CONTENTS

Chapter 1 - Overview 95
1.1 - How to Use This Manual 95
1.1.1 - Definitions of Terms 95
1.1.2 - Foreword 96
1.1.3 - Unit 99
1.1.4 - Overview 100
1.1.5 - Service Procedures 101
1.1.6 - Controller English Abbreviations 102
1.2 - Danger, Warning, Caution 104
1.2.1 - Safety Measures for Electric Vehicle Repair 104
1.2.2 - Safety Precautions for Maintenance Operations 106
1.2.3 - Insulating Protective Clothing and Insulated Tools 110
1.2.4 - DANGER, WARNING 116
1.2.5 - Identification and Handling of High-Voltage Harness and Components 121
1.2.6 - High-Voltage Power-On and Power-Off Operations 123
1.3 - Vehicle Parameters 125
1.3.1 - Standard Value of Insulation Resistance for High-Voltage Components 125
1.3.2 - Main Structure and Technical Parameters 127
1.3.3 - Performance parameters 131
1.3.4 - Basic parameters of complete vehicle 132
1.3.5 - Lighting and Signal Lamp Parameters 134
1.3.6 - Battery Parameters 135
1.4 - Identification 136
1.4.1 - Power battery nameplate 136
1.4.2 - Vehicle Identification Number Coding Rules 137
1.4.3 - Vehicle Identification Number (VIN) 138
1.4.4 - Vehicle tire inflation label 141
1.4.5 - Drive Motor Assembly Nameplate 142
1.4.6 - Vehicle nameplate label 143
1.5 - Vehicle Lifting and Support 144
1.5.1 - Vehicle Support 144
1.5.2 - Vehicle Lifting 147

1.6 - Vehicle towing....148
1.6.1 - Trailer Towing....148
1.6.2 - Emergency traction....149
1.6.3 - Emergency Towing Requirements....150
1.7 - Maintenance Settings....151
1.7.1 - Flashing of Each Controller After Replacement....151
1.8 - Diagnostic Tool Application and Description....164
1.8.1 - Diagnostic Tool Instructions....164
1.9 - Water Leakage Repair Instructions....166
1.9.1 - Repair of Water Leakage in Fixed Windows....166
1.9.2 - Diagnostic Information and Procedures....167
1.9.3 - Repair of Vehicle Body Water Leakage....169
1.10 - Noise, Vibration and Unusual Noises....170
1.10.1 - Description and Operation....170
1.10.2 - Diagnosis and Testing....172
1.11 - Health and Safety....173
1.11.1 - Brake fluid....173
1.11.2 - Lubricants and Greases....174
1.11.3 - Air conditioning refrigerant....175
1.11.4 - Airbag....176
1.11.5 - Electric shock....177
1.11.6 - Fire....178
1.11.7 - Safety Instructions....179
1.11.8 - Asbestos....180
1.11.9 - Battery acid....181
1.11.10 - Dust....182
1.11.11 - Chemical Materials....183
1.11.12 - Fiber isolation....184
1.11.13 - Acids and Bases....185
1.11.14 - Foam-Polyurethane....186
1.11.15 - Noise....187
1.11.16 - Adhesives and Sealants....188
1.11.17 - General Workshop and Equipment....190
1.11.18 - First Aid....191
Chapter 2 - Maintenance and Service....192

2.1 - Maintenance Manual 192
2.1.1 - Precautions 192
2.1.1.1 - Maintenance Precautions 192
2.1.2 - Maintenance Schedule 194
2.1.2.1 - Fluid Specifications and Capacities 194
2.1.2.2 - Maintenance Schedule 195
2.1.2.3 - Maintenance Content 201
2.1.3 - Vehicle Maintenance Inspection 205
2.1.3.1 - Adding Refrigerant Oil 205
2.1.3.2 - Replace the coolant for the air conditioning, drive motor, and power battery 207
2.1.3.3 - Replacing the filter 211
2.1.3.4 - Replace Brake Fluid 212
2.1.3.5 - Brake System Bleeding 214
2.1.3.6 - Refrigerant Recovery 217
2.1.3.7 - Replace Rear Reducer Gear Oil 219
2.1.3.8 - Check and Clean the Air Filter 221
2.1.3.9 - Replace the air filter 222
2.1.3.10 - Recharging refrigerant 223
2.1.3.11 - Replace Main Wiper Blade 224
2.1.3.12 - Evacuating the A/C system 225
2.1.3.13 - Replace rear wiper blade assembly 227
2.1.4 - Vehicle Fluid Check 228
2.1.4.1 - Check the brake fluid 228
2.1.4.2 - Check windscreen washer fluid 230
2.1.4.3 - Check the coolant for the A/C, drive motor, and power battery 231
2.1.5 - Automotive Electronics Maintenance Inspection 233
2.1.5.1 - OBD monitoring data reading and uploading 233
2.1.5.2 - Check the charging port door 234
2.1.5.3 - Clean the windshield water trough drain holes 235
2.1.5.4 - Check front and rear door and window assemblies 236
2.1.5.5 - Check rear MCU cable assembly 237
2.1.5.6 - Check compressor cable assembly 238
2.1.5.7 - Check tailgate power strut assembly 239
2.1.5.8 - Clean the drip tube 240
2.1.5.9 - Seat Belt Maintenance Check 241
2.1.5.10 - Check the door check and door lock 244
2.1.5.11 - Check for refrigerant leaks 245
2.1.5.12 - Airbag Maintenance Check 246
2.1.5.13 - Battery maintenance check 247
2.1.5.14 - Battery Disconnection Operation 249
2.1.5.15 - Adjust Front Combination Lamp Beam Height 250
2.1.5.16 - Check the OBC cable assembly 251
2.1.5.17 - Check the horn 252
2.1.5.18 - Check the fast and slow charging cable assembly 253
2.1.5.19 - High-Voltage Power-Off Operation 254
2.1.5.20 - Check and adjust the windshield washer direction 256
2.1.5.21 - Self-Diagnosis: Check Fault Codes 257
2.1.5.22 - Check tailgate gas springs 258

© 2026, All rights reserved

2.1.6 - Body, Chassis, and Accessory System Maintenance Check....259
2.1.6.1 - Check the brake lines....259
2.1.6.2 - Check brake pedal free play and height....260
2.1.6.3 - Check the ball joints of the front and rear stabilizer bar links....261
2.1.6.4 - Maintenance check of wheel nuts....262
2.1.6.5 - Tighten vehicle chassis bolts and nuts....263
2.1.6.6 - Check the Electronic Parking Brake....268
2.1.6.7 - Check the friction plates....269
2.1.6.8 - Check the brake switch....271
2.1.6.9 - Check tie rod ends and dust boots....272
2.1.6.10 - Check the shock absorber bearing....273
2.1.6.11 - Inspect the bushings and ball joint assembly of the front lower control arm assembly of the front suspension....274
2.1.6.12 - Check the brake disc....275
2.1.6.13 - Tire rotation....277
2.1.6.14 - Check the driveshaft and dust boot....278
2.1.6.15 - Conduct a test drive....279
2.1.6.16 - Tire Maintenance Check....280
2.1.7 - Power Module Maintenance Check....281
2.1.7.1 - Check the appearance of the battery pack....281
2.1.7.2 - Check the mounting bolts of the power battery pack assembly....282
2.1.8 - Labor and Workstation Information....283
2.1.8.1 - Routine maintenance items....283
2.1.8.2 - Painting....286
2.1.8.3 - Check - Adjust....289
2.1.9 - Maintenance tools....293
2.1.9.1 - Special tools....293
2.1.9.2 - General tools....294
2.2 - Body Manual....298
2.2.1 - About This Manual....298
2.2.1.1 - Overview....298
2.2.2 - How to Use This Manual....299
2.2.2.1 - Symbol Explanation....299
2.2.2.2 - Damage Diagnosis....302
2.2.2.3 - Emergency Handling of Unexpected Situations....303
2.2.2.4 - General Information....304
2.2.2.5 - Label Placement Location....305
2.2.2.6 - Body Coatings and Materials....309
2.2.3 - Safety and Protection....310
2.2.3.1 - Safety Instructions....310
2.2.3.1.1 - Safety Instructions....310
2.2.3.1.2 - Site Safety and Vehicle Protection....311
2.2.3.2 - Personal Protection....312
2.2.3.2.1 - Sheet Metal Work Protection....312
2.2.3.2.2 - Protection for Spray Painting Operations....315
2.2.4 - Tools, Equipment and Consumables....317
2.2.4.1 - Painting Tools....317

