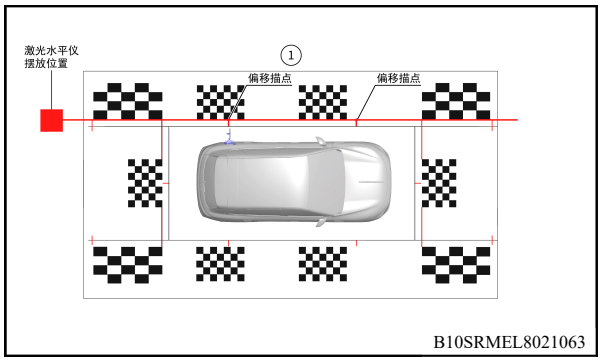
> **NOTE**
>
> Currently, only the four surround-view cameras require static calibration using a calibration cloth, so only calibration cloth No. 1 needs to be placed. The other driving cameras require dynamic calibration.

b. Install the tire clamps on the rear wheel hubs on both sides of the vehicle, and ensure they are securely installed.



c. Install the laser transmitter assembly (without the extension sleeve), rotate the laser transmitter assembly to center the bubble on its universal spirit level, and tighten the locking pin of the tire clamp.

d. Turn on the laser light on the laser emitting assembly. The point where the laser light shines on the ground is the projection point of the rear wheel axle center on the ground. Use a marker to mark the center of the projection point on the ground.



e. Rotate the laser emitter assembly to project the laser dot to approximately the front wheel axis position, and use a marker to mark the center of the projection point on the ground. Then, offset the two center marks outward by a certain amount to obtain two offset marks (Offset for emitter plate state 1: 219.5mm; Offset for emitter plate state 2: 184.5mm).

f. Place camera calibration cloth No. 1 ① outside the vehicle as shown in the figure below. Requirements: Align the red marking lines between the left and right calibration cloths and the front and rear calibration cloths; align the four front and rear marking points on the left and right calibration cloths with the centerlines of the front and rear

© 2026, All rights reserved

wheels respectively (i.e., align with the projection points of the wheel axle centers).

g. Use a laser level to project a laser line connecting the front and rear offset reference points, and adjust the calibration cloth to align the inner edge of the black grid with the laser line.
h. Simply place the calibration cloth on the other side in the same way.
i. After the adjustment is completed, use the diagnostic tool to select the corresponding interface based on the vehicle model and configuration to perform surround view camera calibration.

NOTE

If the calibration cloth develops wrinkles or damage after prolonged use, please replace it promptly.

4. Surround View Camera Calibration
   a. Connect the diagnostic tool and follow the path below: Select the corresponding vehicle model - System Diagnostics - Intelligent Cockpit (ICHS) - Routine Control - After-sales Calibration of Surround View Camera.

ATTENTION

- After replacing any surround view camera, you must select all 4 surround view cameras simultaneously for calibration on the diagnostic tool.
- After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

5. Precautions for Storing Camera Calibration Tools:

ATTENTION

After use, wipe the calibration cloth clean, fold it flat, and store it properly in a dry, clean place away from direct sunlight.

© 2026, All rights reserved

9.5 RADAR SYSTEM

9.5.1 OPERATION AND DESCRIPTION

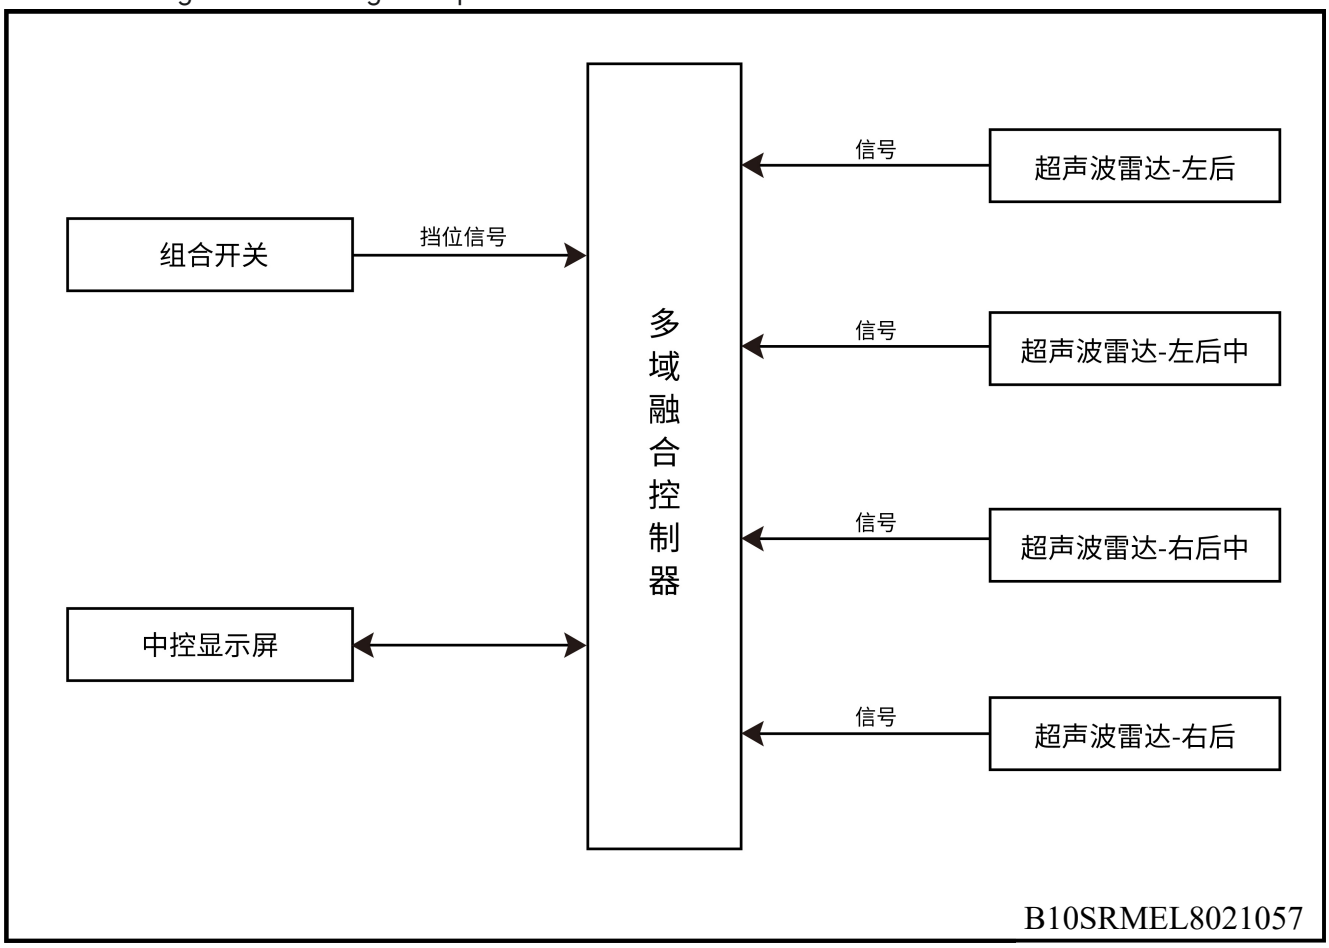
OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

1. Reverse Radar System
   The parking radar system uses rear ultrasonic sensors to transmit and receive ultrasonic waves reflected by obstacles to calculate the distance between the vehicle and the obstacles.

ATTENTION

- Always keep the surface of the reverse ultrasonic sensor clean. When cleaning the surface of the reverse ultrasonic sensor, use a soft, damp cloth to avoid scratching the surface.
- The parking radar system cannot replace the driver's observation of the surroundings. The driver should remain attentive and safely reverse and adjust the parking position according to actual conditions.
- When reversing in narrow spaces or uphill, the reversing ultrasonic sensors may fail to detect railings, trees, or slopes, which is normal.



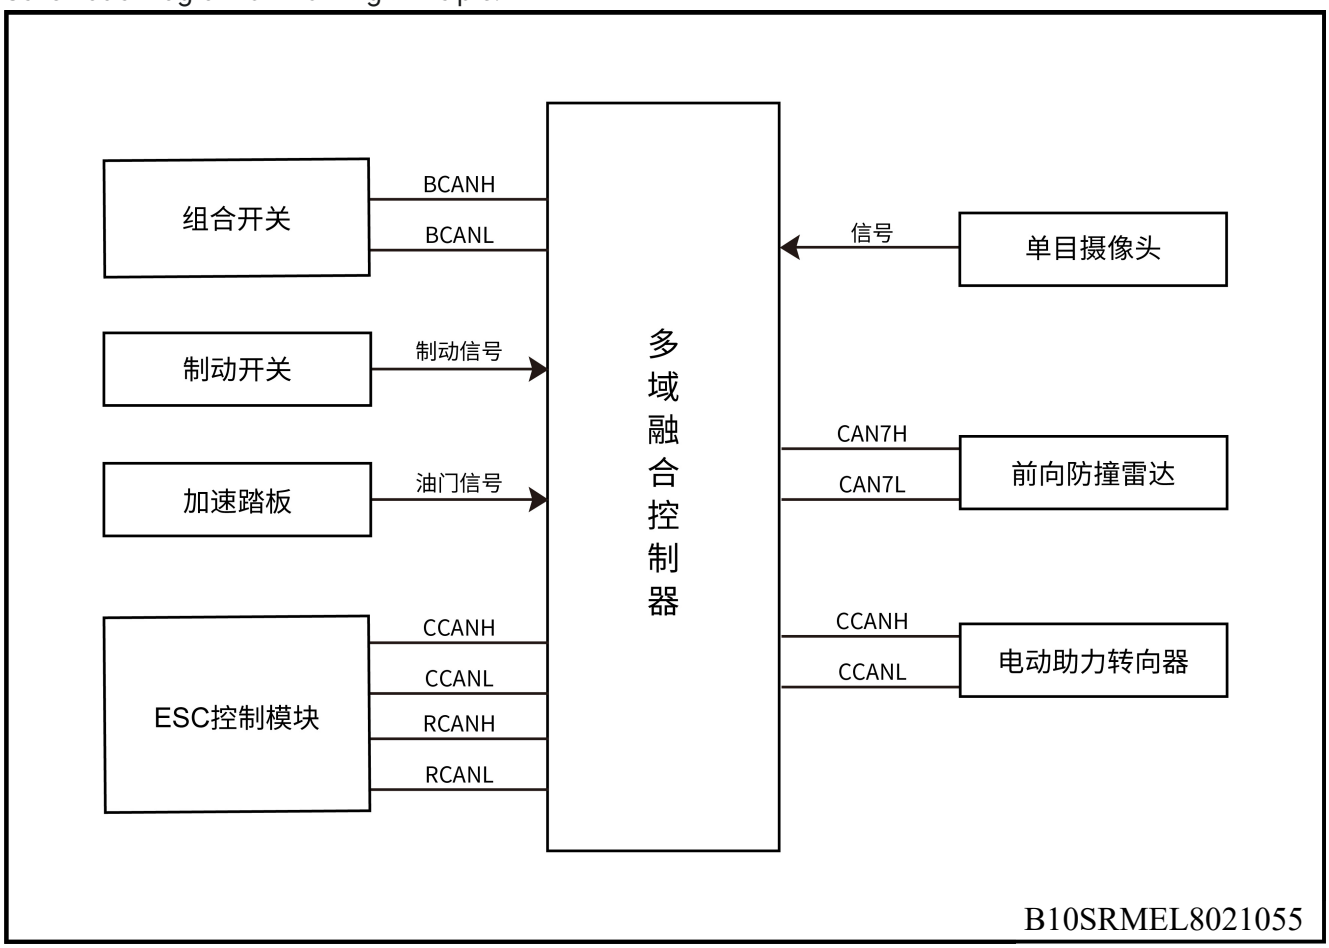
© 2026, All rights reserved

9.5.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Parking sensor system:

1. System Overview:
   - The parking radar system mainly consists of a multi-domain fusion controller and four ultrasonic radars installed on the rear bumper. The system is activated when the reverse gear signal is detected and the vehicle speed conditions are met. It then issues warnings of varying urgency levels based on the distance between the vehicle and the obstacle.
2. System Composition:
   - The reverse radar system mainly consists of a multi-domain fusion controller, 4 reverse ultrasonic sensors, a central control display, and an instrument cluster.
3. Schematic Diagram of Working Principle:

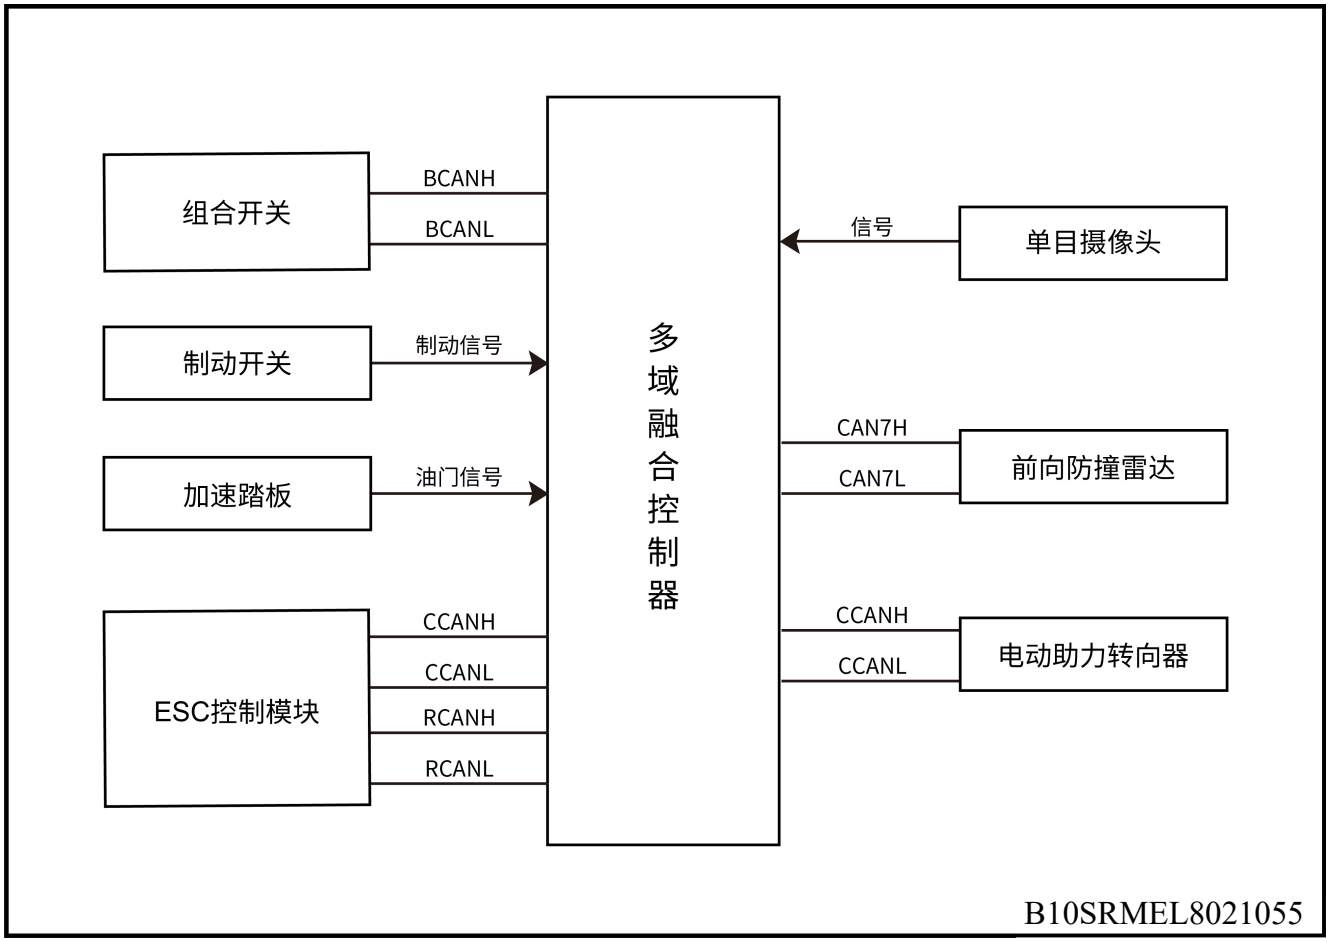


Adaptive Cruise Control (ACC) system:

1. System Overview:
   - The system utilizes the multi-domain fusion controller to automatically accelerate or decelerate the vehicle based on data collected by the monocular camera and MRS radar, along with the cruise switch signal, brake switch signal, and accelerator pedal signal, thereby maintaining a set safe distance from the vehicle ahead.
   - The MRS radar is used to detect the speed, distance, and azimuth of obstacles ahead.

© 2026, All rights reserved

- The monocular camera is used to identify the type of obstacles ahead, road conditions, and other information.



2. System Composition:
   - The system consists of a multi-domain fusion controller, a monocular camera, a forward collision avoidance radar, a brake switch, a steering wheel combination switch, an ESC control module, an accelerator pedal, and an EPS controller.
3. Schematic Diagram of Working Principle:

Forward Collision Warning System:

1. System Overview:
   - The Forward Collision Warning System uses the forward collision radar and monocular camera to detect the relative distance, position, and speed between the preceding vehicle and the host vehicle in the same lane. By integrating other driver operations (such as pressing the brake pedal or accelerator pedal), it assesses the pre-collision risk, warns the driver when necessary, and promptly alerts the driver to take measures to avoid or mitigate a collision when a collision risk is detected.
2. The system consists of a multi-domain fusion controller, a monocular camera, a forward collision avoidance radar, an ESC control module, and an EPS controller.
3. Schematic Diagram of Working Principle:

© 2026, All rights reserved

4. The Forward Collision Warning System will not function under the following conditions:
   - The Forward Collision Warning System is turned off.
   - The steering wheel angle is greater than 30°.
   - While depressing the brake pedal or within 3s after releasing the brake pedal.
   - The road turning radius is less than 200m.
   - Dense fog, heavy rain, or heavy snow.
   - The monocular camera is obstructed by foreign objects.
   - Forward Collision Warning system fault. (The system fault icon will only be displayed on the instrument cluster after this function is enabled.)

Blind Spot Detection Warning System:

1. System Overview:
   - Two rear corner radars monitor the rear area. When a vehicle is in the blind spot or traveling at a high speed in an adjacent lane, the system will alert the driver. The warning lights are installed on the outside of the exterior rearview mirrors.
2. System Composition:
   - The system consists of a blind spot radar, a multi-domain fusion controller, and other components.

Rear Cross Traffic Warning System:

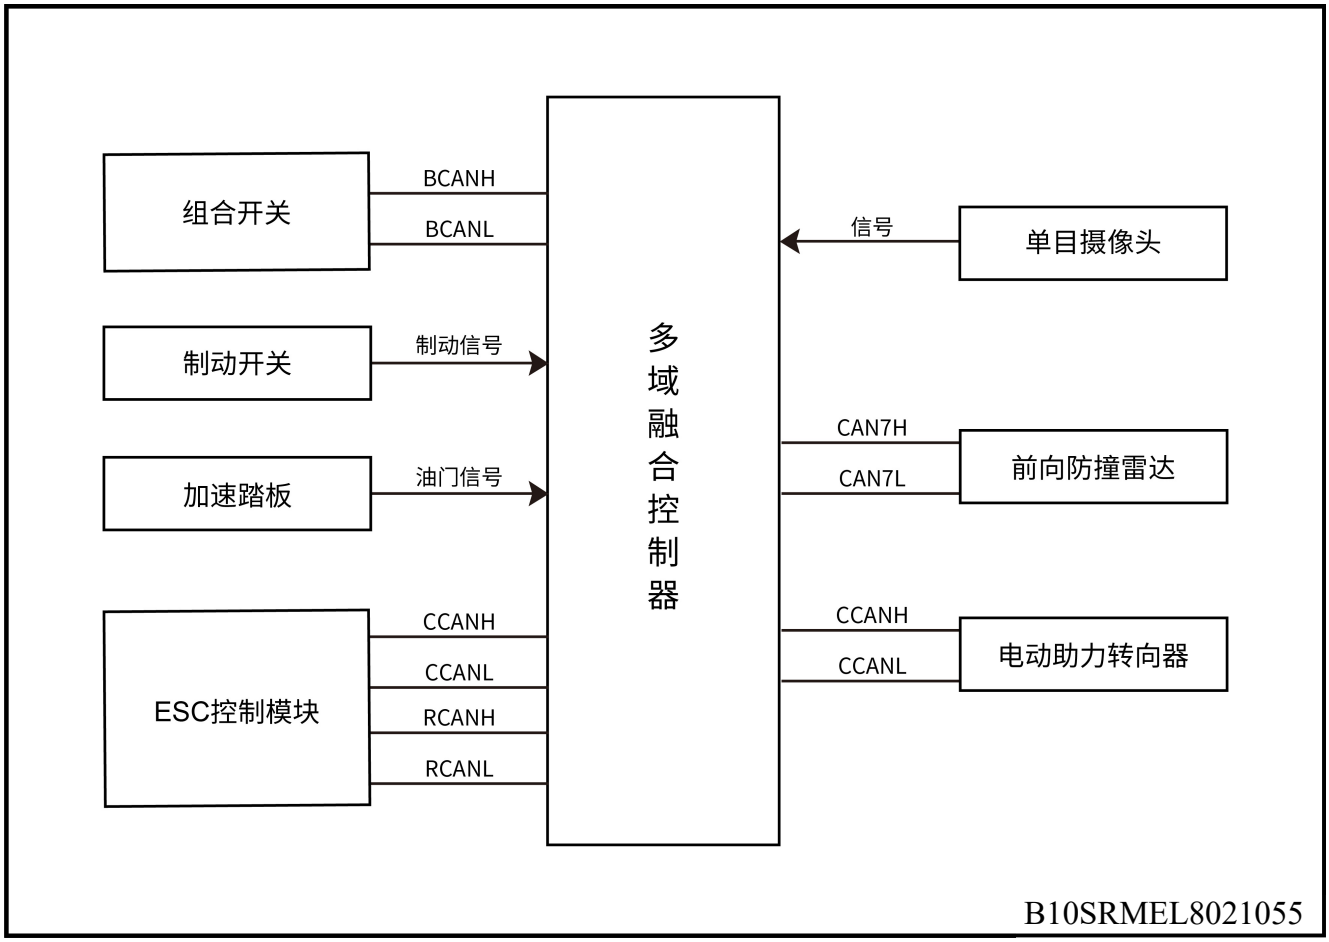
1. System Overview:
   - Rear Cross Traffic Alert system, abbreviated as "RCTA". When the vehicle is reversing, if the system detects approaching vehicles from both sides at the rear, the blind spot indicator lights on the exterior rearview mirrors will flash, and the instrument cluster will simultaneously provide an alert.

© 2026, All rights reserved

2. The system consists of blind spot radar, multi-domain fusion controller, ESC control module, and other components.

Rear Collision Warning System:

1. System Overview:
   - The Rear Collision Warning system, abbreviated as "RCW", will issue an alarm message on the instrument cluster and turn on the hazard warning lights to remind following vehicles to slow down or maintain a safe following distance when the vehicle is in motion and a vehicle is detected approaching rapidly from behind, posing a risk of a rear-end collision.
2. The system consists of blind spot radar, multi-domain fusion controller, ESC control module, and other components.



Door Open Warning System:

1. System Overview:
   - The Door Open Warning system, abbreviated as "DOW", detects when other vehicles enter the blind spot area while the vehicle is stationary. If the driver intends to open the door at this time, the system will issue an alarm warning through the warning indicator lights installed on the exterior rearview mirrors on both sides of the vehicle.
   - Basic conditions for system use: The gear is not in the R position, and the vehicle speed is 0.
2. The system consists of 2 rear blind spot radars, a multi-domain fusion controller, an ESC control module, and other components.

Automatic Emergency Braking System:

1. System Overview:
   - The Automatic Emergency Braking system, abbreviated as "AEB", monitors the distance and relative speed of targets ahead. When the driver brakes too late, applies insufficient braking force, or takes no braking action at all, the system will take measures to assist the driver in avoiding or mitigating a collision.
   - The Automatic Emergency Braking system only operates when the vehicle speed is between approximately 10~80 km/h. When the vehicle speed does not exceed 40 km/h, it can bring the vehicle to a complete stop; when the vehicle speed exceeds 40 km/h, it can only reduce the vehicle speed by 40 km/h, thereby mitigating the collision.
2. The system consists of a monocular camera, forward collision avoidance radar, multi-domain fusion controller, ESC control module, EPS controller, and other components.
3. Schematic Diagram of Working Principle:

© 2026, All rights reserved

Intelligent Cruise Assist:

1. System Overview:
   - This system is a combined function of Adaptive Cruise Control (ACC) and Lane Centering Assist (LCC). When Lane Centering Assist (LCC) is activated, Intelligent Cruise Assist (ICA) engages.
2. The system consists of a monocular camera, forward collision avoidance radar, multi-domain fusion controller, ESC control module, EPS controller, and other components.

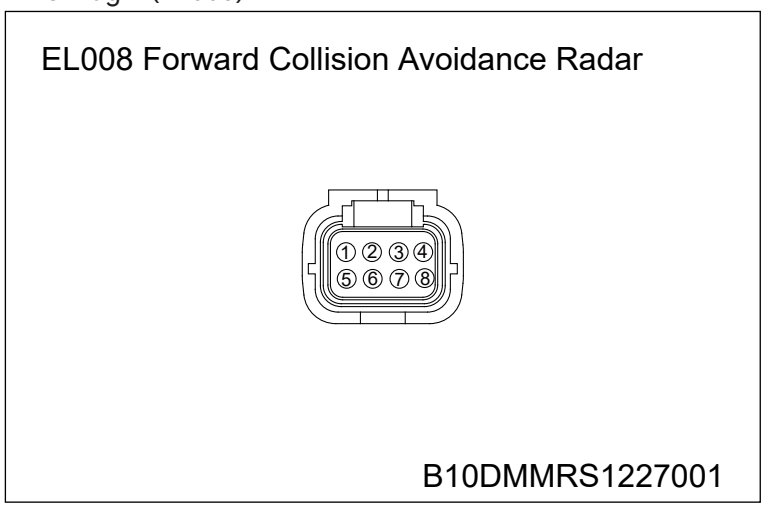
9.5.4 FAULT DIAGNOSIS

DIAGNOSTIC DESCRIPTION – MRS

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the MRS data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-MRS

1. Confirm fault symptoms
   a. The most difficult situation in troubleshooting is when no symptoms appear. In this case, the fault described by the user must be thoroughly analyzed. Then, simulate the same or similar conditions and environment as when the fault occurred in the customer's vehicle. Regardless of how experienced or skilled the technician is, if troubleshooting is performed without confirming the fault symptoms, some important things will be overlooked during the repair, and incorrect guesses will be made in some places. This will lead to the inability to proceed with troubleshooting.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

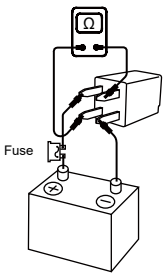
DTC: B111717-MRS

Fault code	Description
B111717	Overvoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the forward collision radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the forward collision warning radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMMRS1227003	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

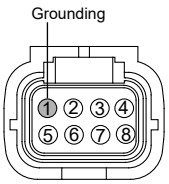
© 2026, All rights reserved

Go to step 5.

Step 5 Check the power circuit of the forward collision radar.

EL008 Forward Collision Avoidance Radar

B10DMMRS1227004



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the forward collision radar harness connector EL008 and the body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the forward collision radar.

EL008 Forward Collision Avoidance Radar

B10DMMRS1227005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C. Use a multimeter, set it to the resistance range, and measure the resistance value between terminal 1 of the wire harness connector EL008 of the forward collision avoidance radar and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replacement of forward collision radar.

A Replacement of the forward collision radar.
B After replacing the forward collision radar and performing the calibration procedure, is the fault cleared?

Yes 》》》 System normal.

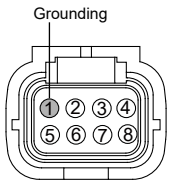
Go to step 5.

Step 5 Check the power circuit of the forward collision radar.

EL008 Forward Collision Avoidance Radar

B10DMMRS1227004



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the forward collision radar harness connector EL008 and the body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the forward collision radar.

EL008 Forward Collision Avoidance Radar

B10DMMRS1227005

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C. Use a multimeter, set it to the resistance range, and measure the resistance value between terminal 1 of the wire harness connector EL008 of the forward collision avoidance radar and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replacement of forward collision radar.

A Replacement of the forward collision radar.
B After replacing the forward collision radar and performing the calibration procedure, is the fault cleared?

Yes 》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

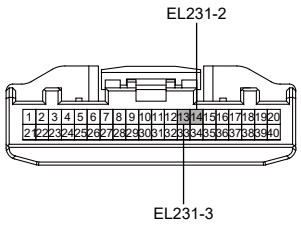
Yes》》》
Go to step 2.



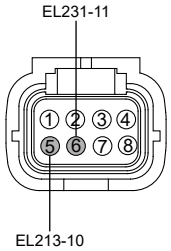
Step 2 Check the CAN harness between the front monocular camera assembly and the multi-domain fusion controller.

EL231 Front Mono Camera Assembly

B10DMMRS1227010

EL215-3 Multi-Domain Fusion Controller

B10DMMRS1227011

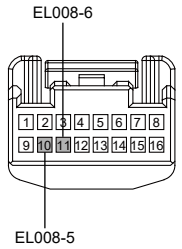


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of harness connector EL231 of the forward-facing monocular camera assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector EL231 of the forward monocular camera assembly and terminal 13 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN harness between the forward collision radar and the front-view monocular camera assembly.



EL008 Forward Collision Avoidance Radar

B10DMMRS1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 5 of the wire harness connector EL008 for the forward collision radar and terminal 10 of the wire harness connector EL231 for the front monocular camera assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the harness conne

DTC: U136382-MRS

Fault code	Description
U136382	ADAS Communication Message Count Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

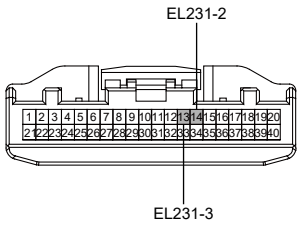
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



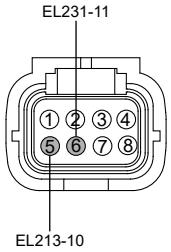
Step 2 Check the CAN harness between the front monocular camera assembly and the multi-domain fusion controller.

EL231 Front Mono Camera Assembly

B10DMMRS1227010

EL215-3 Multi-Domain Fusion Controller

B10DMMRS1227011

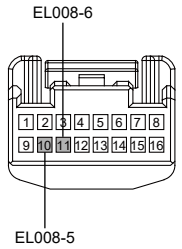


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of harness connector EL231 of the forward-facing monocular camera assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector EL231 of the forward monocular camera assembly and terminal 13 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN harness between the forward collision radar and the front-view monocular camera assembly.



EL008 Forward Collision Avoidance Radar

B10DMMRS1227017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL008 of the forward collision radar.
C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 5 of the wire harness connector EL008 for the forward collision radar and terminal 10 of the wire harness connector EL231 for the front monocular camera assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 6 of the harness conne

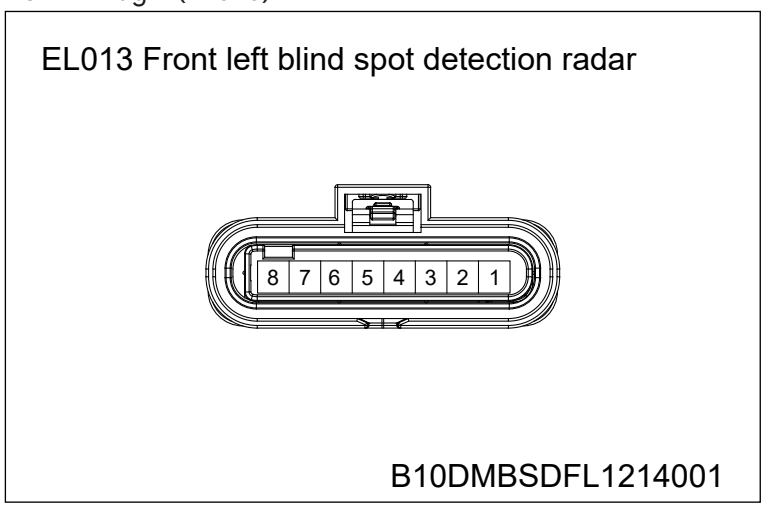
DIAGNOSTIC INSTRUCTIONS – BSDFL

You can use a diagnostic tool to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the BSDFL data list and reading the data list displayed on the diagnostic tool, you can read switch and sensor values without disassembling any components. Reading the data list is the first step in troubleshooting and one of the ways to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-BSDFL

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

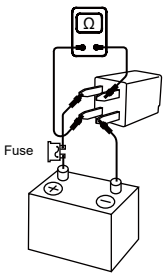
DTC: B111717-BSDFL

Fault code	Description
B111717	Overvoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDFL1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

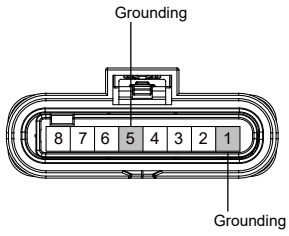
© 2026, All rights reserved

Go to step 5.

Step 5 Check the power supply harness of the front left blind spot detection radar.

EL013 Front left blind spot detection radar

B10DMBSDFL1214007



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of wire harness connector EL013 of the left front blind spot detection radar and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the grounding wire harness of the front left blind spot detection radar.

EL013 Front left blind spot detection radar

B10DMBSDFL1214008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Use a multimeter, set it to the resistance range, and measure the resistance between terminals 1 and 5 of the harness connector EL013 for the left front blind spot detection radar and the vehicle body ground to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

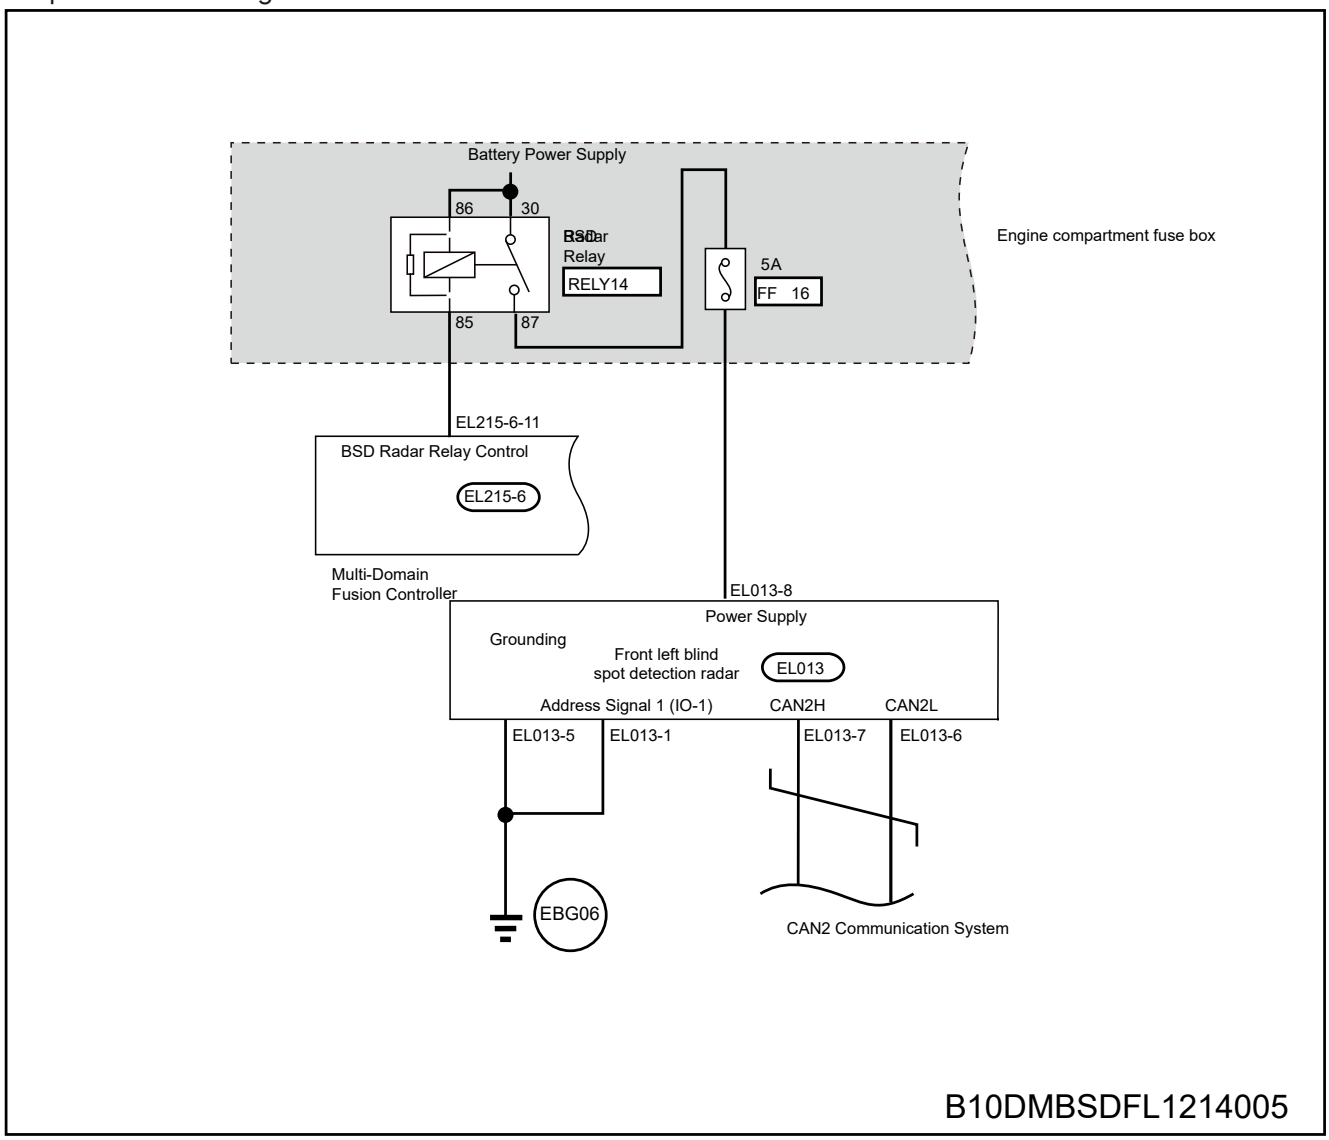
No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the front left blind spot detection radar.

A Replace the left front blind spot detection radar.
B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared?

© 2026, All rights reserved

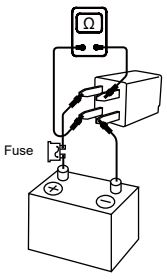


Yes 》》》 System normal.
Next 》》》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

DTC: B111716-BSDFL

Fault code	Description
B111716	Low Voltage Fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDFL1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

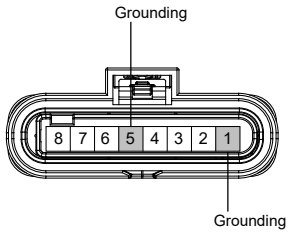
Go to step 5.

Step 5 Check the power supply harness of the front left blind spot detection radar.

EL013 Front left blind spot detection radar

B10DMBSDFL1214007



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of wire harness connector EL013 of the left front blind spot detection radar and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the grounding wire harness of the front left blind spot detection radar.