© 2026, All rights reserved

2.2.4.2 - Introduction to Body Component Replacement Tools....320
2.2.5 - Operating Consumables....323
2.2.5.1 - Body PVC sealant sealing area....323
2.2.5.2 - Body Stone Chip Protection Sealant....403
2.2.5.3 - Body sound insulation rubber block....405
2.2.5.4 - Reinforcement patch installation position....406
2.2.5.5 - Body cavity protective wax....409
2.2.5.6 - Damper pad installation position....412
2.2.5.7 - Spray painting consumables....413
2.2.5.8 - Sheet Metal Auxiliary Materials....416
2.2.5.9 - Cleaning supplies....418
2.2.6 - How to Repair and Paint the Vehicle Body....419
2.2.6.1 - Sheet Metal Repair....419
2.2.6.1.1 - Maintenance Process....419
2.2.6.1.2 - General Maintenance Specifications....422
2.2.6.1.3 - How to Measure and Align the Vehicle Body....424
2.2.6.1.4 - Types of Exterior Panel Damage....425
2.2.6.1.5 - Anti-corrosion treatment....426
2.2.6.1.6 - Inspect the quality of sheet metal repair....427
2.2.6.1.7 - Introduction to Welding Process....429
2.2.6.1.8 - Cutting Principles for Metal Parts....432
2.2.6.1.9 - Sealant Application Specification....433
2.2.6.2 - Paint Repair....435
2.2.6.2.1 - How to Spray Paint....435
2.2.6.2.2 - How to spray body filler....437
2.2.6.2.3 - How to Polish....439
2.2.6.2.4 - How to dry....441
2.2.6.2.5 - Common Issues and Solutions....442
2.2.6.2.6 - How to Mask....444
2.2.6.2.7 - Quick Paint Repair....446
2.2.6.2.8 - Daily Paint Surface Maintenance....450
2.2.6.2.9 - Inspect Paint Repair Quality....452
2.2.6.2.10 - Maintenance Process....453
2.2.7 - Body Data and Structural Information....455
2.2.7.1 - Collision force transfer path....455
2.2.7.2 - Interior clearance....457
2.2.7.3 - Exterior body clearance....577
2.2.7.4 - Measurement Instructions....642
2.2.7.5 - Body steel structure....644
2.2.7.6 - Vehicle Dimensions....675
2.2.7.7 - Description of Non-Cuttable Areas on the Vehicle Body....692
2.2.7.8 - Material Properties of Plastic Body Components....693
2.2.8 - Sheet metal replacement....699
2.2.8.1 - Side panel....699
2.2.8.1.1 - Replacement of the front section of the left side outer panel....699
2.2.8.1.2 - Replacement of Left Inner Rocker Panel Assembly with Bolt Stud....703
2.2.8.1.3 - Replacement of the Lower Section of the Left Side Outer Panel....707
2.2.8.1.4 - Replacement of Rear Section Assembly of Left Side Frame Reinforcement Panel....711

© 2026, All rights reserved

2.2.8.1.5 - Replacement of Left Side Panel Reinforcement Assembly....716
2.2.8.1.6 - Replacement of Rear Section of Left Side Outer Panel....721
2.2.8.1.7 - Replacement of Left Side Frame Inner Panel Sub-assembly....726
2.2.8.2 - Front compartment....730
2.2.8.2.1 - Replacement of water channel assembly....730
2.2.8.2.2 - Replacement of Front Windscreen Lower Crossmember Assembly....734
2.2.8.2.3 - Replacement of the Dash Panel Sub-Assembly....737
2.2.8.2.4 - Replacement of the Front Left Longitudinal Rail Wheelhouse Assembly....742
2.2.8.2.5 - Replacement of the Left Side Front Connecting Plate Assembly....747
2.2.8.3 - Floor....751
2.2.8.3.1 - Replacement of Front Floor Stud Assembly....751
2.2.8.3.2 - Replacement of kick panel assembly....755
2.2.8.3.3 - Replacement of Seat Cross Member Assembly....758
2.2.8.3.4 - Replacement of Rear Floor Stud Assembly....761
2.2.8.4 - Roof Cover....766
2.2.8.4.1 - Replacement of Sunroof Reinforcement Panel Assembly....766
2.2.8.4.2 - Replacement of Roof Outer Panel (Panoramic Roof)....770
2.2.8.4.3 - Replacement of Roof Panel Assembly (with Sunroof)....774
2.2.8.4.4 - Replacement of roof rear crossmember assembly....778
2.2.8.4.5 - Replacement of roof front crossmember sub-assembly....782
2.2.8.4.6 - Replacement of Roof Panel Assembly (Metal Roof)....786
2.2.8.5 - Rear panel....790
2.2.8.5.1 - Replacement of Rear Left Water Drain Channel Assembly....790
2.2.8.5.2 - Rear Panel Assembly Replacement....794
2.2.9 - Body Panel Repair....798
2.2.9.1 - Repair of Four Doors, Hood, Liftgate, and Fenders....798
2.2.9.1.1 - Repair left rear door assembly....798
2.2.9.1.2 - Repair front left door assembly....801
2.2.9.1.3 - Repair Front Cover Assembly....804
2.2.9.1.4 - Repair the tailgate assembly....807
2.2.9.1.5 - Repair Left Fender Assembly....810
2.2.9.1.6 - Body Panel Assembly Overview....812
2.3 - Vehicle Accessories....813
2.3.1 - Alcolock Interlock Device - Installation Guide....813
Chapter 3 - Power Battery System....817
3.1 - Battery Pack System....817
3.1.1 - Precautions....817
3.1.1.1 - Precautions....817
3.1.2 - Overview and Introduction to Principles....818
3.1.2.1 - Introduction to the Structure and Principles of the Power Battery System....818
3.1.3 - Component Location Diagram....820
3.1.3.1 - Component Location Diagram....820
3.1.4 - Exploded view....821
3.1.4.1 - Exploded view....821
3.1.5 - Fault Diagnosis....831

1 OVERVIEW

1.1 HOW TO USE THIS MANUAL

1.1.1 DEFINITIONS OF TERMS

Manufacturer	Description
Warning	**Indicates a potential hazard that could result in death or serious injury if instructions are not followed.**
Note	**Indicates a potential hazard that, if instructions are not followed, may result in minor or moderate injury or damage to components.**
Note	**Provides help tips and information for operations.**
Bold instructions other than Warnings, Cautions, and Notes	**Providing you with useful information:** Standard value: Tolerance during inspection and adjustment. Limit value: The maximum or minimum limit that should not be exceeded during inspection and adjustment.

1. Warning
   - Since electric vehicles are equipped with high-voltage batteries, improper handling of the vehicle poses a risk of electric shock, electrical leakage, or similar incidents. When performing maintenance operations, proper operating procedures must be followed.
   - Before starting work on the high-voltage system, insulating protective equipment (including insulating gloves, electrical safety helmet, and insulating shoes) must be worn. During high-voltage operations, insulated tools must be used.
   - Personnel responsible for high-voltage operations shall be clearly identified to ensure that no other personnel touch the vehicle. When not in operation, high-voltage components shall be covered with insulating shields or similar items to prevent unauthorized contact.
2. Note
   - If the air hose needs to be disconnected during maintenance, clean the air hose connector first. After disconnecting the air hose, take protective measures for the connector and components (such as sealing with tape) to prevent foreign matter or dust from entering and contaminating the interior of the air hose.
3. Note
   - The repair procedures are the operating procedures on the left, and the operating procedures on the right are the same as those on the left.

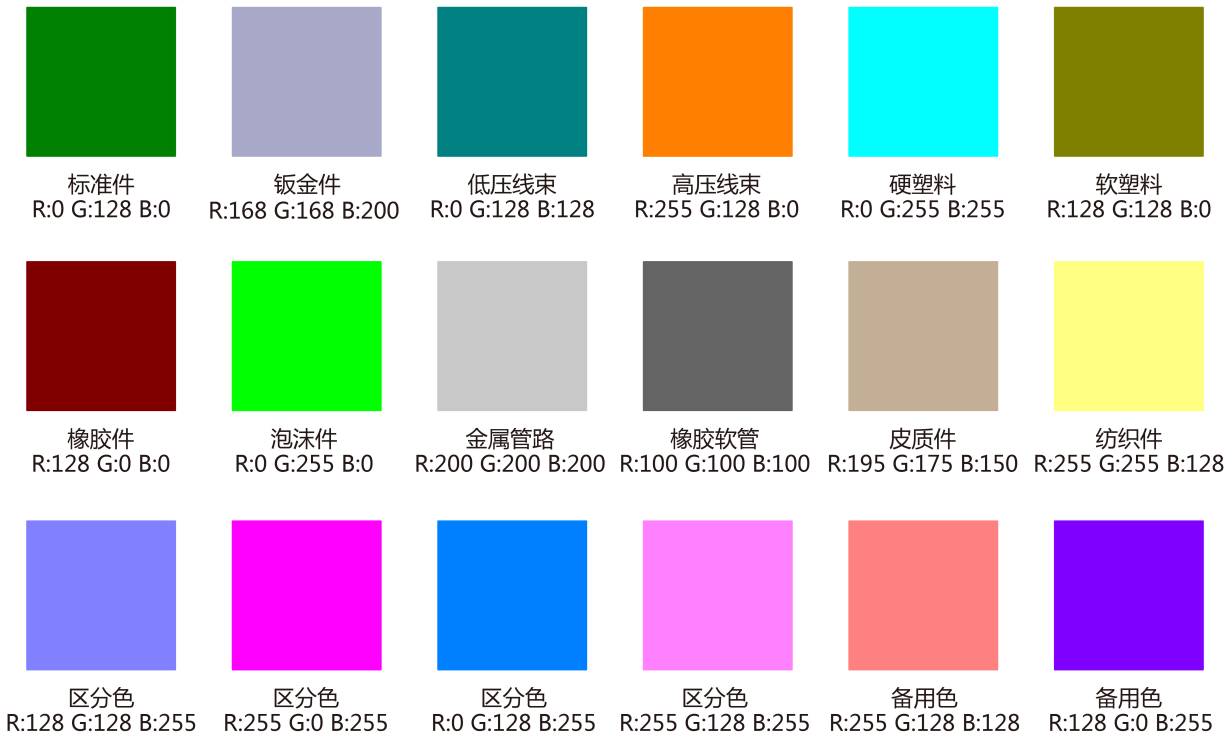
1.1.2 FOREWORD

Foreword - Maintenance

This service manual is primarily developed for the Hongqi EHs4 series vehicles. It compiles the main technical data for systems such as the drive motor assembly, battery pack, interior and exterior trim, chassis, and body of the Hongqi EHs4. It includes procedures for the removal and installation, disassembly and assembly, adjustment, inspection, and fault diagnosis of various components. Carefully reading and strictly following the instructions herein will enable you to master the methods for fault diagnosis, troubleshooting, and maintenance and repair of this vehicle model, ensuring that the repaired vehicle remains in optimal working condition and achieves ideal power performance, economy, and comfort.

For your personal safety and to protect your property, please strictly follow the instructions regarding precautions in this manual. Failure to comply with the precautions in the relevant sections may result in personal injury or vehicle accidents.



Foreword - Spare Parts

To better implement Leapmotor's service philosophy, continuously improve after-sales service quality, and facilitate end customers in ordering and inquiring about spare parts, this illustrated catalog is specially compiled.

This parts catalog lists the structures and details of the major assemblies and main optional configurations of the Hongqi EHs4. To help you quickly and accurately locate genuine Leapmotor parts, it is recommended that you pay attention to the following matters when using this catalog:

1. The Hongqi EHs4 Spare Parts Catalog is applicable only to the Hongqi EHs4 model and is not applicable to other models.
2. When ordering a part, please clearly specify its part number.
3. This catalog is intended for customer use only when purchasing parts. All images are for illustrative purposes only; please refer to the actual vehicle.
4. Reference for color definitions of spare parts in the drawing.

© 2026, All rights reserved

区分色：当整张图纸色调很单一的时候，可以添加部分区分色用于区分不同的零部件。
备用色：如果当前色调不能满足备件图册需求时，可以用备用色来补充。

Foreword-Labor

To better implement Leapmotor's service philosophy, continuously enhance after-sales service standards, and facilitate the after-sales service and maintenance departments in querying repair labor hour information, this Labor Hour Manual has been specially compiled.

This labor time manual lists the labor times for all major assemblies and main optional configurations of the Hongqi EHs4. To help you quickly and accurately look up the labor times for the Hongqi EHs4, please note the following when using this manual:

- This Labor Time Manual applies only to the Hongqi EHs4 product and is not applicable to other products.
- Follow the method below to look up the labor hours for repair parts:

1. First, locate the name of the system to which the required repair parts belong in the general table of contents.
2. Locate the name of the specified replacement part based on the corresponding system name.
3. Find the corresponding labor hours according to the vehicle model configuration and repair part names.

- In this manual, the labor time supplement coefficient is 0.2.

This catalog is compiled based on the latest information available at the time of publication. With the continuous advancement and updating of technology, the structure of the Hongqi EHs4 may be subject to changes. Therefore, Leapmotor reserves the right to modify this catalog without prior notice. Please stay informed of relevant change notifications or updated versions of this catalog.

1.1.3 UNIT

1. The units used in this manual comply with the International System of Units (SI UNIT) standard.
   Example
   - Bolt torque: 30N·m
   - Fill the reducer with gear oil via the filler port to the specified amount (reference value: 500ml±10ml).

1.1.4 OVERVIEW

1. The service manual process is divided into the following main procedures:
   a. Diagnostics.
   b. Removal/Installation, Replacement, Disassembly/Assembly, Inspection and Adjustment.
   c. Final Inspection.
2. The following procedures are omitted from this manual, but they must be performed.
   a. Use a jack or a lift to perform the operation.
   b. Clean all removed parts.
   c. Perform a visual inspection before and after performing any work.

1.1.5 SERVICE PROCEDURES

1. This manual uses illustrations for important and operational parts of the procedures, describes them in detail, and lists the operation methods, reference data, and precautions.
2. The procedure is described in the following order:
   a. Illustrations show "what to do" and "where to do it".
   b. The operation step title explains "what to do".
   c. Operating procedures explain how to "complete a task" and provide operational assistance information such as "Warning", "Caution", and "Tip".

1.1.6 CONTROLLER ENGLISH ABBREVIATIONS

Controller Name	Controller Abbreviations	System
Airbag control module assembly	ACU	Steering Wheel and Airbag System
Power Battery Pack Assembly	BMS	Battery Pack System
Front left blind spot detection radar	BSDFL	Radar System
Front right blind spot detection radar	BSDFR	Radar System
Left Rear Blind Spot Monitoring Radar	BSDRL	Radar System
Right Rear Blind Spot Detection Radar	BSDRR	Radar System
Electric compressor assembly	CCM	Heat pump air conditioning system
2-in-1 Power Supply Assembly	CDU	Vehicle Power Supply System
Integrated Motor Controller	EPS	Steering system
Front-view monocular camera assembly	FSC	Intelligent Driving Assistance System
Intelligent Integrated Braking System Assembly	IBC	Brake servo system
Multi-domain fusion controller	ICHS	Intelligent Cockpit System
Controller Assembly	MCUM	Electric Drive Powertrain System
Forward collision radar	MRS	Radar System
Steering wheel button assembly	SWB	Steering Wheel and Airbag System
Telematics Control Unit	TBOX	Intelligent Cockpit System
Combination switch	TCM	Accessory Switch System
Thermal Management Controller	TMS	Heat pump air conditioning system
Multi-domain fusion controller	USS	Intelligent Cockpit System

© 2026, All rights reserved

Controller Name	Controller Abbreviations	System
Multi-domain fusion controller	VIU	Intelligent Cockpit System
Wireless charging module assembly	WPC	Electrical Accessory System
Charging protocol converter	EVCC	Charging Protocol Conversion System
Power Liftgate Controller	PTG	Support and Limiting System
Front vital sign detection radar	RPDF	Intelligent Cockpit System
Rear vital sign detection radar	RPDR	Intelligent Cockpit System
Anti-theft alarm controller	AAC	Pillar Trim System
Steering column lock	ESCL	Steering system

1.2 DANGER, WARNING, CAUTION

1.2.1 SAFETY MEASURES FOR ELECTRIC VEHICLE REPAIR

INSULATING PROTECTIVE EQUIPMENT

1. Insulating protective clothing (Insulation level: 5KV)
2. Insulating rubber shoes (Insulation class: 10KV)
3. Insulating Cap (Insulation Level: 10 kV)
4. Safety glasses
5. Insulating gloves (Insulation class: 1KV)

Maintenance personnel must wear insulating protective equipment before operation.

- Wear insulating protective clothing.
- Wear an insulating cap.
- Wear insulating rubber shoes.
- Wear safety glasses.
- Wear insulating gloves: Select the appropriate high-voltage insulating gloves or acid- and alkali-resistant gloves for battery electrolyte according to the working conditions.

> **ATTENTION**
>
> Before use, inspect the insulating protective equipment to ensure it is free from damage, holes, and cracks, and that the inner and outer surfaces are clean and dry. Do not operate while wet to ensure safety.

INSULATED TOOLS

1. Insulating rubber mat (Insulation class: 1KV)
2. Insulated tools
3. Power Battery Workbench
4. Insulated protective hook (Insulation rating: 30KV)

Use of insulated tools:

- Place an insulating rubber mat in the maintenance area.
- When servicing energized components, maintenance personnel must use insulated tools.
- When servicing the power battery and electronic control components, a professional workbench with an insulating mat must be used.

> **ATTENTION**
>
> Inspect insulated tools before use to ensure they are free from damage, holes, and cracks, and that their inner and outer surfaces are clean and dry. Do not operate them when wet to ensure safety.

MAINTENANCE SITE

1. High Voltage Warning Sign

© 2026, All rights reserved

2. Carbon dioxide or ammonium phosphate fire extinguishers
3. Warning line
4. Grounding Wire for Dedicated Service Bay

Service Site Requirements

- Prior to maintenance operations, isolation measures must be taken: use warning barriers to isolate the area and set up high-voltage warning signs to warn unrelated personnel to stay away from the area and prevent safety accidents.
- The maintenance site must be equipped with fire hydrants at designated locations, and clean water shall be used to extinguish fires.
- Before repairing high-voltage equipment, connect the vehicle body to the grounding point of the dedicated electric vehicle maintenance bay using a grounding cable.
- Install a dedicated AC circuit (220V50Hz16A) and power outlet. If a dedicated circuit is not used when charging the electric vehicle, it may affect the normal operation of other devices on the circuit.
- Keep the work area clean and well-ventilated, away from liquids and flammable materials.

© 2026, All rights reserved

1.2.2 SAFETY PRECAUTIONS FOR MAINTENANCE OPERATIONS

Safety Precautions for Maintenance Operations:

- When repairing high-voltage components of the vehicle, a dedicated safety supervisor must be assigned. Both the supervisor and maintenance personnel must be qualified professional technicians recognized by the relevant authorities.
- The supervisor is responsible for overseeing the entire repair process.
- Verify whether the composition of maintenance personnel, tool usage, wearing of protective equipment, safety protection of spare parts, and maintenance safety warning signs meet the requirements.
- Check and confirm whether the high-voltage load is energized.
- Responsible for inspecting the safety maintenance operating procedures during the maintenance process, the supervisor shall direct operations in accordance with the safety maintenance operating procedures, the maintenance personnel shall notify the supervisor upon completion of each operation, and the supervisor shall make a mark on the operation workflow form.
- It is strictly prohibited for untrained personnel to perform maintenance on high-voltage components, all personnel are prohibited from taking chances and performing hazardous operations, to prevent safety accidents.
- Do not reuse a dropped power battery, as excessive collision may cause damage or rupture to some internal components of the power battery, and even lead to extreme conditions such as short circuits in the power battery.
- Prevent the power battery from getting wet or submerged, as a wet or submerged power battery may cause an internal short circuit, leading to the loss of the circuit protection function and abnormal chemical reactions.
- During assembly, avoid colliding with or striking the power battery, to prevent deformation of the battery case and its internal structure caused by external forces, which may result in the loss of the internal circuit protection function of the power battery.
- Do not weld on the enclosure, as the external voltage applied to the power battery may cause the loss of its internal circuit protection function.
- The contents of this manual do not cover all items required for vehicle repair and maintenance. This manual is intended exclusively for use by personnel with professional skills and qualifications. If non-professional or unqualified technicians perform repair or maintenance relying solely on this manual or without using appropriate equipment or tools, it may result in injury to themselves or surrounding personnel, as well as damage to the customer's vehicle.