EL013 Front left blind spot detection radar

B10DMBSDFL1214008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Use a multimeter, set it to the resistance range, and measure the resistance between terminals 1 and 5 of the harness connector EL013 for the left front blind spot detection radar and the vehicle body ground to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

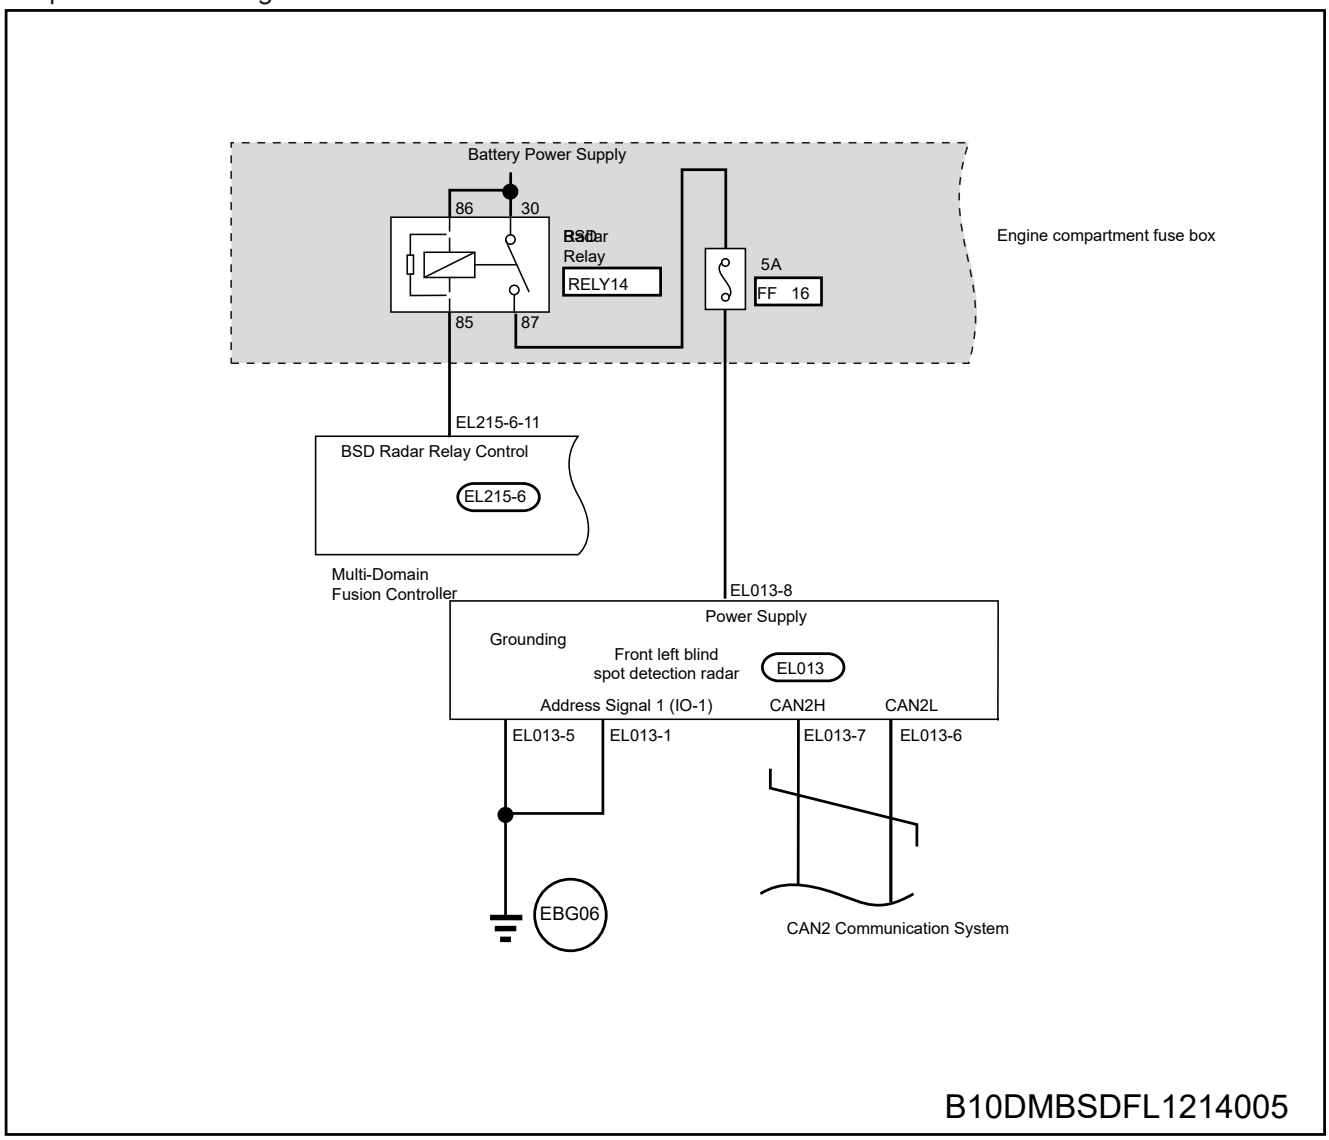
No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the front left blind spot detection radar.

A Replace the left front blind spot detection radar.
B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared?

© 2026, All rights reserved



Yes 》》》 System normal.
Next 》》》 Go to step 8.
Step 8 Diagnosis complete.

DTC: B16C200-BSDFL

Fault code	Description
B16C200	Radar blocked

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the front left blind spot detection radar.	
	A Check whether the surface of the left front blind spot det ection radar is blocked by foreign objects or improperly inst alled.
	Yes 》 》 》 Reinstall and remove obstructions.
	No 》 》 》 Go to step 3.
Step 3 Check the power and ground of the left front blind spot detection radar.	
	A Check whether the power supply and ground of the left fr ont blind spot detection radar are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar an d performing the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

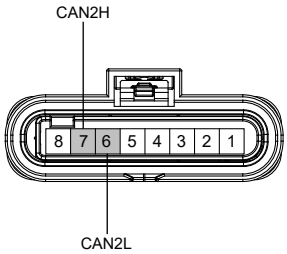
DTC: U007F88-BSDFL

Fault code	Description
U007F88	CAN Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the front left blind spot detection radar is normal.	
EL013 Front left blind spot detection radar  B10DMBSDFL1214009	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL013 of the left front blind spot detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage values between terminal 6 and the vehicle body ground, and between terminal 7 and the vehicle body ground, of the wire harness connector EL013 for the left front blind spot detection radar. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power and ground of the left front blind spot detection radar.	
	A Check whether the power supply and ground of the left front blind spot detection radar are normal.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

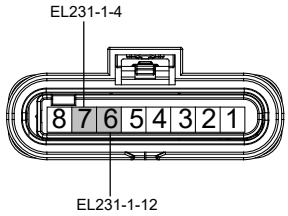
DTC: U136383-BSDFL

Fault code	Description
U136383	Checksum error in ADAS communication message

1. Simplified Circuit Diagram

2. Diagnostic Steps

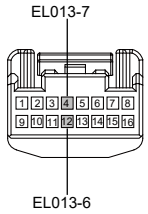
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



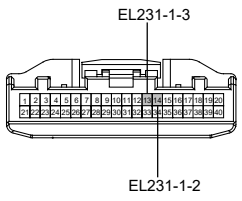
Step 2 Check whether the CAN harness between the left front blind spot detection radar and the forward-facing monocular camera assembly is normal.

EL013 Front left blind spot detection radar

B10DMBSDFL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDFL1214016

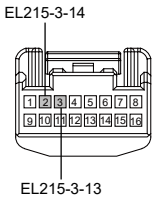


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of harness connector EL013 for the left front blind spot detection radar and terminal 12 of harness connector EL231-1 for the forward-facing monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of the wire harness connector EL013 of the left front blind spot detection radar and terminal 4 of the wire harness connector EL231-1 of the front monocular camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDFL1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connect

EL215-3 Multi-Domain Fusion Controller

B10DMBSDFL1214017

EL231-1 Front Mono Camera Assembly

B10DMBSDFL1214018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connector EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》》》 System normal.

No 》》》
Go to step 7.

Step 7 Replace the front left blind spot detection radar.

A Replace the left front blind spot detection radar.

© 2026, All rights reserved

	B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

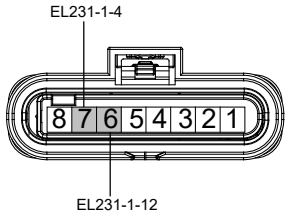
DTC: U136387-BSDFL

Fault code	Description
U136387	ADAS Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

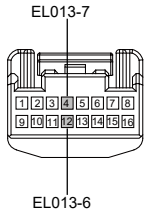
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



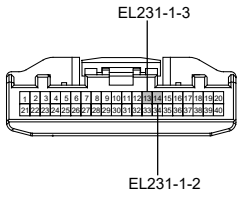
Step 2 Check whether the CAN harness between the left front blind spot detection radar and the forward-facing monocular camera assembly is normal.

EL013 Front left blind spot detection radar

B10DMBSDFL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDFL1214016

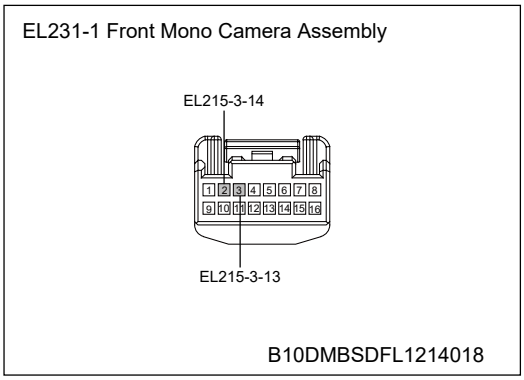


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL013 of the left front blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of harness connector EL013 for the left front blind spot detection radar and terminal 12 of harness connector EL231-1 for the forward-facing monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of the wire harness connector EL013 of the left front blind spot detection radar and terminal 4 of the wire harness connector EL231-1 of the front monocular camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDFL1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connect

© 2026, All rights reserved

	or EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the front left blind spot detection radar.	
	A Replace the left front blind spot detection radar. B After replacing the left front blind spot detection radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

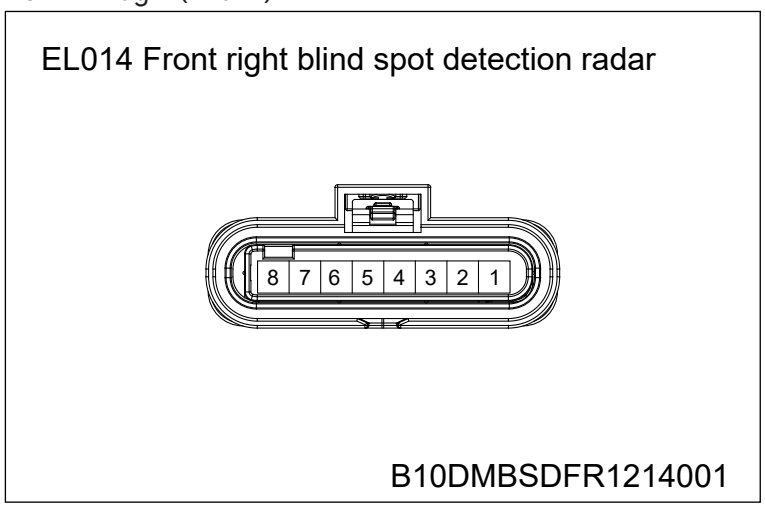
DIAGNOSTIC DESCRIPTION-BSDFR

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the BSDFR data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-BSDFR

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

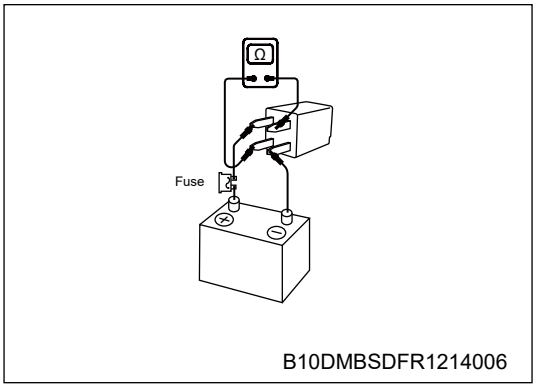
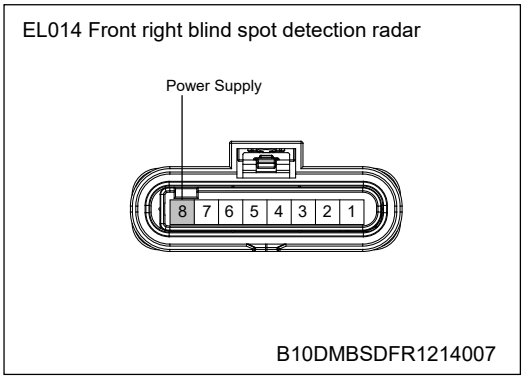
Fault code	Description
B111717	Overvoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



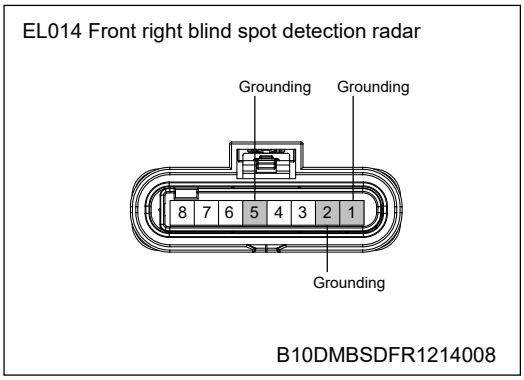
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the right front blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right front blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery terminal to one side of the BSD radar relay coil, and connect the other side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

© 2026, All rights reserved

Go to step 5.

Step 5 Check the power supply harness of the right front blind spot detection radar.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right fron t blind spot detection radar.
C Connect the negative terminal of the battery, use a jumpe r wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 8 of the wire harness conn ector EL014 of the right front blind spot detection radar an d the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard val ue.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the right front blind spot detection radar.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right fron t blind spot detection radar.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 1, 2, and 5 of the wirin g harness connector EL014 for the right front blind spot det ection radar and the vehicle body ground to check if the res istance values are normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

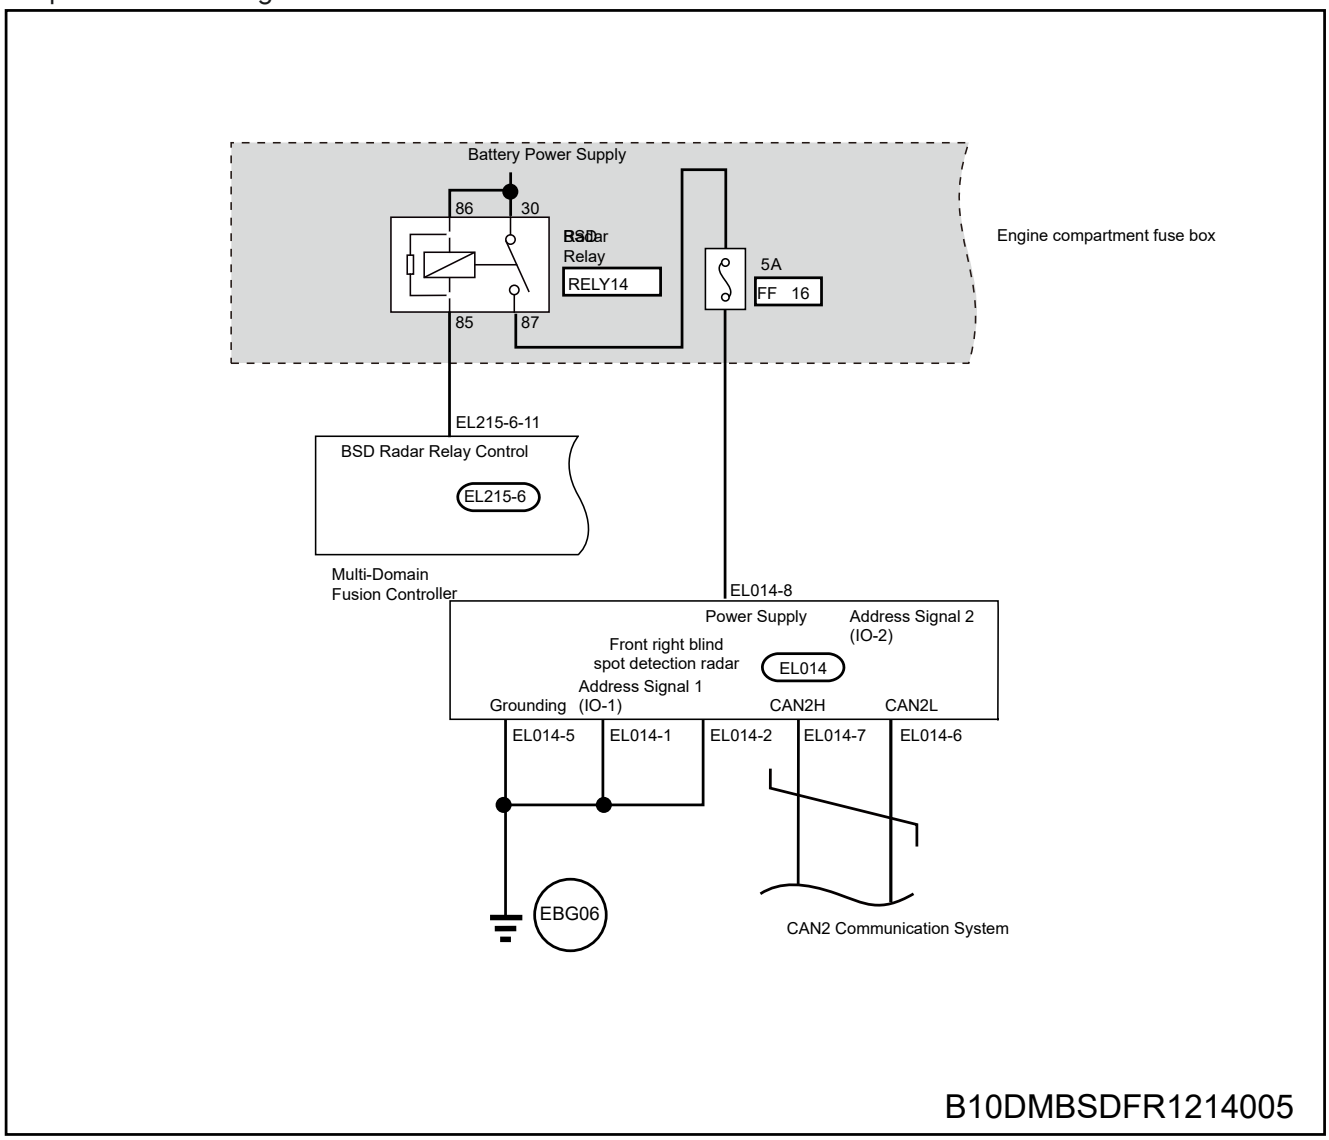
No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the right front blind spot detection radar.

A Replace the right front blind spot detection radar.
B After replacing the right front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?

© 2026, All rights reserved



Yes 》》》 System normal.
Next 》》》 Go to step 8.
Step 8 Diagnosis complete.

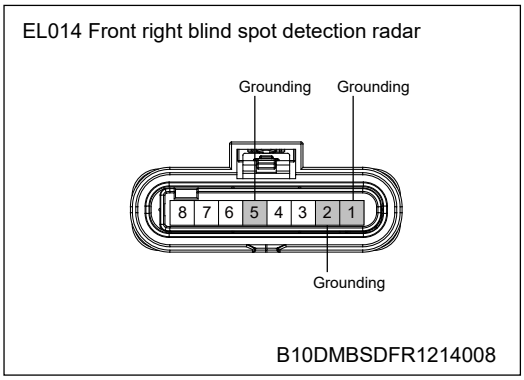
Go to step 5.

Step 5 Check the power supply harness of the right front blind spot detection radar.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right front blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the wire harness connector EL014 of the right front blind spot detection radar and the vehicle body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the right front blind spot detection radar.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right front blind spot detection radar.
C Use a multimeter, set it to the resistance range, and measure the resistance between terminals 1, 2, and 5 of the wiring harness connector EL014 for the right front blind spot detection radar and the vehicle body ground to check if the resistance values are normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the right front blind spot detection radar.

A Replace the right front blind spot detection radar.
B After replacing the right front blind spot detection radar and performing the calibration procedure, is the fault cleared?

May be caused by an intermittent fault. Check for intermittent faults.

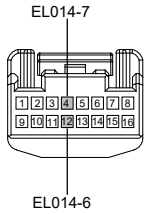
Yes》》》
Go to step 2.



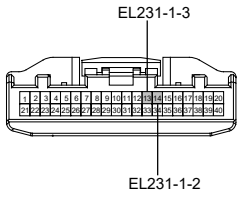
Step 2 Check whether the CAN harness between the right front blind spot detection radar and the forward-facing monocular camera assembly is normal.

EL014 Front right blind spot detection radar

B10DMBSDFR1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDFR1214016

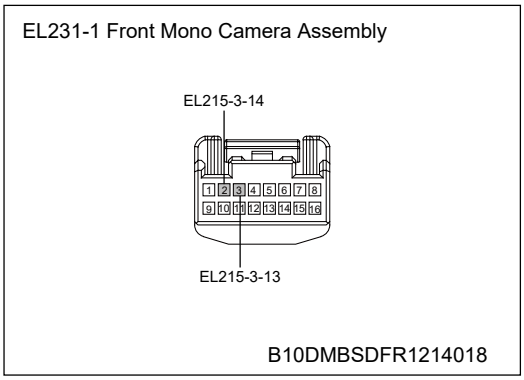


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right front blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the wire harness connector EL014 of the right front blind spot detection radar and terminal 12 of the wire harness connector EL231-1 of the forward-facing monocular camera assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of harness connector EL014 for the right front blind spot detection radar and terminal 4 of harness connector EL231-1 for the front monocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDFR1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connect

or EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harn ess of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes 》》》 System normal.

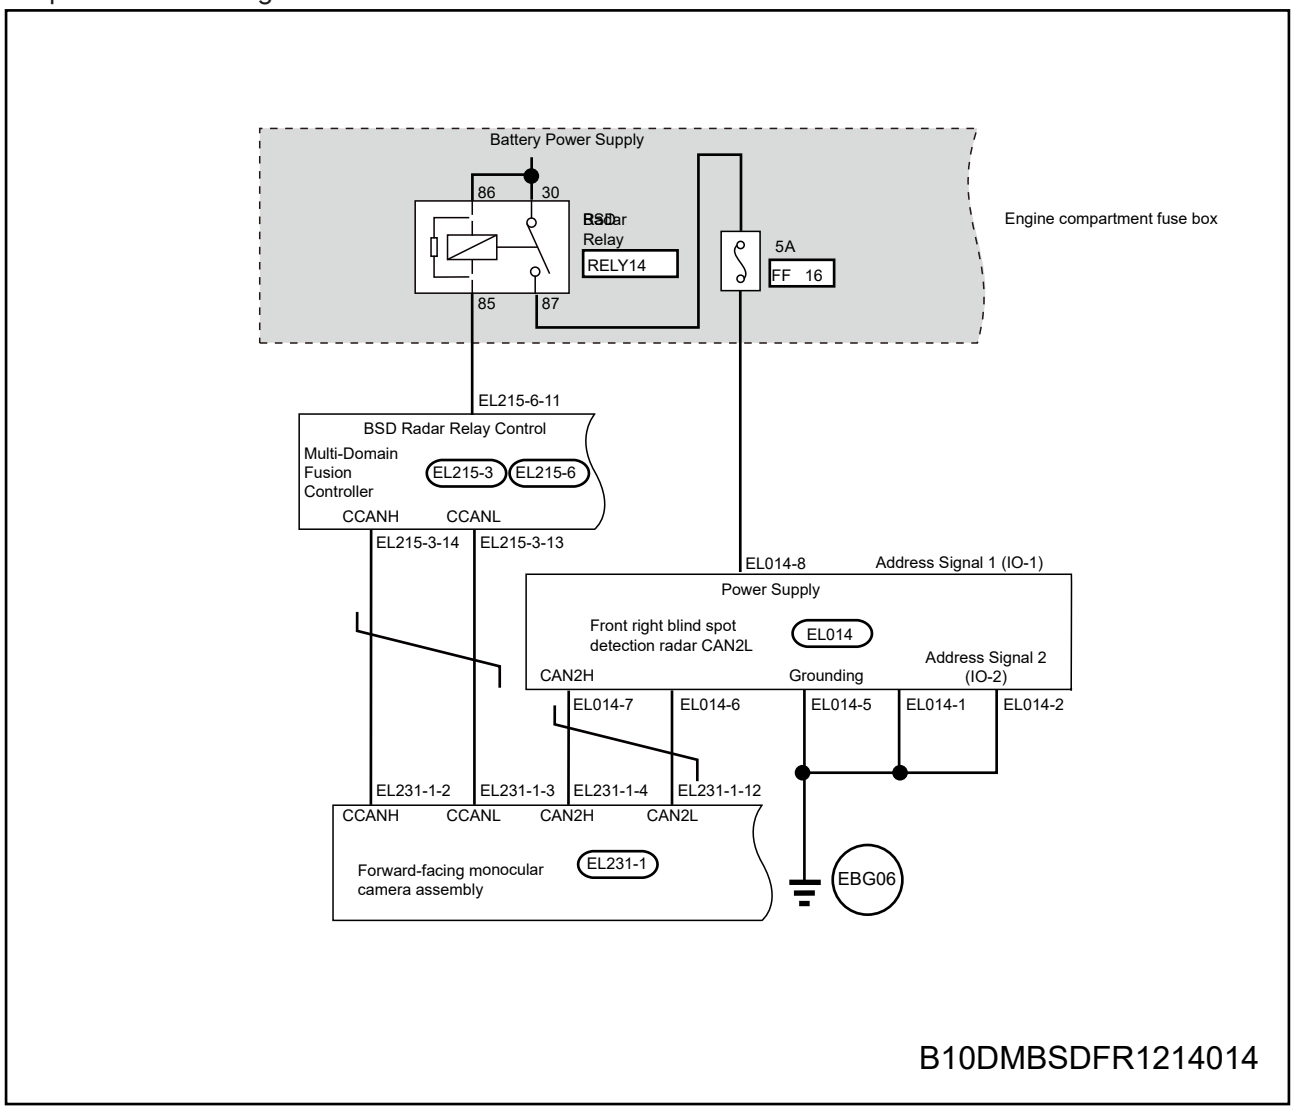
No 》》》
Go to step 6.

Step 6 Replace the right front blind spot detection radar.

A Replace the right front blind spot detection radar.
B After replacing the right front blind spot detection radar a nd performing the calibration procedure, is the fault cleared ?

Yes 》》》 System normal.

Next 》》》
Go to step 7.



Step 7 Diagnosis complete.

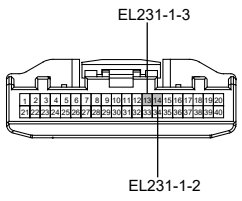
EL014 Front right blind spot detection radar

B10DMBSDFR1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDFR1214016

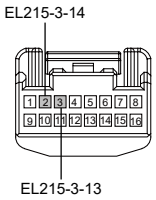


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL014 of the right front blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the wire harness connector EL014 of the right front blind spot detection radar and terminal 12 of the wire harness connector EL231-1 of the forward-facing monocular camera assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of harness connector EL014 for the right front blind spot detection radar and terminal 4 of harness connector EL231-1 for the front monocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDFR1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connect

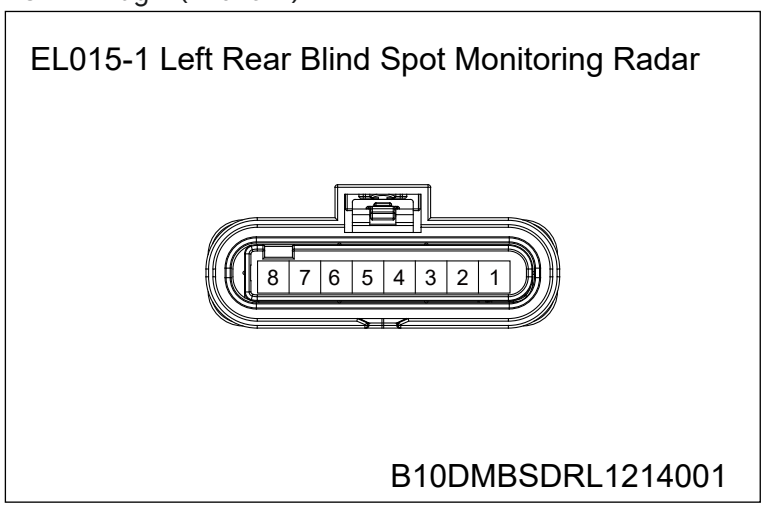
DIAGNOSTIC DESCRIPTION-BSDRL

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the BSDRL data list and reading the data list displayed on the diagnostic tool, you can read switch and sensor values without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-BSDRL

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

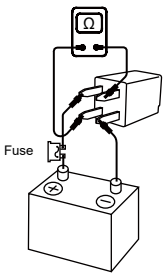
DTC: B111716-BSDRL

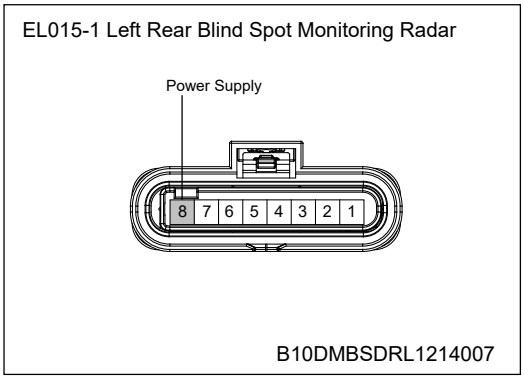
Fault code	Description
B111716	Low Voltage Fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



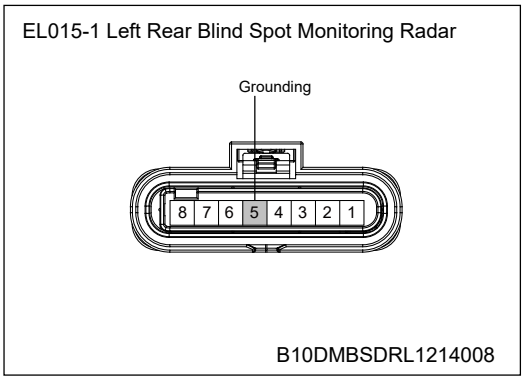
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the left rear blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left rear blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDRL1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

© 2026, All rights reserved

Go to step 5.

Step 5 Check the power supply harness of the left rear blind spot detection radar.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rear blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the left rear blind spot detection radar harness connector EL015-1 and the body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the grounding wire harness of the left rear blind spot detection radar.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rear blind spot detection radar.
C. Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the wiring harness connector EL015-1 for the left rear blind spot detection radar and the body ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the left rear blind spot detection radar.

A Replace the left rear blind spot monitoring radar.
B After replacing the left rear blind spot detection radar and performing the calibration procedure, is the fault cleared?

Yes 》》》 System normal.

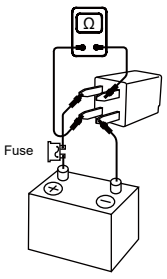
DTC: B111717-BSDRL

Fault code	Description
B111717	Overvoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the left rear blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left rear blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDRL1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

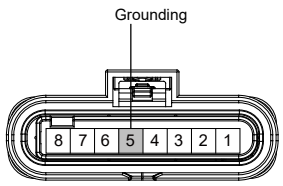
Go to step 5.

Step 5 Check the power supply harness of the left rear blind spot detection radar.

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214007



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rear blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the left rear blind spot detection radar harness connector EL015-1 and the body ground to check if it is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the grounding wire harness of the left rear blind spot detection radar.

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rear blind spot detection radar.
C. Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the wiring harness connector EL015-1 for the left rear blind spot detection radar and the body ground to check if it is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the left rear blind spot detection radar.

A Replace the left rear blind spot monitoring radar.
B After replacing the left rear blind spot detection radar and performing the calibration procedure, is the fault cleared?

Yes 》》》 System normal.

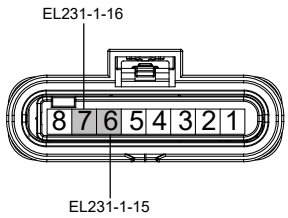
DTC: U136383-BSDRL

Fault code	Description
U136383	Checksum error in ADAS communication message

1. Simplified Circuit Diagram

2. Diagnostic Steps

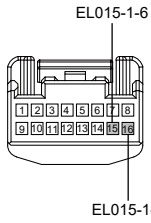
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



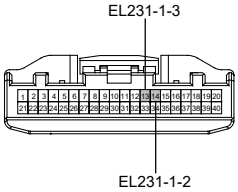
Step 2 Check whether the CAN harness between the left rear blind spot detection radar and the front mono cular camera assembly is normal.

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRL1214016

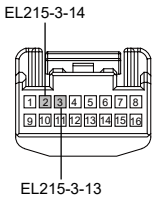


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rea r blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 15 of harness connector EL231-1 for the forward-faci ng monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 16 of harness connector EL231-1 for the forward mo nocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.

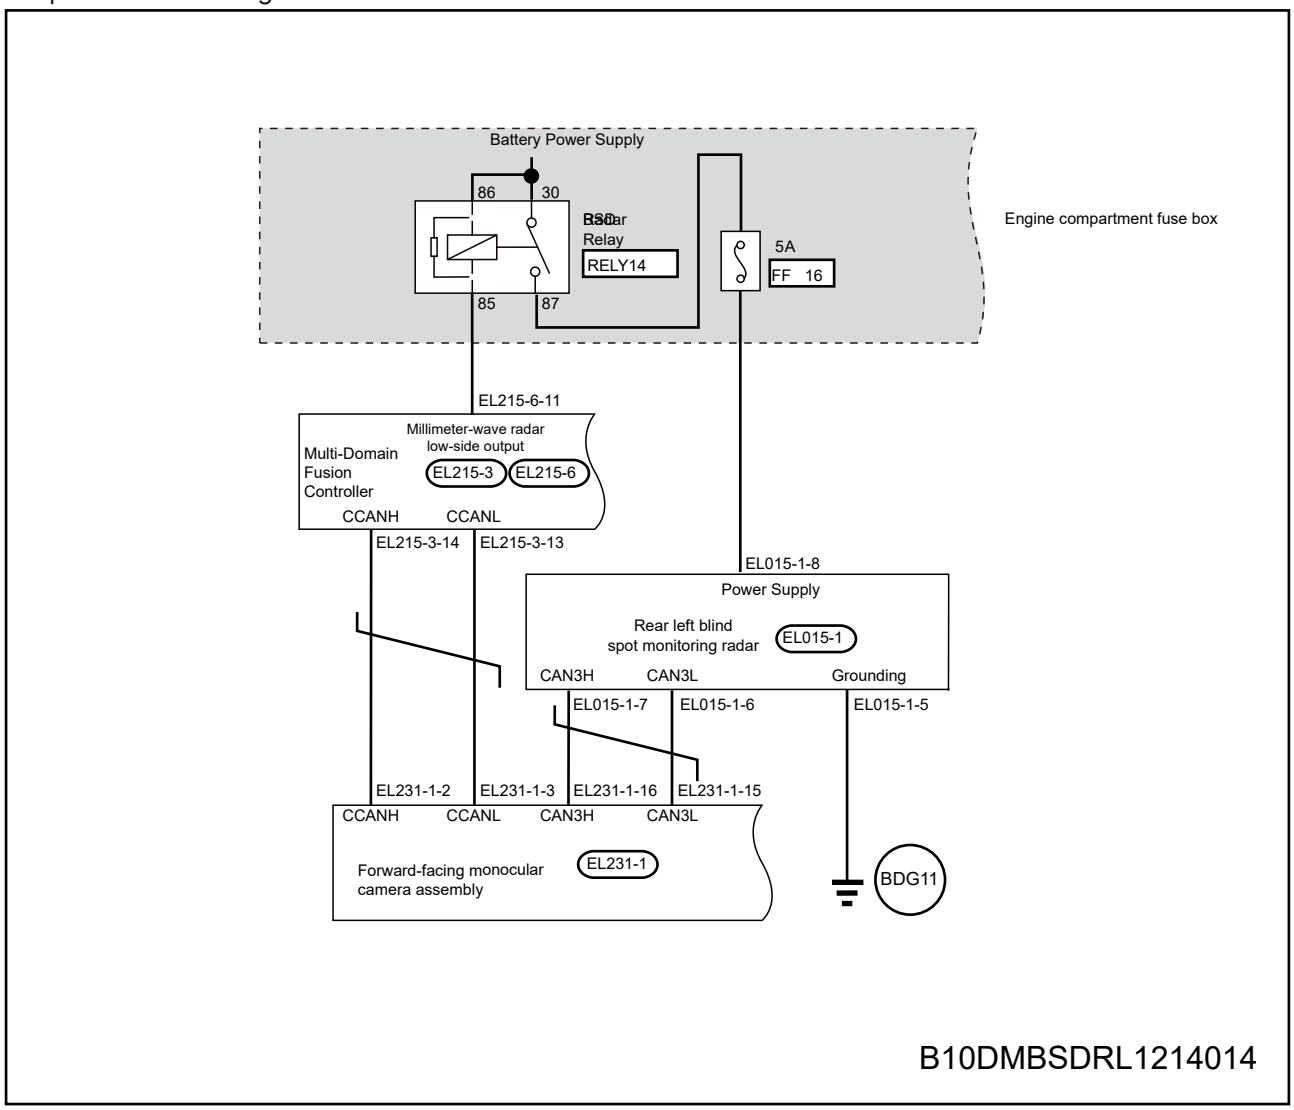


EL215-3 Multi-Domain Fusion Controller

B10DMBSDRL1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect or EL231-1 of the forward monocular camera assembly and

© 2026, All rights reserved



EL231-1 Front Mono Camera Assembly  B10DMBSDRL1214018	terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the left rear blind spot detection radar.	
	A Replace the left rear blind spot monitoring radar. B After replacing the left rear blind spot detection radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: C142A4A-BSDRL

Fault code	Description
C142A4A	Time Synchronization Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

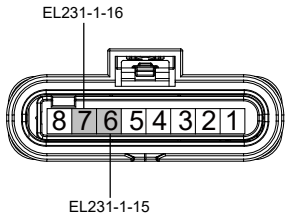
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

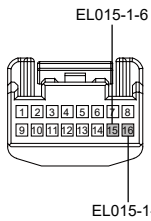
Step 2 Check the fault codes of the multi-domain fusion controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the Multi-Do main Fusion Controller, and record them.
C Check for any related faults.

Yes》》》 Prioritize the repair of related faults.

No》》》
Go to step 3.



Step 3 Check whether the CAN harness between the left rear blind spot detection radar and the front mono cular camera assembly is normal.

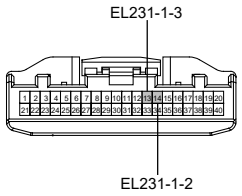
EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRL1214016

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rea r blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 15 of harness connector EL231-1 for the forward-faci ng monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 16 of harness connector EL231-1 for the forward mo nocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.

EL215-3 Multi-Domain Fusion Controller

B10DMBSDRL1214017

EL231-1 Front Mono Camera Assembly

B10DMBSDRL1214018

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front view monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connector EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the power supply and ground harness of the multi-domain fusion controller.

A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》》》 System normal.

No 》》》
Go to step 7.

Step 7 Replace the left rear blind spot detection radar.

A Replace the left rear blind spot monitoring radar.

© 2026, All rights reserved

	B After replacing the left rear blind spot detection radar an d performing the calibration procedure, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

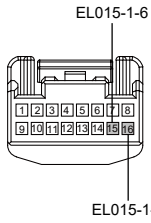
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



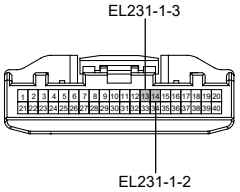
Step 2 Check whether the CAN harness between the left rear blind spot detection radar and the front mono cular camera assembly is normal.

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRL1214016

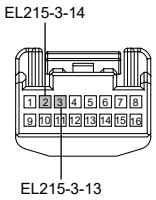


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rea r blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 15 of harness connector EL231-1 for the forward-faci ng monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 16 of harness connector EL231-1 for the forward mo nocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDRL1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect or EL231-1 of the forward monocular camera assembly and

EL231-1 Front Mono Camera Assembly  B10DMBSDRL1214018	terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the left rear blind spot detection radar.	
	A Replace the left rear blind spot monitoring radar. B After replacing the left rear blind spot detection radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

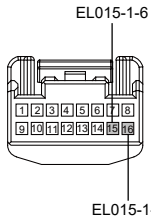
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



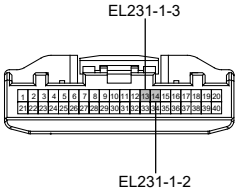
Step 2 Check whether the CAN harness between the left rear blind spot detection radar and the front mono cular camera assembly is normal.

EL015-1 Left Rear Blind Spot Monitoring Radar

B10DMBSDRL1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRL1214016

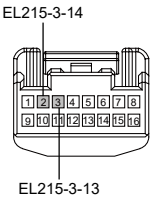


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL015-1 of the left rea r blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 15 of harness connector EL231-1 for the forward-faci ng monocular camera assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of harness connector EL015-1 for the left rear blind spot detection radar and ter minal 16 of harness connector EL231-1 for the forward mo nocular camera assembly to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDRL1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect or EL231-1 of the forward monocular camera assembly and

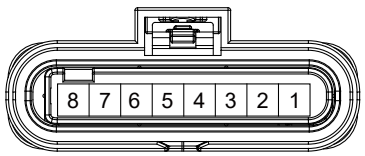
DIAGNOSTIC DESCRIPTION - BSDRR

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic connector. By utilizing the BSDRR data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved

VISUAL INSPECTION-BSDRR



1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

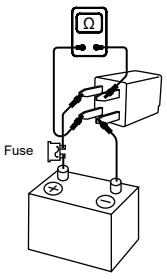
DTC: B111716-BSDRR

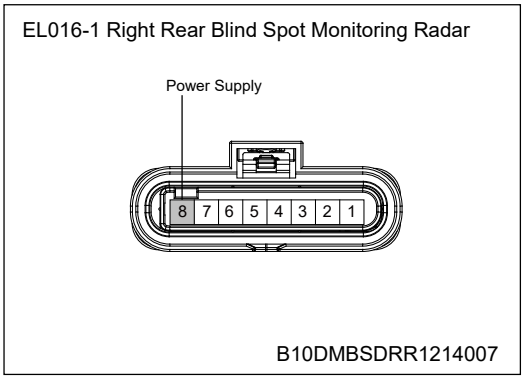
Fault code	Description
B111716	Low Voltage Fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



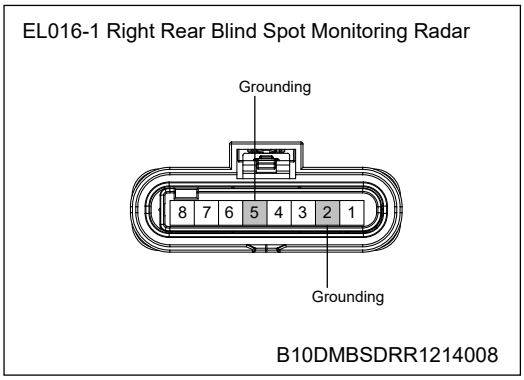
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the right rear blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right rear blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDRR1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

© 2026, All rights reserved

Go to step 5.

Step 5 Check the power supply wiring harness for the right rear blind spot detection radar.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right rear blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the wire harness connector EL016-1 of the right rear blind spot detection radar and the vehicle body ground to check whether the voltage is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the right rear blind spot detection radar.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right rear blind spot detection radar.
C. Use a multimeter set to the resistance range to measure the resistance between terminals 2 and 5 of the harness connector EL016-1 for the right rear blind spot detection radar and the vehicle body ground to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the right rear blind spot detection radar.