To prevent dangerous operations and avoid damage to the vehicle, be sure to follow the instructions below:

- You must read the entire contents of this manual.
- The repair methods provided in this manual are highly effective for vehicle repair and maintenance. When performing repair operations in accordance with the procedures in this manual, always use the specified special tools. If non-specified special tools and repair methods are used, ensure the technician's safety before starting the operation, and ensure that no personal injury or damage to the customer's vehicle is caused.
- If parts need to be replaced, parts with the same part number must be used. Do not use substandard parts.
- To effectively prevent potential personal injury during repair or maintenance, as well as vehicle damage or unsafe conditions caused by improper operation, you must strictly adhere to all "Warning" and "Caution" notices in this manual. It should also be noted that the contents of the "Warning" and "Caution" sections in

© 2026, All rights reserved

this manual are not exaggerated; rather, failure to follow these instructions may result in hazardous consequences.
- The vehicle is equipped with a powertrain that operates at high voltage. All related operations on the vehicle's high-voltage system (such as maintenance and repair of the electrical system) must only be performed by qualified personnel trained in high-voltage electrical knowledge.

Important precautions for filling the brake system with brake fluid:

ATTENTION

- When adding brake fluid to the master cylinder reservoir, only use brake fluid from a clean, sealed container. The fluid must be DOT4 grade. Using non-recommended brake fluid can lead to system contamination, thereby damaging the rubber seals or gaskets inside the hydraulic brake system components.

Important Precautions for Brake Calipers:

ATTENTION

- When removing the brake caliper, secure it with a wire to prevent damage to the brake hose.

Special precautions regarding the effects of brake fluid on paint and electrical components:

ATTENTION

- Avoid getting brake fluid on painted surfaces, electrical connectors, wires, or cables. Brake fluid can damage the paint finish and cause corrosion of electrical components. If brake fluid comes into contact with painted surfaces, immediately rinse the affected area with water. If it comes into contact with electrical connectors, wires, or cables, wipe it off with a clean cloth.

Important precautions for exterior emblem removal:

ATTENTION

- When removing the badge/nameplate, use a plastic flat-blade tool to avoid damaging the paint.

Important Precautions for Fasteners:

ATTENTION

- Use the correct fasteners in the correct positions, ensure the part numbers of the replacement fasteners are correct, note that fasteners needing replacement or the use of threadlocker or sealant are specifically indicated in the repair procedures, and do not apply paint, lubricants, or corrosion inhibitors to the fasteners or their mating surfaces unless otherwise specified. These substances affect the torque and clamping force of the fasteners and may damage them. When installing fasteners, always follow the correct tightening sequence and torque specifications to avoid damaging components and systems.

© 2026, All rights reserved

Important precautions for handling electrostatic discharge sensitive components:

ATTENTION

- Electrostatic discharge can damage many solid-state electronic components, handle all electronic components with care. Please follow the safety precautions below to avoid damage from electrostatic discharge:
  - Before servicing any electrical components, touch a metal ground point to discharge static electricity from your body.
  - Do not touch exposed terminals, as they may be connected to circuits susceptible to damage from electrostatic discharge.
  - When repairing the connector, do not allow tools to contact the exposed terminals.
  - Do not remove the component from the protective housing unless otherwise specified.
- Avoid the following operations unless specifically required by the diagnostic procedure:
  - Jumper or ground the component or connector.
  - Connect the test equipment probe to the component or connector. When using the test probe, connect the ground lead first.
  - Before opening the protective housing of the component, ground it first, and do not place solid-state components on a metal workbench or on top of other electrical equipment.

Important precautions for powering down the vehicle for service when disconnecting the battery:

ATTENTION

- Whenever connecting or disconnecting the battery cables or battery charger, always power off the vehicle for maintenance; otherwise, it may cause damage to control modules or other electrical components.

Important precautions when installing the hose: Do not twist or bend it.

ATTENTION

- The inlet and outlet hoses shall not be twisted during installation, do not bend or deform the hoses to facilitate installation, otherwise it may cause component damage.

Important Precautions for Machined Surface Damage:

ATTENTION

- Do not nick, scratch, or damage the sealing surface, which is a machined surface, and damage to the machined surface will cause leakage.

Special Precautions for the Powertrain Control Module and Electrostatic Discharge:

ATTENTION

© 2026, All rights reserved

- Do not touch the connector pins or soldered components on the circuit board to prevent electrostatic discharge from damaging the electronic control modules on the vehicle.

Important precautions when using the diagnostic tool:

ATTENTION

- Before performing vehicle diagnostics, the following conditions must be noted; otherwise, the control module may be damaged.
- The software versions of the diagnostic tool and the terminal must be up to date.
- The vehicle battery must be fully charged, and the battery voltage should be between 12 V and 14 V.
- The connection between the scan tool and the terminal cable must be secure.
- When programming the control module, the battery charger must not be connected to the battery.

Important notes for test probes:

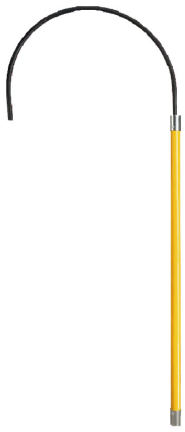
ATTENTION

- Do not insert the probes of test equipment (such as a digital multimeter) into harness connectors or fuse box terminals. The diameter of the test probes may deform most terminals, and deformed terminals will result in poor contact, leading to system failure. Always use specialized tools to probe the terminals from the front, and never use paper clips or other substitutes to test the terminals.
- When testing components with special tools, ensure that the selected terminal test adapter matches the size of the connector terminals, do not select the terminal test adapter by visual estimation, because the cavities of some connector terminals may appear larger than the actual terminals inside, using an oversized terminal test adapter will damage the terminals.

Important Precautions for Stopping or Parking:

ATTENTION

- Exercise caution when parking in areas with protrusions or fixed stoppers, otherwise the vehicle bumper and other components may be damaged. Please stop the vehicle before the wheels come into contact with these protrusions.
- When leaving the vehicle, please take the key with you.



Important Precautions in the Event of a Vehicle Collision:

ATTENTION

- When the crash sensor detects a certain level of impact, the emergency shut-off system will cut off the high-voltage current to minimize the risk of electrical leakage. If this system is activated, the vehicle cannot be restarted. To restart the vehicle, please contact a Leapmotor authorized service center.

1.2.4 DANGER, WARNING

- The electrical equipment on the Hongqi EHs4 model is divided into low-voltage electrical components and high-voltage electrical components, low-voltage electrical components include: instrument cluster, audio system, lighting, horn, and buzzer, etc.; high-voltage electrical components include: drive motor assembly, motor controller, high-voltage wiring harness, high-voltage battery pack, and air conditioning compressor.
- Orange high-voltage warning labels are affixed to high-voltage components. Please pay attention to the requirements on the warning labels. To avoid electric shock, do not touch high-voltage components, high-voltage cables (orange), or their connectors.
- If the vehicle cables are exposed or damaged, do not touch them to prevent electric shock.
- Non-professional maintenance personnel are prohibited from touching, disassembling, or modifying electrical equipment. Otherwise, contact with high voltage will lead to severe consequences such as burns or even electrocution.

Warning Regarding Servicing High-Voltage Components

Repair site requirements:

- Before maintenance operations, safety isolation measures must be implemented: use warning barriers to isolate the area, and set up high-voltage warning signs, to warn unauthorized personnel to stay away from the area and prevent safety accidents.
- Designated locations in the maintenance area must be equipped with carbon dioxide or dry powder fire extinguishers. When the power battery catches fire, use a carbon dioxide or dry powder fire extinguisher to extinguish the fire, or bury it with sand or soil.
- Before repairing high-voltage equipment, connect the vehicle body to the grounding point of the dedicated electric vehicle maintenance bay using a grounding cable.
- Install a dedicated AC circuit and power outlet. If a dedicated circuit is not used when charging the electric vehicle, it may affect the normal operation of other devices on the circuit.

- Keep the work area clean and well-ventilated, away from liquids and flammable materials.

Before operation, maintenance personnel must wear insulating protective equipment:

- Wear insulating protective clothing.
- Wear insulating rubber shoes.
- Wear safety glasses.
- Wear insulated gloves (select the appropriate high-voltage insulated gloves or acid- and alkali-resistant gloves for battery electrolyte according to the working conditions).

Insulated tools:

- Place an insulating rubber mat in the maintenance area.
- Maintenance personnel must use insulated tools when working on live parts.
- After disconnecting the battery high-voltage connector, immediately wrap the high-voltage output part with a dedicated protective cover or insulating tape.
- When servicing the power battery and electronic control components, a dedicated workbench with an insulating mat must be used.

⚠ WARNING

© 2026, All rights reserved

- Before use, the insulating protective equipment must be inspected to ensure it is free from damage, holes, and cracks, and that its inner and outer surfaces are clean and dry. Do not operate while wet to ensure safety.

Warnings Regarding the Driving Assistant

⚠ WARNING

- When a technician is inspecting the reported faulty component, an assistant should drive the vehicle. Otherwise, a vehicle accident may occur.

Warning Regarding Battery Disconnection

⚠ WARNING

- Before repairing electrical components, all electrical equipment must be turned off. Tap "Vehicle Maintenance Power Off" on the central control panel, unless otherwise specified in the operating procedure.
- If tools or equipment can easily come into contact with exposed live electrical terminals, also disconnect the negative battery terminal. Failure to follow these safety precautions may result in personal injury and vehicle damage.
- When repairing the airbag, the negative battery terminal must be disconnected for at least 90s, before performing any other repair operations.

Warning About Brake Dust

⚠ WARNING

- When servicing wheel brake components, please avoid the following operations:
  - Do not grind the brake friction pads.
  - Do not use sandpaper to sand the brake friction pads.
  - Do not use a dry brush or compressed air to clean wheel brake components.

Warning About Brake Fluid

⚠ WARNING

- Brake fluid is highly hygroscopic and readily absorbs moisture, do not use brake fluid stored in unsealed containers, as using improper or contaminated brake fluid may result in system failure, loss of vehicle control, and personal injury.

Warning Regarding Brake Fluid Irritation

⚠ WARNING

- Brake fluid is irritating to the skin and eyes. In case of contact, take the following measures:
  - In case of eye contact, immediately rinse thoroughly with water.

© 2026, All rights reserved

- In case of skin contact, wash immediately with soap and water.

Warning Regarding Brake Pipe Replacement

⚠ WARNING

- When replacing the brake line, please install and secure it carefully, and be sure to use the correct fasteners; otherwise, it may cause damage to the brake line and brake system, resulting in personal injury.

Warning Regarding the Clock Spring of the Airbag System

⚠ WARNING

- Improper installation of the clock spring assembly can damage the internal spiral coil of the clock spring, which may cause coil failure and prevent the airbag module from functioning properly, resulting in personal injury.

Warning Regarding Disposal of Airbag Modules in the Safety System

⚠ WARNING

- To prevent accidental airbag deployment and resulting personal injury, undeployed airbag modules shall not be disposed of as regular workshop waste. If the sealed container is damaged during the scrapping process, certain substances contained in the undeployed module may cause serious illness or personal injury. Undeployed airbag modules shall be safely disposed of using the deployment procedure.

Warnings for Handling and Storage of Airbag Modules in the Airbag System

⚠ WARNING

- When transporting undeployed airbag modules:
  - Do not lift or carry the airbag module by its wires or connector.
  - Ensure the airbag opening is not facing you or anyone else.
- When storing an undeployed airbag module, ensure that the airbag opening does not face the surface on which the module is placed. The airbag opening must not face downwards, and do not place any objects on the airbag module. Ensure there is sufficient space around the airbag for unintended deployment; otherwise, personal injury may occur.
- Do not submerge an undeployed airbag module in water or expose it to other liquids.
- Do not place an uninflated airbag module near an open flame or in a high-temperature area to prevent accidental airbag deployment that could cause injury.
- Do not strike or shake the airbag system crash sensor, and before applying power to the crash sensor, ensure that the crash sensor is securely mounted, as failure to follow the correct installation procedures may cause unintended deployment of the airbag system or failure to deploy when required, resulting in personal injury.

© 2026, All rights reserved

Warning regarding the airbag system

WARNING

- This vehicle is equipped with an airbag system. Failure to follow the correct operating procedures may result in the following:
  - Pretensioner deployment.
  - Personal injury.
  - Unnecessary airbag system repairs.
- Follow the guidelines below to avoid the above situations:
  - Refer to the airbag system component view to determine whether you are performing repair operations on, around, or on the wiring of the airbag system components.
  - If you are performing repair work on or around airbag system components or their wiring harnesses, the airbag system must be disabled.

Warning: The deployed airbag module becomes very hot

WARNING

- After deployment, the metal surfaces of airbag system components may become very hot. To prevent fire and personal injury:
  - Allow sufficient cooling time before touching any metal surfaces of the airbag system components.
  - Do not place inflated airbag system components near any flammable materials.

Warning Regarding Inhalation of Air Conditioning Refrigerant

WARNING

- Avoid inhaling A/C refrigerant and lubricating oil vapors, as contact with them can irritate the eyes, nose, and throat. Work in a well-ventilated area. When discharging A/C refrigerant from the A/C system, use service equipment to recover the A/C refrigerant. If an accidental system leak occurs, the work area must be ventilated before continuing maintenance.

Warning Regarding Power Window Function

WARNING

- When operating the power window switch on the driver's door, the fast movement of the power window may cause personal injury.

Warning Regarding Eye Protection

WARNING

- When performing certain procedures (such as welding or cutting), wear an approved welding helmet and gloves to reduce the risk of personal injury.

© 2026, All rights reserved

Warning Regarding Foam Sound Insulation Material

WARNING

- When welding is required during body repair, the foam sound insulation material within a certain distance from the welding area must be removed. When reinstalling the foam sound insulation material, avoid inhaling fumes and dust, otherwise it will be harmful to your health.
- Please keep a water-based fire extinguisher nearby.

Warnings Regarding the Handling of Glass and Metal Panels

WARNING

- When handling any glass or metal sheets with sharp edges or burrs, safety glasses and gloves should be worn to reduce the risk of personal injury.

Warning Regarding Removal of the Expansion Tank Cap

WARNING

- To avoid burns, do not remove the expansion tank cap before the vehicle has cooled down. If the expansion tank cap is removed while the vehicle is still hot, the cooling system will release scalding high-pressure liquid and steam.

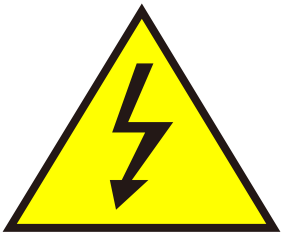
Warning Regarding Cooling System Maintenance

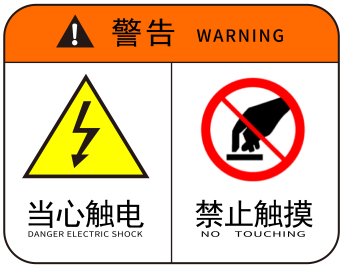
WARNING

- As long as there is pressure in the cooling system, the coolant temperature will be higher than the boiling point even if the coolant in the radiator is not boiling. If the expansion tank cap is opened while the vehicle has not cooled down and the pressure is still high, the coolant will boil immediately and may spray onto the operator, causing severe burns.

Warning regarding road test! Warning!

WARNING





- Road test the vehicle while ensuring safety and comply with all traffic laws and regulations, do not attempt any maneuvers that could compromise vehicle control, as violating these safety instructions may result in severe personal injury and damage to the vehicle.

© 2026, All rights reserved

1.2.5 IDENTIFICATION AND HANDLING OF HIGH-VOLTAGE HARNESS AND COMPONENTS

- **High-Voltage Wiring Harness and Component Identification**
  - All high-voltage wiring harnesses and connectors are orange. The power battery and other high-voltage components are marked with high-voltage labels. Do not touch these wiring harnesses and high-voltage components.
- **High-Voltage Wiring Harness and Component Identification**
  - After performing maintenance operations on the vehicle's high-voltage components, immediately isolate the disconnected high-voltage connectors and terminals with insulating tape.

- **Safety Sign Examples**

Warning Sign Name	Warning Symbols	Warning Signs Description
High Voltage Warning Sign		Danger! Do not touch high-voltage components.
Traction battery high voltage warning sign		High-voltage components, danger, do not touch high-voltage components without wearing protective equipment, beware of electric shock!
Drive motor high voltage warning sign (State 1)		High-voltage components, danger, do not touch high-voltage components without wearing protective equipment, beware of electric shock!
Drive motor high voltage warning sign (State 2)		High-voltage components, danger, do not touch high-voltage components without wearing protective equipment, beware of electric shock!

© 2026, All rights reserved

Warning Sign Name	Warning Symbols	Warning Signs Description
High voltage harness label		All high-voltage components of the vehicle are connected with orange high-voltage wiring harnesses. Do not touch high-voltage components without wearing protective equipment to avoid electric shock!

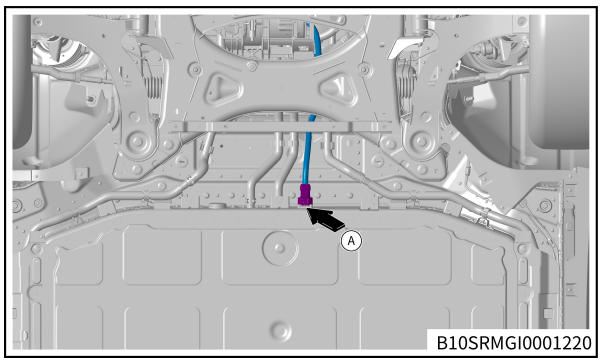
1.2.6 HIGH-VOLTAGE POWER-ON AND POWER-OFF OPERATIONS

POWER-OFF PROCEDURE

ATTENTION

- Do not charge when the high-voltage power is disconnected, please read the relevant precautions carefully before disconnecting the high voltage.

1. Read "Danger" and "Warning" carefully.
   See:DANGER, WARNING (page 116)
2. Read the "Safety Precautions for Electric Vehicle Repair" carefully.
   See:Safety Measures for Electric Vehicle Repair (page 104)
3. Read the "Safety Precautions for Maintenance Operations" carefully.
   See:Safety Precautions for Maintenance Operations (page 106)
4. Read "Insulating Protective Clothing and Insulated Tools" carefully.
   See:Insulating Protective Clothing and Insulated Tools (page 110)
5. Read "Identification and Handling of High-Voltage Wiring Harnesses and Components" carefully.
   See:Identification and Handling of High-Voltage Harness and Components (page 121)
6. Please read the "Maintenance Precautions" carefully.
   See:Maintenance Precautions (page 192)
7. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
8. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
9. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
10. Remove the rear compartment lower cover assembly.
    See:Rear compartment under cover assembly (page 5327)
11. High-voltage power disconnection operation.



a. Disconnect 1 connector - arrow A - between the rear MCU cable assembly and the power battery pack.
b. Disconnect 1 connection plug between the fast and slow charging cable assembly and the power battery pack - arrow B -.
c. Disconnect 1 connection plug between the OBC cable assembly and the power battery pack -Arrow C-.