A Replace the right rear Blind Spot Detection radar.

© 2026, All rights reserved

	B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

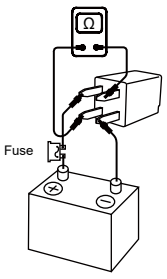
DTC: B111717-BSDRR

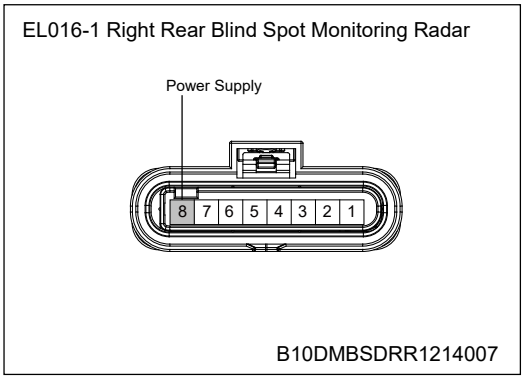
Fault code	Description
B111717	Overvoltage fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



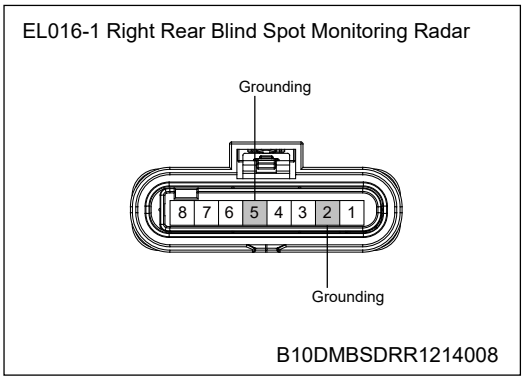
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the right rear blind spot detection radar.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right rear blind spot detection radar fuse FF16. Fuse specification: FF16 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the BSD radar relay.	
 B10DMBSDRR1214006	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the BSD radar relay RELY14, connect the positive battery termin al to one side of the BSD radar relay coil, and connect the o ther side to ground, then check whether there is continuity across the two ends of the relay switch contacts.
	No》》》 Replace the BSD radar relay.
	Yes》》》

© 2026, All rights reserved

Go to step 5.

Step 5 Check the power supply wiring harness for the right rear blind spot detection radar.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right rear blind spot detection radar.
C Connect the negative terminal of the battery, use a jumper wire to short pins 30# and 87# of the BSD radar relay REL Y14, and power on the vehicle.
D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 8 of the wire harness connector EL016-1 of the right rear blind spot detection radar and the vehicle body ground to check whether the voltage is normal.
Standard voltage: 11~14V
E Confirm whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the ground wire harness of the right rear blind spot detection radar.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right rear blind spot detection radar.
C. Use a multimeter set to the resistance range to measure the resistance between terminals 2 and 5 of the harness connector EL016-1 for the right rear blind spot detection radar and the vehicle body ground to check if the resistance value is normal.
Resistance standard value: Less than 1Ω
D Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the right rear blind spot detection radar.

A Replace the right rear Blind Spot Detection radar.

© 2026, All rights reserved

	B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: B16C200-BSDRR

Fault code	Description
B16C200	Radar blocked

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the right rear blind spot detection radar.	
	A Check the surface of the right rear blind spot detection ra dar for any foreign object obstruction or improper installati on.
	Yes 》 》 》 Reinstall and remove obstructions.
	No 》 》 》 Go to step 3.
Step 3 Check the power supply and ground of the right rear blind spot detection radar.	
	A Check whether the power supply and ground of the right rear blind spot detection radar are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleare d?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

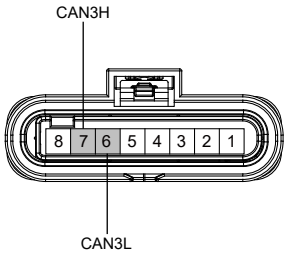
DTC: U007F88-BSDRR

Fault code	Description
U007F88	CAN Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the right rear blind spot detection radar is normal.	
EL016-1 Right Rear Blind Spot Monitoring Radar  B10DMBSDRR1214009	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL016-1 of the right re ar blind spot detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 6 and vehicle body ground, and between terminal 7 and vehicle body ground, respectiv ely, at the wire harness connector EL016-1 of the right rear blind spot detection radar. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the right rear blind spot detection radar.	
	A Check whether the power supply and ground of the right rear blind spot detection radar are normal.
	No》》》 Repair or replace the wiring harness.

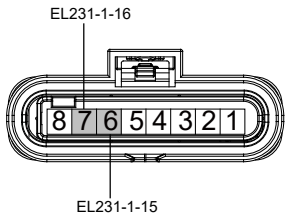
DTC: U136387-BSDRR

Fault code	Description
U136387	ADAS Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

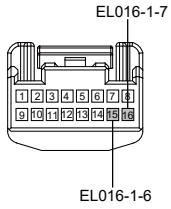
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



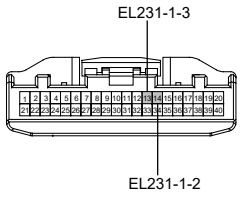
Step 2 Check whether the CAN harness between the right rear blind spot detection radar and the front mo nocular camera assembly is normal.

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMBSDRR1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRR1214016

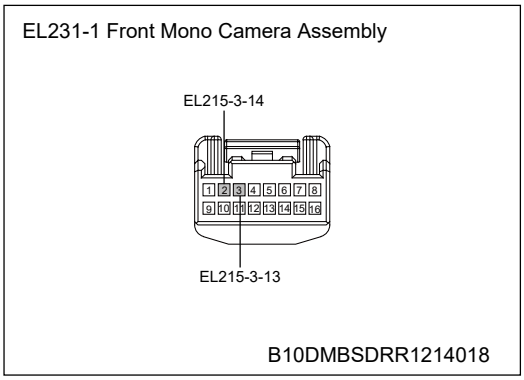


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right re ar blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the wire harness conne ctor EL016-1 for the right rear blind spot detection radar a nd terminal 15 of the wire harness connector EL231-1 for t he front monocular camera assembly to check if it is normal.
E. Use a multimeter, select the resistance setting, and meas ure the resistance between terminal 7 of harness connector EL016-1 for the right rear blind spot detection radar and te rminal 16 of harness connector EL231-1 for the front mono cular camera assembly to check if the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDRR1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect

© 2026, All rights reserved

	or EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

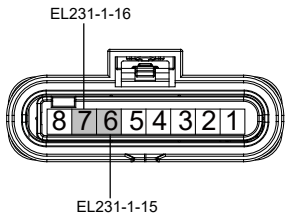
DTC: U136382-BSDRR

Fault code	Description
U136382	ADAS Communication Message Count Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

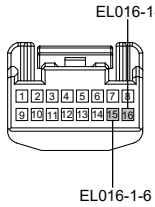
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



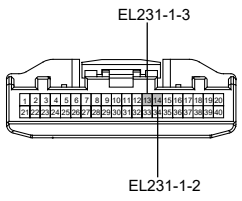
Step 2 Check whether the CAN harness between the right rear blind spot detection radar and the front mo nocular camera assembly is normal.

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMBSDRR1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRR1214016

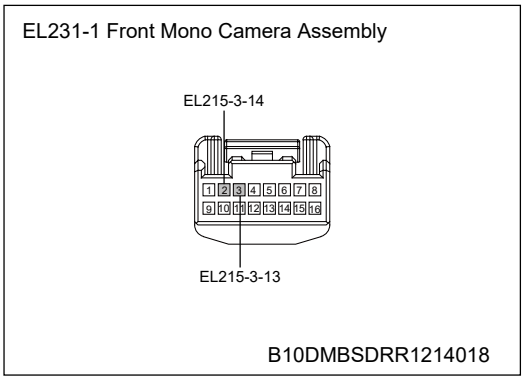


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right re ar blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the wire harness conne ctor EL016-1 for the right rear blind spot detection radar a nd terminal 15 of the wire harness connector EL231-1 for t he front monocular camera assembly to check if it is normal.
E. Use a multimeter, select the resistance setting, and meas ure the resistance between terminal 7 of harness connector EL016-1 for the right rear blind spot detection radar and te rminal 16 of harness connector EL231-1 for the front mono cular camera assembly to check if the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDRR1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect

© 2026, All rights reserved

	or EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the right rear blind spot detection radar.	
	A Replace the right rear Blind Spot Detection radar. B After replacing the right rear blind spot monitoring radar and performing the calibration procedure, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

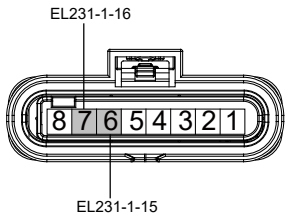
DTC: U136383-BSDRR

Fault code	Description
U136383	Checksum error in ADAS communication message

1. Simplified Circuit Diagram

2. Diagnostic Steps

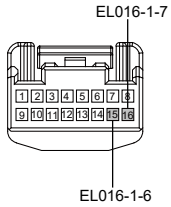
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



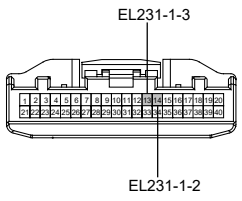
Step 2 Check whether the CAN harness between the right rear blind spot detection radar and the front mo nocular camera assembly is normal.

EL016-1 Right Rear Blind Spot Monitoring Radar

B10DMBSDRR1214015

EL231-1 Front Mono Camera Assembly

B10DMBSDRR1214016

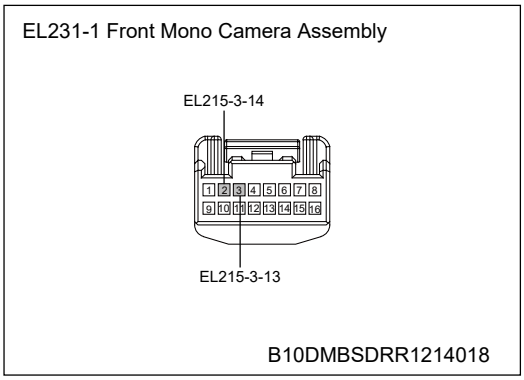


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL016-1 of the right re ar blind spot detection radar.
C Disconnect the harness connector EL231-1 of the forwar d-looking monocular camera assembly.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the wire harness conne ctor EL016-1 for the right rear blind spot detection radar a nd terminal 15 of the wire harness connector EL231-1 for t he front monocular camera assembly to check if it is normal.
E. Use a multimeter, select the resistance setting, and meas ure the resistance between terminal 7 of harness connector EL016-1 for the right rear blind spot detection radar and te rminal 16 of harness connector EL231-1 for the front mono cular camera assembly to check if the resistance value is no rmal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check whether the CAN harness between the forward-facing monocular camera assembly and the multi-domain fusion controller is normal.



EL215-3 Multi-Domain Fusion Controller

B10DMBSDRR1214017

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL231-1 of the front vi ew monocular camera assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the harness conne ctor EL231-1 of the forward-facing monocular camera asse mbly and terminal 14 of the harness connector EL215-3 of t he multi-domain fusion controller to check if it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the harness connect

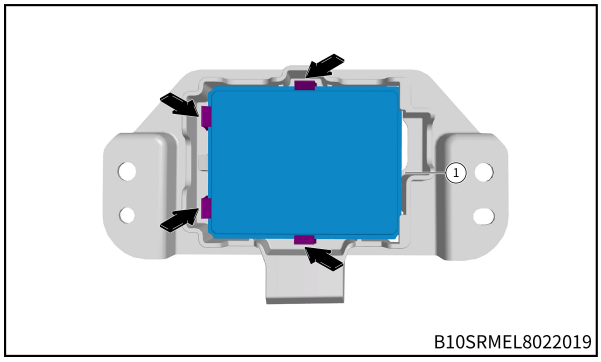
9.5.7 SERVICE AND REPAIR GUIDANCE



FORWARD COLLISION RADAR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the forward collision avoidance radar.

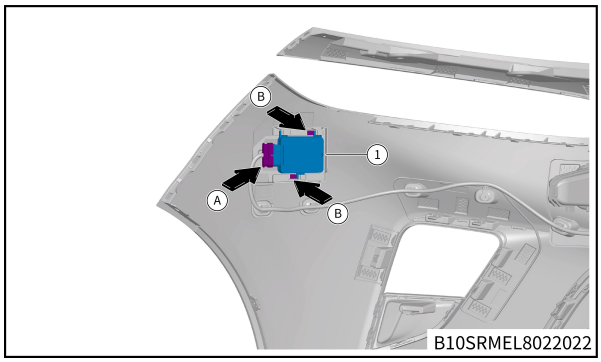
a. Disconnect the 1 connector of the forward collision radar -arrow A-, and unscrew the 2 fixing screws of the ACC mounting bracket -arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.2N m
b. Remove the forward collision radar with ACC mounting bracket ①.

c. Release the 4 retaining clips - arrow - securing the forward collision radar to the ACC mounting bracket, and remove the forward collision radar ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the forward collision avoidance radar.
      See:Forward Collision Avoidance Radar Calibration (page 9432)
   b. After calibration is completed, check that the forward collision avoidance radar is functioning properly.

© 2026, All rights reserved



BLIND SPOT DETECTION RADAR (FRONT BUMPER)

NOTE

This section describes the removal and installation of the blind spot detection radar on the left side of the front bumper. For the removal and installation of the blind spot detection radar on the right side of the front bumper, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the blind spot detection radar.

a. Disconnect the 1 connector between the Blind Spot Detection radar and the front bumper wiring harness -Arrow A-, and release the 2 retaining clips of the Blind Spot Detection radar -Arrow B-.
b. Remove the blind spot detection radar ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the blind spot detection radar.
      See:Blind Spot Detection Radar Calibration (page 9434)
   b. After calibration is completed, check that the blind spot detection radar is functioning properly.

REVERSING ULTRASONIC SENSOR (REAR BUMPER)

NOTE

This section describes the removal and installation of the reversing ultrasonic sensor on the left side of the rear bumper, and the removal and installation of the reversing ultrasonic sensor on the right side of the rear bumper can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the reverse ultrasonic sensor.

a. Disconnect the 1 connector of the reversing ultrasonic sensor -Arrow A-, and release the 2 retaining clips of the reversing ultrasonic sensor -Arrow B-.
b. Remove the reversing ultrasonic sensor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the reversing ultrasonic sensor is functioning properly.

FORWARD COLLISION AVOIDANCE RADAR CALIBRATION

FORWARD COLLISION AVOIDANCE RADAR CALIBRATION

1. Preparation for Forward Collision Avoidance Radar Calibration
   a. The following tools are required for calibrating the forward collision avoidance radar: diagnostic tool.
   b. For vehicles to be calibrated, the tire pressure must be at the standard pressure.
2. Forward Collision Radar Calibration Procedure

> **ATTENTION**
>
> Forward collision avoidance radar calibration is a dynamic calibration. Once the diagnostic tool triggers the calibration command, simply drive the vehicle normally for a certain distance along the specified path and at the specified speed.

   a. With the vehicle stationary, connect the diagnostic scanner and follow the path below:
      - Select the corresponding vehicle model - System Diagnosis - Front Radar (MRS) - Data Writing - Write VIN.
      - Select Corresponding Vehicle Model - System Diagnosis - Front Radar (MRS) - Data Write - Write End-of-Line Configuration
      - Select corresponding vehicle model - System Diagnosis - Front Radar (MRS) - Routine Control - After-sales Calibration.

> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

   b. During the calibration process, the vehicle should be driven in a straight line at a constant speed of >30 km/h, and the calibration can be completed in a maximum of 15 minutes.
   c. While driving, on the premise of ensuring safety, drive as straight as possible along the road, and do not change lanes, overtake, or turn en route.

BLIND SPOT DETECTION RADAR (REAR BUMPER)

NOTE

This section describes the removal and installation of the blind spot detection radar on the left side of the rear bumper, and the removal and installation of the blind spot detection radar on the right side of the rear bumper can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the blind spot detection radar.

a. Disconnect the 1 connector -Arrow A- between the blind spot detection radar and the rear bumper wiring harness, and release the 2 retaining clips -Arrow B- of the blind spot detection radar.
b. Remove the blind spot detection radar ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Calibrate the blind spot detection radar.
      See:Blind Spot Detection Radar Calibration (page 9434)
   b. After calibration is completed, check that the blind spot detection radar is functioning properly.

BLIND SPOT DETECTION RADAR CALIBRATION

BLIND SPOT DETECTION RADAR CALIBRATION

1. Preparation for Blind Spot Detection Radar Calibration

> **NOTE**
>
> This section describes the calibration method for the rear left corner radar. The calibration for other corner radars can be performed with reference to the rear left corner radar.

   a. The following tools are required for blind spot detection radar calibration: diagnostic tool.
   b. For vehicles to be calibrated, the tire pressure must be at the standard pressure.
   c. Ensure that the vehicle has undergone four-wheel alignment before radar calibration.
2. Environmental Requirements
   a. The radar surface is clean and free of snow, mud, or other coverings;
   b. The road surface on which the vehicle travels should be flat and even, avoiding bumps and irregularities; there should be no accumulated snow, ice, mud, or other road conditions that affect driving stability;
   c. Metal guardrails should be present on both sides of the road, and the metal guardrails should be stable and continuous. It is recommended that the guardrail be at least 150 meters long and straight to avoid interference from other moving targets. When calibrating the left rear corner radar, the guardrail should be located on the left side of the vehicle's direction of travel; when calibrating the right rear corner radar, the guardrail should be located on the right side of the vehicle's direction of travel.
   d. When the vehicle is driven in a standard 3.5/3.75 m lane, the guardrail is no more than 1 m from the lane edge.
3. Vehicle Driving Behavior Requirements
   a. Once dynamic driving calibration is initiated, the vehicle must be driven under the conditions specified in the table below to ensure the successful completion of the dynamic driving calibration.

Limitations	Recommended value	Permissible error	Note
Radar lateral distanc e to guardrail	2m	±0.5m	
Guardrail height	69cm	±0.1m	Level with the radar i nstallation height
Uniform Linear Motio n Speed	40km/h		Straight-line driving at a constant speed of 30–80km/h
Longitudinal accelera tion	0m/s²	±0.5m/s²	
Yaw rate	0rad/s	±0.01rad/s	

4. Blind Spot Detection Radar Calibration Procedure

> **ATTENTION**

© 2026, All rights reserved

Blind Spot Detection radar calibration is a dynamic calibration, and after the diagnostic tool triggers the calibration command, simply drive the vehicle normally for a certain distance along the specified path and at the specified speed.

a. With the vehicle stationary, connect the diagnostic scanner and follow the path below:
   - Select the corresponding vehicle model - System Diagnosis - Blind Spot Detection Radar (BSD) - Data Writing - Write VIN Code.
   - Select the corresponding vehicle model - System Diagnosis - Blind Spot Detection (BSD) - Write end-of-line configuration.
   - Select Corresponding Vehicle Model - System Diagnostics - Blind Spot Detection (BSD) Radar - Routine Control - After-sales Calibration.

   ATTENTION

   After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

b. During the calibration process, the vehicle should travel in a straight line at a constant speed of 30–80 km/h, and generally, the calibration can be completed in 5 minutes.
c. While driving, on the premise of ensuring safety, drive as straight as possible along the road, and do not change lanes, overtake, or turn en route.

9.6 LIGHTING SYSTEM

9.6.1 OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

System Description:

The exterior lighting system of this vehicle includes various lights that comply with relevant regulatory requirements, and also features user-friendly functions such as automatic Follow Me Home, Find My Car lighting, headlamp height adjustment, position lamps, and daytime running lamps.

1. The exterior lighting system mainly includes:
   Front combination lamps, full-width rear combination lamps, rear combination lamps, rear retroreflectors, high-mounted brake lamps, license plate lamps.
2. The interior lighting system mainly includes:
   Reading lamp, luggage compartment lamp, vanity mirror lamp, ambient light, door open warning lamp.
3. Exterior Lighting System Operating Instructions:
   a. Position lamp
      Touch the position lamp button to turn on the front position lamps, rear position lamps, license plate lamp, and interior switch backlight. Touch the button again to turn off the position lamps.
   b. Low beam
      Touch the low beam button to turn on the position lamps and low beams. Touch the button again to turn off the position lamps and low beams.
   c. Automatic lighting
      Touch the automatic light button to turn on the automatic light function. When the exterior lighting is insufficient, the position lamps and low beams turn on automatically. When the exterior lighting is sufficient, the position lamps and low beams turn off automatically. Touch the button again to turn off the automatic light function.
   d. Headlamp height adjustment
      Touch the headlamp height adjustment button to enter the "Height Adjustment" interface, and slide the slider up or down to adjust the headlamp height. Touch the restore default button to restore the headlamp height to the factory setting.
   e. Rear fog lamp
      Touch the rear fog lamp button to turn on the rear fog lamp, and the position lamps and low beam headlamps will automatically turn on. Touch the button again to turn off the rear fog lamp.

      > ATTENTION
      >
      > When driving in foggy weather, turn on the rear fog lights and slow down, honk the horn to remind other pedestrians and vehicles.

   f. Daytime running lamp
      After the vehicle is powered on, the daytime running lamp turns on automatically when the position lamp, low beam, or high beam is turned off. When the position lamp, low beam, or high beam is turned on, the daytime running lamp turns off automatically.

© 2026, All rights reserved

g. High beam
After the low beam is turned on, push the light control lever outward to turn on the high beam. After the high beam is turned on, pull the light control lever inward to turn off the high beam.

> NOTE
>
> When the high beam is on, turning off the low beam will turn off the high beam.

h. Overtaking light
Repeatedly pull the lighting control lever toward the steering wheel and release it immediately; the high beams will flash on and off to indicate the intention to overtake.

i. High-mounted brake lamp and stop lamp
Press the brake pedal, and the high-mounted brake light and brake light will light up.

j. Reversing lamp
After the vehicle is started, the reversing lamps illuminate when the gear is shifted to R; the reversing lamps turn off when the gear is shifted out of R.

4. Interior Lighting System Operation Instructions:
   a. Reading lamp
   When the front reading lamp is off, touch the reading lamp to turn it on; touch it again to turn it off.
   b. Vanity mirror lamp
      a. Open the sun visor, open the vanity mirror cover, and the vanity mirror light turns on.
      b. Close the vanity mirror cover, and the vanity mirror light turns off.
   c. Ambient light
   It can be set on the central control screen, Vehicle > Lighting > Ambient Light, to turn on or off this function, and the ambient light color can also be adjusted.
   d. Trunk light
   Open the back door, and the luggage compartment light illuminates. Close the back door, and the luggage compartment light turns off.
   e. Door Open Warning Light
   Opening any door illuminates the corresponding door lamp.

9.6.6 SERVICE AND REPAIR GUIDANCE

INSTRUMENT PANEL AMBIENT LIGHT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the instrument panel upper trim assembly.
   See:Instrument panel upper trim assembly (page 5435)
5. Remove the instrument panel ambient light.

a. Unscrew the 2 fixing screws of the instrument panel ambient light -Arrow A-, and disengage the 28 fixing clips of the instrument panel ambient light -Arrow B-.
   Recommended tools: Phillips screwdriver, trim clip remover
   Torque: 1.5±0.4N m
b. Remove the instrument panel ambient light ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the instrument panel ambient lights are working properly.

REAR FULL-WIDTH LIGHT LEFT TRIM PANEL

NOTE

This section describes the removal and installation of the left trim panel of the rear full-width lamp. For the removal and installation of the right trim panel of the rear full-width lamp, please refer to the left side.

REMOVAL PROCEDURE

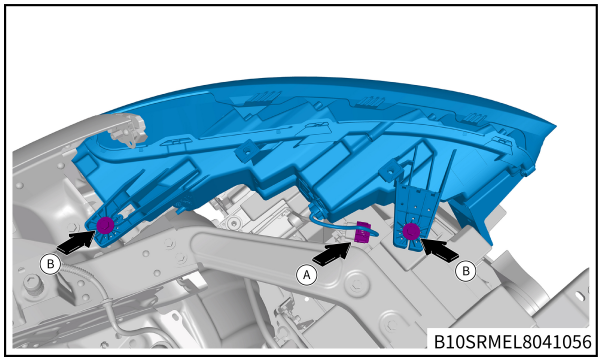
1. Open the liftgate assembly.
2. Remove the left trim panel of the rear light bar.

a. Unscrew the 1 fixing bolt -Arrow A- of the left trim panel of the rear through-type lamp, and detach the left trim panel in the direction of -Arrow B-.
Recommended tool: T30 Torx socket wrench
Torque: 3.5±1N m
b. Remove the left trim panel ① of the rear full-width lamp.

SETUP

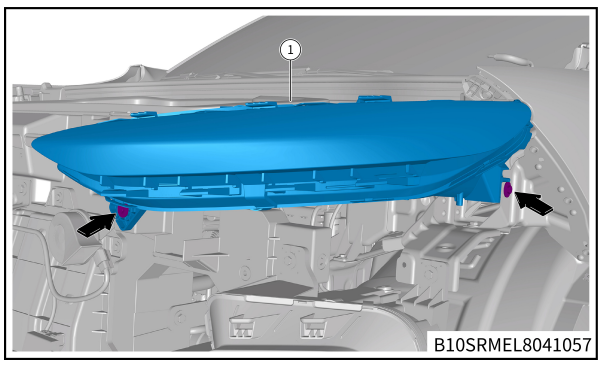
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



FRONT LEFT TURN SIGNAL AND DAYTIME RUNNING LIGHT ASSEMBLY

NOTE



This section describes the removal and installation of the front left position turn signal and daytime running lamp assembly. For the removal and installation of the front right position turn signal and daytime running lamp assembly, refer to the left side.

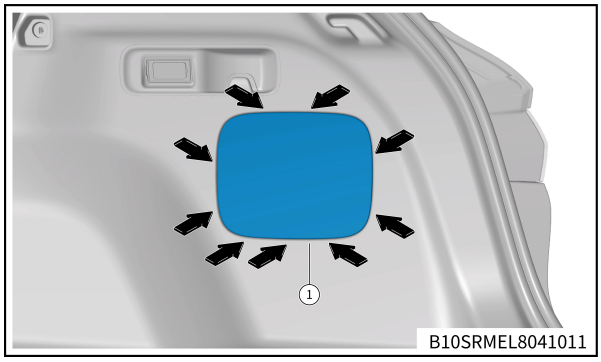
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front bumper left mounting bracket assembly 1.
   See:Front bumper left mounting bracket assembly 1 (page 5244)
5. Remove the left front steering daytime running lamp assembly.

a. Disconnect the 1 connector -Arrow A- of the front left turn signal and daytime running lamp assembly, and unscrew the 2 mounting bolts -Arrow B- of the front left turn signal and daytime running lamp assembly.
Recommended tool: 10mm socket
Torque: 3.5±1N m

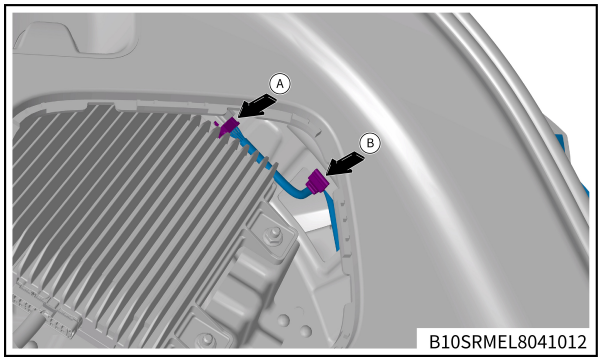
b. Unscrew the 2 mounting bolts of the front left turn signal and daytime running lamp assembly -arrow-, and remove the front left turn signal and daytime running lamp assembly ①.
Recommended tool: 10mm socket
Torque: 3.5±1N m

SETUP



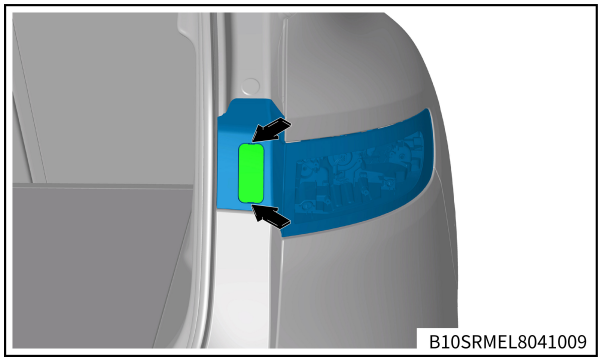
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the left front position turn signal and daytime running light assembly is working properly.

© 2026, All rights reserved

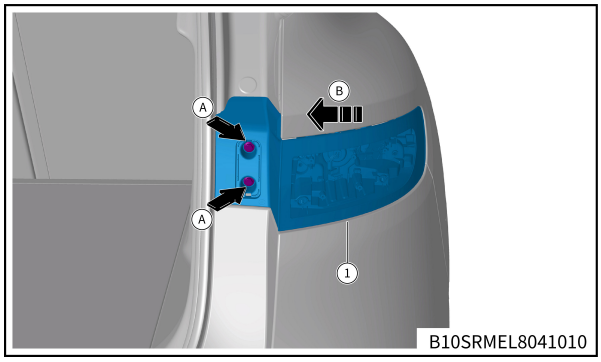


REAR RIGHT COMBINATION LAMP GARNISH

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right rear combination lamp trim.



a. Disengage the 9 retaining clips -arrow- of the right side panel maintenance cover, and remove the right side panel maintenance cover ①.
Recommended tool: Interior trim removal tool

b. Disconnect 1 connector between the right rear combination lamp trim cover and the floor wiring harness - Arrow A -, and release 1 retaining clip of the right rear combination lamp wiring harness - Arrow B -.

c. Release the 2 retaining clips -arrow- of the right rear combination lamp strip trim cover, and remove the trim cover.

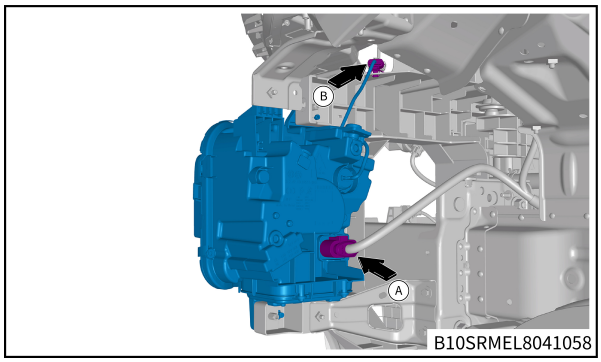
d. Unscrew the 2 fixing bolts for the right rear combination lamp strip trim -Arrow A-, and remove the right rear combination lamp strip trim ① in the direction of -Arrow B-.
Recommended tool: 8mm socket
Torque: 3.5±1N m

© 2026, All rights reserved

SETUP

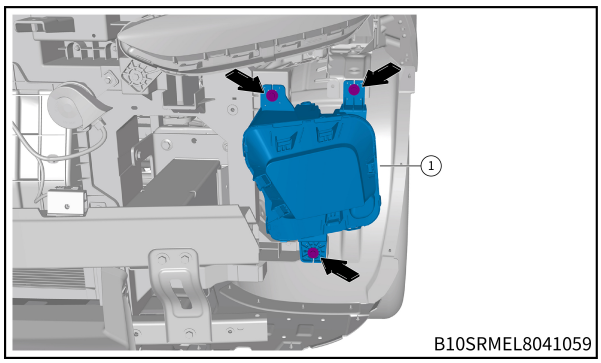
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the right rear combination lamp works properly.

© 2026, All rights reserved



LEFT FRONT COMBINATION LAMP

NOTE



This section describes the removal and installation of the left front combination lamp, and for the right front combination lamp, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front left combination lamp.

a. Disconnect 1 connector between the engine compartment wiring harness and the left front combination lamp -Arrow A-, and disconnect 1 connector between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly -Arrow B-.

b. Unscrew the 3 mounting bolts -arrow- of the left front combination lamp, and remove the left front combination lamp ①.
Recommended tool: 10mm socket
Torque: 3.5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the left/right front combination lamp with a new one requires a matching operation:

ATTENTION

After installing the controller, first read its software version. If the new version is higher than or equal to the old version, it can be used normally. If the new version is lower than the old version, the controller software must first be updated to the original vehicle version or the corresponding OTA version.

- Write VIN: Select the corresponding vehicle model - System Diagnosis - AHLL - Data Write - Write VIN.

© 2026, All rights reserved

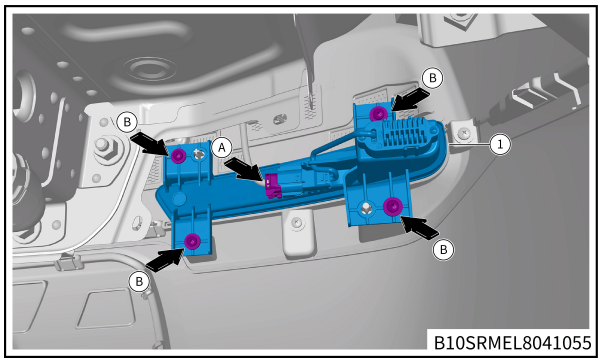
- Write End-of-Line Configuration: Select the corresponding vehicle model - System Diagnosis - AHLL - Data Writing - Write End-of-Line Configuration.

  ATTENTION

  After software flashing is completed, the vehicle must be locked and enter sleep mode for more than 1 min.

- After installation, verify that the front combination lamps are functioning properly.

© 2026, All rights reserved



REAR LEFT FOG LAMP REFLECTOR ASSEMBLY

NOTE

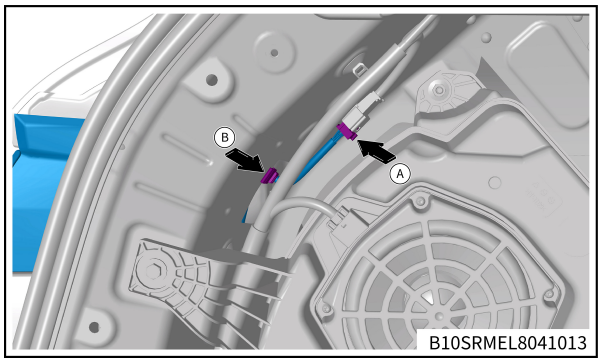
This section describes the removal and installation of the left rear fog lamp reflector assembly. For the removal and installation of the right rear fog lamp reflector assembly, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the left rear fog lamp reflector assembly.

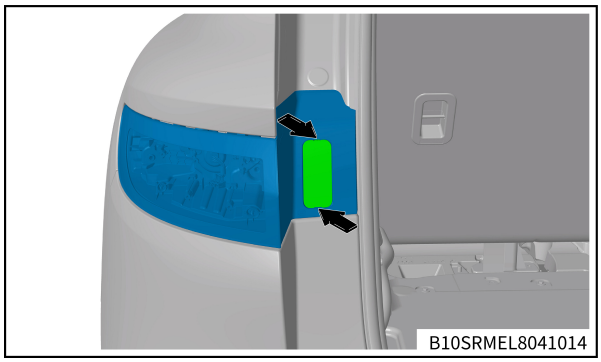
a. Disconnect the 1 connector -Arrow A- between the rear bumper wiring harness and the left rear fog reflector assembly, and unscrew the 4 fixing screws -Arrow B- of the left rear fog reflector assembly.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m
b. Remove the left rear fog lamp reflector assembly ①.

SETUP



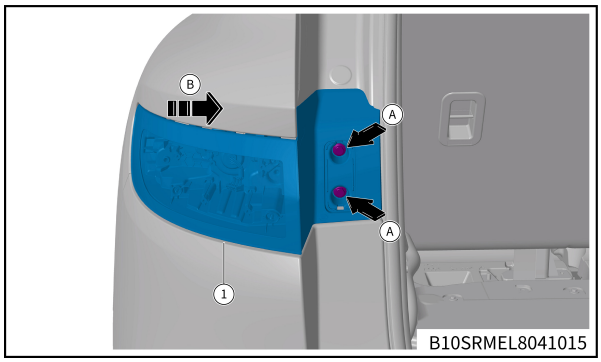
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the left rear fog lamp reflector assembly works properly.

© 2026, All rights reserved



REAR LEFT COMBINATION LAMP COVER

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the left rear combination lamp strip trim.

a. Disconnect the 1 connector between the left rear combination lamp trim and the floor wiring harness - arrow A -, and release the 1 retaining clip of the left rear combination lamp wiring harness - arrow B -.

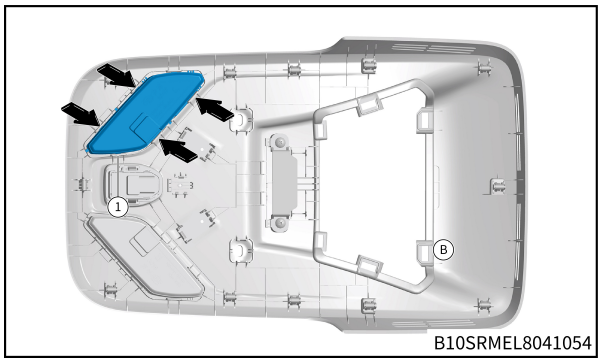
b. Release the 2 retaining clips - arrow - of the left rear combination lamp strip trim cover, and remove the trim cover.

c. Unscrew the 2 fixing bolts of the left rear combination lamp strip trim -Arrow A-, and remove the left rear combination lamp strip trim ① in the direction of -Arrow B-.
Recommended tool: 8mm socket
Torque: 3.5±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the left rear combination lamp works properly.

© 2026, All rights reserved



FRONT LEFT ROOF LAMP

NOTE

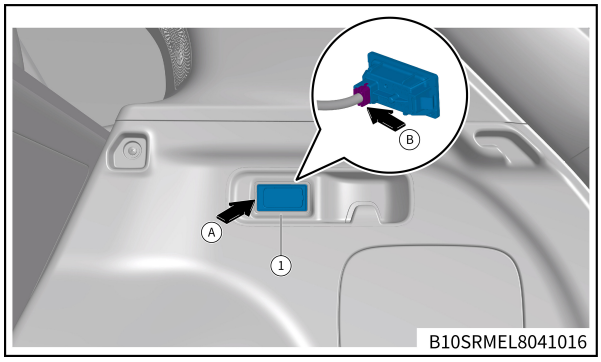
This section describes the removal and installation of the front left overhead lamp. For the removal and installation of the front right overhead lamp, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
4. Remove the front left dome light.

a. Release the 4 retaining clips -arrow- of the front left reading lamp, and remove the front left reading lamp ①.
Recommended tool: Flathead screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the front left overhead lamp works properly.

© 2026, All rights reserved

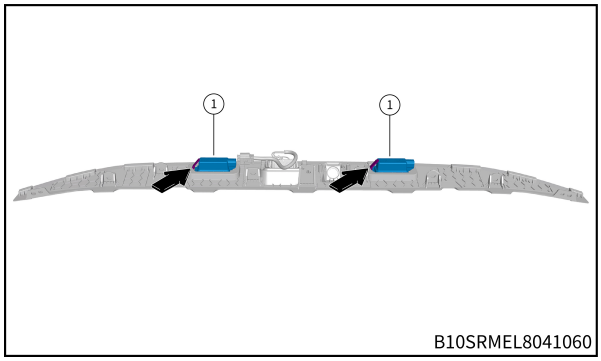
TRUNK LIGHT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the trunk lamp.

a. Release the 1 retaining clip -arrow A- for the luggage compartment lamp, and disconnect the 1 connector -arrow B- for the luggage compartment lamp.
   Recommended tool: Flathead screwdriver
b. Remove the luggage compartment light ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the luggage compartment light operates normally.

© 2026, All rights reserved

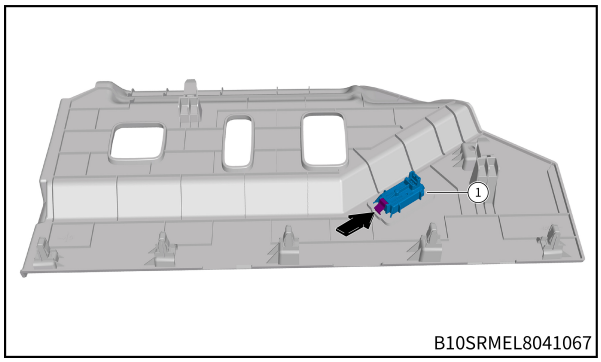
LICENSE PLATE LIGHT

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the full-width rear combination lamp.
   See:Full-Width Rear Combination Lamp (page 9457)
4. Remove the lower trim panel of the rear full-width lamp.
   See:Rear full-width lamp lower trim panel (page 5314)
5. Remove the license plate lamp.

a. Release the 2 retaining clips -arrows- of the license plate lamp, and remove the license plate lamp ①.
Recommended tool: Flathead screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the license plate lamp is working properly.

© 2026, All rights reserved

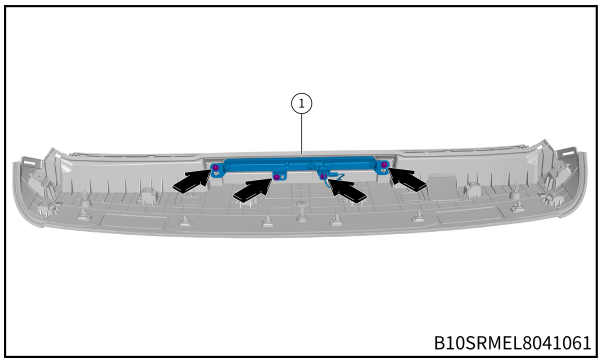
TRUNK LIGHT (GLOVE BOX)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
4. Remove the trunk lamp.

a. Disengage the 1 retaining clip -arrow- of the luggage compartment lamp, and remove the luggage compartment lamp ①.
Recommended tool: Flathead screwdriver

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the luggage compartment light operates normally.