© 2026, All rights reserved

d. Disconnect 1 connector - arrow D - between the floor wiring harness assembly and the power battery pack.

> **WARNING**
>
> - Only qualified personnel (high-voltage electricians) can disconnect the power supply of the high-voltage system. Operations can only be performed after the high-voltage cable has been disconnected for 10 minutes.

e. Disconnect 1 connector of the compressor cable assembly from the power battery pack - arrow A -.
f. After disconnecting the high-voltage cable for 10 minutes, use an insulation tester at the 1000Vdc range to apply voltage for 1 minute to measure the insulation resistance between the terminals of the power battery and the housing. The standard value is ≥10MΩ.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

1.3 VEHICLE PARAMETERS

1.3.1 STANDARD VALUE OF INSULATION RESISTANCE FOR HIGH-VOLTAGE COMPONENTS

Components	Insulation resistance	Measurement Method
Air conditioning compressor	> 50MΩ	With the compressor disconnected from the system, set the insulation resistance meter to the 1000V range, ensure the compressor cavity is free of refrigerant, connect the red probe of the insulation meter to the high-voltage positive or negative terminal of the compressor, connect the black probe to the compressor housing, and start the measurement.
	> 20MΩ	Connect the compressor to the A/C system, set the insulation resistance meter to the 1000V range, ensure the system is filled with refrigerant, connect the red probe of the insulation meter to the high-voltage positive or negative terminal of the compressor, connect the black probe to the compressor housing, and start the measurement.
2-in-1 Power Supply	≥10MΩ	Use the 1000V DC range of the insulation tester to measure the insulation resistance between each independent circuit and the metal housing, and after the reading stabilizes, record the corresponding insulation value.
Drive Motor Assembly	≥10MΩ	Set the insulation tester to the 500 VDC range, connect the red test lead to the positive or negative terminal of the electric drive assembly bus input, and the black test lead to the electric drive assembly housing, wait for about 10 seconds until the reading st

© 2026, All rights reserved

Components	Insulation resistance	Measurement Method
		abilizes, and record the corresp onding insulation resistance val ue.
High-voltage wiring harness	≥100MΩ	Using the 1000V DC range of th e insulation tester, apply voltage across the terminals with the tes t leads, and observe whether th e insulation tester displays a resi stance of ≥100MΩ. Then, apply voltage between the positive ter minal and the shield contact wit h the test leads, and observe wh ether the insulation tester displa ys a resistance of ≥100MΩ. Final ly, apply voltage between the ne gative terminal and the shield co ntact with the test leads, and ob serve whether the insulation tes ter displays a resistance of ≥100 MΩ.
Power battery	≥10MΩ	Use an insulation tester set to th e 1000Vdc range to apply voltag e for 1min, and measure the ins ulation resistance between the power battery terminals and the housing.

1.3.2 MAIN STRUCTURE AND TECHNICAL PARAMETERS

POWER BATTERY

Item		Parameters
Battery cell	Model	6FX0B1
	Type	Lithium iron phosphate
	Rated voltage (V)	3.16
	Rated capacity(Ah)	170
Power battery system	Model	LP-PBP50V-AA
	Type	Lithium iron phosphate
	Rated voltage (V)	404.4
	Rated capacity(Ah)	170
	Total battery capacity (kWh)	68.7
	Number of power battery packs (units)	1
	Traction battery pack dimensions (L×W×H) (mm)	1849x1515x137
	Battery pack weight (kg)	471
Auxiliary power supply type		Lead-acid battery
Auxiliary power voltage (V)		12
Protection level		IP67

DRIVE MOTOR

Item	Parameters
Motor model	TZ180QY048
Drive motor type	AC Permanent Magnet Synchronous
Drive Type	Rear-Wheel Drive
Rated Power (kW)	70
Rated torque (N • m)	95.5
Peak power (kW)	160

© 2026, All rights reserved

Item	Parameters
Peak speed (r/min)	17000
Peak Torque (N • m)	240

BRAKE SYSTEM

Item		Parameters
Front wheel brake type		Ventilated disc
Rear wheel brake type		Disc
Parking brake system type		Electronic Parking Brake (EPB)
Brake pedal free travel (mm)		≤10
Maximum brake pedal travel (mm)		144
Normal operating range of brake discs	Front brake disc thickness (mm)	23~25
	Rear brake disc thickness (mm)	8~10
Brake disc minimum service thickness	Front brake disc thickness (mm)	23
	Rear brake disc thickness (mm)	8
Brake pad normal operating range	Front brake pad friction material thickness (mm)	2~8
	Rear brake pad friction material thickness (mm)	2~7
Brake pad minimum service thickness	Front brake pad friction material thickness (mm)	2
	Rear brake pad friction material thickness (mm)	2

WHEELS AND TIRES

Item		Parameters
Tyre specifications	Front wheel	225/50 R18
	Rear wheels	235/50 R18
Standard tire pressure (kPa)	Unladen (Front/Rear)	250/250
	Full load (Front/Rear)	270/270

© 2026, All rights reserved

Item		Parameters
Wheel dynamic balance requirements (g)		≤60g per side
Residual unbalance (g)		≤8/per side
Pitch Circle Diameter (PCD)		5-hole 144.3mm
Center hole diameter		66.6mm
Wheel type		Aluminum alloy wheels
Wheel size		18*7.5J ET42 18*7.5 ET50
Four-wheel alignment	Front wheel toe	3.5′±6′
	Front wheel camber	-0.283°±0.75°
	Front wheel kingpin caster angle	3.85°±1°
	Front wheel kingpin inclination angle	13.04°±1°
	Rear wheel camber	-0.83°±0.75°
	Rear wheel toe	6.7′±6′

SEAT

Item		Parameters
Driver's Seat	Seat forward/backward travel distance (a) (mm)	230/30
	Set seat backrest angle (a) (°)	25
	Seat backrest forward/backward adjustable angle (°)	30/70
	Seat vertical travel (mm)	40/20
Front passenger seat	Seat forward/backward travel distance (a) (mm)	230/30
	Set seat backrest angle (a) (°)	25
	Seat backrest forward/backward adjustable angle (°)	30/70

© 2026, All rights reserved

Item		Parameters
	Seat up/down travel distance*(mm)	40/20
Rear seats	Rear seat forward/backward adjustment distance (mm)	Non-adjustable
	Set seat backrest angle (a) (°)	27
	Seat backrest forward/backward adjustable angle (°)	Non-adjustable, 60/40 split back rest can be folded down.

Note: a. When measuring the cushion depth,

TECHNICAL SPECIFICATIONS OF OTHER MAJOR ASSEMBLIES

Item		Parameters
Reducer	Type	Central reducer
Suspension	Front	MacPherson independent suspension
	Rear	Multi-link independent suspension
Steering gear	Type	Rack and pinion type
Steering column	Type	Electric Power Steering

1.3.4 BASIC PARAMETERS OF COMPLETE VEHICLE

Item		Parameters
Product model		G117
Overall dimensions (mm)	Long	4540
	Width	1890
	High	1655
Track (mm)	Front	1615
	Rear	1605
Wheelbase (mm)		2740
Front overhang/Rear overhang (mm)		910/890
Curb weight (kg)		1824
Axle load (curb weight) (kg)	Front	872

© 2026, All rights reserved

Item		Parameters
	Rear	952
Maximum permissible gross mass (kg)		2247
Maximum permissible front/rear axle load (kg)	Front	965
	Rear	1282
Minimum ground clearance (mm)		145
Minimum turning radius(m)		5.25
Top speed	km/h	170
	mile/h	106
Maximum gradeability (%)		40
Approach angle (°)		17°
Departure angle (°)		25°
Number of axles/Drive axle		2/Second axle
Drive Type		Rear-Wheel Drive
Rated seating capacity (persons)		5
NEDC* range	km	570
	mile	354
NEDC* Energy Consumption	kWh/100km	13.3
	kWh/62mile	
WLTC* Range	km	470
	mile	292
WLTC* Energy Consumption	kWh/100km	16.1
	kWh/62mile	

Note: The exterior rearview mirror is not included in the overall dimensions of the vehicle.