© 2026, All rights reserved

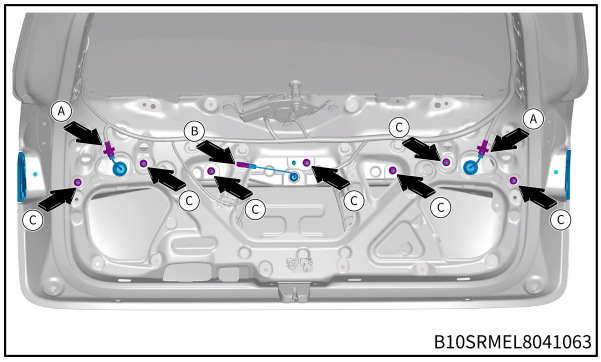
HIGH-MOUNTED BRAKE LAMP

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the spoiler assembly.
   See:Spoiler assembly (page 5312)
4. Remove the high-mounted stop lamp.

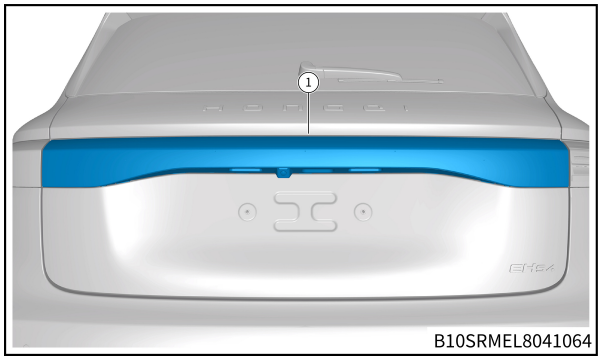
a. Unscrew the 4 fixing screws -arrow- of the high-mounted brake lamp, and remove the high-mounted brake lamp ①.
   Recommended tool: Phillips screwdriver
   Torque: 1.5±0.4N m

SETUP



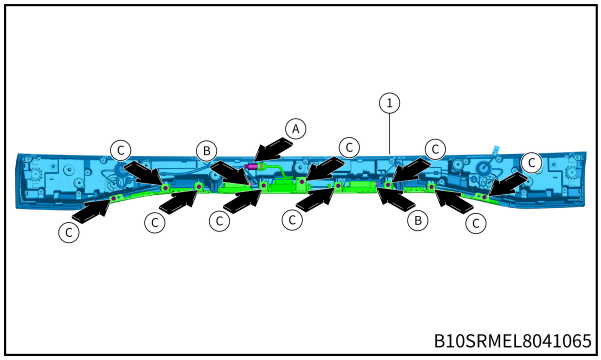
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the high-mounted brake lamp is working properly.

© 2026, All rights reserved



FULL-WIDTH REAR COMBINATION LAMP

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
4. Remove the left/right trim panel of the rear through-type lamp.
   See:Rear full-width light left trim panel (page 9444)
5. Remove the full-width rear combination lamp.

a. Disconnect the 2 connectors - Arrow A - between the liftgate wiring harness and the full-width rear combination lamp, and disconnect the 1 connector - Arrow B - between the liftgate wiring harness and the rear surround view camera.
b. Unscrew the 7 fixing nuts of the full-width rear combination lamp -Arrow C-.
   Recommended tool: 10mm socket
   Torque: 3.5±1N m

c. Remove the full-width rear combination lamp ①.

d. Disconnect 1 connector between the full-width rear combination lamp and the liftgate micro switch -arrow A-, and disconnect 2 connectors between the full-width rear combination lamp and the license plate lamp -arrow B-.
e. Unscrew the 9 mounting screws - Arrow C - securing the lower trim panel of the rear full-width lamp and the rear full-width combination lamp, and then remove the lower trim panel.
   Recommended tool: T20 Torx wrench
   Torque: 1±0.2N m
f. Remove the full-width rear combination lamp ①.

© 2026, All rights reserved

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the full-width rear combination lamp is working properly.

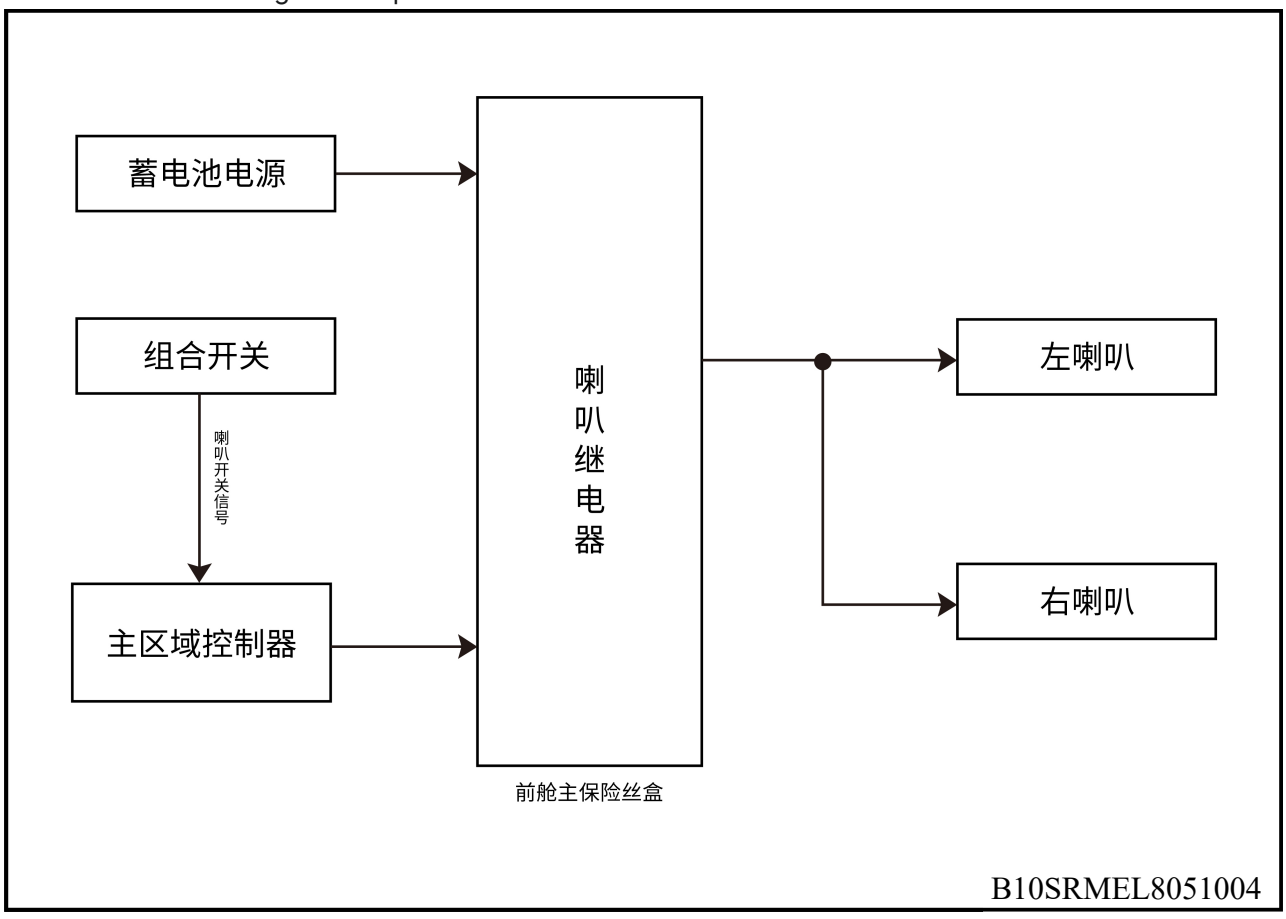
9.7 HORN SYSTEM

9.7.1 OPERATION AND DESCRIPTION

PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Warning regarding disconnecting the battery:

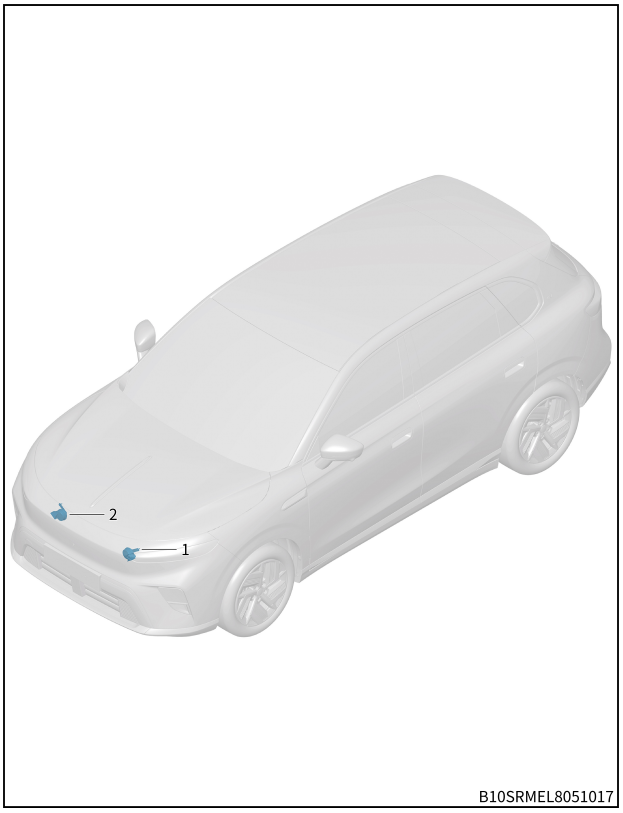


> **ATTENTION**
>
> Before servicing any electrical components, the central control panel must be powered off for maintenance, and all electrical loads must be turned off, unless otherwise specified in the operating procedures. If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

© 2026, All rights reserved

9.7.2 STRUCTURE AND PRINCIPLE INTRODUCTION

INTRODUCTION TO THE STRUCTURE AND WORKING PRINCIPLE OF THE HORN SYSTEM



1. Horn System
   a. The horn is a signaling device of the vehicle. During driving, the driver sounds the horn as needed and in accordance with regulations to issue necessary acoustic signals, warning pedestrians and alerting other vehicles to ensure traffic safety. It is also used to urge others to proceed and to transmit signals.
   b. The horn mainly consists of components such as the horn relay, high and low tone horns, horn switch, and main zone controller.
   c. When the horn switch is closed, the Main Zone Controller receives the hardwired signal from the horn switch and directly activates the horn. When the horn switch is opened, the Main Zone Controller stops activating the horn. Meanwhile, upon receiving the activation request for the horn from other related systems via CAN communication, the Main Zone Controller drives and controls the horn according to the relevant control strategies to implement the related functions.

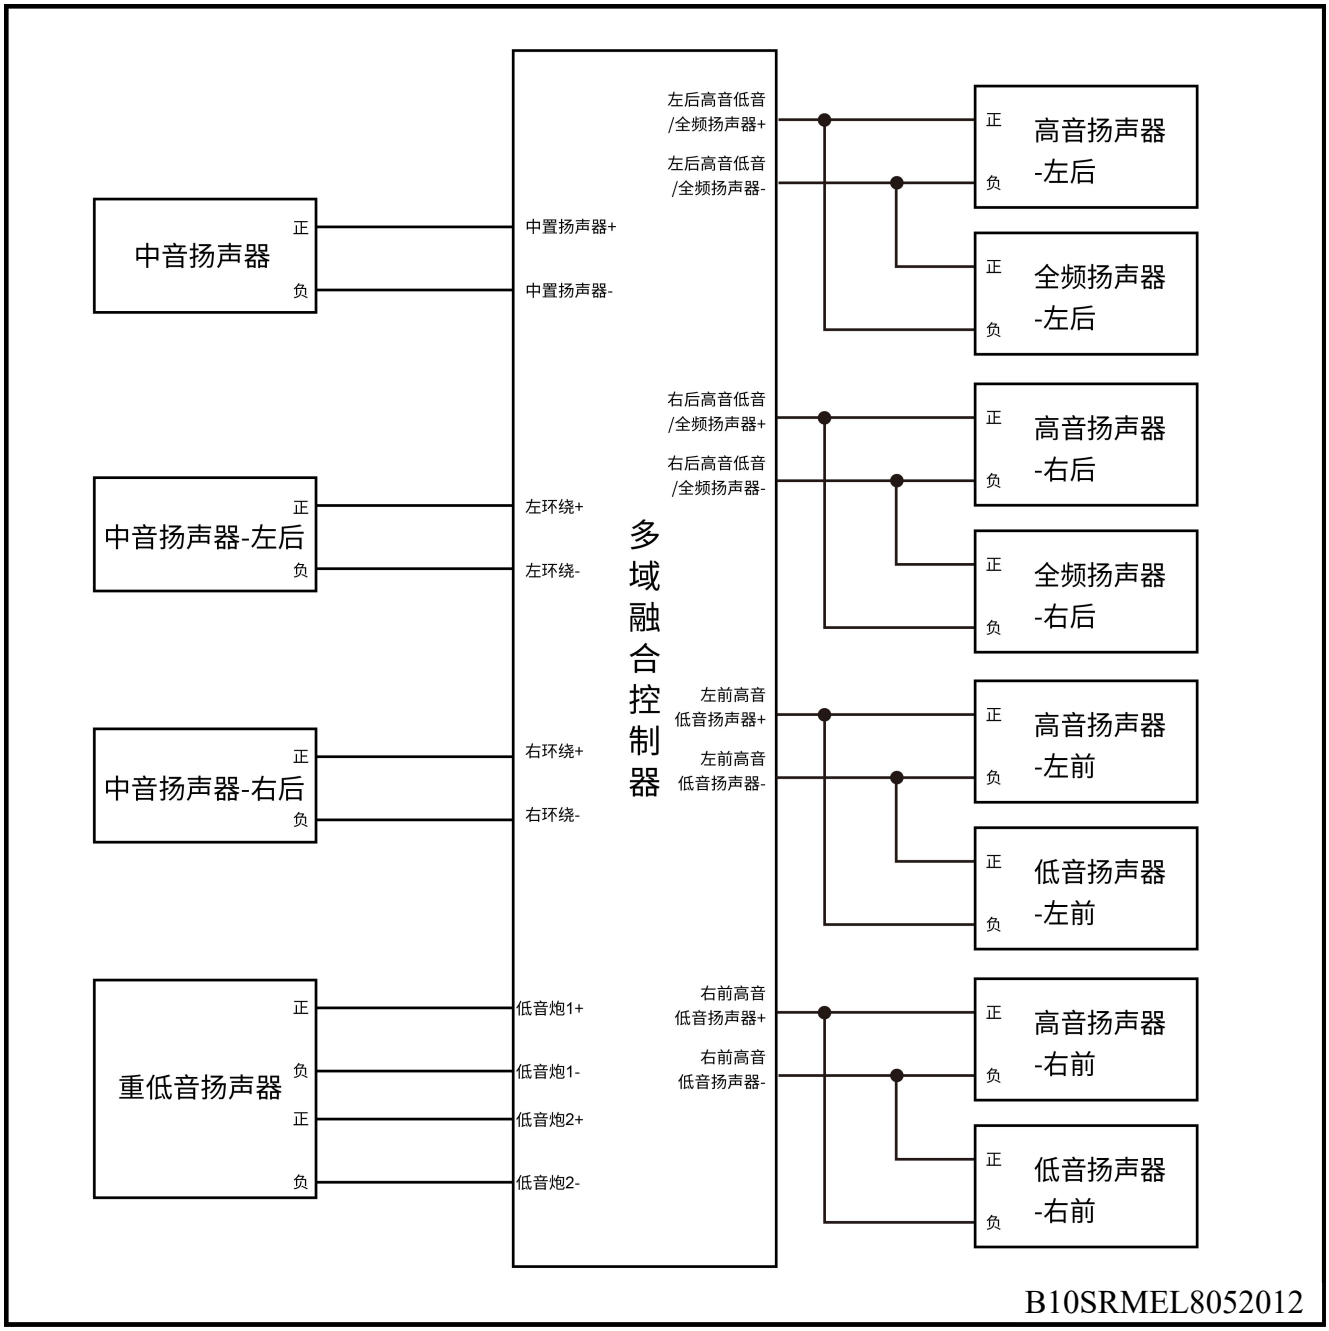
If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

© 2026, All rights reserved



9.8.2 STRUCTURE AND PRINCIPLE INTRODUCTION

INTRODUCTION TO AUDIO SYSTEM STRUCTURE AND PRINCIPLES

Audio system:

1. System Overview:
   - The intelligent cockpit system includes an 8.8-inch instrument display, a 14.6-inch central control display, and an Internet of Vehicles host. The multi-domain fusion controller integrates functions such as vehicle control, multimedia entertainment, 360-degree surround view, and digital instrument cluster, and provides driver assistance functions.
2. System Composition:
   - This system consists of a multi-domain fusion controller system, a central control display screen, an instrument display screen, a microphone, two front door woofers, two rear door woofers, two rear door tweeters, two D-pillar mid-range speakers, two instrument tweeters, one instrument mid-range speaker, and a subwoofer.
3. Component Functions:
   - Bluetooth music and Bluetooth phone calls are transmitted via wireless Bluetooth signals. For the first use, the handheld terminal (e.g., mobile phone) must be manually connected to the vehicle's infotainment system and instrument cluster. For subsequent use, it will automatically connect once the handheld terminal is powered on.
   - The microphone captures the voice of in-vehicle passengers and converts it into electrical signals, which are then converted into corresponding characters based on different voltage values; vehicles equipped with microphones support voice wake-up of the vehicle host by in-vehicle passengers for accessing vehicle information or performing partial controls, such as turning on navigation, playing music, and making phone calls.
   - The Bluetooth headset transmits signals wirelessly via Bluetooth; it requires pairing and connection upon first use, and will connect automatically thereafter.
4. Audio system electrical schematic:

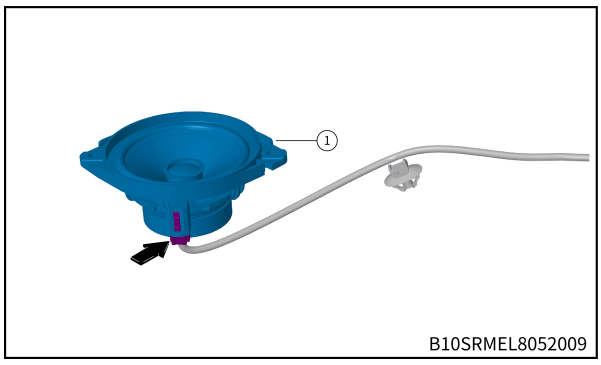
9.8.6 SERVICE AND REPAIR GUIDANCE



MIDRANGE SPEAKER ASSEMBLY (INSTRUMENT PANEL)

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the speaker cover assembly.
   See:Speaker cover assembly (page 5415)
4. Remove the midrange speaker assembly.

a. Unscrew the 2 fixing screws of the midrange speaker assembly -arrow-.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

b. Disconnect the 1 connector -arrow- between the instrument panel wiring harness and the midrange speaker assembly, and remove the midrange speaker assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the midrange speaker assembly operates normally.

MIDRANGE SPEAKER ASSEMBLY (D-PILLAR)

NOTE

This section describes the removal and installation of the left midrange speaker assembly, and the removal and installation of the right midrange speaker assembly can refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar upper interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
4. Remove the midrange speaker assembly.

a. Disconnect the 1 connector of the midrange speaker assembly - arrow A -, and unscrew the 2 mounting screws of the midrange speaker assembly - arrow B -.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
b. Remove the midrange speaker assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the midrange speaker assembly operates normally.

WOOFER ASSEMBLY (FRONT DOOR)

NOTE

This section describes the removal and installation of the left woofer assembly, and for the removal and installation of the right woofer assembly, refer to the left side.

REMOVAL PROCEDURE

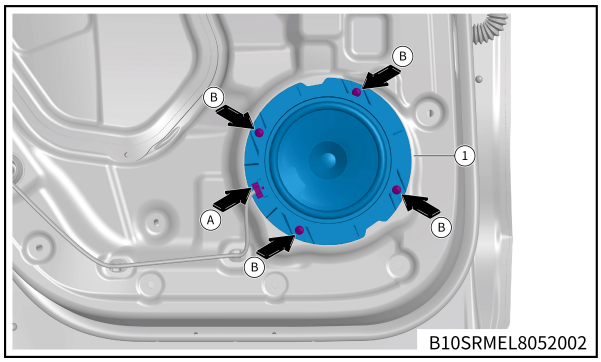
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the woofer assembly.

a. Disconnect the 1 connector of the woofer assembly -Arrow A-, and unscrew the 4 mounting screws of the woofer assembly -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 2.5±0.5N m
b. Remove the woofer assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the woofer assembly operates normally.

© 2026, All rights reserved



FULL-RANGE SPEAKER ASSEMBLY (REAR DOOR)

NOTE

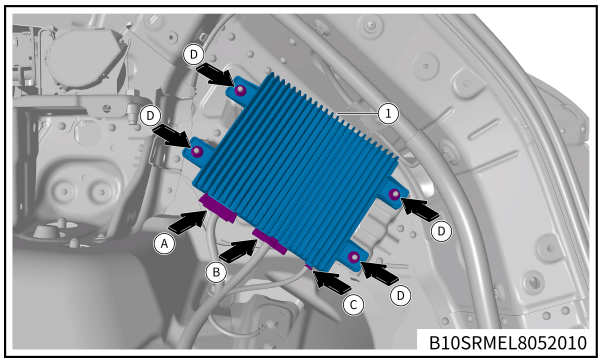
This section describes the removal and installation of the left full-range speaker assembly, and the removal and installation of the right full-range speaker assembly can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the full-range speaker assembly.

a. Disconnect the 1 connector of the full-range speaker assembly -Arrow A-, and unscrew the 4 fixing screws of the full-range speaker assembly -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 2.5±0.5N m
b. Remove the full-range speaker assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the full-range speaker assembly is working properly.

POWER AMPLIFIER

REMOVAL PROCEDURE

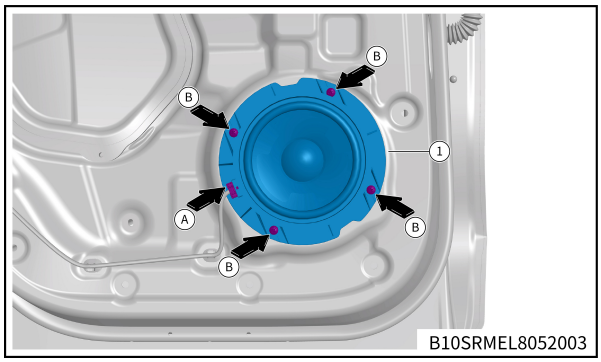
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the power amplifier.

a. Disconnect the 3 connection plugs of the power amplifier -Arrow A-, -Arrow B-, -Arrow C-, and unscrew the 4 fixing nuts of the power amplifier -Arrow D-.
   Recommended tool: 10mm socket
   Torque: 7±1N m
b. Remove the power amplifier ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the power amplifier is functioning properly.

© 2026, All rights reserved



WOOFER ASSEMBLY (REAR DOOR)

NOTE

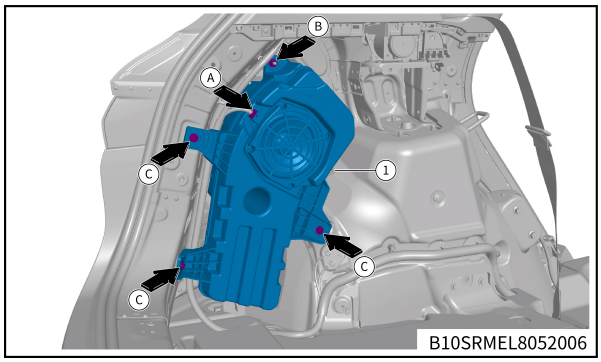
This section describes the removal and installation of the left woofer assembly, and for the removal and installation of the right woofer assembly, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the woofer assembly.

a. Disconnect the 1 connector of the woofer assembly -Arrow A-, and unscrew the 4 mounting screws of the woofer assembly -Arrow B-.
   Recommended tool: Phillips screwdriver
   Torque: 2.5±0.5N m
b. Remove the woofer assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the woofer assembly operates normally.

SUBWOOFER ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left C-pillar lower interior trim panel assembly.
   See:Left lower C-pillar interior trim panel assembly (page 5392)
4. Remove the subwoofer assembly.

a. Disconnect 1 connector of the subwoofer assembly -Arrow A-, and unscrew 1 fixing nut of the subwoofer assembly -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 7±1N m
b. Unscrew the 3 mounting bolts of the subwoofer assembly -Arrow C-, and remove the subwoofer assembly ①.
   Recommended tool: 10mm socket
   Torque: 7±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the subwoofer assembly is functioning properly.

TWEETER ASSEMBLY (INSTRUMENT PANEL)

NOTE

This section describes the removal and installation of the right tweeter assembly, and the removal and installation of the left tweeter assembly can refer to the right side.

REMOVAL PROCEDURE

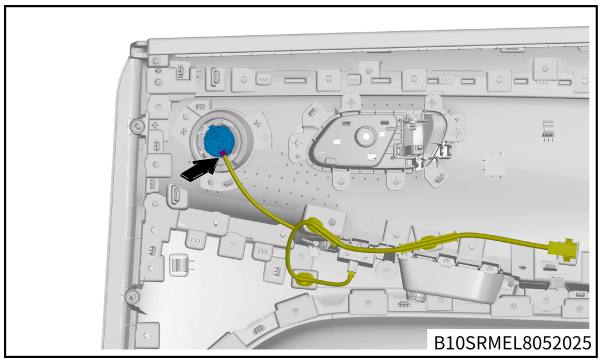
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the speaker cover assembly.
   See:Speaker cover assembly (page 5415)
4. Remove the tweeter assembly.

a. Disengage the 3 retaining clips of the tweeter assembly -arrow-, and remove the tweeter assembly ①.

SETUP

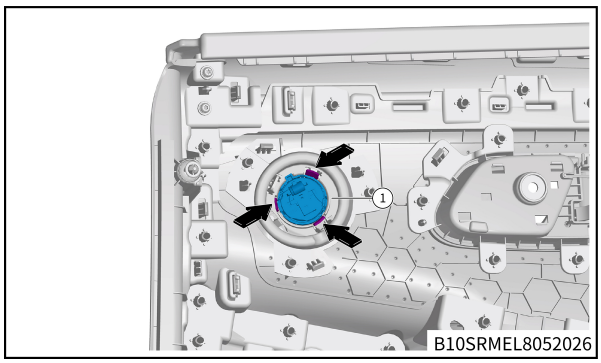
1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the tweeter assembly is working properly.

© 2026, All rights reserved



TWEETER ASSEMBLY (REAR DOOR)

NOTE



This section describes the removal and installation of the left tweeter assembly, and the removal and installation of the right tweeter assembly can refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the tweeter assembly.

a. Disconnect the 1 connector of the tweeter assembly -arrow-.

b. Disengage the 3 retaining clips of the tweeter assembly -arrow-, and remove the tweeter assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check that the tweeter assembly is working properly.

9.9 FRONT WIPER SYSTEM

9.9.1 OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION

1. Front Wiper System
   a. Front wiper manual control
      Move the wiper switch on the wiper control lever up or down to select the wiper wiping gear.
      a. Reset gear: The wiper remains in the initial position and does not move.
      b. AUTO gear: The wiper can automatically select the wiping frequency or turn it off according to the surrounding rainfall environment.
      c. Manual low-speed gear: The wiper continues to work at a certain frequency and low speed.
      d. Intermittent gear: The wiper wipes at a certain time interval.
      e. Manual high-speed gear: The wiper continues to work at a certain frequency and high speed.
   b. Automatic Front Wiper Control
      a. Move the wiper switch on the front wiper stalk to the AUTO position. Once activated, the front wipers can automatically select the wiping frequency or turn off according to the surrounding rainfall environment.
      b. On the "Frequently Used" interface of the central control screen, touch the sensitivity button for the automatic wiper mode. Depending on the selected sensitivity level, the front wipers will automatically turn on and off when rain is detected.

> **ATTENTION**
>
> - When washing the vehicle, please turn off the automatic wiper function to avoid damage to the wipers or personal injury.
> - Automatic wipers are an assist function, and the driver must still manually adjust the wipers according to external conditions when necessary to ensure driving safety.

2. Front windscreen washer
   a. After the vehicle is powered on, press the washer switch button at the top of the front wiper stalk to activate the single wipe function, and the wiper will wipe once.
   b. Press and hold the washer switch button, the front washer sprays washer fluid, the wipers wipe at low speed three times, then wipe once more after 5 seconds and stop.
   c. The windscreen washing function should not be used for too long each time, otherwise it may damage the windscreen washing system motor.

> **ATTENTION**
>
> Please use different types of windshield washer fluid according to the driving environment. It is strictly prohibited to add water, otherwise the windshield washer system may freeze, causing vehicle damage.

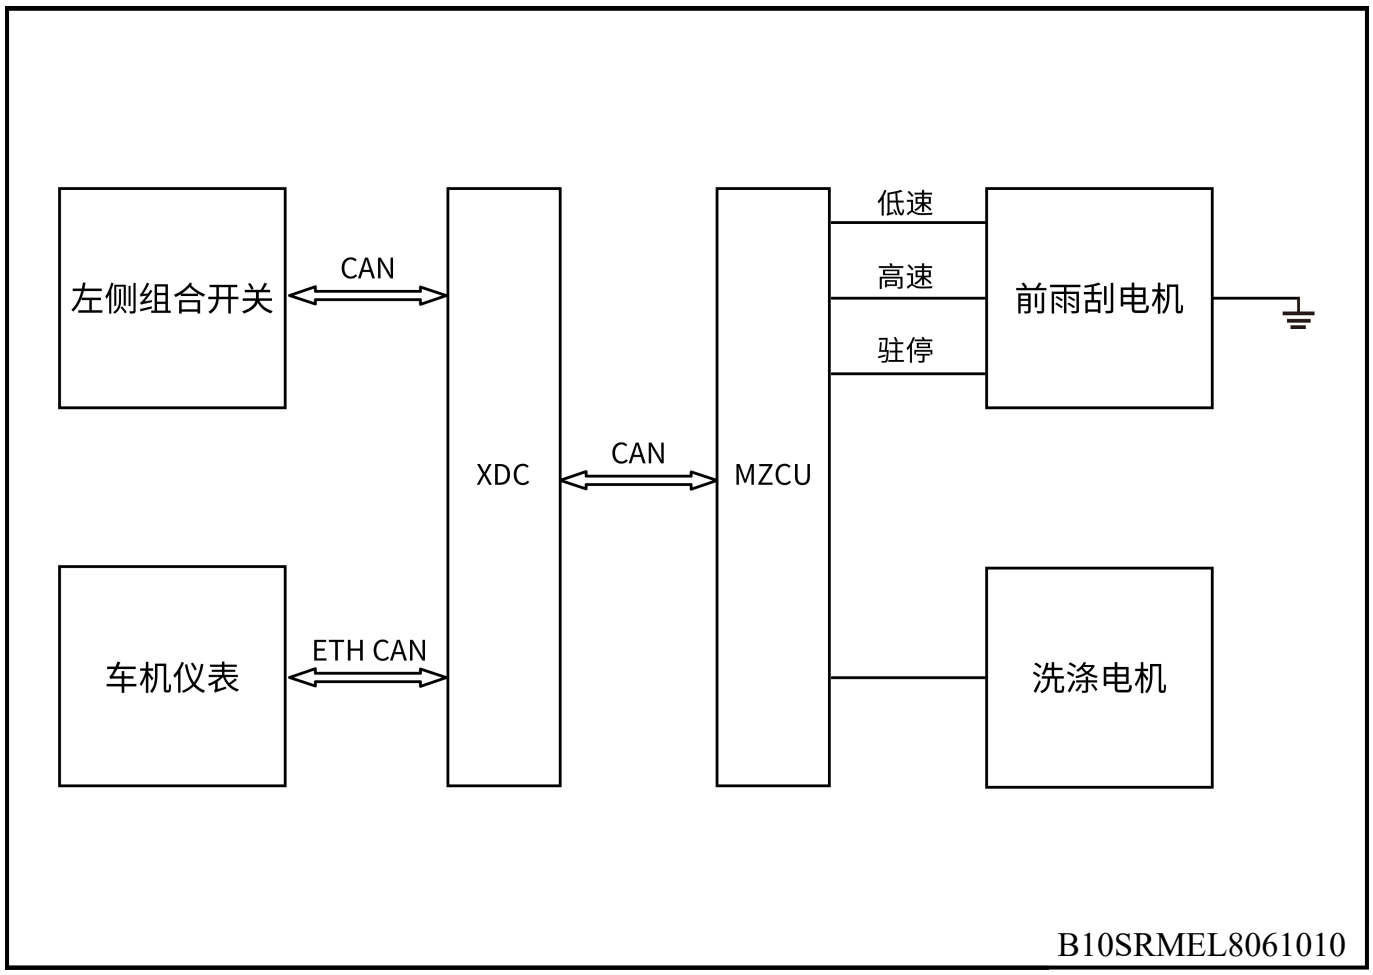
© 2026, All rights reserved

9.9.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

System Overview

1. The wipers support high-speed, low-speed, intermittent, and other control modes;
2. The wiper and washer system mainly consists of the following components:
   - Main zone controller;
   - Wiper and washer combination switch;
   - Washer reservoir;
   - Wiper motor and linkage assembly;
   - Washer motor assembly;
   - Nozzle assembly and piping.



Operating Principle

1. The wiper motor features an auto-stop mechanism consisting of a worm gear and a cam plate, designed to briefly maintain circuit continuity after the wiper/washer combination switch is turned off, keeping the circuit intact until the wiper arm fully returns to its initial position. The wiper system is driven by a DC motor. The wiper motor is mounted on the dash panel and directly connected to the wiper linkage. The wiper/washer combination switch serves as the input control component for the wiper and washer systems.
2. The main zone controller receives signals from the wiper and washer combination switch and the rain and light sensor, and controls the front wiper motor for high-speed, low-speed, intermittent, and automatic operation according to its internal logic. The stop and reset of the front wiper is achieved when the main zone controller stops driving the motor after receiving the reset signal from the wiper motor.
3. The washer motor is mounted on the washer fluid reservoir, and it pumps the washer fluid through hoses to the two nozzles. The wiper/washer combination switch controls the operation and stopping of the washer motor.
4. The main zone controller receives the CAN signal from the wiper and washer combination switch and directly drives the washer motor to operate based on the relevant signals.
5. After the vehicle is powered on, press the washer switch button at the top of the wiper/washer combination switch to activate the single-wipe function, and the wiper will wipe once.
6. Press and hold the washer switch button, the front washer sprays washer fluid, the wipers wipe at low speed three times, then wipe once more after 5 seconds and stop.

> **NOTE**
>
> The windscreen washing function should not be used for too long each time, otherwise it may damage the windscreen washing system motor.

> **ATTENTION**
>
> Please use different types of windshield washer fluid according to the driving environment. It is strictly prohibited to add water, otherwise the windshield washer system will freeze in winter, causing damage to the vehicle.

9.9.7 SERVICE AND REPAIR GUIDANCE

WIPER DECORATIVE CAP

REMOVAL PROCEDURE

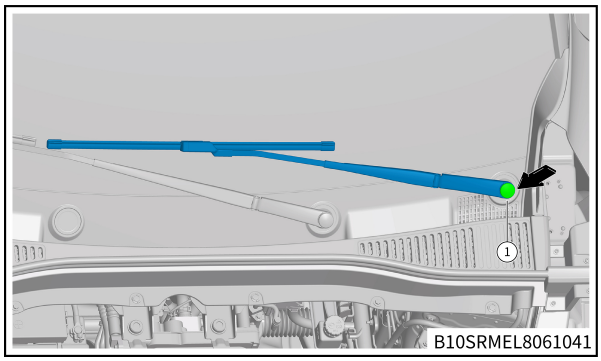
1. Open the hood assembly.
2. Remove the wiper decorative cap.

a. Detach the wiper trim cap at the -arrow- position, and remove the wiper trim cap ①.
Recommended tool: Flathead screwdriver

SETUP

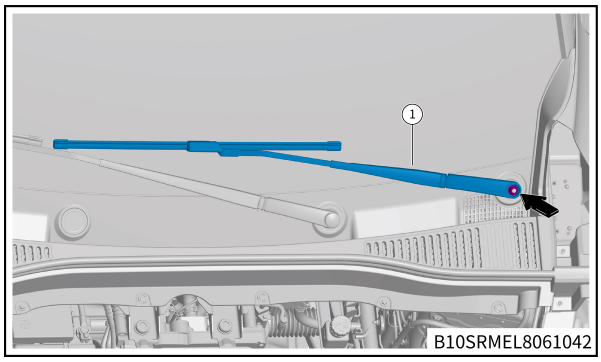
1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



MAIN WIPER ARM BLADE ASSEMBLY

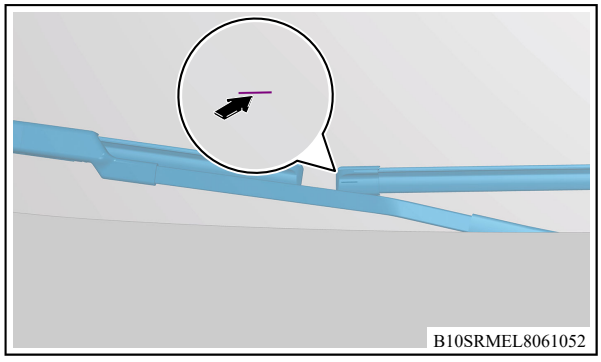
NOTE



This section describes the removal and installation of the main wiper blade assembly. For the removal and installation of the passenger wiper blade assembly, refer to the main wiper blade assembly.

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the main wiper arm wiper blade assembly.



a. Detach the wiper trim cap at the -arrow- position, and remove the wiper trim cap ①.
Recommended tool: Flathead screwdriver

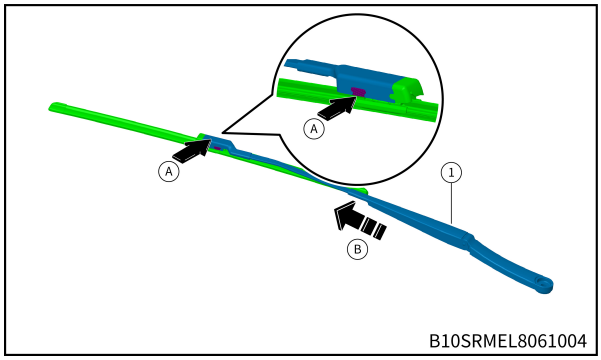
b. Unscrew the 1 fixing nut connecting the main wiper arm blade assembly to the front wiper motor and linkage assembly -arrow-.
Recommended tool: 15mm socket
Torque: 23±2N m
c. Remove the main wiper arm blade assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

a. When installing the wiper arm assembly, ensure that the left and right arms are installed on their respective sides.
b. The wiper blade shall be aligned with the wiper blade installation mark position-arrow- on the glass, and the wiper blade installation tolerance is ±10mm.
c. After installation, test the front wiper assembly to ensure it operates normally.

© 2026, All rights reserved



MAIN WIPER ARM

NOTE

This section describes the removal and installation of the main wiper arm, and for the removal and installation of the secondary wiper arm, please refer to the main wiper arm.

REMOVAL PROCEDURE

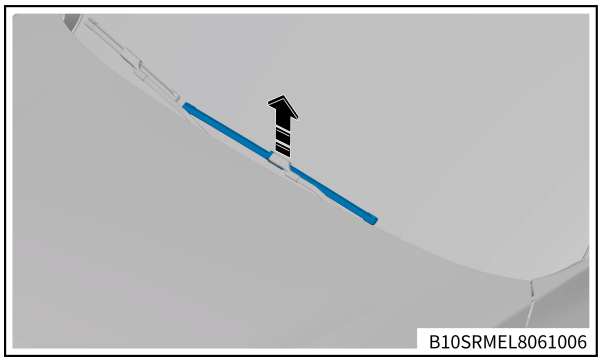
1. Remove the main wiper arm wiper blade assembly.
   See:Main wiper arm blade assembly (page 9489)
2. Remove the main wiper arm.

a. Press the release buttons on both sides of the main wiper arm -Arrow A-, and remove the main wiper blade in the direction of -Arrow B-.
b. Remove the main wiper arm ①.

SETUP

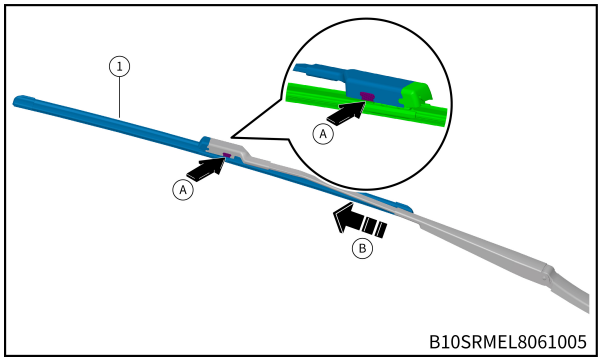
1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the wiper assembly, ensure correct left and right installation. Check and adjust the mounting position of the wiper arm.
   b. After installing the main wiper arm, do not let it drop on its own to avoid damaging the front windshield.
   c. After installation, turn off the front wiper maintenance mode and test the front wiper assembly to ensure it operates normally.

© 2026, All rights reserved



MAIN WIPER BLADE

NOTE



This section describes the removal and installation of the main wiper blade. For the removal and installation of the secondary wiper blade, refer to the main wiper blade.

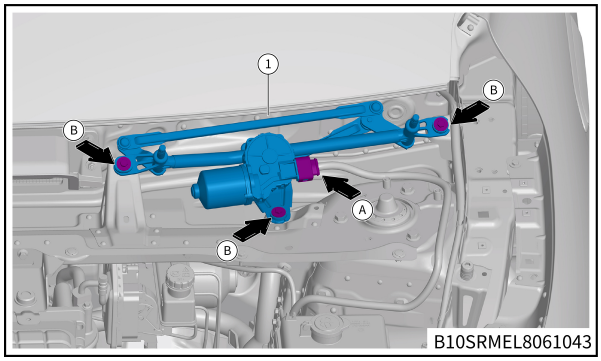
REMOVAL PROCEDURE

1. Turn on the front wiper maintenance mode on the central control screen.
2. Remove the main wiper blade.

a. Lift the main wiper arm in the direction of the arrow.

b. Press the release buttons on both sides of the main wiper blade - Arrow A -, and remove the main wiper blade ① in the direction of - Arrow B -.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. When installing the wiper assembly, ensure that the left and right sides are installed correctly. Check and adjust the installation position of the wiper blade.
   b. After installing the main wiper blade, do not let the wiper arm fall on its own to avoid damaging the windshield.
   c. After installation, turn off the front wiper maintenance mode and test the front wiper assembly to ensure it operates normally.

FRONT WIPER MOTOR AND LINKAGE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the main/secondary wiper arm blades.
   See:Main wiper arm blade assembly (page 9489)
4. Remove the cowl panel grille assembly.
   See:Cowl Grille Assembly (page 5311)
5. Remove the front wiper motor and linkage assembly.

a. Disconnect the 1 connector -Arrow A- of the front wiper motor and linkage assembly, and unscrew the 3 mounting bolts -Arrow B- of the front wiper motor and linkage assembly.
   Recommended tool: 10mm socket
   Torque: 9±1N m
b. Remove the front wiper motor and linkage assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Apply grease to the moving parts of the wiper linkage.
   b. After installation, test the front wiper system to ensure it operates normally.

RESERVOIR TANK WITH MOTOR ASSEMBLY

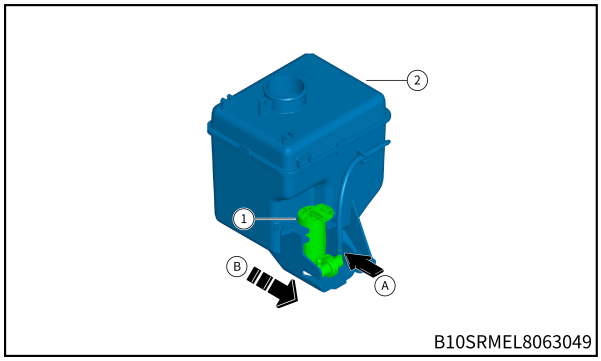
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the reservoir with motor assembly.

a. Disconnect 1 connector -Arrow A- between the engine compartment wiring harness and the washer motor, and detach 1 fixed joint -Arrow B- between the rear washer hose and the washer motor.
b. Release 1 retaining clip of the engine compartment wiring harness - Arrow C -, and disconnect the front washer hose from the integrated hose of the reservoir with motor assembly - Arrow D -.

c. Unscrew the 2 fixing bolts of the reservoir with motor assembly -Arrow A-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
d. Unscrew the 1 fixing nut of the reservoir with motor assembly - arrow B -, and remove the reservoir with motor assembly ①.
   Recommended tool: 10mm socket
   Torque: 5±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill with washer fluid.
   b. Check that the washer system operates normally and the reservoir with motor assembly has no fluid leakage.

© 2026, All rights reserved

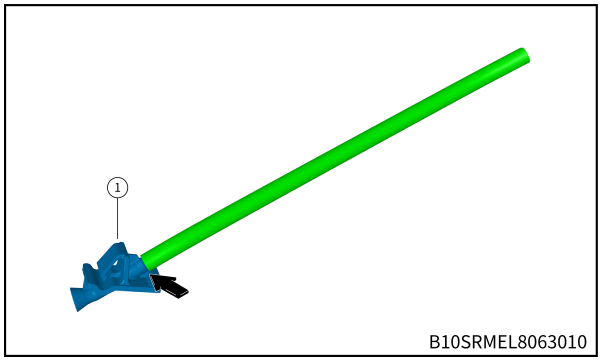
RESERVOIR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the reservoir with motor assembly.
   See:Reservoir Tank with Motor Assembly (page 9511)
4. Remove the washer filler cap.
   See:Washer filler cap (page 9517)
5. Remove the reservoir.

a. Disconnect the washer hose from the washer motor - arrow A -, remove the washer motor ① in the direction of - arrow B -, and take out the reservoir ②.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, fill with washer fluid.
   b. Check that the washer system operates normally and the reservoir with motor assembly has no fluid leakage.

© 2026, All rights reserved

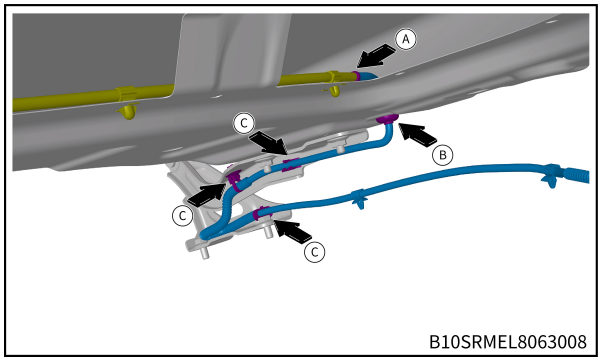
FRONT WASHER NOZZLE

REMOVAL PROCEDURE

1. Remove the front washer line with the nozzle.
   See:Front washer line with nozzle (page 9516)
2. Remove the front washer nozzle.

a. Disconnect the front washer pipe from the front washer nozzle -arrow-, and remove the front washer nozzle ①.

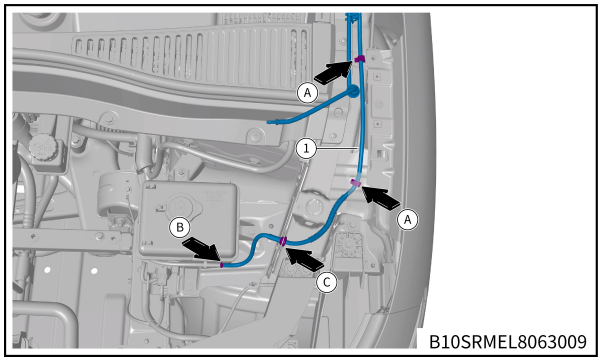
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check the washer hose for damage, and replace it if damaged.
   b. After installation, check the pipe connections for any leakage.

© 2026, All rights reserved

FRONT WASHER LINE



REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the front hood insulation pad.
   See:Front hood insulation pad (page 5569)
3. Remove the front washer line.

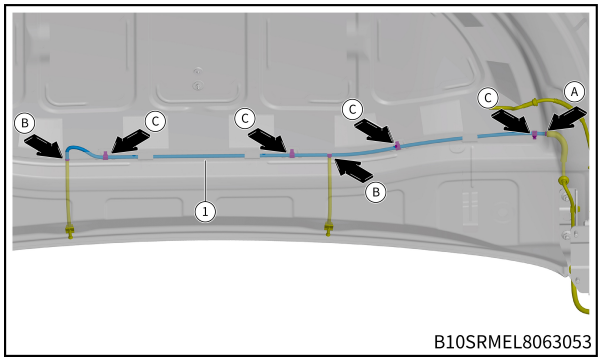
B10SRMEL8063008

a. Disconnect the connection between the front washer hose and front washer hose 1 -Arrow A-, and remove 1 grommet from the front washer hose -Arrow B-.
b. Disconnect the 3 retaining clips of the front washer hose and the hood left hinge assembly - arrow C -.
   Recommended tool: Clip remover

B10SRMEL8063009

c. Release the 2 retaining clips securing the front washer hose to the vehicle body -arrow A-, and disconnect the front washer hose from the reservoir's integrated hose -arrow B-.
   Recommended tool: Clip remover
d. Disconnect 1 grommet from the front washer pipe -Arrow C-, and remove the front washer pipe ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check the washer hose for damage, and replace it if damaged.
   b. After installation, check the pipe connections for any leakage.

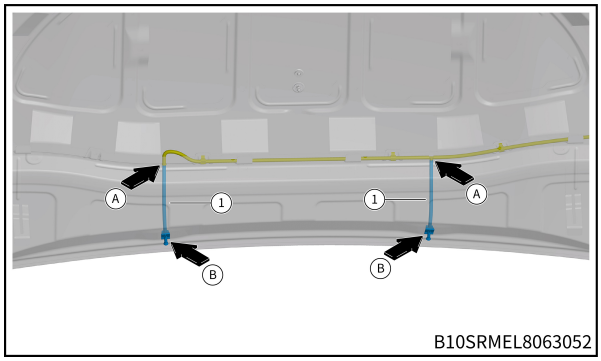
FRONT WASHER LINE 1

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the front hood insulation pad.
   See:Front hood insulation pad (page 5569)
3. Remove the front washer line 1.

a. Disconnect the connection between front washer hose 1 and the front washer hose -Arrow A-, and disconnect the connection between front washer hose 1 and the front washer hose with nozzle -Arrow B-.
b. Disconnect the front washer line 1 from the 4 retaining clips of the front hood assembly -Arrow C-, and remove the front washer line 1 ①.
   Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check the washer hose for damage, and replace it if damaged.
   b. After installation, check the pipe connections for any leakage.

© 2026, All rights reserved

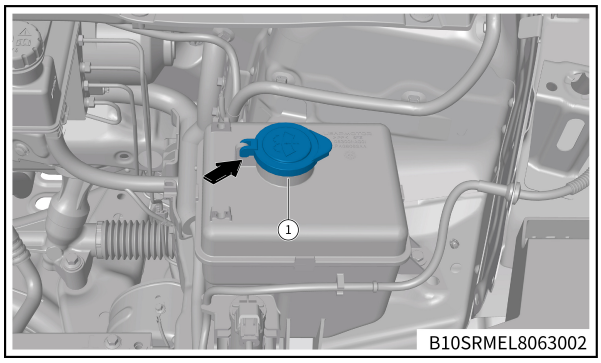
FRONT WASHER LINE WITH NOZZLE

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the front hood insulation pad.
   See:Front hood insulation pad (page 5569)
3. Remove the front washer line with the nozzle.

a. Disconnect the connection between the front washer hose with nozzle and the front washer hose 1 -Arrow A-, and detach the 2 retaining clips between the front washer nozzle and the front hood assembly -Arrow B-.
   Recommended tool: Flathead screwdriver
b. Remove the front washer hose with nozzle ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check the washer hose for damage, and replace it if damaged.
   b. After installation, check the pipe connections for any leakage.

© 2026, All rights reserved

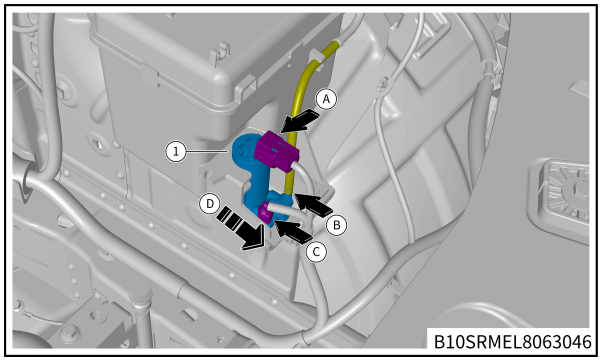
WASHER FILLER CAP

REMOVAL PROCEDURE

1. Open the hood assembly.
2. Remove the washer filler cap.

a. Release the 1 retaining clip -arrow- of the washer filler cap, and remove the washer filler cap ①.

SETUP

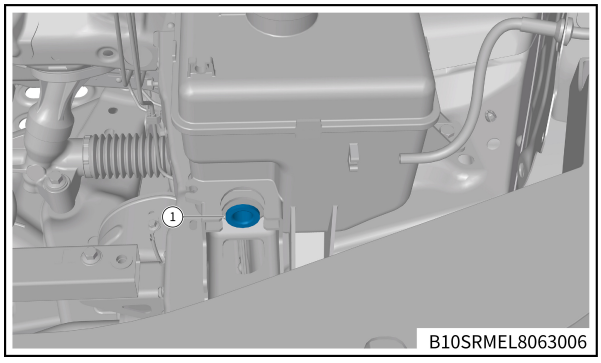


1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

WASHER MOTOR

REMOVAL PROCEDURE

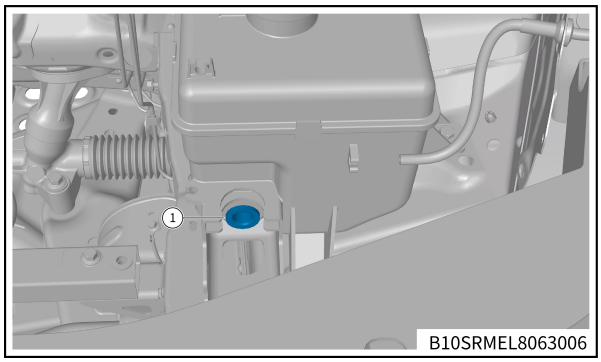


1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the washer motor.

a. Disconnect the 1 connector between the washer motor and the engine compartment wiring harness -Arrow A-, and disconnect the washer motor from the built-in washer hose of the reservoir -Arrow B-.
b. Disconnect the 1 fixing connector between the rear washer pipe and the washer motor -Arrow C-, and disconnect the washer motor from the reservoir body in the direction of -Arrow D-.
c. Remove the washer motor ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:



a. Check the washer motor seal ① for damage, and replace it if damaged.
b. After installation, fill with washer fluid and check that the washer motor operates normally.

© 2026, All rights reserved

WASHER MOTOR SEAL

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the washer motor.
   See:Washer motor (page 9518)
4. Remove the washer motor seal.

a. Remove the washer motor seal ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Check whether the washer motor seal is damaged, and replace it if so.
   b. After installation, fill with washer fluid and check that the washer motor operates normally.

9.12 LOW VOLTAGE WIRING HARNESS SYSTEM

9.12.1 PRECAUTIONS

PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Before starting work, turn off the vehicle power and disconnect the negative terminal of the battery.

   ATTENTION

   Before servicing any electrical components, the central control panel must be powered off for maintenance, and all electrical loads must be turned off, unless otherwise specified in the operating procedures. If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

2. Precautions for setting the central control panel to the maintenance power-off state when disconnecting the battery:

   ATTENTION

   Whenever connecting or disconnecting the battery cables, battery charger, or jumper cables, be sure to set the central control screen to the maintenance power-off state. Otherwise, it may cause damage to control modules or other electrical components.

3. When disconnecting and connecting connectors, do not pull on the wiring harness to avoid damaging it.
4. Replace all damaged wiring harness retaining clips.
5. The fixed clips are securely fastened, the wiring harness routing is clear, and there is no looping or coiling.
6. Connectors are securely mated, with no incomplete insertion or bent terminals, and the secondary locks are fully engaged.
7. The grommet fits snugly against the sheet metal, ensuring a good seal and preventing water leakage.
8. Ground wires must not cross.

9.12.3 TECHNICAL PARAMETERS

TIGHTENING TORQUE TABLE

Fastener name	Torque (N·m)
Fixing bolt/nut of the DCDC negative wire harness assembly	15±1.5
Mounting bolt for IPU ground cable assembly and rear subframe	23±2
Fixing bolt for IPU ground wire assembly and electric drive assembly	9±1
Fixing bolt for the ground wire of the floor wiring harness	9±1
Mounting bolt for the floor wiring harness and the 2-in-1 power supply assembly	15±1.5
Fixing nut for connecting the engine compartment harness to the floor harness	15±1.5
Fixing bolt/nut of the floor wire harness bracket	9±1
Retaining nut for the floor wiring harness fuse box	9±1
Fixing bolt for the ground wire of the liftgate wiring harness	9±1
Fixing bolt of the rear ground cable assembly on the rear subframe	23±2
Fixing bolt of the front ground cable assembly of the rear subframe	23±2
Fixing bolt for the compressor ground wiring harness assembly	9±1
Fixing bolt for the front subframe grounding wire harness assembly	9±1
Fixing bolt for the ground wire of the rear subframe wiring harness	9±1
Fixing nut for the engine compartment wiring harness and instrument wiring harness fuse box	15±1.5
Mounting bolts/nuts for the engine compartment wiring harness bracket	9±1
Fixing bolt for the ground wire of the engine compartment wiring harness	9±1
Mounting bolt for the engine compartment wiring harness fuse box	9±1
Fixing nut for the engine compartment wiring harness and the positive battery terminal	9±1

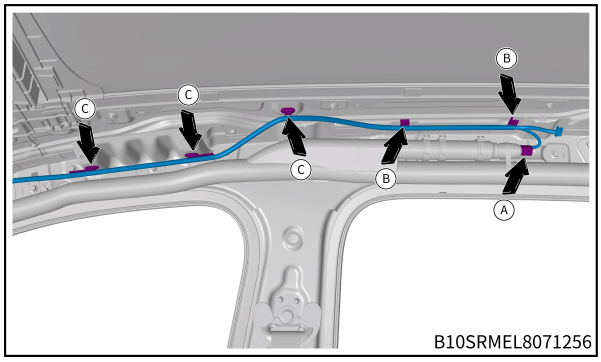
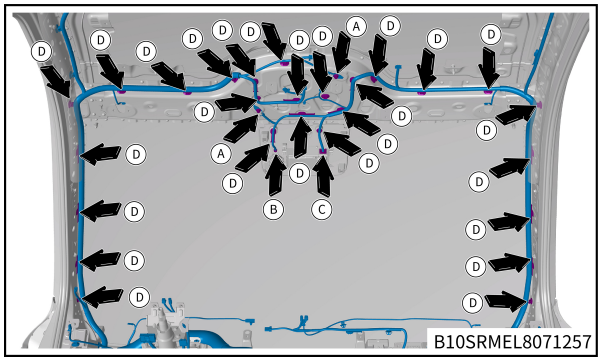
9.12.5 SERVICE AND REPAIR GUIDANCE

INSTRUMENT WIRING HARNESS ASSEMBLY



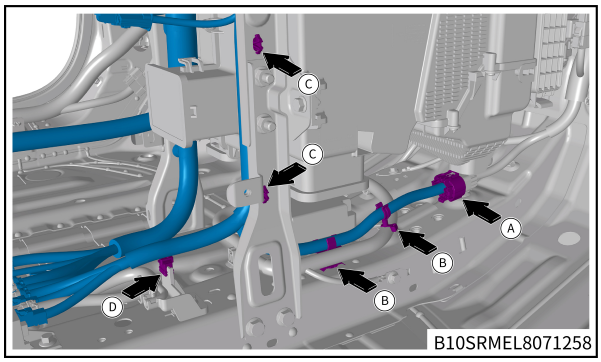
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
5. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
6. Remove the steering column upper shroud assembly.
   See:Steering Column Upper Cover Assembly (page 5430)
7. Remove the lower steering column cover assembly.
   See:Steering Column Lower Cover Assembly (page 5432)
8. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
9. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
10. Remove the headliner assembly.
    See:Headliner assembly (Panoramic roof) (page 5528)
11. Remove the left/right front seat assembly.
    See:Front left seat assembly (page 6267)
12. Remove the left/right lower bracket of the instrument panel crossmember.
    See:Lower left bracket of instrument panel cross car beam (page 5512)
13. Remove the combination switch assembly.
    See:Combination switch (page 8635)
14. Remove the instrument panel wire harness assembly.

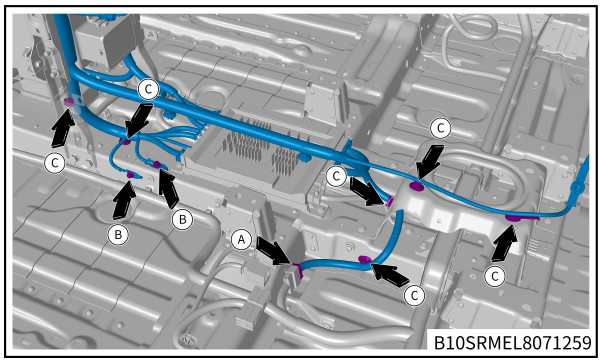


a. Disconnect the 2 connectors - Arrow A - between the instrument panel wiring harness and the liftgate wiring harness, and release the connector retaining clips.
   Recommended tool: Clip remover
b. Disconnect the 1 connector between the instrument panel wiring harness and the left side curtain airbag -Arrow B-, and release the 13 retaining clips of the instrument panel wiring harness -Arrow C-.
   Recommended tool: Clip remover

© 2026, All rights reserved

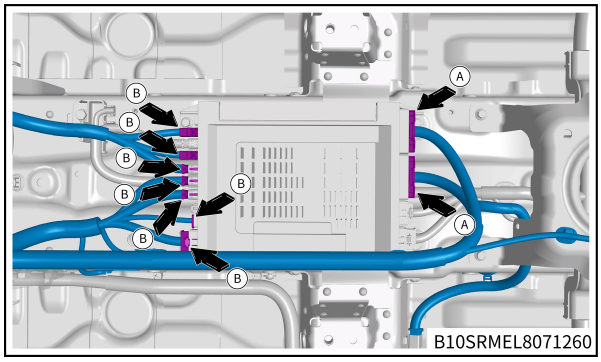


c. Disconnect the 1 connector between the instrument panel wiring harness and the right curtain airbag -Arrow A-, and detach the 5 retaining clips securing the instrument panel wiring harness to the vehicle body -Arrow B-, -Arrow C-.
Recommended tool: Clip remover

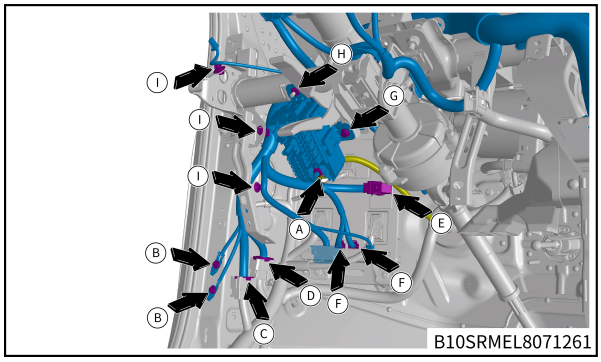


d. Unscrew the 2 fixing bolts of the ground wire for the instrument panel wiring harness -Arrow A-, and disconnect the 1 connector between the instrument panel wiring harness and the rain and light sensor -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m

e. Disconnect the 1 connector -arrow C- between the instrument panel harness and the forward-facing monocular camera assembly, and release the 26 retaining clips -arrow D- of the instrument panel harness.
Recommended tool: Clip remover



f. Disconnect the 1 connector between the instrument wire harness and the engine compartment wire harness -Arrow A-, and release the 5 retaining clips of the instrument wire harness -Arrow B-, -Arrow C-, -Arrow D-.
Recommended tool: Clip remover



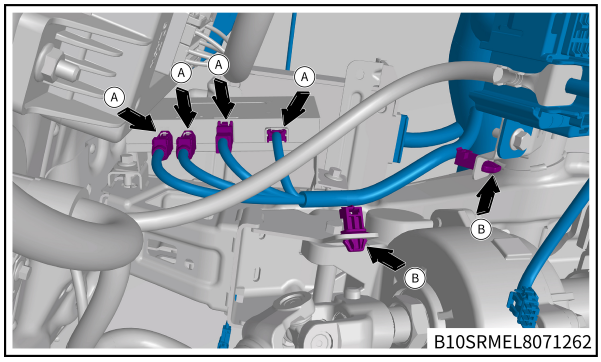
g. Disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow A-, and unscrew the 2 fixing bolts of the ground wire of the instrument wiring harness -Arrow B-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

h. Disconnect the 6 retaining clips of the instrument wiring harness - arrow C -.
Recommended tool: Clip remover

© 2026, All rights reserved

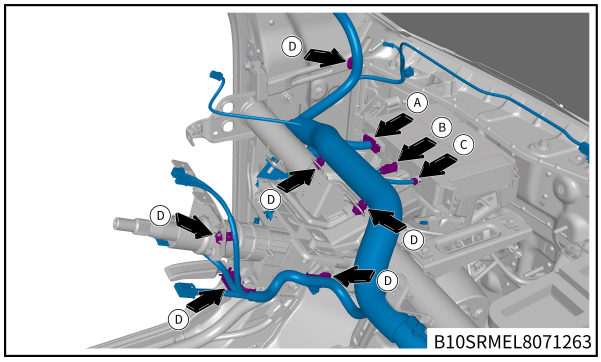
i. Disconnect the 9 connectors between the instrument panel wiring harness and the multi-domain fusion controller - Arrow A -, - Arrow B -.

j. Unscrew the 1 fixing nut connecting the engine compartment wiring harness to the instrument wiring harness fuse box -Arrow A-, and move the engine compartment wiring harness aside.
Recommended tool: 10mm socket
Torque: 15±1.5N m



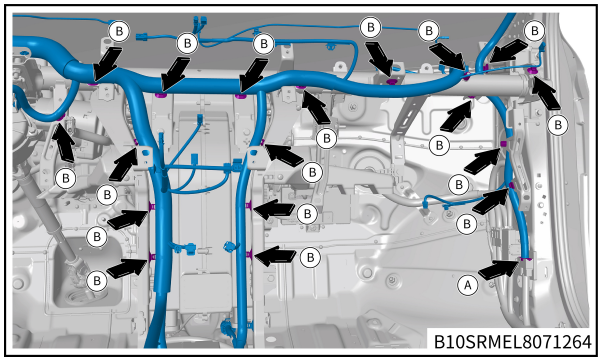
k. Unscrew the 2 fixing bolts for the ground wire of the instrument wiring harness -arrow B-, and disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -arrow C-.
Recommended tool: 8mm socket
Torque: 9±1N m

l. Disconnect the 1 connector -Arrow D- between the instrument panel wiring harness and the engine compartment wiring harness, and disconnect the 3 connectors -Arrow E- and -Arrow F- between the instrument panel wiring harness and the main zone controller.

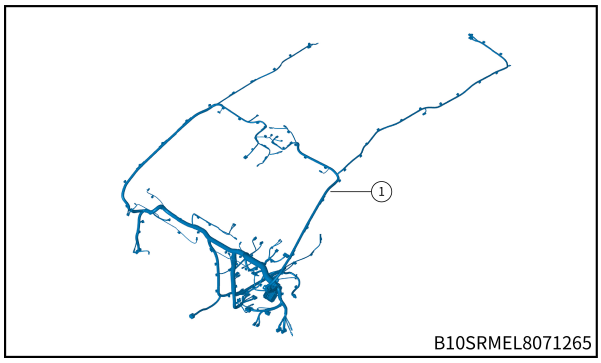


m. Unscrew 1 mounting bolt -arrow G- of the instrument wire harness fuse box, and unscrew 1 mounting nut -arrow H- of the instrument wire harness fuse box.
Recommended tools: 10mm socket, clip remover
-Arrow G-Torque: 9±1N m
-Arrow H- Torque: 9±1 N m

n. Release the 3 retaining clips of the instrument panel wiring harness -arrow I-.
Recommended tool: Clip remover



© 2026, All rights reserved



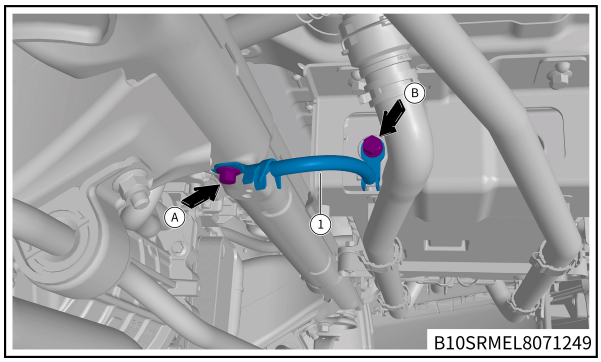
o. Disconnect the 4 connectors between the instrument wiring harness and the DAB head unit assembly -arrow A-, and release the 2 retaining clips of the instrument wiring harness -arrow B-.
Recommended tool: Clip remover

p. Disconnect the 3 connectors between the instrument panel wiring harness and the telematics host -Arrow A-, -Arrow B-, -Arrow C-, and release the 6 retaining clips of the instrument panel wiring harness -Arrow D-.
Recommended tool: Clip remover

q. Disconnect the 1 connector between the instrument wiring harness and the floor wiring harness -Arrow A-, and release the 18 retaining clips of the instrument wiring harness -Arrow C-.
Recommended tool: Clip remover

r. Remove the instrument panel wire harness assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   d. After installation, check whether the relevant electrical components can function properly.

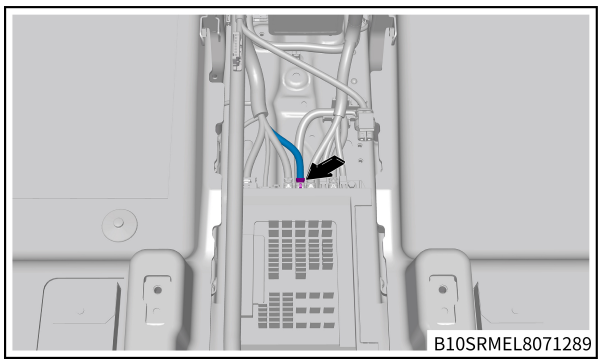
DCDC NEGATIVE WIRE HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the DCDC negative wiring harness assembly.

a. Unscrew the 1 fixing bolt -Arrow A- between the DCDC negative wire harness assembly and the rear subframe.
   Recommended tool: 10mm socket
   Torque: 23±2N m
b. Unscrew the 1 fixing bolt -arrow B- between the DCDC negative wire harness assembly and the 2-in-1 power supply.
   Recommended tool: 13mm socket
   Torque: 15±1.5N m
c. Remove the DCDC negative wiring harness assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

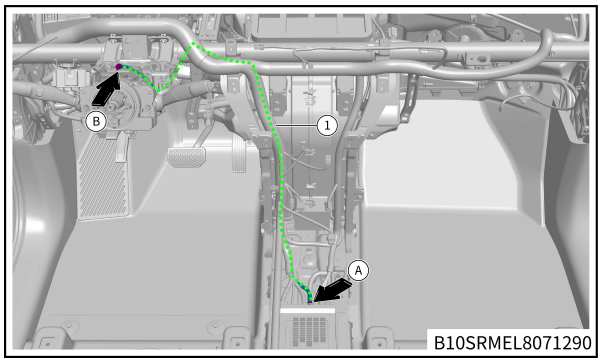
G117 SMART COCKPIT HEAD UNIT TO INSTRUMENT SCREEN WIRING HARNESS (8155)

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
5. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
6. Remove the wiring harness from the G117 smart cockpit head unit to the instrument screen (8155).

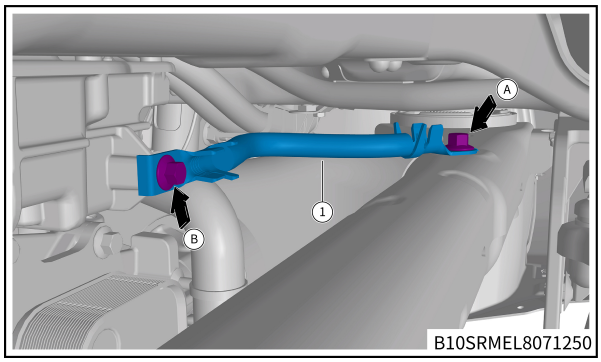
a. Disconnect 1 connector between the instrument wiring harness and the Multi-Domain Fusion Controller - arrow -.

SETUP

1. Install the G117 smart cockpit head unit to the instrument screen wiring harness (8155).

a. Connect the connector - Arrow A - of the wiring harness (8155) from the G117 intelligent cockpit host to the instrument screen to the multi-domain fusion controller.
b. Route the connector - Arrow B - of the wiring harness (8155) from the G117 smart cockpit head unit to the instrument display next to the original connector of the instrument display.

> NOTE
>
> Route the added wiring harness ① along the original wiring path and secure it with nylon cable ties. Ensure the cable ties are securely fastened, the wiring harness routing is clear, and there is no looping.



2. The installation procedure for the remaining components is performed in reverse order.

© 2026, All rights reserved

IPU GROUND CABLE ASSEMBLY

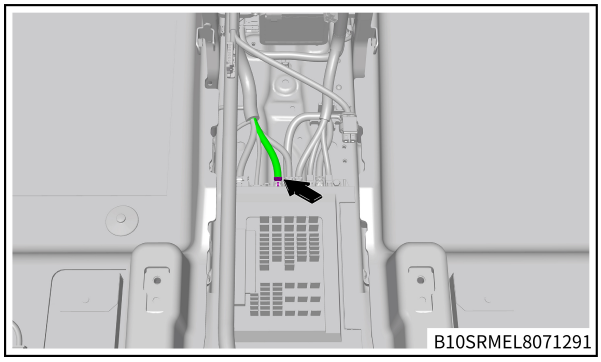
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment under cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the IPU ground cable assembly.

a. Unscrew the 1 mounting bolt securing the IPU ground wire assembly to the rear subframe - Arrow A -.
Recommended tool: 10mm socket
Torque: 23±2N m

b. Unscrew the 1 fixing bolt -Arrow B- between the IPU ground wire assembly and the electric drive assembly, and remove the IPU ground wire assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

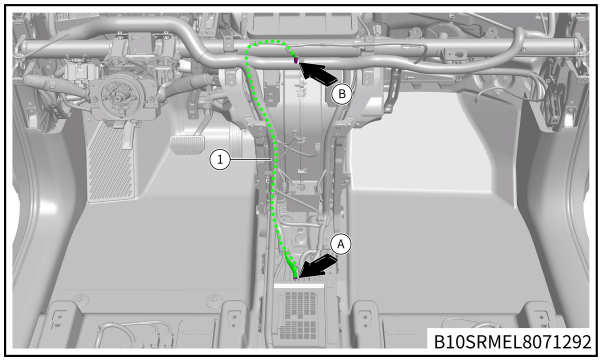
G117 SMART COCKPIT HEAD UNIT TO CENTRAL CONTROL SCREEN WIRING HARNESS (8155)

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
5. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
6. Remove the wiring harness from the G117 smart cockpit head unit to the central control screen (8155).

a. Disconnect 1 connector between the instrument wiring harness and the Multi-Domain Fusion Controller - arrow -.

SETUP

1. Install the wiring harness from the G117 smart cockpit head unit to the central control screen (8155).

a. Connect the connector - arrow A - of the wiring harness (8155) from the G117 smart cockpit host to the central control screen to the multi-domain fusion controller.
b. Position the connector - Arrow B - of the wiring harness (8155) from the G117 smart cockpit host to the central control screen next to the original connector of the central control screen.

NOTE

Route the added wiring harness ① along the original wiring path and secure it with nylon cable ties. Ensure the cable ties are securely fastened, the wiring harness routing is clear, and there is no looping.

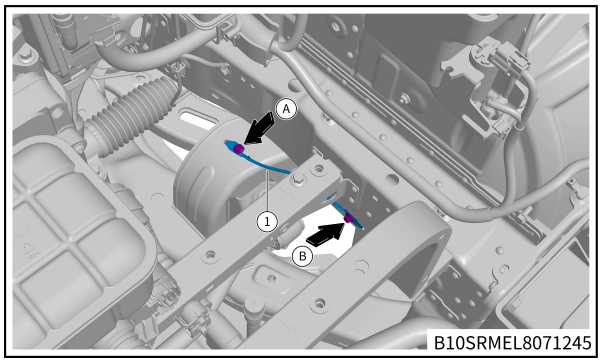
REAR SUBFRAME FRONT GROUND WIRE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the front ground cable assembly of the rear subframe.

a. Unscrew the 1 fixing bolt -Arrow A- securing the front ground cable assembly to the rear subframe.
   Recommended tool: 10mm socket
   Torque: 23±2N m
b. Unscrew the 1 fixing bolt - Arrow B - between the rear subframe front ground cable assembly and the vehicle body, and remove the rear subframe front ground cable assembly ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

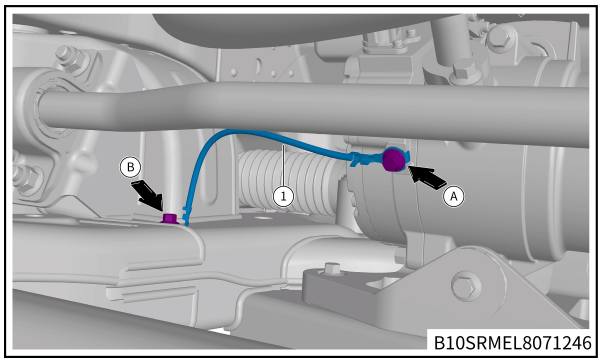
FRONT SUBFRAME GROUND WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the front subframe ground wire harness assembly.

a. Unscrew the 1 fixing bolt securing the ground wire harness assembly to the front subframe - Arrow A -.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Unscrew the 1 fixing bolt -Arrow B- securing the front subframe grounding wire harness assembly to the body, and remove the front subframe grounding wire harness assembly ①.
   Recommended tool: 8mm socket
   Torque: 9±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. After installation, check whether the relevant electrical components are functioning properly.

© 2026, All rights reserved

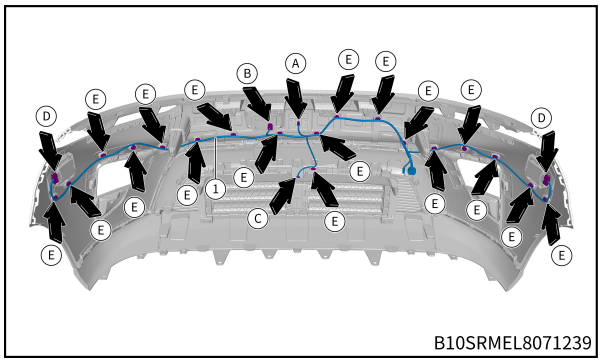
COMPRESSOR GROUND WIRE HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the compressor ground wire harness assembly.

a. Unscrew the 1 fixing bolt between the compressor ground wire harness and the electric compressor - arrow A -.
Recommended tool: 8mm socket
Torque: 9±1N m
b. Unscrew the 1 mounting bolt -Arrow B- securing the compressor ground harness to the front subframe assembly, and remove the compressor ground harness assembly ①.
Recommended tool: 10mm socket
Torque: 9±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

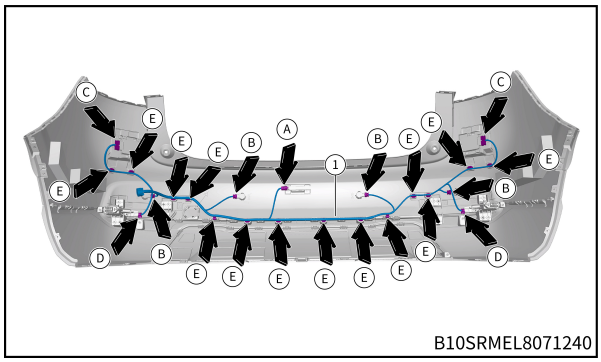
FRONT BUMPER WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the front bumper wiring harness assembly.

a. Disconnect 1 connector between the front bumper wiring harness and the front surround view camera - Arrow A -, and disconnect 1 connector between the front bumper wiring harness and the forward collision avoidance radar - Arrow B -.
b. Disconnect the 1 connector between the front bumper wiring harness and the active grille shutter - Arrow C -, and disconnect the 2 connectors between the front bumper wiring harness and the blind spot monitoring radar - Arrow D -.
c. Release the 18 retaining clips of the front bumper wiring harness assembly - Arrow E -, and remove the front bumper wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check that the relevant electrical components are functioning properly.

© 2026, All rights reserved

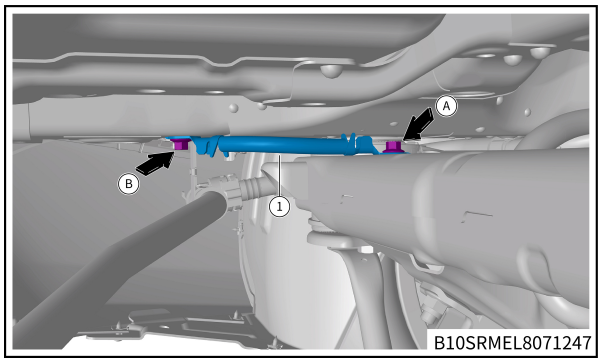
REAR BUMPER WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the rear bumper wiring harness assembly.

a. Disconnect the 1 connector -Arrow A- between the rear bumper wiring harness and the rear bumper low-frequency antenna, and disconnect the 4 connectors -Arrow B- between the rear bumper wiring harness and the reversing ultrasonic sensors.
b. Disconnect the 2 connectors between the rear bumper wiring harness and the blind spot monitoring radar -Arrow C-, and disconnect the 2 connectors between the rear bumper wiring harness and the left and right rear fog reflector assemblies -Arrow D-.
c. Disconnect the 14 retaining clips of the rear bumper wiring harness assembly -Arrow E-, and remove the rear bumper wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check that the relevant electrical components are functioning properly.

© 2026, All rights reserved

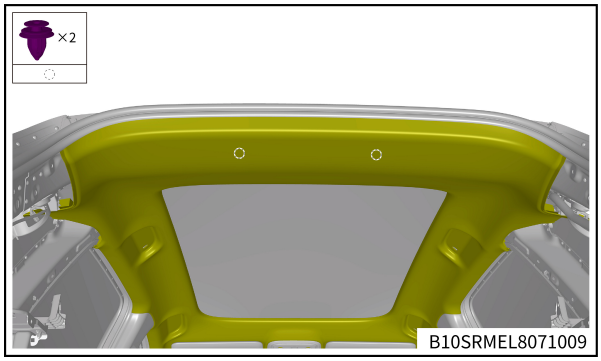
REAR SUBFRAME REAR GROUND CABLE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment under cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the rear ground cable assembly of the rear subframe.