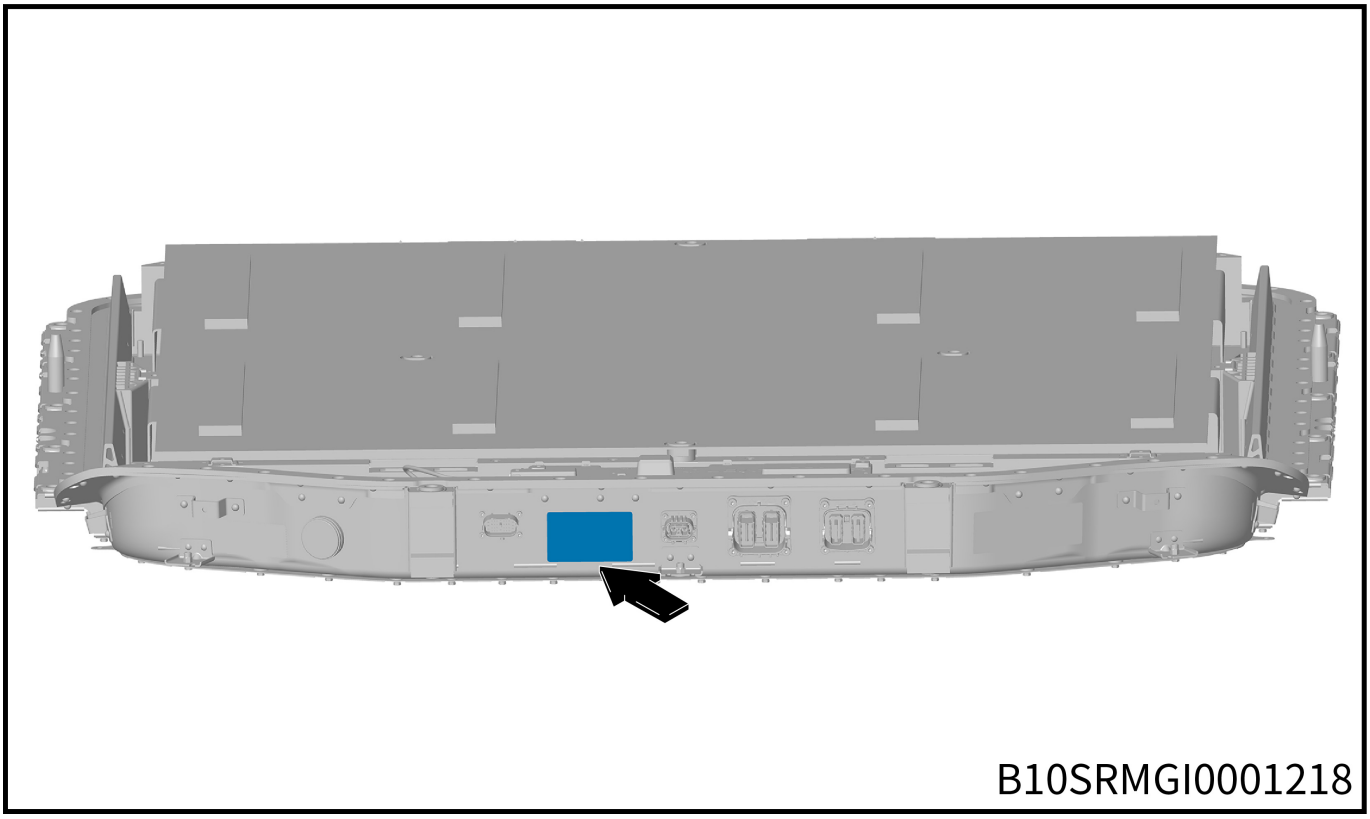
1.3.5 LIGHTING AND SIGNAL LAMP PARAMETERS

Function	Function Classification	Type	Power(W)
Front combination lamp	Low beam	LED	22
	High beam	LED	37
Rear combination lamp	Rear turn signal	LED	4
	Rear position light	LED	5（7.5）
Full-width rear light	Brake light	LED	3
	Position lamp	LED	3
	Reversing lamp	LED	9
High-mounted brake lamp	High-mounted brake lamp	LED	2.7
Instrument Panel Ambient Light	Instrument Panel Ambient Light	LED	1.35
Reading lamp	Reading Light (Left)	LED	2
	Reading lamp (right)	LED	2
License plate light	License plate light	LED	0.4
Trunk light	Trunk light	LED	0.36

© 2026, All rights reserved

1.3.6 BATTERY PARAMETERS



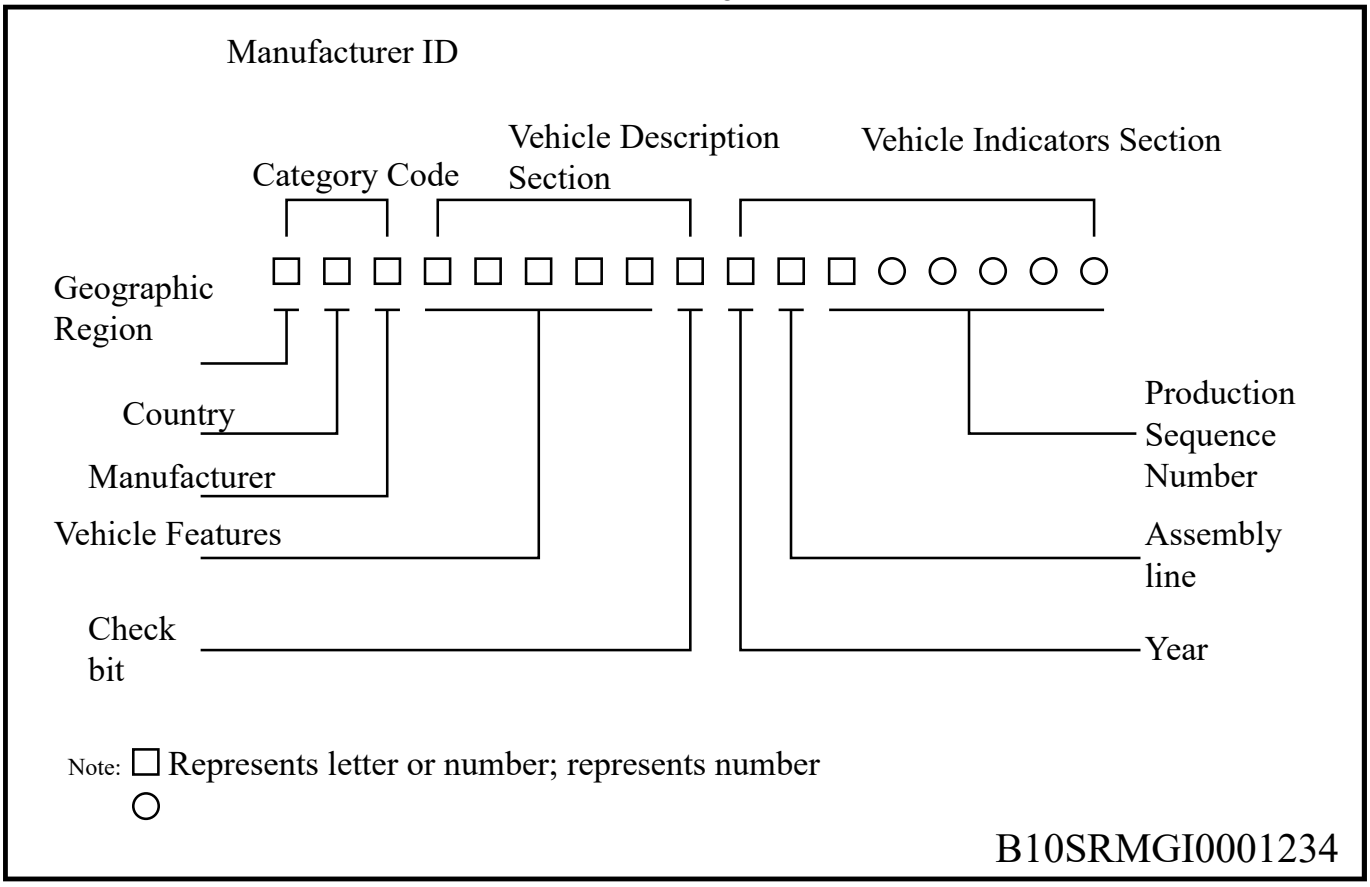
Manufacturer	Camel Group Co., Ltd.
Battery Type	Lead-acid
Capacity (Ah)	35
Maximum overall dimensions (mm)	175*175*190
Operating voltage (V)	12

© 2026, All rights reserved

1.4 IDENTIFICATION

1.4.1 POWER BATTERY NAMEPLATE

The power battery nameplate is located on the outside of the power battery pack.