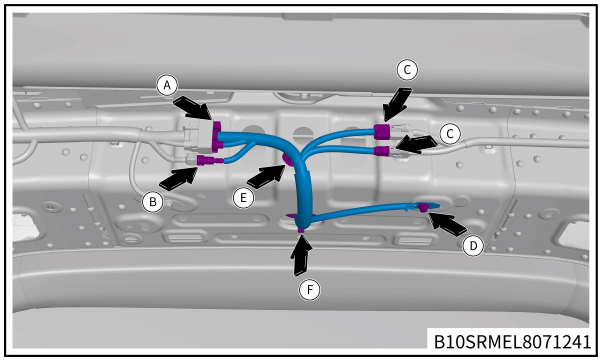
a. Unscrew the 1 fixing bolt -Arrow A- that secures the rear ground cable assembly to the rear subframe.
   Recommended tool: 10mm socket
   Torque: 23±2N m
b. Unscrew the 1 mounting bolt -Arrow B- securing the rear ground cable assembly of the rear subframe to the body, and remove the rear ground cable assembly of the rear subframe ①.
   Recommended tool: 10mm socket
   Torque: 23±2N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

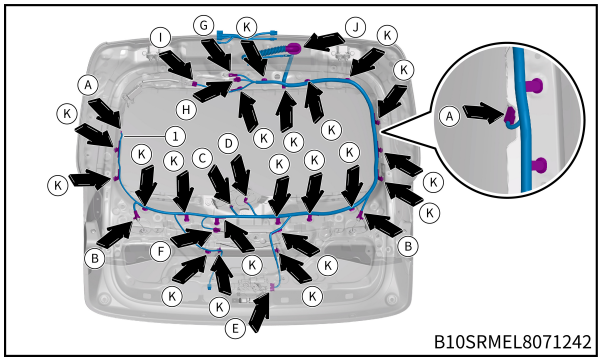
© 2026, All rights reserved



LIFTGATE WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
6. Remove the left/right upper C-pillar interior trim panel assembly.
   See:Left upper C-pillar interior trim panel assembly (page 5394)
7. Remove the left/right grab handle assembly of the rear folding roof.
   See:Rear folding roof left handle assembly (page 5532)
8. Remove the liftgate wiring harness assembly.



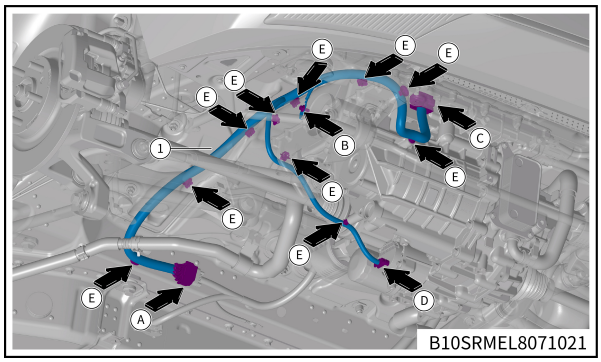
a. Release the 2 retaining clips at the rear of the headliner assembly, and lift the rear part of the headliner assembly.

b. Disconnect the 1 connector -Arrow A- between the liftgate wiring harness assembly and the floor wiring harness assembly, and disconnect the 1 fixing joint -Arrow B- of the rear washer hose.
c. Disconnect the 2 connectors between the liftgate wiring harness assembly and the instrument wiring harness -Arrow C-, and unscrew the 1 fixing bolt for the ground wire of the liftgate wiring harness -Arrow D-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
d. Disconnect 1 fixing clip of the liftgate wiring harness assembly - arrow E -, disconnect the grommet of the liftgate wiring harness assembly - arrow F -, and remove the liftgate wiring harness assembly.
   Recommended tool: Clip remover

© 2026, All rights reserved

e. Disconnect the 2 electrical connectors for the liftgate glass heating -Arrow A-, disconnect the 2 electrical connectors for the rear full-width lamp -Arrow B-, and release the connector retaining clips.
f. Disconnect 1 connector -arrow C- of the rear wiper motor, and detach 1 fixing joint -arrow D- of the rear washer hose.
g. Disconnect 1 connector for the liftgate lock -arrow E-, disconnect 1 connector for the rear surround view camera assembly -arrow F-, and release the connector retaining clip.
h. Disconnect the 1 connector for the high-mounted brake lamp -arrow G-, and disconnect the 1 connection connector for the GPS antenna -arrow H-.
i. Disconnect 1 connector of the FM antenna amplifier - arrow I -, and detach 1 grommet of the liftgate wiring harness assembly - arrow J -.
j. Detach the 20 fixing clips of the liftgate wiring harness assembly - Arrow K -, and remove the liftgate wiring harness assembly ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. Ensure the wiring harness pass-through rubber grommet is securely snapped into place to prevent water leakage.
   c. After installation, check whether the relevant electrical components can function properly.

© 2026, All rights reserved

REAR SUBFRAME WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the rear subframe wiring harness assembly.

a. Disconnect 1 connector between the rear subframe wiring harness and the floor wiring harness -Arrow A-, and unscrew 1 fixing bolt -Arrow B- for the ground wire of the rear subframe wiring harness.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect 1 connector -arrow C- between the rear subframe wiring harness assembly and the electric drive controller, and disconnect 1 connector -arrow D- between the rear subframe wiring harness assembly and the electric oil pump.
c. Detach the 10 retaining clips of the rear subframe wiring harness - Arrow E -, and remove the rear subframe wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts to the specified torque.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   d. After installation, check whether the relevant electrical components can function properly.

REAR DOOR TRIM PANEL WIRING HARNESS ASSEMBLY

NOTE

This section describes the removal and installation of the left rear door trim panel wiring harness assembly, and the removal and installation of the right rear door trim panel wiring harness assembly can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
4. Remove the rear door trim panel wiring harness assembly.

a. Disconnect the 1 connector -Arrow A- between the rear door trim panel wiring harness assembly and the single door glass switch, and disconnect the 1 connector -Arrow B- between the rear door trim panel wiring harness assembly and the rear door tweeter.
b. Release the 4 retaining clips - Arrow C - of the rear door trim wiring harness assembly, and remove the rear door trim wiring harness assembly ①.
   Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

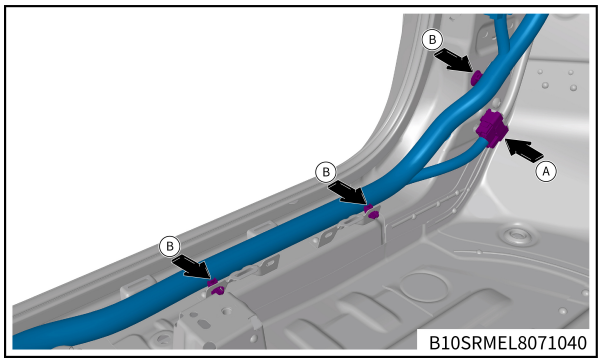
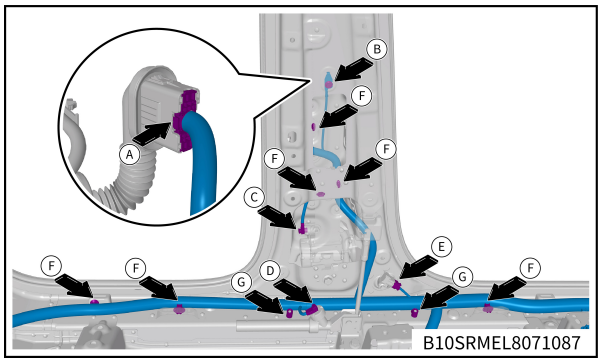
FLOOR WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE



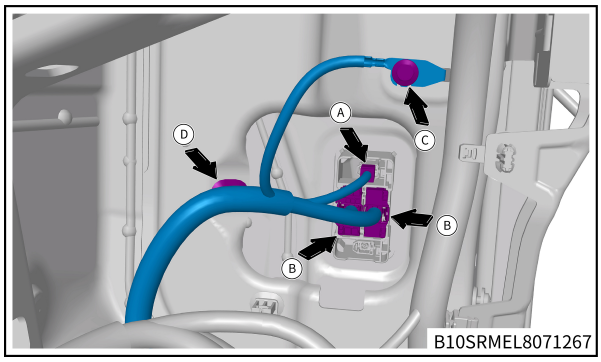
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the center console body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the waterproof cover.
   See:Waterproof cover (page 5484)
5. After removing the center console, install the rear mounting bracket assembly.
   See:Center console rear mounting bracket assembly (page 5485)
6. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
7. Remove the glove box lower cover assembly.
   See:Glove box lower trim panel assembly (page 5455)
8. Remove the left/right rear footwell air duct.
   See:Rear left footwell air duct (page 5419)
9. Remove the driver's carpet assembly.
   See:Driver floor carpet assembly (page 5539)
10. Remove the left/right lower A-pillar interior trim panel assembly.
    See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
11. Remove the left/right lower B-pillar interior trim panel assembly.
    See:Left B-pillar lower interior trim panel assembly (page 5387)
12. Remove the left/right lower C-pillar interior trim panel assembly.
    See:Left lower C-pillar interior trim panel assembly (page 5392)
13. Remove the left/right upper C-pillar interior trim panel assembly.
    See:Left upper C-pillar interior trim panel assembly (page 5394)
14. Remove the left/right grab handle assembly of the rear folding roof.
    See:Rear folding roof left handle assembly (page 5532)
15. Remove the left/right rear door sill trim panel assembly.
    See:Rear left sill trim panel assembly (page 5406)
16. Remove the left/right rear wheelhouse liner assembly.
    See:Left rear wheelhouse trim panel assembly (page 5322)
17. Remove the rear compartment lower cover assembly.
    See:Rear compartment under cover assembly (page 5327)
18. Remove the rear seat cushion assembly.
    See:Rear seat cushion assembly (page)
19. Remove the rear seat cushion EPP assembly.
    See:Rear seat cushion EPP assembly (page 5546)
20. Remove the rear right seat backrest assembly.
    See:Rear right seatback assembly (page)
21. Remove the rear left backrest assembly.
    See:Rear left backrest assembly (page)
22. Remove the multi-domain fusion controller.
    See:Multi-domain fusion controller (page 8537)

© 2026, All rights reserved



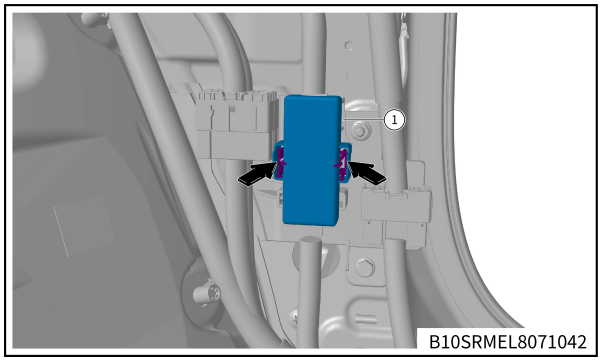
23. Remove the subwoofer assembly.
    See:Subwoofer Assembly (page 9478)
24. Remove the floor wiring harness assembly.

a. Disconnect the 3 connectors between the left front door wiring harness and the floor wiring harness -arrow A-, -arrow B-, and unscrew the 1 fixing bolt of the floor wiring harness ground wire -arrow C-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
b. Disconnect the 1 connector -arrow D- between the floor wiring harness and the instrument panel wiring harness, and disconnect the 4 connectors -arrow E-, -arrow F-, -arrow G-, and -arrow H- between the floor wiring harness and the main zone controller.
c. Release the 2 retaining clips of the floor wiring harness -arrow I-.
   Recommended tool: Clip remover



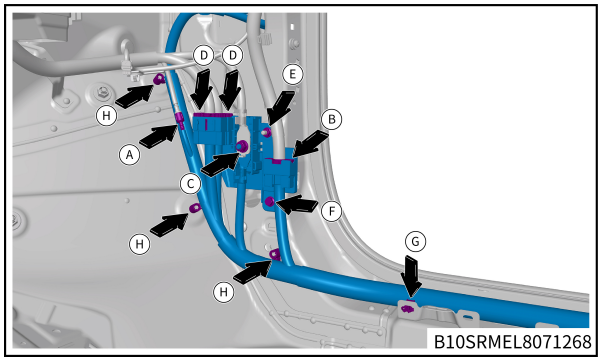
d. Disconnect the 1 connector between the floor wiring harness and the engine compartment wiring harness -arrow A-, and release the 3 retaining clips of the floor wiring harness -arrow B-.
   Recommended tool: Clip remover

e. Disconnect the 1 connector between the left rear door harness and the floor harness -arrow A-, and unscrew the 1 fixing bolt for the ground wire of the floor harness -arrow B-.
   Recommended tool: 8mm socket
   Torque: 9±1N m
f. Disconnect the 1 connector -Arrow C- between the floor wiring harness and the front left seat belt assembly, and disconnect the 1 connector -Arrow D- between the floor wiring harness and the front left pretensioner end plate assembly.
g. Disconnect the 1 connector between the floor wire harness and the left impact sensor - Arrow E -, and detach the 8 retaining clips of the floor wire harness - Arrow F -, - Arrow G -.



© 2026, All rights reserved

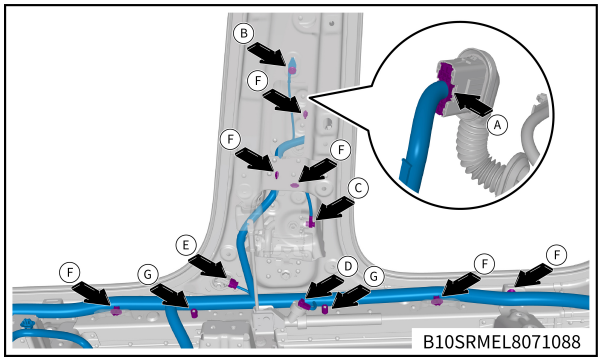
Recommended tool: Clip remover



h. Disconnect the 3 connectors between the right front door wiring harness and the floor wiring harness -Arrow A-, -Arrow B-, and unscrew the 1 fixing bolt for the ground wire of the floor wiring harness -Arrow C-.
Recommended tool: 8mm socket
Torque: 9±1N m

i. Detach 1 retaining clip of the floor wire harness - arrow D -.
Recommended tool: Clip remover

j. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.

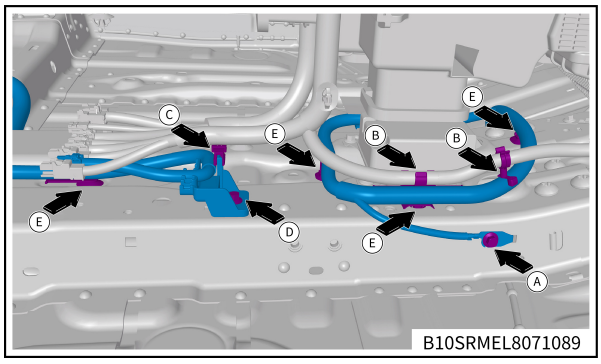


k. Disconnect 1 fixing connector of the rear washer pipe -Arrow A-, and disconnect 1 connector between the instrument harness and the floor harness -Arrow B-.

l. Unscrew the 1 fixing nut connecting the engine compartment wiring harness to the floor wiring harness -Arrow C-, and disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness -Arrow D-.
Recommended tool: 13mm socket
Torque: 15±1.5N m

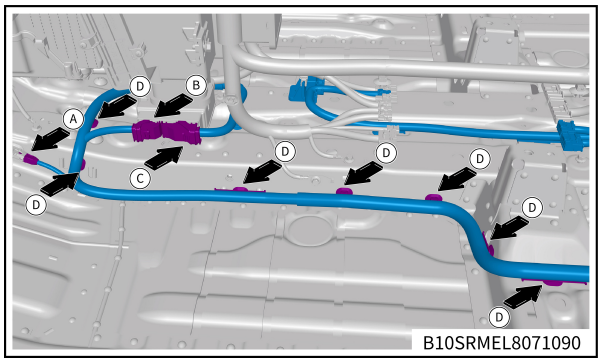
m. Unscrew 1 fixing nut - arrow E - from the floor wiring harness bracket, and unscrew 1 fixing bolt - arrow F - from the floor wiring harness bracket.
Recommended tool: 8mm socket
-Arrow F-Torque: 9±1N m
-Arrow G-Torque: 9±1N m

n. Release the 4 retaining clips of the floor wiring harness -arrow G-, -arrow H-.
Recommended tool: Clip remover



© 2026, All rights reserved

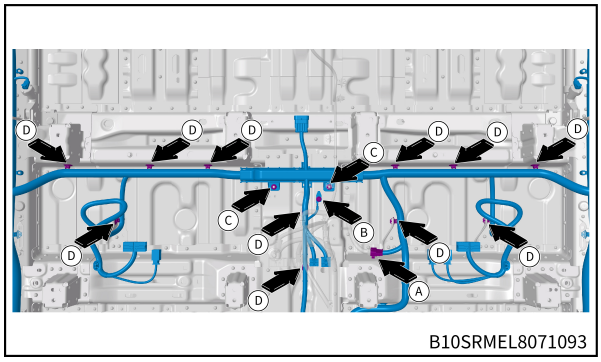
o. Disconnect 1 connector between the right rear door harness and the floor harness -arrow A-, and unscrew 1 fixing bolt of the floor harness ground wire -arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m



p. Disconnect 1 connector - Arrow C - between the floor wiring harness and the front right seat belt assembly, and disconnect 1 connector - Arrow D - between the floor wiring harness and the front right pretensioner end plate assembly.

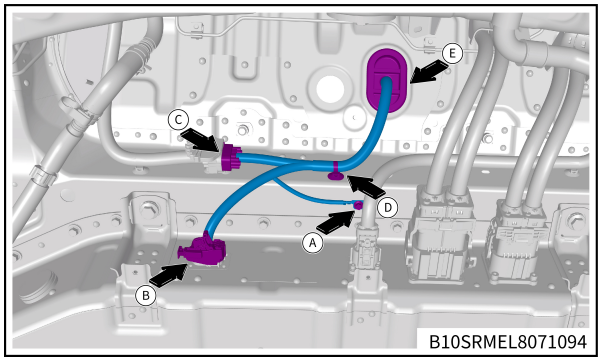
q. Disconnect the 1 connector between the floor wiring harness and the right impact sensor -Arrow E-, and detach the 8 retaining clips of the floor wiring harness -Arrow F-, -Arrow G-.
Recommended tool: Clip remover

r. Unscrew the 1 fixing bolt for the floor wiring harness ground wire -Arrow A-, and disconnect the 3 fixing clips between the instrument wiring harness and the floor wiring harness -Arrow B-, -Arrow C-.
Recommended tool: 8mm socket
Torque: 9±1N m



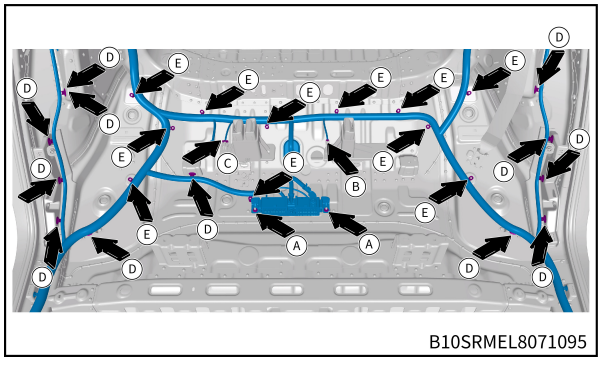
s. Unscrew the 1 fixing bolt -Arrow D- of the floor wiring harness bracket, and disconnect the 4 fixing clips -Arrow E- of the floor wiring harness.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

t. Disconnect the 1 connector between the floor wiring harness and the engine compartment wiring harness -Arrow A-, and disconnect the 2 connectors between the floor wiring harness and the airbag control module -Arrow B- and -Arrow C-.



u. Disconnect the 7 retaining clips of the floor wiring harness - arrow D -.
Recommended tool: Clip remover

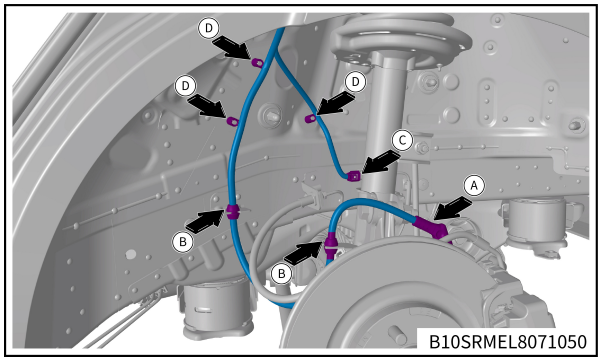
© 2026, All rights reserved



v. Disconnect 1 connector -arrow A- between the floor wiring harness and the instrument panel wiring harness, and unscrew 1 fixing bolt -arrow B- securing the ground wire of the floor wiring harness.
Recommended tool: 8mm socket
Torque: 9±1N m

w. Unscrew the 2 mounting nuts of the floor wiring harness bracket -Arrow C-, and disconnect the 11 retaining clips of the floor wiring harness -Arrow D-.
Recommended tools: 10mm socket, clip remover
Torque: 9±1N m

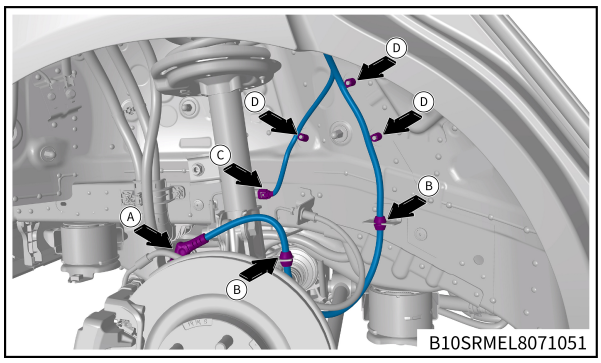
x. Unscrew 1 fixing bolt of the floor wiring harness ground wire -Arrow A-, and disconnect 1 connector between the floor wiring harness and the battery pack assembly -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m



y. Disconnect 1 connector between the floor wiring harness and the rear subframe wiring harness -Arrow C-, detach 1 retaining clip of the floor wiring harness -Arrow D-, and detach 1 grommet of the floor wiring harness -Arrow E-.
Recommended tool: Clip remover

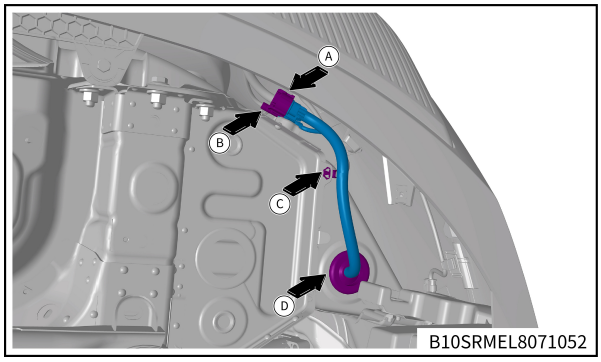
z. Unscrew the 2 mounting nuts of the floor wiring harness fuse box -Arrow A-, and disconnect the 1 connector between the floor wiring harness and the rear single latch assembly -Arrow B-.
Recommended tool: 10mm socket
Torque: 9±1N m

aa Disconnect the 1 connector -arrow C- between the floor wiring harness and the rear dual latch assembly, and release the 23 retaining clips -arrow D-, -arrow E- of the floor wiring harness.
Recommended tool: Clip remover



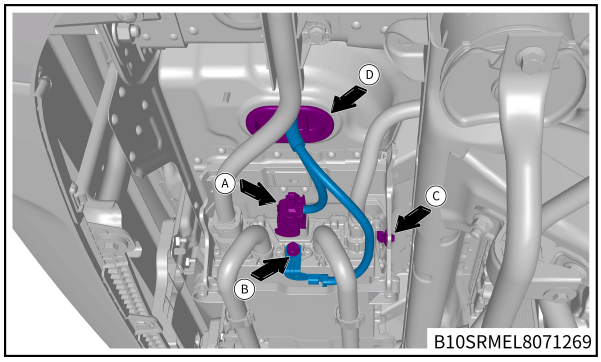
© 2026, All rights reserved

abDisconnect the 1 connector -arrow A- between the floor wiring harness assembly and the left drive brake motor, and detach the 2 retaining clips -arrow B- of the floor wiring harness assembly.



acDisconnect the 1 connector between the floor wiring harness assembly and the left rear intelligent wheel speed sensor -arrow C-, and release the 3 retaining clips of the floor wiring harness assembly -arrow D-.

Recommended tool: Clip remover

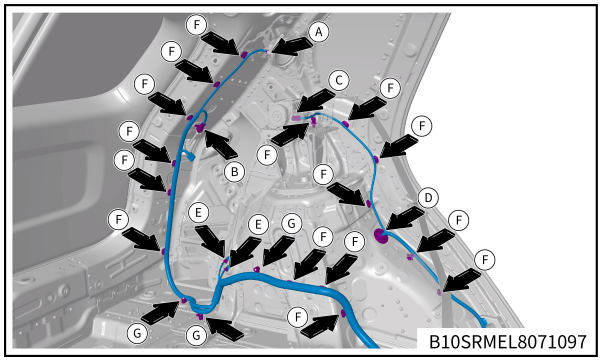


a. Disconnect the 1 connector -arrow A- between the floor wire harness assembly and the right-side drive brake motor, and release the 2 retaining clips -arrow B- of the floor wire harness assembly.
b. Disconnect the 1 connector between the floor wiring harness assembly and the right rear intelligent wheel speed sensor -arrow C-, and release the 3 retaining clips of the floor wiring harness assembly -arrow D-.

Recommended tool: Clip remover

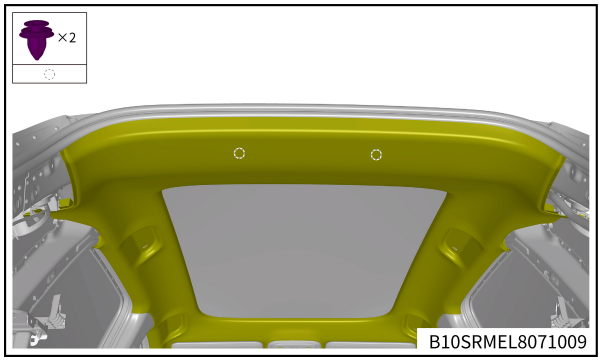
a. Disconnect the 2 connectors between the floor wiring harness and the rear bumper wiring harness -Arrow A-, -Arrow B-.
b. Release 1 retaining clip of the floor wiring harness - arrow C -, and detach 1 rubber grommet of the floor wiring harness - arrow D -.

Recommended tool: Clip remover



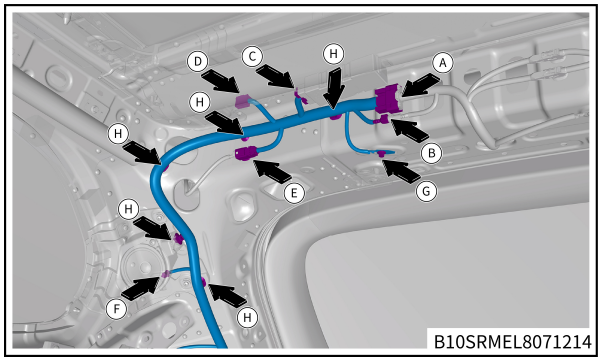
a. Disconnect the 1 connector between the floor wiring harness and the 2-in-1 power supply -Arrow A-, and unscrew the 1 fixing bolt between the floor wiring harness and the 2-in-1 power supply -Arrow B-.

Recommended tool: 13mm socket
Torque: 15±1.5N m



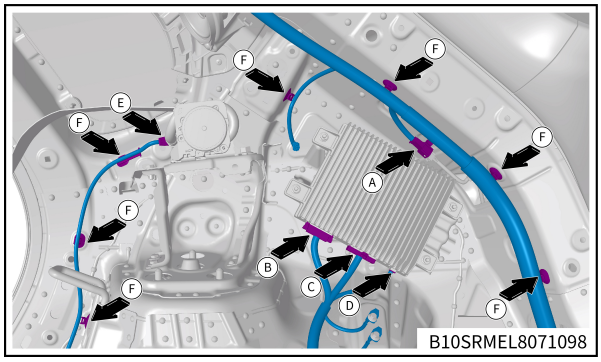
b. Release 1 retaining clip of the floor wiring harness - arrow C -, and detach 1 rubber grommet of the floor wiring harness - arrow D -.

Recommended tool: Clip remover

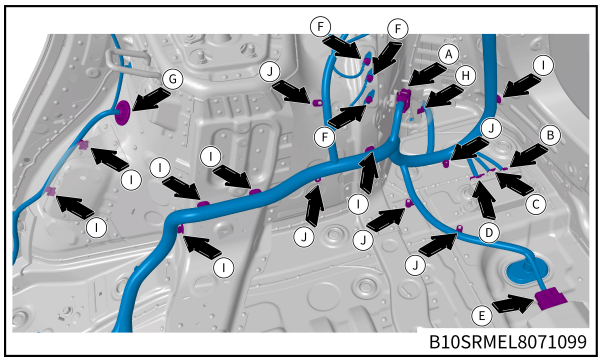


© 2026, All rights reserved

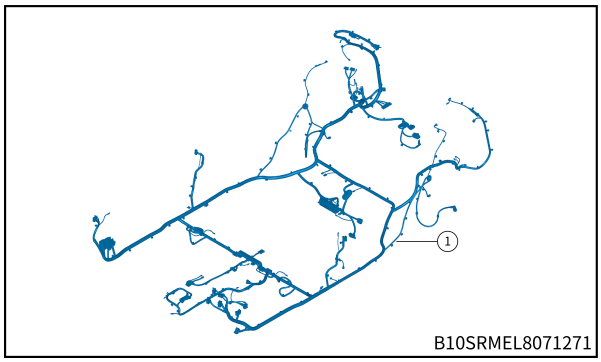
a. Disconnect the 1 connector between the floor wire harness and the left midrange speaker -Arrow A-, and disconnect the 1 connector between the floor wire harness and the left rear combination lamp -Arrow B-.
b. Disconnect 1 connector - arrow C - between the floor wiring harness and the rear left seat belt assembly, and remove 1 grommet - arrow D - from the floor wiring harness.
c. Unscrew the 2 fixing bolts of the floor wiring harness ground wire -Arrow E-, and disconnect the 18 fixing clips of the floor wiring harness -Arrow F-, -Arrow G-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m



a. Release the 2 retaining clips at the rear of the headliner assembly, and lift the rear part of the headliner assembly.



a. Disconnect the 1 connector -Arrow A- between the floor wiring harness and the liftgate wiring harness, and detach the 1 fixing connector -Arrow B- of the rear washer line.
b. Disconnect 1 connector between the floor wiring harness and the sunshade SCU assembly - Arrow C -, and disconnect 1 connector between the floor wiring harness and the sunroof motor - Arrow D -.
c. Disconnect 1 connector between the floor wiring harness and the right electric strut -arrow E-, and disconnect 1 connector between the floor wiring harness and the right midrange speaker -arrow F-.
d. Unscrew the 1 fixing bolt of the floor wire harness ground wire -Arrow G-, and release the 5 fixing clips of the floor wire harness -Arrow H-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m



© 2026, All rights reserved

a. Disconnect the 1 connector -Arrow A- between the floor wiring harness and the right combination lamp, and disconnect the 3 connectors -Arrow B-, -Arrow C-, -Arrow D- between the floor wiring harness and the power amplifier.
b. Disconnect the 1 connector -Arrow E- between the floor wiring harness and the rear right seat belt assembly, and release the 7 retaining clips -Arrow F- of the floor wiring harness.
Recommended tool: Clip remover

a. Disconnect 1 connector -Arrow A- between the floor wiring harness and the fast and slow charging cable, and disconnect 3 connectors -Arrow B-, -Arrow C-, -Arrow D- between the floor wiring harness and the liftgate ECU.
b. Disconnect the 1 connector between the floor wiring harness and the charging protocol converter -Arrow E-, and unscrew the 3 fixing bolts of the floor wiring harness ground wire -Arrow F-.
Recommended tool: 8mm socket
Torque: 9±1N m
c. Detach the 1 grommet between the floor wiring harness and the left rear wheel house inner panel -Arrow G-, and release the 13 retaining clips of the floor wiring harness -Arrow H-, -Arrow I-, -Arrow J-.
Recommended tool: Clip remover

a. Remove the floor wiring harness assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   c. Ensure the wiring harness pass-through rubber grommet is securely snapped into place to prevent water leakage.

© 2026, All rights reserved

d. After installation, check whether the relevant electrical components can function properly.

FRONT LEFT DOOR TRIM PANEL WIRING HARNESS ASSEMBLY

NOTE

This section describes the removal and installation of the wiring harness assembly for the front left door trim panel. For the removal and installation of the wiring harness assembly for the front right door trim panel, refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door trim panel wiring harness assembly.

a. Disconnect 1 connector between the left front door trim panel wiring harness assembly and the driver's window switch -Arrow A-, and disconnect 1 connector between the left front door trim panel wiring harness assembly and the door low-frequency antenna -Arrow B-.
b. Release the 1 retaining clip of the left front door trim panel wiring harness assembly -arrow C-, and remove the left front door trim panel wiring harness assembly ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   b. After installation, check whether the relevant electrical components can function properly.

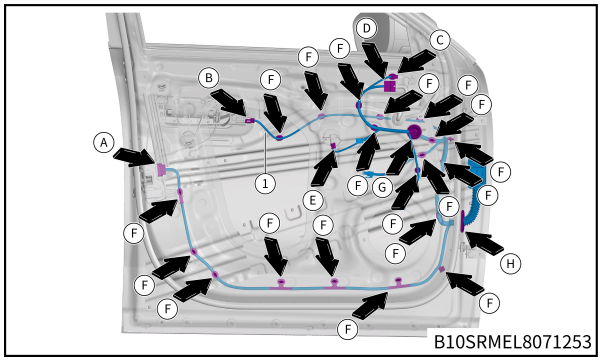
FRONT LEFT DOOR WIRING HARNESS ASSEMBLY

NOTE



This section describes the removal and installation of the left front door wiring harness assembly, and the removal and installation of the right front door wiring harness assembly can be performed by referring to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the front left door waterproof membrane.
   See:Front left door waterproof membrane (page 6582)
5. Remove the front water shield of the front door.
   See:Front door front waterproof film (page 6584)
6. Remove the woofer assembly (front door).
   See:Woofer Assembly (Front Door) (page 9474)
7. Remove the front left power window regulator assembly.
   See:Left front door power window regulator assembly (page 6428)
8. Remove the left front door wiring harness assembly.

a. Disconnect 1 waterproof boot of the left front door wiring harness assembly -arrow A-.
b. Disconnect the 3 connectors between the left front door wiring harness and the floor wiring harness -Arrow B-, -Arrow C-.

c. Disconnect the 1 connector between the left front door wiring harness and the left front door lock actuator - arrow A -, and disconnect the 1 connector between the left front door wiring harness and the outer handle - arrow B -.
d. Disconnect the 2 connectors -Arrow C- and -Arrow D- between the left front door wiring harness and the left exterior rearview mirror, and disconnect the 1 connector -Arrow E- between the left front door wiring harness and the pressure sensor assembly.

© 2026, All rights reserved

e. Detach the 19 retaining clips of the left front door wiring harness - Arrow F -, and detach the 2 grommets of the left front door wiring harness - Arrow G -, - Arrow H -.
Recommended tool: Interior trim removal tool
f. Remove the front left door wiring harness assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   b. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   c. Ensure the wiring harness pass-through rubber grommet is securely snapped into place to prevent water leakage.
   d. After installation, check whether the relevant electrical components can function properly.

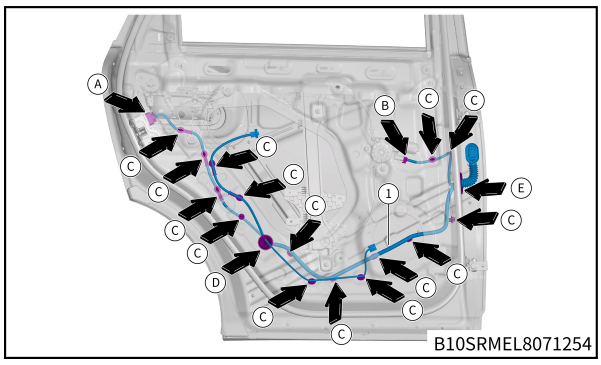
LEFT REAR DOOR WIRING HARNESS ASSEMBLY

NOTE



This section describes the removal and installation of the left rear door wiring harness assembly, and the removal and installation of the right rear door wiring harness assembly can refer to the left side.

REMOVAL PROCEDURE

1. Open the left rear door and raise the door glass.
2. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
3. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
4. Remove the rear left door interior trim panel assembly.
   See:Rear left door trim panel assembly (page 5363)
5. Remove the waterproof film on the rear left door.
   See:Rear left door waterproof film (page 6583)
6. Remove the woofer assembly (rear door).
   See:Woofer Assembly (Rear Door) (page 9477)
7. Remove the left rear door wiring harness assembly.

a. Disconnect 1 waterproof grommet of the left rear door wiring harness assembly -Arrow A-, and disconnect 1 connector between the left rear door wiring harness and the floor wiring harness -Arrow B-.

b. Disconnect 1 connector between the left rear door wiring harness and the left rear door lock actuator -Arrow A-, and disconnect 1 connector between the left rear door wiring harness and the window lift motor -Arrow B-.
c. Release the 15 retaining clips -Arrow C- of the left rear door wiring harness, and release the 2 grommets -Arrow D-, -Arrow E- of the left rear door wiring harness.
   Recommended tool: Interior trim removal tool
d. Remove the left rear door wiring harness assembly ①.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.

© 2026, All rights reserved

b. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
c. Ensure the wiring harness pass-through rubber grommet is securely snapped into place to prevent water leakage.
d. After installation, check whether the relevant electrical components can function properly.

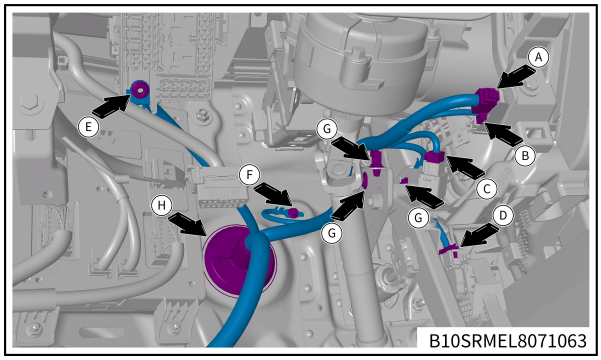
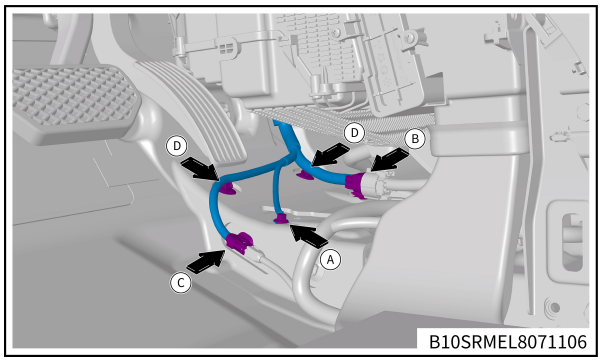
ENGINE COMPARTMENT WIRING HARNESS ASSEMBLY



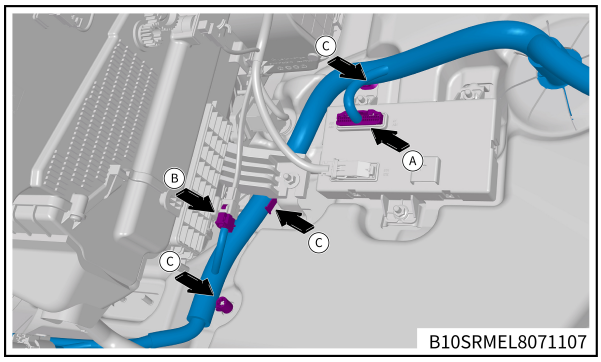
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front bumper assembly.
   See:Front bumper assembly (page 5237)
4. Remove the left/right extension panel assembly of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
5. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
6. Remove the left/right front wheel assembly.
   See:Wheel Assembly (page 2962)
7. Remove the left/right front seat assembly.
   See:Front left seat assembly (page 6267)
8. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
9. Remove the left/right lower A-pillar interior trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
10. Remove the front compartment storage box assembly.
    See:Front compartment storage box assembly (page 5302)
11. Remove the cowl panel grille assembly.
    See:Cowl Grille Assembly (page 5311)
12. Remove the battery assembly.
    See:Battery Assembly (page 9594)
13. Remove the battery tray.
    See:Battery tray (page 9595)
14. Remove the super integrated module.
    See:Super Integrated Module (page 5226)
15. Remove the interior condenser liquid outlet pipe.
    See:Interior condenser liquid outlet pipe (page 5165)
16. Remove the interior condenser inlet pipe.
    See:Interior condenser inlet pipe (page 5159)
17. Remove the front evaporator outlet pipe.
    See:Front evaporator outlet pipe (page 5154)
18. Remove the front evaporator liquid inlet pipe.
    See:Front evaporator liquid inlet pipe (page 5156)
19. Remove the engine compartment wiring harness assembly.



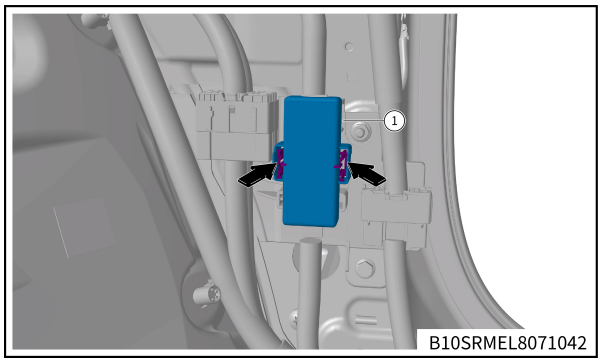
© 2026, All rights reserved

a. Disconnect 1 connector between the engine compartment harness and the floor harness -arrow A-, disconnect 1 connector between the engine compartment harness and the instrument panel harness -arrow B-, and release the connector retaining clips.
b. Release the 2 retaining clips of the engine compartment wiring harness -Arrow C-, -Arrow D-.
Recommended tool: Clip remover



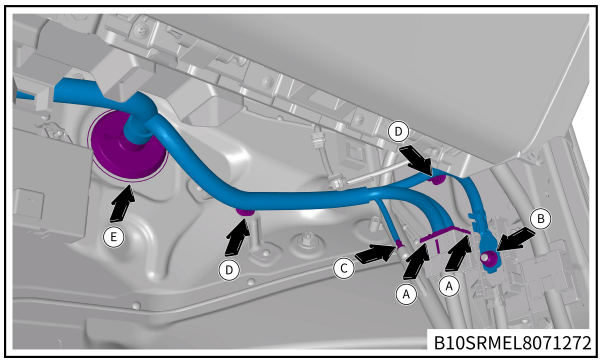
c. Disconnect the 2 connectors, -Arrow A- and -Arrow B-, between the engine compartment wiring harness and the electric steering column with intermediate shaft assembly, and disconnect the 1 connector, -Arrow C-, between the engine compartment wiring harness and the brake light switch.
d. Disconnect the 1 connector between the engine compartment wiring harness and the electronic accelerator pedal - arrow D -, and unscrew the 1 fixing nut between the engine compartment wiring harness and the instrument wiring harness fuse box - arrow E -.
Recommended tool: 13mm socket
Torque: 15±1.5N m
e. Unscrew 1 fixing bolt for the ground wire of the engine compartment wiring harness -Arrow F-, and unclip 3 fixing clips of the engine compartment wiring harness -Arrow G-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m
f. Detach 1 grommet of the engine compartment wiring harness -arrow H-, and feed out the left engine compartment wiring harness.

g. Unscrew the 1 fixing bolt for the ground wire of the engine compartment wiring harness -Arrow A-, and disconnect the 1 connector between the engine compartment wiring harness and the instrument panel wiring harness -Arrow B-.
Recommended tool: 8mm socket
Torque: 9±1N m



© 2026, All rights reserved

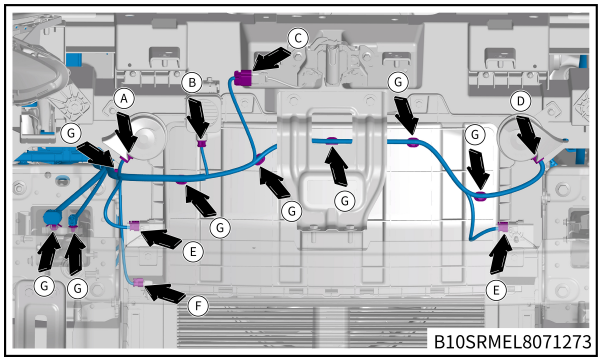
h. Disconnect the 1 connector between the engine compartment harness and the floor harness -Arrow C-, and release the 2 retaining clips of the engine compartment harness -Arrow D-.
Recommended tool: Clip remover



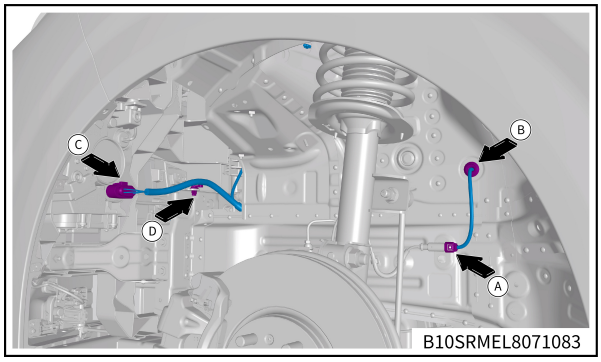
i. Disconnect 1 connector between the engine compartment wiring harness and the thermal management controller -Arrow A-, and disconnect 1 connector between the engine compartment wiring harness and the HVAC wiring harness -Arrow B-.

j. Unclip the 3 retaining clips of the engine compartment wiring harness - Arrow C -.
Recommended tool: Clip remover

k. Release the 2 retaining clips - arrow - of the floor wiring harness cover, and remove the floor wiring harness cover ①.

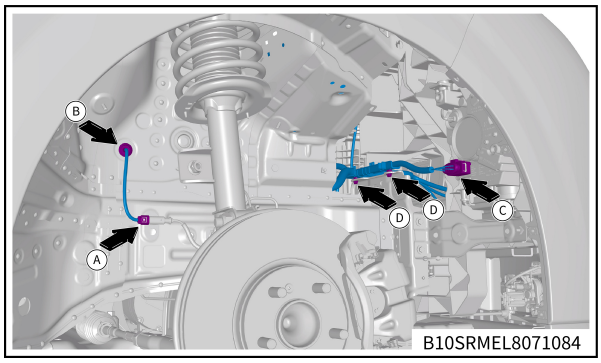


l. Disconnect the 2 connectors between the engine compartment wiring harness and the floor wiring harness - arrow A -, and unscrew the 1 fixing nut securing the engine compartment wiring harness to the floor wiring harness - arrow B -.
Recommended tool: 13mm socket
Torque: 15±1.5N m



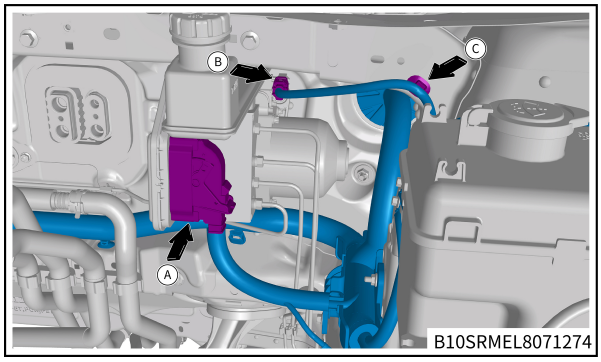
m. Disconnect the 1 fixing connector of the rear washer line - arrow C -, and detach the 2 fixing clips of the engine compartment wiring harness - arrow D -.
Recommended tool: Clip remover

n. Disconnect 1 rubber grommet of the engine compartment wiring harness - Arrow E -, and route out the right engine compartment wiring harness.

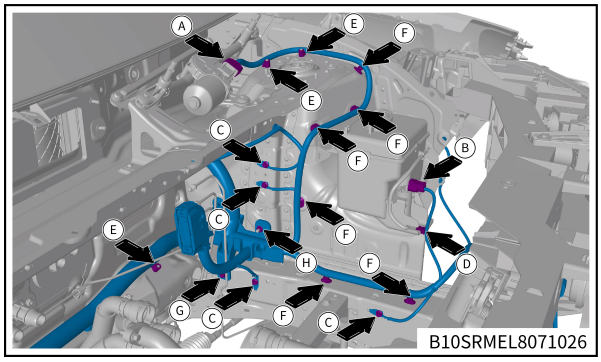


© 2026, All rights reserved

o. Disconnect 1 connector between the engine compartment wiring harness and the high-tone horn -Arrow A-, and disconnect 1 connector between the engine compartment wiring harness and the warning horn assembly -Arrow B-.
p. Disconnect 1 connector between the engine compartment harness and the hood latch -Arrow C-, and disconnect 1 connector between the engine compartment harness and the low-tone horn -Arrow D-.
q. Disconnect the 2 connectors between the engine compartment wiring harness and the front impact sensor - arrow E -, and disconnect the 1 connector between the engine compartment wiring harness and the ambient temperature sensor - arrow F -.
r. Detach the 8 retaining clips of the engine compartment wiring harness - arrow G -.
Recommended tool: Clip remover

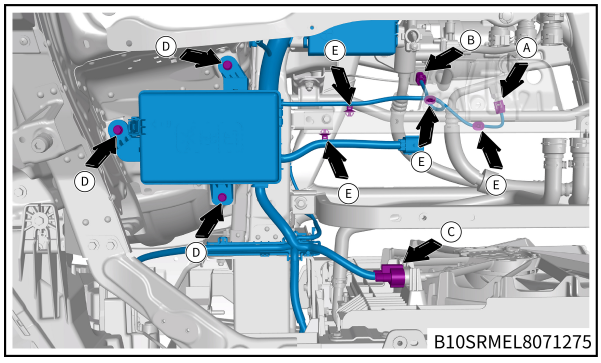


s. Disconnect 1 connector -Arrow A- between the engine compartment harness and the left front intelligent wheel speed sensor, and detach 1 grommet -Arrow B- from the engine compartment harness.
t. Disconnect 1 connector between the engine compartment wiring harness and the left combination lamp -arrow C-, and release 1 retaining clip of the engine compartment wiring harness -arrow D-.
Recommended tool: Clip remover



u. Disconnect the connector -arrow A- between the engine compartment wiring harness and the right front intelligent wheel speed sensor, and detach the grommet -arrow B- from the engine compartment wiring harness.
v. Disconnect the 1 connector between the engine compartment wiring harness and the right combination lamp -Arrow C-, and release the 2 retaining clips of the engine compartment wiring harness -Arrow D-.
Recommended tool: Clip remover

© 2026, All rights reserved

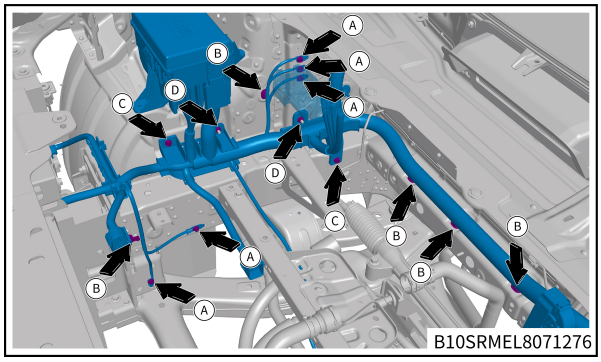


w. Disconnect the 2 connectors -Arrow A- and -Arrow B- between the engine compartment wiring harness and the Intelligent Integrated Brake System assembly, and unclip the 1 retaining clip -Arrow C- of the engine compartment wiring harness.
Recommended tool: Clip remover

x. Disconnect 1 connector -arrow A- between the engine compartment wiring harness and the front wiper motor and linkage assembly, and disconnect 1 connector -arrow B- between the engine compartment wiring harness and the washer motor.

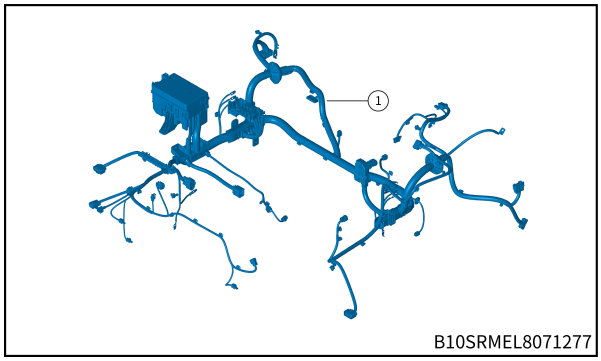
y. Unscrew the 4 mounting bolts of the engine compartment wiring harness ground wire -Arrow C-, and release the 10 mounting clips of the engine compartment wiring harness -Arrow D-, -Arrow E-, -Arrow F-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

z. Unscrew 1 fixing bolt of the engine compartment wiring harness bracket -arrow G-, and unscrew 1 fixing nut of the engine compartment wiring harness bracket -arrow H-.
Recommended tool: 10mm socket
-Arrow G-Torque: 9±1N m
-Arrow H- Torque: 9±1 N m



aaDisconnect 1 connector between the engine compartment wiring harness and the compressor high-pressure pipe -Arrow A-, and disconnect 1 connector between the engine compartment wiring harness and the electric compressor assembly -Arrow B-.

abDisconnect the 1 connector between the engine compartment wiring harness and the electronic fan -arrow C-, and unscrew the 3 fixing bolts of the engine compartment wiring harness fuse box -arrow D-.
Recommended tool: 10mm socket
Torque: 9±1N m



acDisconnect the 4 retaining clips of the engine compartment wiring harness - arrow E -.
Recommended tool: Clip remover

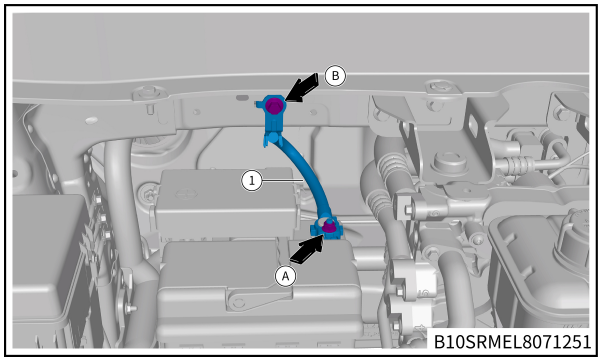
© 2026, All rights reserved

a. Unscrew the 5 mounting bolts of the ground wire for the engine compartment wiring harness -arrow A-, and release the 5 retaining clips of the engine compartment wiring harness -arrow B-.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m

b. Unscrew the 2 mounting bolts of the engine compartment wiring harness bracket -Arrow C-, and unscrew the 2 mounting nuts of the engine compartment wiring harness bracket -Arrow D-.
Recommended tool: 10mm socket
-Arrow C-Torque: 9±1N m
-Arrow D-Torque: 9±1N m

a. Remove the engine compartment wiring harness assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. If the double-sided clip or fixed clip is damaged, it must be replaced with a new double-sided clip or fixed clip.
   c. The retaining clips are securely fastened, the wiring harness routing is clear, and there is no looping.
   d. Ensure the wiring harness pass-through rubber grommet is securely snapped into place to prevent water leakage.
   e. After installation, check whether the relevant electrical components can function properly.

BATTERY NEGATIVE WIRING HARNESS ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the hood assembly.
3. Remove the battery negative terminal wiring harness assembly.

a. Loosen the 1 fixing nut securing the battery negative cable to the battery negative terminal - arrow A -, and remove the battery negative cable.
Recommended tool: 10mm socket
Torque: 6±1N m

b. Unscrew the 1 fixing bolt connecting the battery negative cable to the vehicle body -arrow B-, and remove the battery negative cable assembly ①.
Recommended tool: 10mm socket
Torque: 23±2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the bolts/nuts to the specified torque.
   b. After installation, check whether the relevant electrical components can function properly.

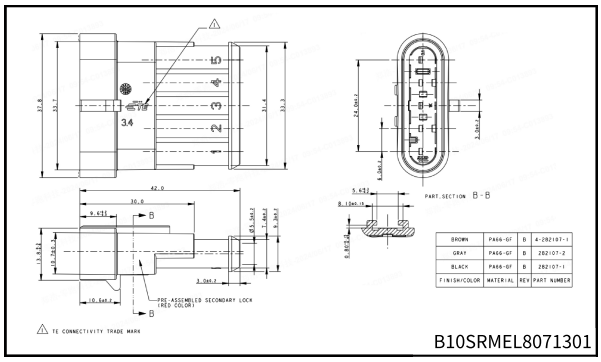
ALCOLOCK INTERLOCK DEVICE - INSTALLATION GUIDE



NOTE

Announcement: Alcolock - Installation Guide.

NOTE

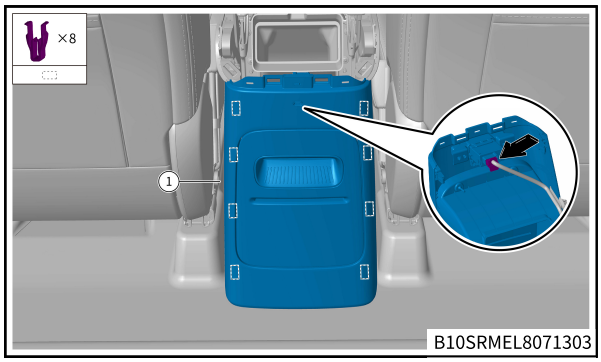
Keywords: Alcolock, Modification/Alteration, Wiring Harness/Wiring/Circuit.

1. Purpose: To comply with European regulatory requirements, the OEM shall issue this guide manual, which aims to guide customers on how to install the alcolock device.
2. Target vehicle: G117.
3. Symptom: None.
4. Operation procedure:
   Overview
   a. Leapmotor can be equipped with an alcolock interlock device (AI). This is optional equipment that can be installed by the after-sales service.
   b. This function is implemented based on EN50436-4(2022) (the European standard for alcolocks).
   c. The device communicates with the Vehicle Intelligent Unit (VIU) via hardwired signals, and the VIU is integrated into the multi-domain fusion controller (ICHS).
   d. If the coding parameter "Alcolock" in the VIU coding data string is set to "Enabled" (DID 0xF1A8), the function is activated. When the vehicle is ready to start, the driver must undergo a breath test via AI to start the vehicle. The alcolock device sends high and low level signals to the VIU to determine the lock/unlock command. If the signal input to the VIU is at a low level, the alcolock is considered locked; if it is at a high level, the alcolock is considered unlocked, and the VIU feeds back the alcolock status to the CAN network.
   e. Once the breath test is passed, the lock will be released.
   Components
   Perform the function of the following ICHS part number:
   a. ICHS Assembly Number: 8011037-AH01.
   b. The following device shall be connected: an alcolock device based on EN50436-7(2022).
   c. Coding parameters and description: Based on the coding parameter "Alcolock device" in the VIU coding data string (UDS) 0xF1A8, the alcolock function can be disabled (0x00 "None") or enabled (0x01 "Yes") via the OBD interface.
   Connector Pin Definition:

	Function	Cable or pin	Connection Position
1	Battery power supply: 12V	Red wire, Pin 5, 0.5 mm^2	Pin 5 of the connector, located in the sub-instrument

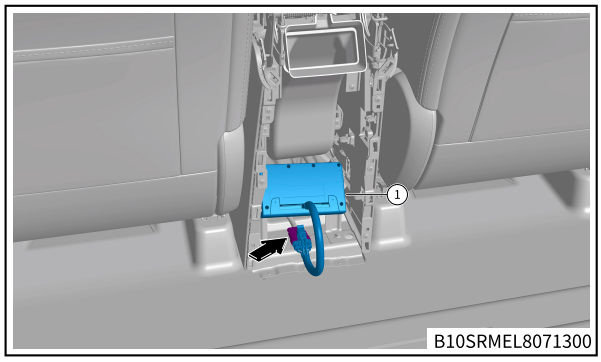
© 2026, All rights reserved

	Function	Cable or pin	Connection Position
2	Grounding	Black wire, pin 4, 0.5mm²	Pin 4 in the connector, located in the sub-instrument
3	Input/Output a. When the alcolock signal is grounded or at a high level, vehicle starting/movement shall be prohibited. b. After the alcolock signal, the vehicle should be allowed to start/move, with the signal at a high level or grounded.	Gray cable, Pin 2, 0.5mm²	Pin 2 in the connector, the connector is located in the sub-instrument
4	Vehicle Ready a. High level: For a nominal 12V, the alcolock is ready for use. b. Low level: May not be usable for a nominally grounded alcolock.	Brown cable, Pin 1, 0.5 mm²	Pin 1 in the connector, which is located in the sub-instrument.



© 2026, All rights reserved

	Function	Cable or pin	Connection Position
5	Wake up a. High level: The alcolock is in the awake state. b. Low level: The alcolock is in sleep mode.	Blue cable, Pin 3, 0.5mm²	Pin 3 in the connector, which is located in the sub-instrument

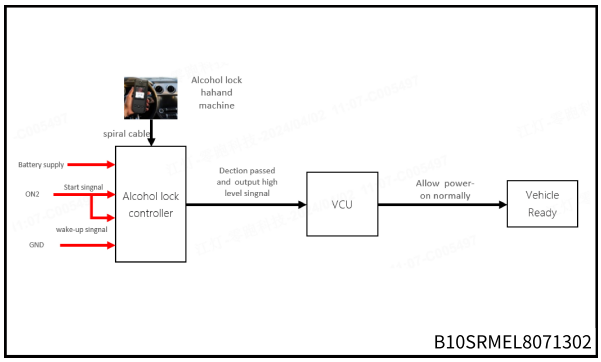


a. The alcolock device connector is located as shown in the figure - arrow -.

Installation steps:

a. Remove the passenger side air outlet assembly.
See:Passenger instrument panel air outlet assembly (page 5479)
b. Release the 8 double-sided clips of the center console rear panel assembly, and disconnect the 1 connector for the rear USB charging from the instrument wiring harness -arrow-.
Recommended tool: Interior trim removal tool
c. Remove the center console rear panel assembly ①.

© 2026, All rights reserved



d. Connect the connector -arrow- of alcolock device ① to the floor wiring harness assembly.

> **ATTENTION**
>
> - For specific details on alcolock device installation, refer to the alcolock device instructions.

e. The remaining installation steps are performed in reverse order, while noting the following:

f. The VIU must be coded accordingly: UDS (0xF1A8) coding parameter Alcohol Interlock = 0x01 "Yes" (instead of 0x00 "No").

Function Description:

- If the vehicle is powered on and started, the alcohol interlock program will be activated, and it will initiate a breath test.
- Once the breath test is passed, the vehicle can be started, and relevant information will be displayed on the ignition interlock.

Mode:

- Off: The vehicle is off;
- Conduction: Request and pass the breath test, the ignition interlock unlocks, allowing the vehicle to start;
- Disconnected: No test requested or test failed, the alcohol interlock is in the off state, and vehicle starting is not permitted;

When the vehicle is powered on, it will transition from the OFF state to the DISCONNECTED state. At this point, the vehicle is in the alcohol interlock state. When the alcohol interlock test is passed, it will enter the START state;

When the vehicle is disabled (ACC off), the alcohol interlock is powered on only, the detection function operates normally, but the detection results have no effect on vehicle starting.

5. Note: For technical support, please contact the regional technical support engineer.

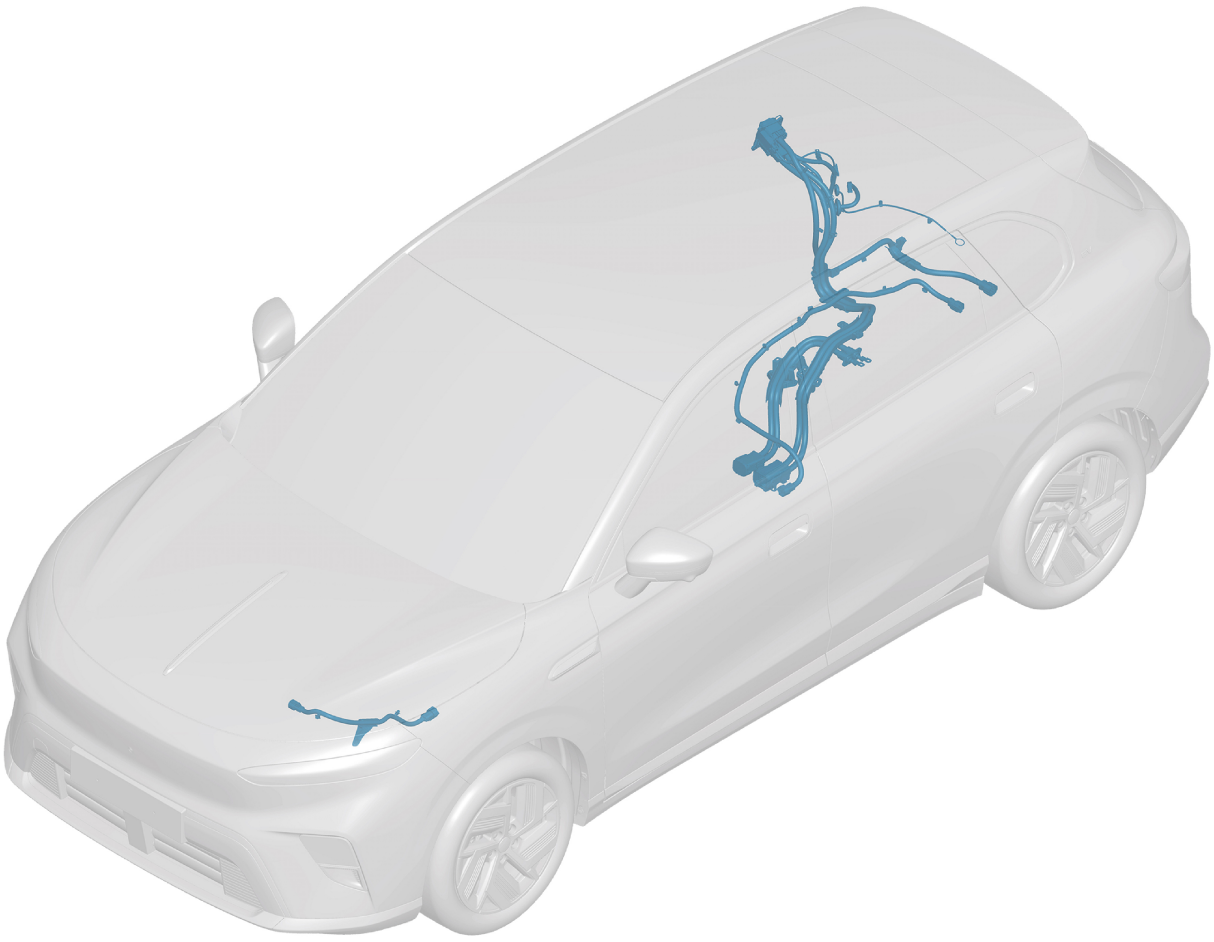
9.13 HIGH-VOLTAGE HARNESS SYSTEM

9.13.1 PRECAUTIONS



PRECAUTIONS

1. When disassembling and assembling the high-voltage wiring harness, pay attention to electrical safety. Do not work on live parts.
2. It is prohibited to replace the high-voltage wiring harness in a damp environment to prevent insulation failure caused by moisture.
3. Wiring harness connector, install it correctly according to the functional labels, close the anti-loosening safety clip, and ensure it is fully seated.
4. When repairing and securing the control cable, it is prohibited to secure the control cable to the high-voltage cable.
5. After disconnecting the cable, take care to protect the cable connector to prevent breakage or damage.

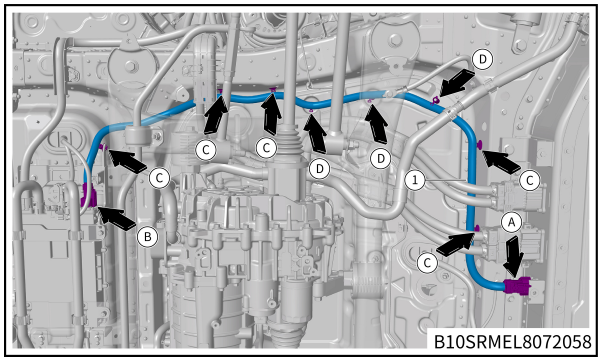
9.13.6 SERVICE AND REPAIR GUIDANCE



OBC CABLE ASSEMBLY

⚠ WARNING

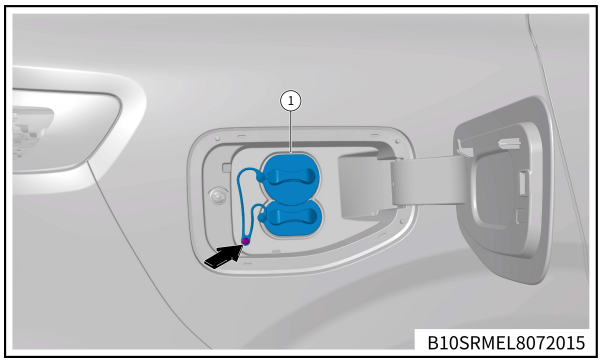
- Only qualified personnel (high-voltage electricians) can disconnect the power supply of the high-voltage system. Operations can only be performed 10 minutes after the high-voltage cable is disconnected; do not charge the vehicle when the high-voltage system is powered off.
- After disconnecting the high-voltage cable for 10 minutes, use an insulation tester at the 100 Vdc range to apply a voltage for 1 min to measure the insulation resistance between the terminals of the power battery and the housing.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Remove the OBC cable assembly.

a. Disconnect 1 connector -arrow A- between the OBC cable assembly and the battery pack, and disconnect 1 connector -arrow B- between the OBC cable assembly and the 2-in-1 power supply.
b. Release the 8 fixing clips of the OBC cable assembly -Arrow C-, -Arrow D-, and remove the OBC cable assembly ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   c. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

© 2026, All rights reserved

CHARGING PORT DUST COVER

REMOVAL PROCEDURE

1. Open the charging port door.
2. Remove the charging port dust cover.

a. Release the 1 retaining clip -arrow- of the charging socket dust cover, and remove the charging socket dust cover ①.
Recommended tool: Clip remover

SETUP

1. The installation procedure is performed in reverse order.

COMPRESSOR CABLE ASSEMBLY

WARNING

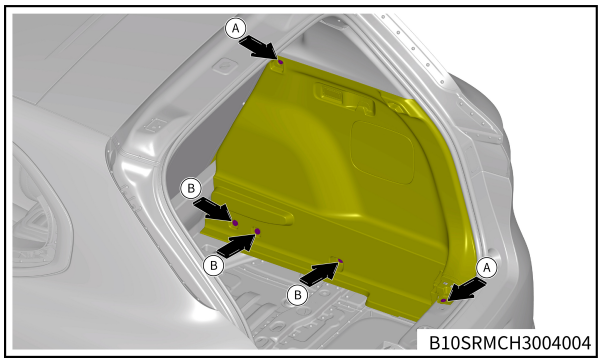
- Only qualified personnel (high-voltage electricians) can disconnect the power supply of the high-voltage system. Operations can only be performed 10 minutes after the high-voltage cable is disconnected; do not charge the vehicle when the high-voltage system is powered off.
- After disconnecting the high-voltage cable for 10 minutes, use an insulation tester at the 100 Vdc range to apply a voltage for 1 min to measure the insulation resistance between the terminals of the power battery and the housing.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Remove the compressor cable assembly.

a. Disconnect 1 connector -Arrow A- between the compressor cable assembly and the battery pack assembly, and unscrew 1 fixing bolt -Arrow B- of the compressor cable assembly.
Recommended tools: 8mm socket, clip remover
Torque: 9±1N m
b. Disconnect the 1 connector of the compressor cable assembly from the electric compressor -Arrow C-, and release the 2 retaining clips of the compressor cable assembly -Arrow D-.
Recommended tool: Clip remover
c. Remove the compressor cable assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   c. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

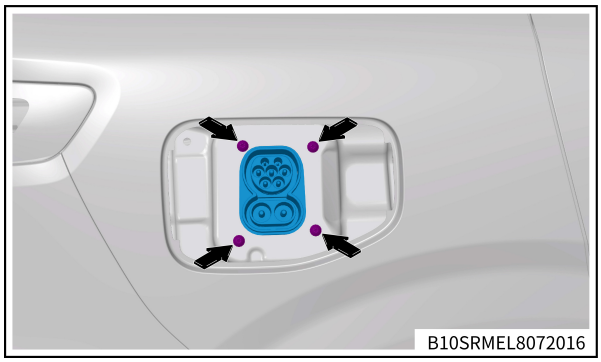
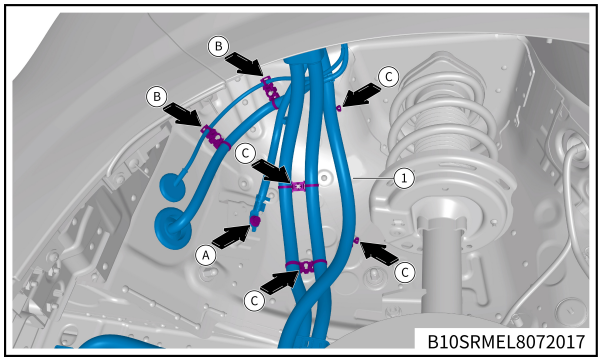
CHARGING PORT PANEL

REMOVAL PROCEDURE

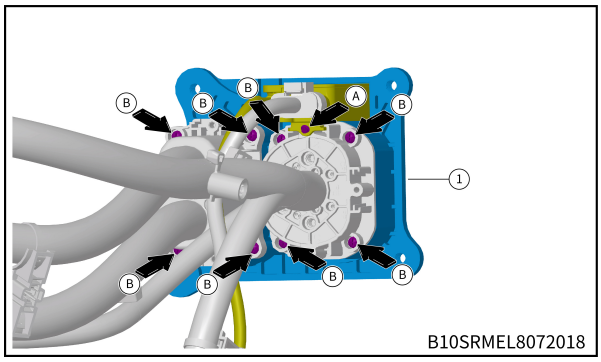


1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
4. Remove the charging port box assembly.
   See:Charging port housing assembly (page 6367)
5. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
6. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5405)
7. Remove the charging socket panel.

a. Unscrew the 2 mounting screws securing the right C-pillar lower trim panel assembly to the body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Unscrew the 3 mounting bolts connecting the right C-pillar lower interior trim panel assembly to the vehicle body -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
c. Lift up one side of the lower trim panel assembly below the right C-pillar.



d. Disconnect the 1 connector between the floor wiring harness and the fast and slow charging cable assembly - Arrow A -.
e. Detach the 3 retaining clips of the electronic lock cable -Arrow B-, -Arrow C-, and detach the 2 rubber grommets of the fast and slow charging cable assembly -Arrow D-, -Arrow E-.
   Recommended tool: Clip remover



f. Unscrew the 4 fixing bolts between the charging socket panel and the vehicle body -arrow-.
   Recommended tool: T30 Torx socket wrench
   Torque: 7±1N m

© 2026, All rights reserved

g. Unscrew the 1 fixing bolt of the ground wire for the fast and slow charging cable -Arrow A-, and disconnect the 2 fixing clips of the electronic lock cable -Arrow B-.
Recommended tools: 10mm socket, clip remover
Torque: 23±2N m

h. Release the 4 retaining clips of the AC/DC charging cable assembly -Arrow C-, and remove the AC/DC charging cable assembly ①.
Recommended tool: Clip remover

i. Unscrew the 1 fixing screw - arrow A - of the electronic lock, and remove the electronic lock.
Recommended tool: T20 Torx wrench

j. Unscrew the 8 fixing screws -Arrow B- between the charging socket panel and the fast and slow charging cable assembly, and remove the charging socket panel ①.
Recommended tool: 4mm hex key

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   c. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

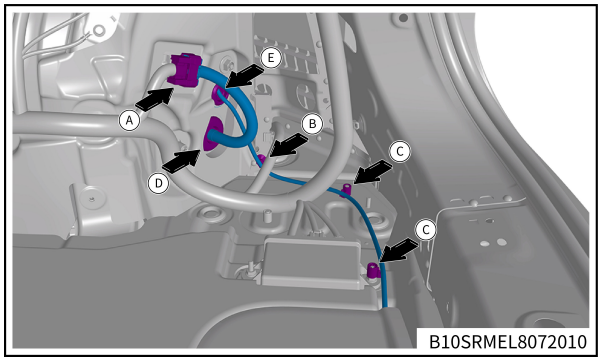
FAST AND SLOW CHARGING CABLE ASSEMBLY

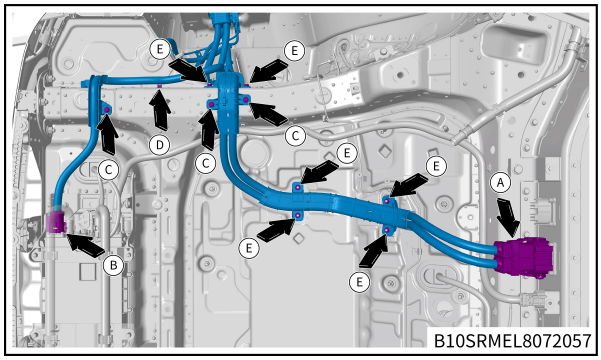
WARNING

- Only qualified personnel (high-voltage electricians) can disconnect the power supply of the high-voltage system. Operations can only be performed 10 minutes after the high-voltage cable is disconnected; do not charge the vehicle when the high-voltage system is powered off.
- After disconnecting the high-voltage cable for 10 minutes, use an insulation tester at the 100 Vdc range to apply a voltage for 1 min to measure the insulation resistance between the terminals of the power battery and the housing.

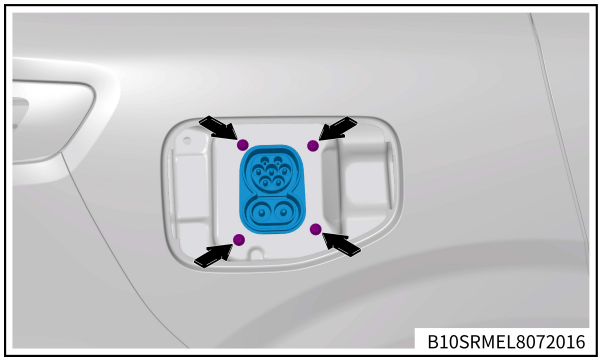


REMOVAL PROCEDURE

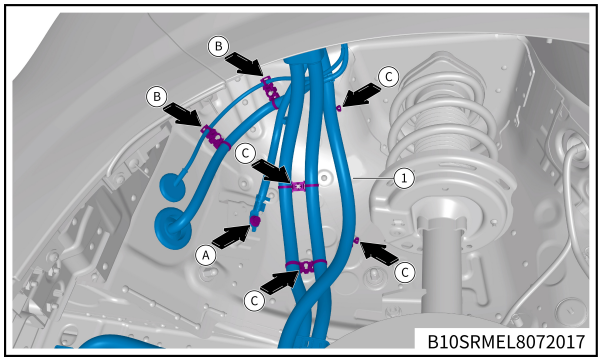
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
4. Remove the charging port box assembly.
   See:Charging port housing assembly (page 6367)
5. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
6. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5405)
7. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
8. Remove the fast and slow charging cable assembly.



a. Unscrew the 2 mounting screws securing the right C-pillar lower trim panel assembly to the body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Unscrew the 3 mounting bolts connecting the right C-pillar lower interior trim panel assembly to the vehicle body -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
c. Lift up one side of the lower trim panel assembly below the right C-pillar.



© 2026, All rights reserved



d. Disconnect the 1 connector between the floor wiring harness and the fast and slow charging cable assembly - Arrow A -.
e. Detach the 3 retaining clips of the electronic lock cable -Arrow B-, -Arrow C-, and detach the 2 rubber grommets of the fast and slow charging cable assembly -Arrow D-, -Arrow E-.
Recommended tool: Clip remover

f. Disconnect 1 connector between the fast and slow charging cable assembly and the battery pack - arrow A -, and disconnect 1 connector between the fast and slow charging cable assembly and the two-in-one power supply - arrow B -.
g. Unscrew the 3 fixing bolts of the cable protection box for the AC/DC charging cable assembly -arrow C-, and disengage the 1 fixing clip of the AC/DC charging cable assembly -arrow D-.
Recommended tools: 10mm socket, clip remover
Torque: 9±1N m
h. Unscrew the 6 fixing nuts on the cable protection box of the fast and slow charging cable assembly - Arrow E -.
Recommended tool: 10mm socket
Torque: 9±1N m

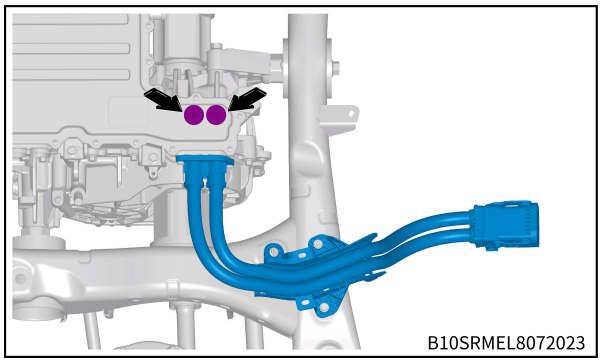
i. Unscrew the 4 fixing bolts between the charging socket panel and the vehicle body -arrow-.
Recommended tool: T30 Torx socket wrench
Torque: 7±1N m

j. Unscrew the 1 fixing bolt of the ground wire for the fast and slow charging cable -Arrow A-, and disconnect the 2 fixing clips of the electronic lock cable -Arrow B-.
Recommended tools: 10mm socket, clip remover
Torque: 23±2N m
k. Release the 4 retaining clips of the fast and slow charging cable assembly -Arrow C-, and

© 2026, All rights reserved

remove the fast and slow charging cable assembly ①.
Recommended tool: Clip remover

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   c. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

REAR MCU CABLE ASSEMBLY

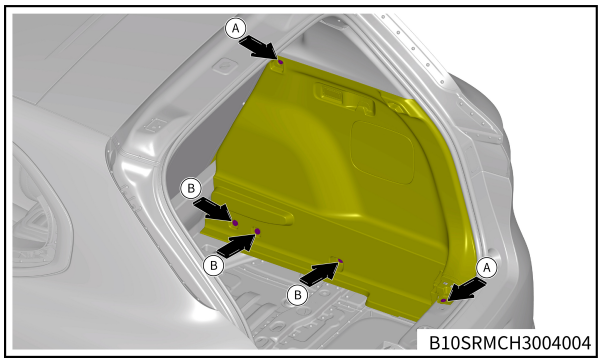
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear subframe assembly.
   See:Rear subframe assembly (page 2920)
4. Remove the rear MCU cable assembly.

a. Unscrew the 2 bolt plugs on the rear MCU cable assembly - arrow -.
Recommended tool: T45 Torx key

b. Unscrew the 2 fixing bolts -Arrow A- securing the rear MCU cable assembly to the electric drive copper busbar.
Recommended tool: T45 Torx key
Torque: 23±2N m
c. Unscrew the 2 fixing bolts -Arrow B- connecting the rear MCU cable assembly to the electric drive controller housing.
Recommended tool: T30 Torx socket wrench
Torque: 9±1N m
d. Unscrew the 1 fixing bolt -Arrow C- of the rear MCU cable assembly grommet box, and unscrew the 2 fixing nuts -Arrow D- of the rear MCU cable assembly grommet box.
Recommended tools: 8mm socket, 10mm socket
-Arrow C-Torque: 9±1N m
-Arrow D-Torque: 9±1N m
e. Remove the rear MCU cable assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. Tighten the fixing bolt to the specified torque.
   b. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   c. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

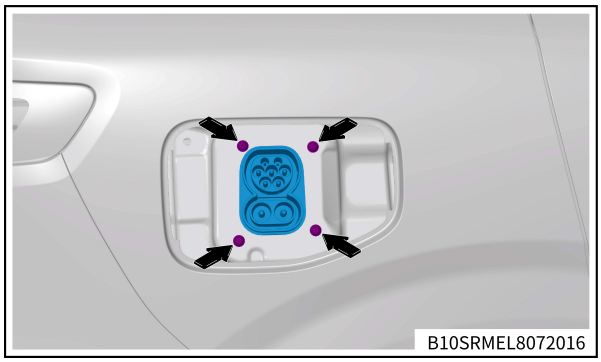
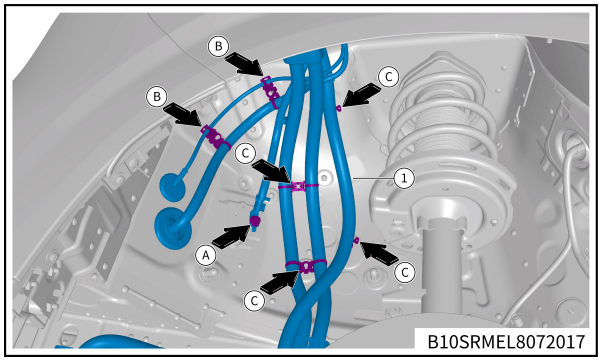
ELECTRONIC LOCK

REMOVAL PROCEDURE

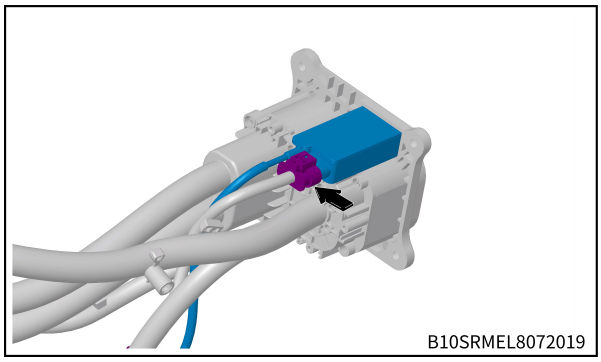


1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
4. Remove the charging port box assembly.
   See:Charging port housing assembly (page 6367)
5. Remove the luggage compartment cover assembly.
   See:Luggage compartment cover assembly (page 5549)
6. Remove the liftgate sill trim panel assembly.
   See:Liftgate sill interior trim panel assembly (page 5405)
7. Remove the electronic lock.

a. Unscrew the 2 mounting screws securing the right C-pillar lower trim panel assembly to the body - Arrow A -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.2N m
b. Unscrew the 3 mounting bolts connecting the right C-pillar lower interior trim panel assembly to the vehicle body -Arrow B-.
   Recommended tool: 10mm socket
   Torque: 5±1N m
c. Lift up one side of the lower trim panel assembly below the right C-pillar.

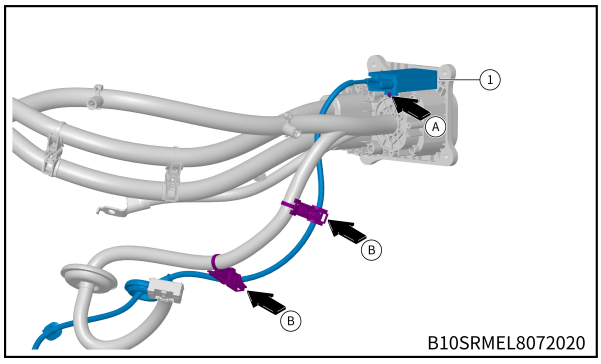


d. Disconnect the 1 connector between the floor wiring harness and the fast and slow charging cable assembly - Arrow A -.
e. Detach the 3 retaining clips of the electronic lock cable -Arrow B-, -Arrow C-, and detach the 2 rubber grommets of the fast and slow charging cable assembly -Arrow D-, -Arrow E-.
   Recommended tool: Clip remover



f. Unscrew the 4 fixing bolts between the charging socket panel and the vehicle body -arrow-.
   Recommended tool: T30 Torx socket wrench
   Torque: 7±1N m

© 2026, All rights reserved



g. Unscrew the 1 fixing bolt of the ground wire for the fast and slow charging cable -Arrow A-, and disconnect the 2 fixing clips of the electronic lock cable -Arrow B-.
Recommended tools: 10mm socket, clip remover
Torque: 23±2N m

h. Release the 4 retaining clips of the AC/DC charging cable assembly -Arrow C-, and remove the AC/DC charging cable assembly ①.
Recommended tool: Clip remover

i. Disconnect the 1 connector of the electronic lock -arrow-.

j. Unscrew the 1 fixing screw of the electronic lock -Arrow A-, detach the 2 fixing cable ties of the electronic lock -Arrow B-, and remove the electronic lock ①.
Recommended tool: T20 Torx wrench

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the outer insulation tape rubs against the vehicle body or other components.
   b. Check whether the retaining clips and connectors are securely fastened, and check for any issues such as improperly seated connectors or bent terminals.

9.14 LOW-VOLTAGE BATTERY SYSTEM

9.14.1 PRECAUTIONS

PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Warning regarding disconnecting the battery:

> **ATTENTION**
>
> Before servicing any electrical components, the central control panel must be powered off for maintenance, and all electrical loads must be turned off, unless otherwise specified in the operating procedures. If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

2. Precautions for setting the central control panel to the maintenance power-off state when disconnecting the battery:

> **ATTENTION**
>
> Whenever connecting or disconnecting the battery cables, battery charger, or jumper cables, be sure to set the central control screen to the maintenance power-off state. Otherwise, it may cause damage to control modules or other electrical components.

© 2026, All rights reserved

9.14.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Structure Introduction

1. This vehicle is equipped with a 12V, 35Ah maintenance-free lead-acid battery, installed on the battery tray and secured by the battery hold-down clamp.

Feature Introduction

1. The low-voltage battery has the following functions:
    - Provide starting energy for the power battery;
    - Supply power to the electrical system;
    - Buffer storage voltage;

Maintenance-free lead-acid batteries have the following advantages:

- Requires no electrolyte top-up throughout its entire service life;
- Overcharge protection measures are adopted;
- The battery is not prone to self-discharge during long-term storage;

Operating Principle

1. The operating process of the battery is the charging and discharging process, which is the process of mutual conversion between chemical energy and electrical energy;
2. When the battery supplies power externally, it converts chemical energy into electrical energy, and the battery is in the discharging process.

9.15 ELECTRICAL ACCESSORY SYSTEM

9.15.1 PRECAUTIONS

PRECAUTIONS

WARNINGS AND PRECAUTIONS

1. Warning regarding disconnecting the battery:

> **ATTENTION**
>
> Before servicing any electrical components, the central control panel must be powered off for maintenance, and all electrical loads must be turned off, unless otherwise specified in the operating procedures. If tools or equipment can easily come into contact with exposed live electrical terminals, the negative battery cable must also be disconnected. Failure to comply with these safety instructions may result in personal injury or damage to the vehicle or its components.

2. Precautions for setting the central control panel to the maintenance power-off state when disconnecting the battery:

> **ATTENTION**
>
> Whenever connecting or disconnecting the battery cables, battery charger, or jumper cables, be sure to set the central control screen to the maintenance power-off state. Otherwise, it may cause damage to control modules or other electrical components.

3. Warning Regarding Mobile Phone Wireless Charging Function

> **ATTENTION**
>
> - When the driver is not in the vehicle, please do not leave your mobile phone charging inside to avoid safety hazards.
> - While driving, do not check the mobile phone charging status for an extended period to avoid traffic safety hazards.
> - Please do not place heavy objects in the charging area to prevent damage to the mobile phone wireless charging system.
> - If the product malfunctions and fails to operate normally, please discontinue use and promptly visit a Leapmotor Service Center or authorized service store for inspection and repair.
> - The Company shall not be held liable for any issues caused by improper use (such as connecting external wireless charging coils, etc.); the free warranty service will be voided if the product has been disassembled or modified.
> - Wireless charging can heat metal objects. Before charging, please ensure that there are no metal foreign objects on the back of the mobile phone or in the front storage compartment; otherwise, the metal objects may be heated or damaged, or even cause safety incidents. Metal foreign objects here refer to other objects containing metal components, including but not limited to coins, keys, chips, and magnetic cards.

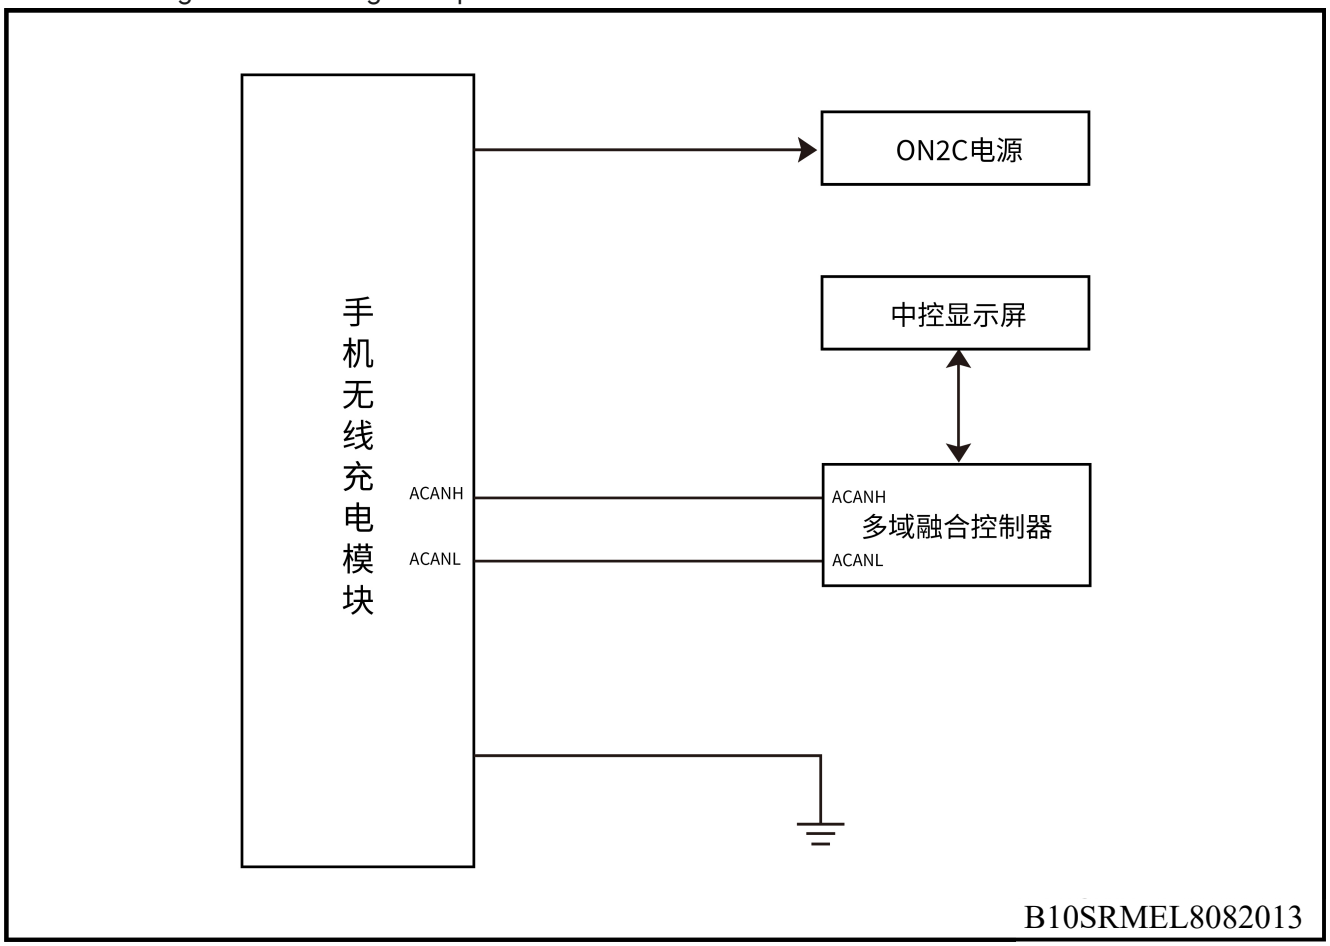
© 2026, All rights reserved

- Do not spill water into the front storage box to prevent water from entering the wireless charging module and causing damage to electronic components.
- The Company assumes no responsibility for any issues caused by an external wireless charging coil. Please use with caution.

4. Precautions for Wireless Phone Charging Function

ATTENTION

- Only one mobile phone can be charged at a time.
- On bumpy roads, wireless phone charging may intermittently stop and resume. If the phone moves out of the charging area and stops charging, reposition it back to the charging area.
- Mobile phone charging may stop when the temperature is too high (above 85°) or too low (below -40°), and will resume once the temperature returns to normal.



© 2026, All rights reserved

9.15.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

Mobile phone wireless charging system:

1. System Overview:
   - Mobile phone wireless charging utilizes the principle of electromagnetic induction to enable wireless charging without the need to connect a charging cable. When the wireless charging function is active, the wireless charging indicator light on the central control screen will illuminate.
   - The mobile phone wireless charging sensing area is located in front of the front center armrest.
2. Schematic Diagram of Working Principle:

Mobile phone wireless charging module: The system power is ON, the power supply voltage is normal, there is no key search signal, and the temperature detection is normal; a receiver is detected, the connection is normal, and the wireless charging function is activated.
Telematics Host: Sends the operating status of the key search signal to the mobile phone wireless charging module via the CAN network to interrupt the wireless charging output function.
Multi-domain fusion controller: Receives the on/off signal of the mobile phone wireless charging function and sends it to the mobile phone wireless charging module via the CAN system; at the same time, it sends the operating status indication from the mobile phone wireless charging module to the central control screen.
Central control display: Primarily used for enabling and disabling the wireless phone charging function and indicating the operating status.

Auxiliary power system:

1. USB interface
   - The center console USB mounting plate and the center console rear panel assembly each have a USB port, which supports USB 2.0 data transfer and charging.
2. 12V power interface
   - The 12V power interface is located on the USB mounting plate of the center console, and can be used by opening the trim cover.
3. Type-C interface
   - The center console USB mounting plate and the center console rear panel assembly each have a Type-C port, which supports charging only.

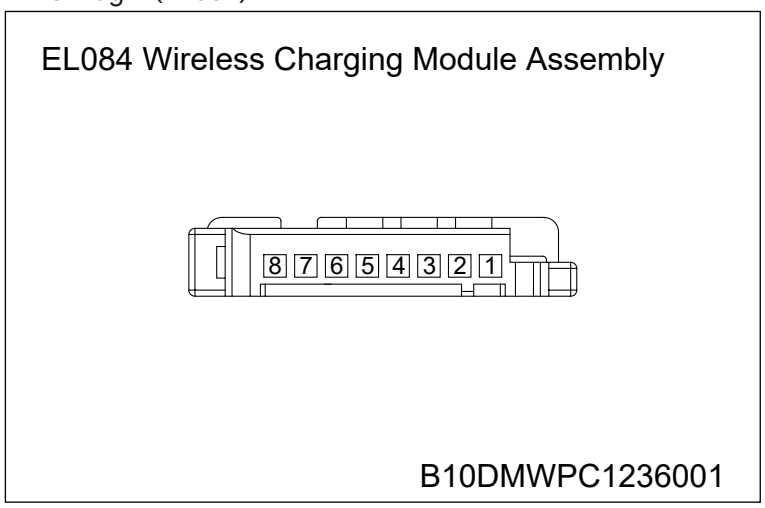
9.15.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS - WPC

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic connector. By utilizing the WPC data list and reading the data list displayed on the diagnostic tool, you can read switch and sensor values without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-WPC

1. Confirm fault symptoms
   a. The most difficult situation in troubleshooting is when no symptoms appear. In this case, the fault described by the user must be thoroughly analyzed. Then, simulate the same or similar conditions and environment as when the fault occurred in the customer's vehicle. Regardless of how experienced or skilled the technician is, if troubleshooting is performed without confirming the fault symptoms, some important things will be overlooked during the repair, and incorrect guesses will be made in some places. This will lead to the inability to proceed with troubleshooting.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

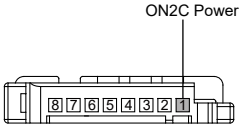
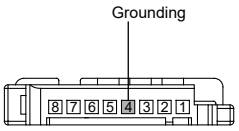
DTC: B162017-WPC

Fault code	Description
B162017	High power supply voltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the wireless charging module assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the wireless charging module assembly fuse RF05. Fuse specification: RF05 10A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the wireless charging module assembly.	
EL084 Wireless Charging Module Assembly  B10DMWPC1236003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL084 of the wireless c harging module assembly. C Connect the negative terminal of the battery, and power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure whether the voltage between terminal 1 of the wire har ness connector EL084 of the wireless charging module asse mbly and the vehicle body ground is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard val ue.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the wireless charging module assembly.	
EL084 Wireless Charging Module Assembly  B10DMWPC1236004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL084 of the wireless c harging module assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of the wire harness c onnector EL084 of the wireless charging module assembly and the vehicle body ground to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replace the wireless charging module assembly.	
	A Replace the wireless charging module assembly. B After replacing the wireless charging module assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

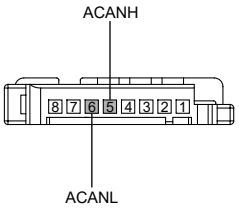
DTC: U007388-WPC

Fault code	Description
U007388	CAN Bus Off



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the wireless charging module assembly is normal.	
EL084 Wireless Charging Module Assembly  B10DMWPC1236005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL084 of the wireless charging module assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 5 and body ground, and between terminal 6 and body ground, at the harness connector EL084 of the wireless charging module assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply and ground of the wireless charging module assembly.	
	A Check if the power supply and ground of the wireless charging module assembly are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the wireless charging module assembly.	
	A Replace the wireless charging module assembly. B After replacing the wireless charging module assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

9.15.8 SERVICE AND REPAIR GUIDANCE

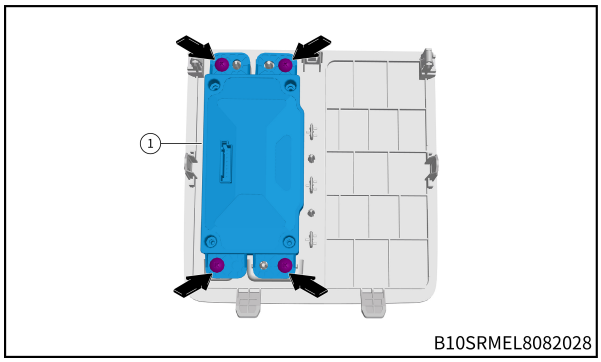
REAR BUMPER LOW-FREQUENCY ANTENNA

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear bumper assembly.
   See:Rear bumper assembly (page 5261)
4. Remove the low-frequency antenna on the rear bumper.

a. Disconnect the 1 connector between the rear bumper wiring harness and the rear bumper low-frequency antenna -arrow A-, and release the 1 retaining clip of the rear bumper low-frequency antenna -arrow B-.
b. Remove the rear bumper low-frequency antenna ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the rear bumper low-frequency antenna to ensure it operates normally.

© 2026, All rights reserved

WIRELESS CHARGING MODULE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the wireless charging pad assembly.
   See:Wireless charging pad assembly (page 5470)
4. Remove the wireless charging module assembly.

a. Unscrew the 4 mounting screws connecting the wireless charging module assembly to the wireless charging pad assembly - arrow -, and remove the wireless charging module assembly ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.2N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Replacing the wireless charging module assembly requires the use of a diagnostic tool to perform the following operations:

> **ATTENTION**
>
> After installing the controller, first read its software version. If the new version is higher than or equal to the old version, it can be used normally. If the new version is lower than the old version, the controller software must first be updated to the original vehicle version or the corresponding OTA version.

   - Write VIN: Select the corresponding vehicle model - System Diagnosis - Wireless Power Charging Module Assembly (WPC) - Data Writing - Write VIN.

> **ATTENTION**
>
> After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

   b. After installation, test the wireless charging module assembly to ensure it operates normally.

© 2026, All rights reserved

IN-VEHICLE INTEGRATED IMMO LOW-FREQUENCY ANTENNA

REMOVAL PROCEDURE

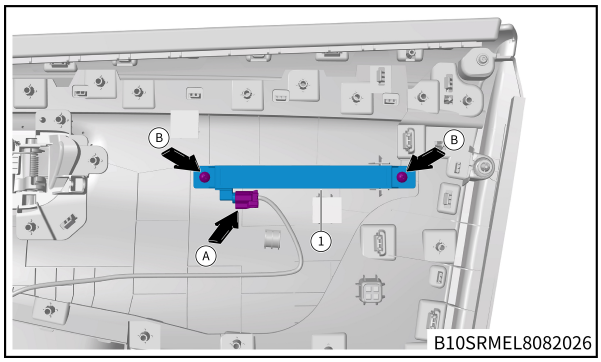
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the sub-instrument panel body and accessory assembly.
   See:Center console body and accessory assembly (page 5471)
4. Remove the center console front upper trim panel assembly.
   See:Passenger Instrument Panel Front Upper Trim Panel Assembly (page 5486)
5. Remove the integrated IMMO low-frequency antenna inside the vehicle.

a. Unscrew the 2 mounting screws -arrow- of the interior integrated IMMO low-frequency antenna, and remove the interior integrated IMMO low-frequency antenna ①.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the integrated IMMO low-frequency antenna in the vehicle to ensure it functions properly.

© 2026, All rights reserved



DOOR LOW FREQUENCY ANTENNA

NOTE

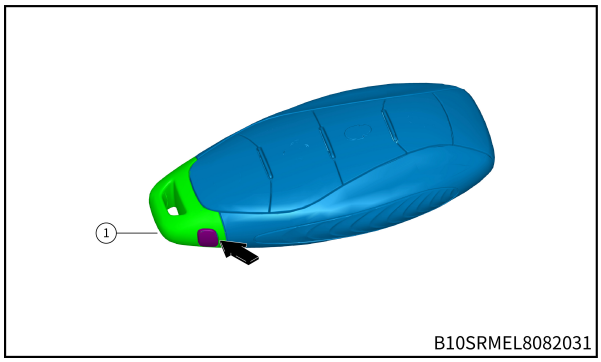
This section describes the removal and installation of the low-frequency antenna on the left door. For the removal and installation of the low-frequency antenna on the right door, please refer to the left side.

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front left door interior trim panel assembly.
   See:Front left door trim panel assembly (page 5352)
4. Remove the door low-frequency antenna.

a. Disconnect the 1 connector -Arrow A- between the front door trim panel wiring harness and the door low-frequency antenna, and unscrew the 2 fixing screws -Arrow B- of the door low-frequency antenna.
Recommended tool: Phillips screwdriver
Torque: 1.5±0.4N m
b. Remove the door low-frequency antenna ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the door low-frequency antenna to ensure it functions properly.

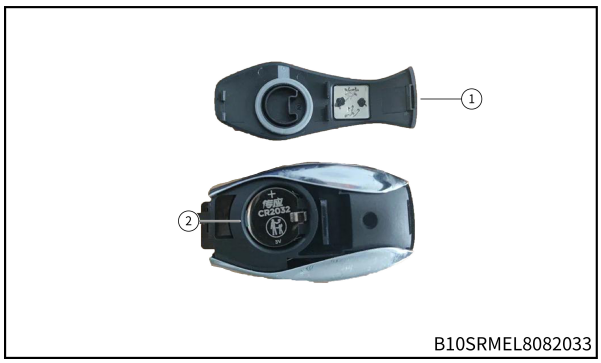
REMOTE KEY BATTERY REPLACEMENT INSTRUCTIONS

KEY BATTERY REPLACEMENT PROCEDURE

1. Steps for replacing the remote key battery.



B10SRMEL8082031

a. Press the button on the side of the remote key -arrow- to remove the rear section of the remote key ①.

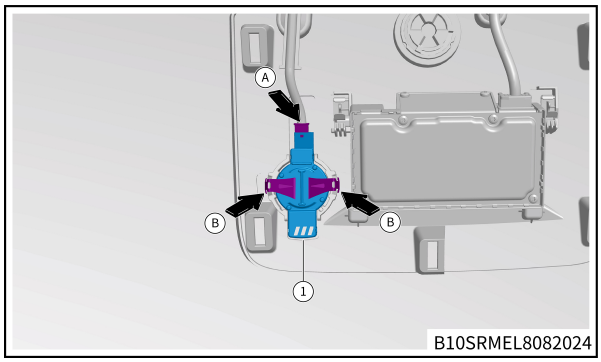
B10SRMEL8082032

b. Release the retaining clip on the back cover of the remote key -arrow-.

B10SRMEL8082033

c. Remove the rear cover ① of the remote key, take out the battery ②, and replace it.

ATTENTION



- Insert the new battery at an angle into the battery compartment; ensure that the "+" terminal of the battery faces up and the "-" terminal faces down;
- Hold the key with both hands, align the key rear cover with the fixing clips and press it in, and ensure the key rear cover is fully seated.

RAIN/LIGHT SENSOR

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
4. Remove the rain and light sensor.

a. Disconnect the 1 connector -Arrow A- between the instrument wiring harness and the rain and light sensor, and release the 2 retaining clips -Arrow B- of the rain and light sensor.
b. Remove the rain and light sensor ①.

ATTENTION

After removing the rain and light sensor, seal it in a sealed bag to prevent dust ingress. Wipe away any dust before installation, as contact with dust may affect the product's functionality and performance.

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. Use a non-woven cloth dampened with 75% pure industrial alcohol to clean the glass mounting position, and ensure the glass is clean and neat.
   b. After installation, test the rain and light sensor to ensure it functions properly.

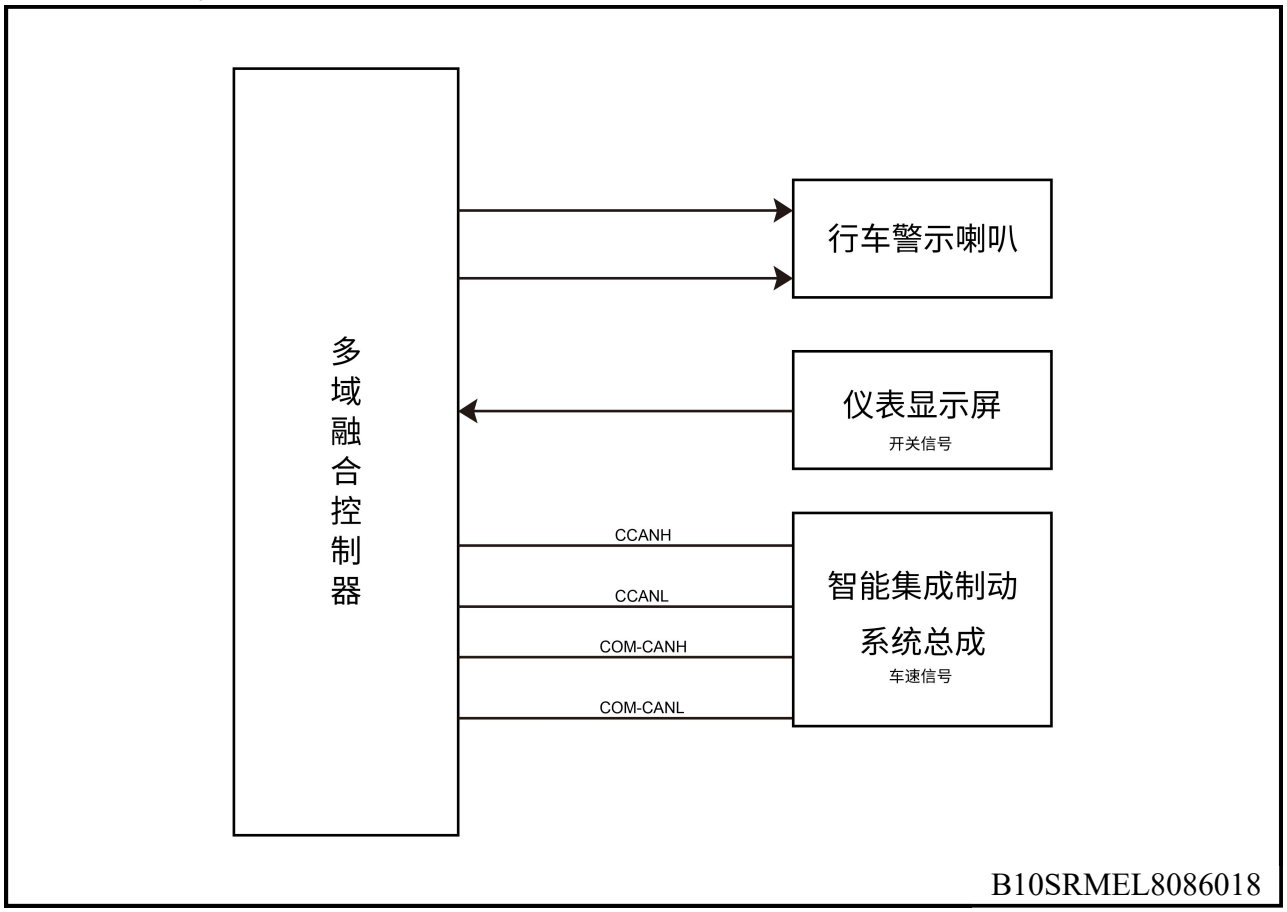
9.16 MULTIMEDIA ACCESSORY SYSTEM

9.16.1 PRECAUTIONS

OPERATION AND DESCRIPTION

OPERATION AND DESCRIPTION



1. Pedestrian Warning System Overview
   When a battery electric vehicle is driven at low speeds in pure electric mode, the exterior noise is significantly reduced compared to traditional internal combustion engine vehicles. This makes it difficult for other road users, including pedestrians and cyclists, especially the blind and visually impaired, to detect the approaching vehicle, which can easily lead to traffic accidents. Therefore, a pedestrian warning sound device is added to the vehicle to prevent accidents.

© 2026, All rights reserved

9.16.2 STRUCTURE AND PRINCIPLE INTRODUCTION

STRUCTURE AND PRINCIPLE INTRODUCTION

1. Pedestrian Warning System
   a. The Pedestrian Warning System is a product specifically developed for electric vehicles, and its sole function is to generate noise. It emits noise when the electric vehicle is traveling at low speeds to indicate the vehicle's presence to other road users, thereby serving as a warning.
   b. After the instrument cluster is powered on, the low-speed warning system indicator illuminates and turns off after the low-speed warning horn is confirmed to be functioning normally. When the low-speed warning device receives valid signals such as vehicle status, gear position, and vehicle speed that meet the sounding requirements, the audible warning function is activated. You can turn the low-speed warning function on or off on the central control screen.
   c. Pedestrian Warning System Trigger Conditions:
      - Controlled by a switch, the switch status is not memorized after power-off, and it defaults to ON upon power-on.
      - The pedestrian warning sound is triggered when the vehicle speed is greater than 0 km/h and less than 30 km/h, and within the trigger range, the volume of the pedestrian warning sound increases as the vehicle speed increases.

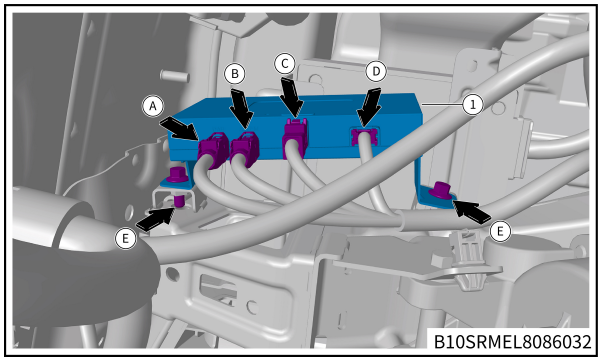
4G INTEGRATED ANTENNA ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel body and accessory assembly.
   See:Instrument panel body and accessories assembly (page 5459)
4. Remove the 4G integrated antenna assembly.

a. Disconnect 1 connector between the 4G integrated antenna assembly and the telematics host - Arrow A -, and unscrew the 2 mounting screws of the 4G integrated antenna assembly - Arrow B -.
   Recommended tool: Phillips screwdriver
   Torque: 2±0.5N m
b. Remove the 4G integrated antenna assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the 4G integrated antenna assembly to ensure proper operation.

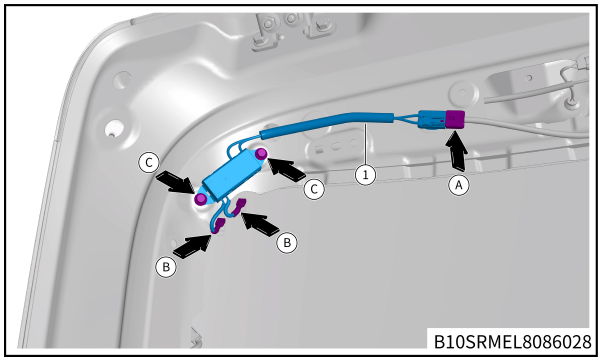
DAB HEAD UNIT ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the instrument panel lower left trim panel assembly.
   See:Lower left instrument panel trim assembly (page 5417)
4. Remove the main zone controller.
   See:Master Zone Controller (page 6640)
5. Remove the DAB head unit assembly.

a. Disconnect the 4 connectors -Arrow A-, -Arrow B-, -Arrow C-, and -Arrow D- between the DAB head unit assembly and the engine compartment wiring harness.
b. Unscrew the 2 fixing bolts -arrow E- of the DAB head unit assembly, and remove the DAB head unit assembly ①.
Recommended tool: 8mm socket
Torque: 9±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation is completed, test the DAB head unit assembly to ensure it operates normally.

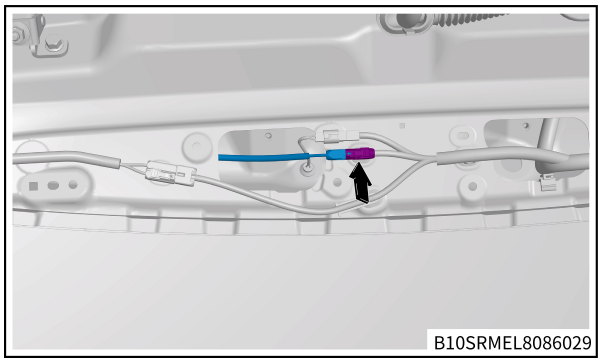
FM ANTENNA AMPLIFIER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the right interior trim panel assembly of the liftgate.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the FM antenna amplifier.

a. Disconnect the 1 connector -Arrow A- between the FM antenna amplifier and the liftgate wiring harness, and disconnect the 2 connectors -Arrow B- between the FM antenna amplifier and the rear windshield assembly.
b. Unscrew the 2 mounting bolts of the FM antenna amplifier -Arrow C-, and remove the FM antenna amplifier ①.
   Recommended tool: 8mm socket
   Torque: 5±1N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the FM antenna amplifier to ensure it operates normally.

GPS ANTENNA ASSEMBLY

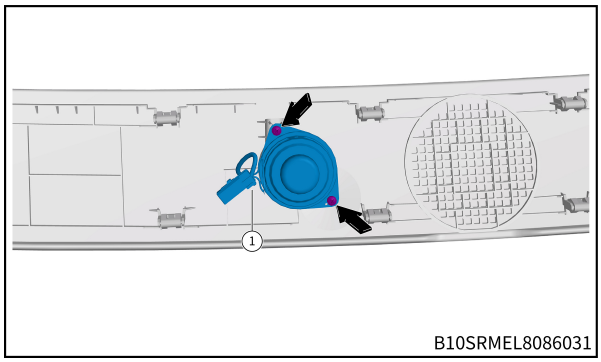
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the upper interior trim panel assembly of the liftgate.
   See:Liftgate upper interior trim panel assembly (page 5377)
4. Remove the liftgate left/right interior trim panel assembly.
   See:Left liftgate interior trim panel assembly (page 5374)
5. Remove the lower interior trim panel assembly of the liftgate.
   See:Tailgate Lower Interior Trim Panel Assembly (page 5378)
6. Remove the spoiler assembly.
   See:Spoiler assembly (page 5312)
7. Remove the GPS antenna assembly.

a. Disconnect the connector -arrow- between the GPS antenna assembly and the liftgate wiring harness.

b. Detach 1 grommet of the GPS antenna assembly -Arrow A-, detach the fixing adhesive of the GPS antenna assembly -Arrow B-, and remove the GPS antenna assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the GPS antenna assembly to ensure it functions properly.

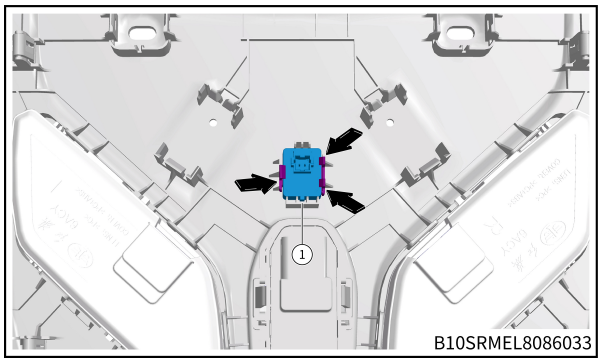
SPEAKER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the speaker cover assembly.
   See:Speaker cover assembly (page 5415)
4. Remove the speaker.

a. Unscrew the 2 fixing screws of the speaker -arrow-, and remove the speaker ①.
Recommended tool: Phillips screwdriver
Torque: 1±0.2N m

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, the test speaker should function properly.

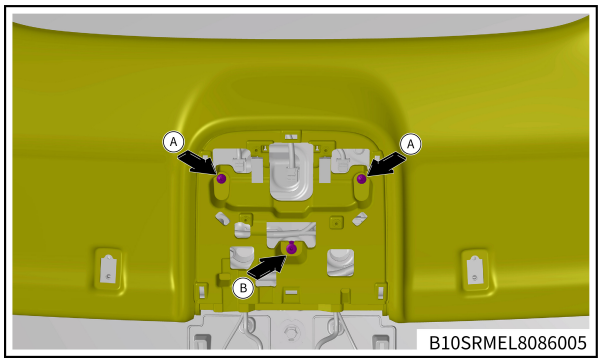
SINGLE MICROPHONE ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
4. Remove the single microphone assembly.

a. Release the 3 retaining clips of the single microphone assembly -arrow-, and remove the single microphone assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the single microphone assembly to ensure it functions properly.

ACTIVE DUAL MICROPHONE ASSEMBLY

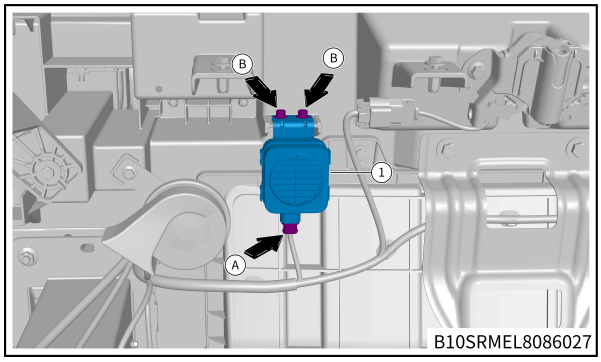
REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the monocular upper cover assembly.
   See:Monocular upper cover assembly (page 5388)
4. Remove the left/right A-pillar upper interior trim panel assembly.
   See:Left A-pillar upper interior trim panel assembly (page 5386)
5. Remove the left/right upper B-pillar interior trim panel assembly.
   See:Left B-pillar upper interior trim panel assembly (page 5397)
6. Remove the front passenger's folding roof handle assembly.
   See:Front passenger folding roof handle assembly (page 5525)
7. Remove the left/right sun visor assembly.
   See:Left sun visor assembly (page 5522)
8. Remove the left/right mounting bracket B.
   See:Mount B (page 5527)
9. Remove the active dual microphone assembly.

a. Unscrew the 2 retaining screws -Arrow A- of the headliner assembly, disengage the 1 retaining clip -Arrow B- of the headliner assembly, and lift the front end of the headliner assembly.
Recommended tool: Phillips screwdriver

b. Disconnect the 1 connector - arrow - between the active dual microphone assembly and the instrument wiring harness, and release the connector clip.
Recommended tool: Clip remover
c. Remove the active dual microphone assembly ①.

SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the active dual-microphone assembly to ensure it operates normally.

DRIVING WARNING HORN ASSEMBLY

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the driving warning horn assembly.

a. Disconnect the 1 connector between the warning horn assembly and the engine compartment wiring harness - Arrow A -.
b. Unscrew the 2 mounting bolts of the warning horn assembly -Arrow B-, and remove the warning horn assembly ①.
   Recommended tool: 8mm socket
   Torque: 7±1N m

SETUP

1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, test the horn assembly to ensure it operates normally.