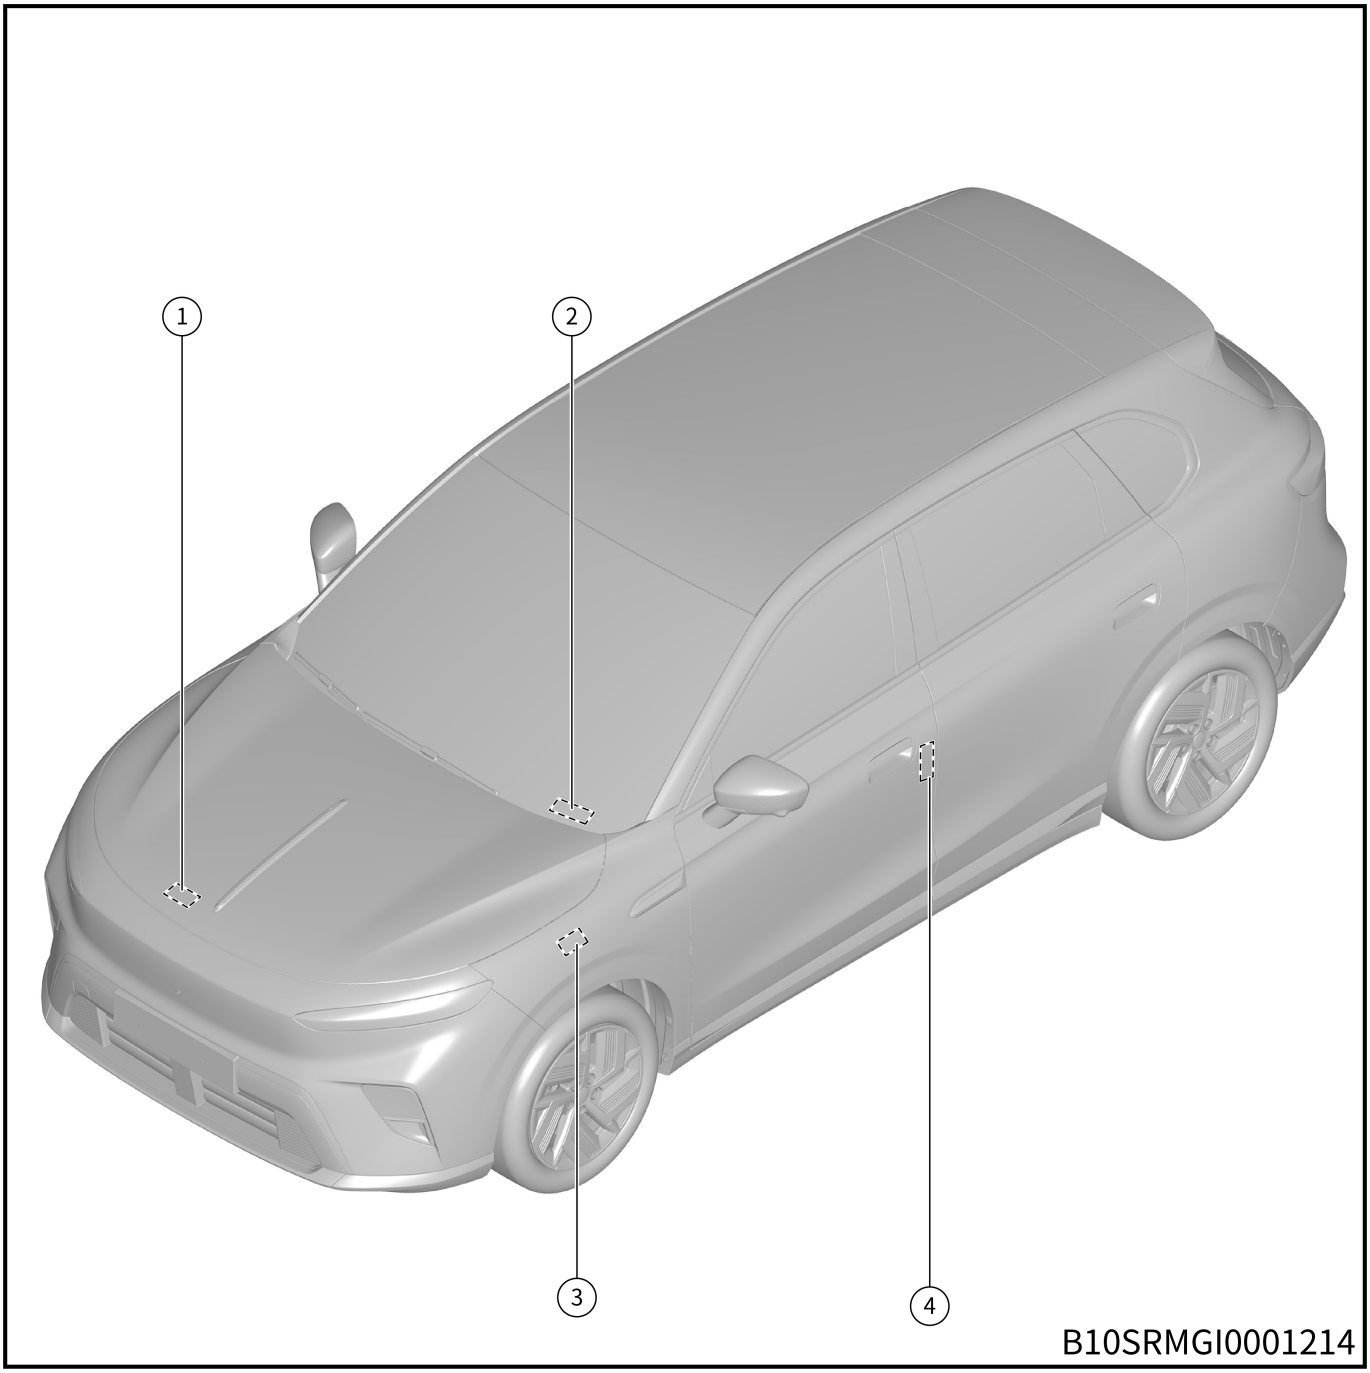


© 2026, All rights reserved

1.4.2 VEHICLE IDENTIFICATION NUMBER CODING RULES

Vehicle Identification Number (Coding Method)

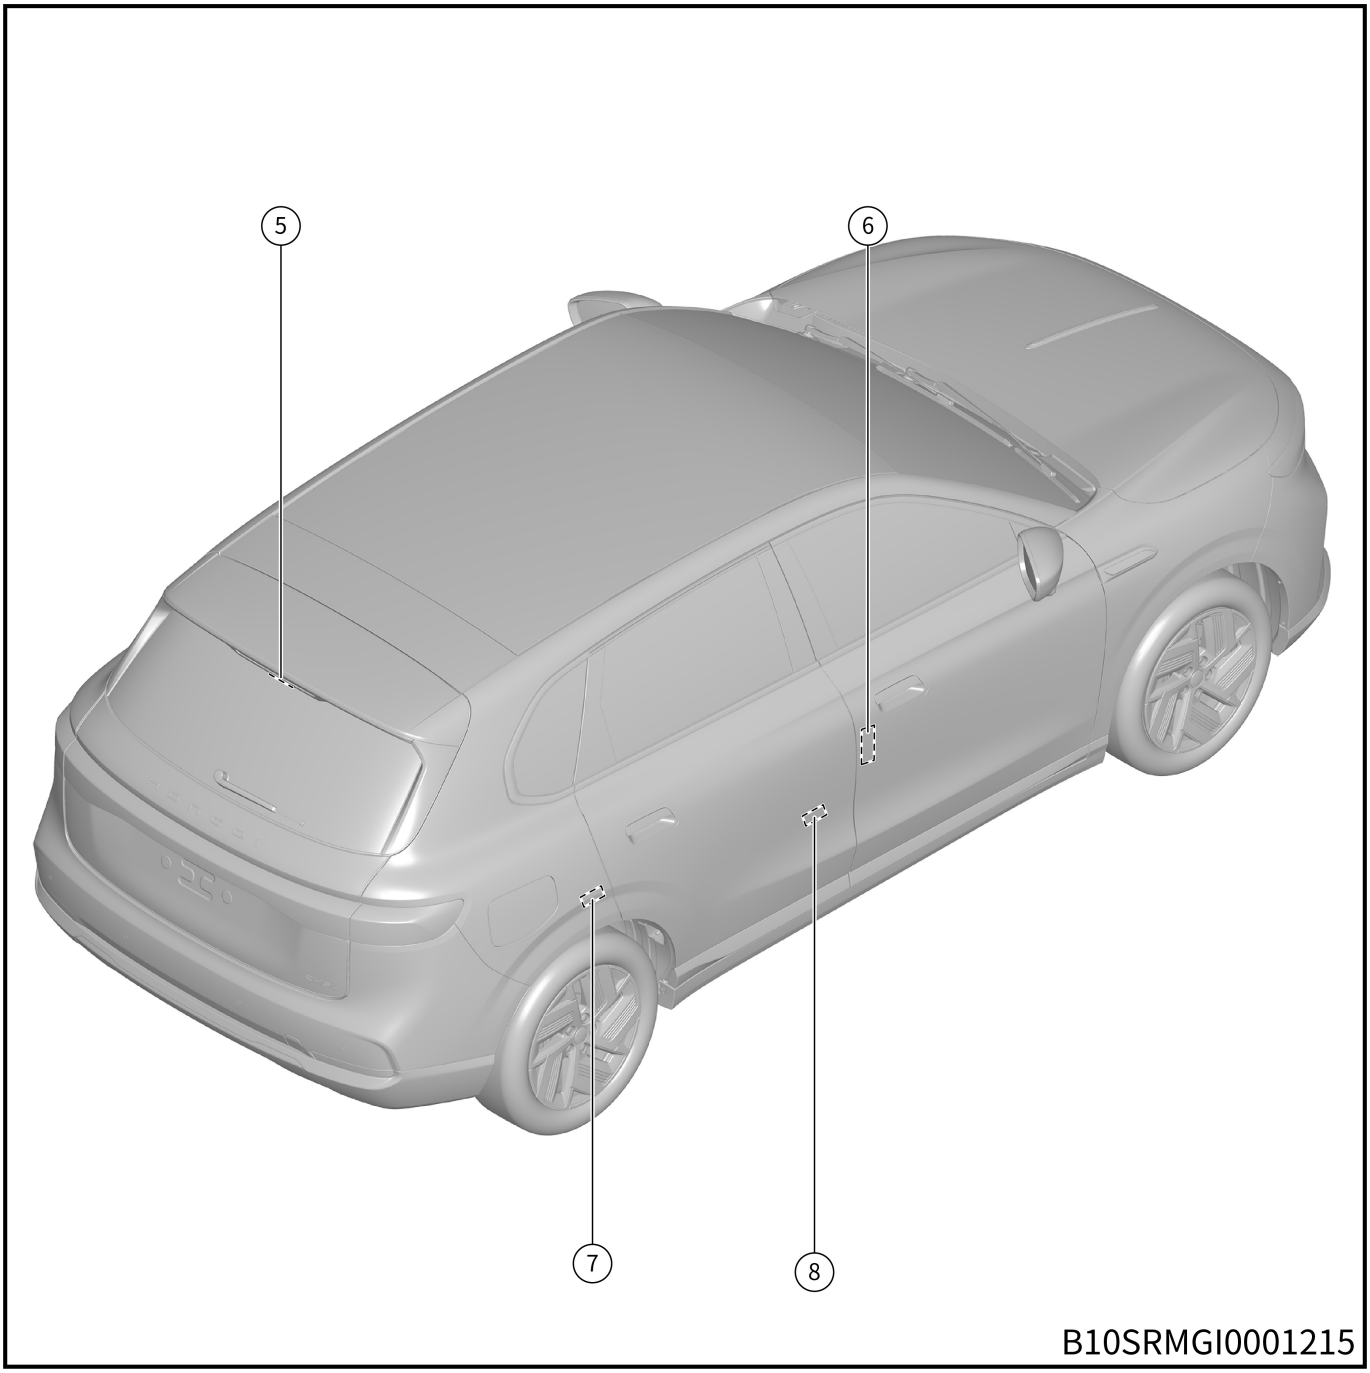
- The Vehicle Identification Number contains the following information:



© 2026, All rights reserved

1.4.3 VEHICLE IDENTIFICATION NUMBER (VIN)

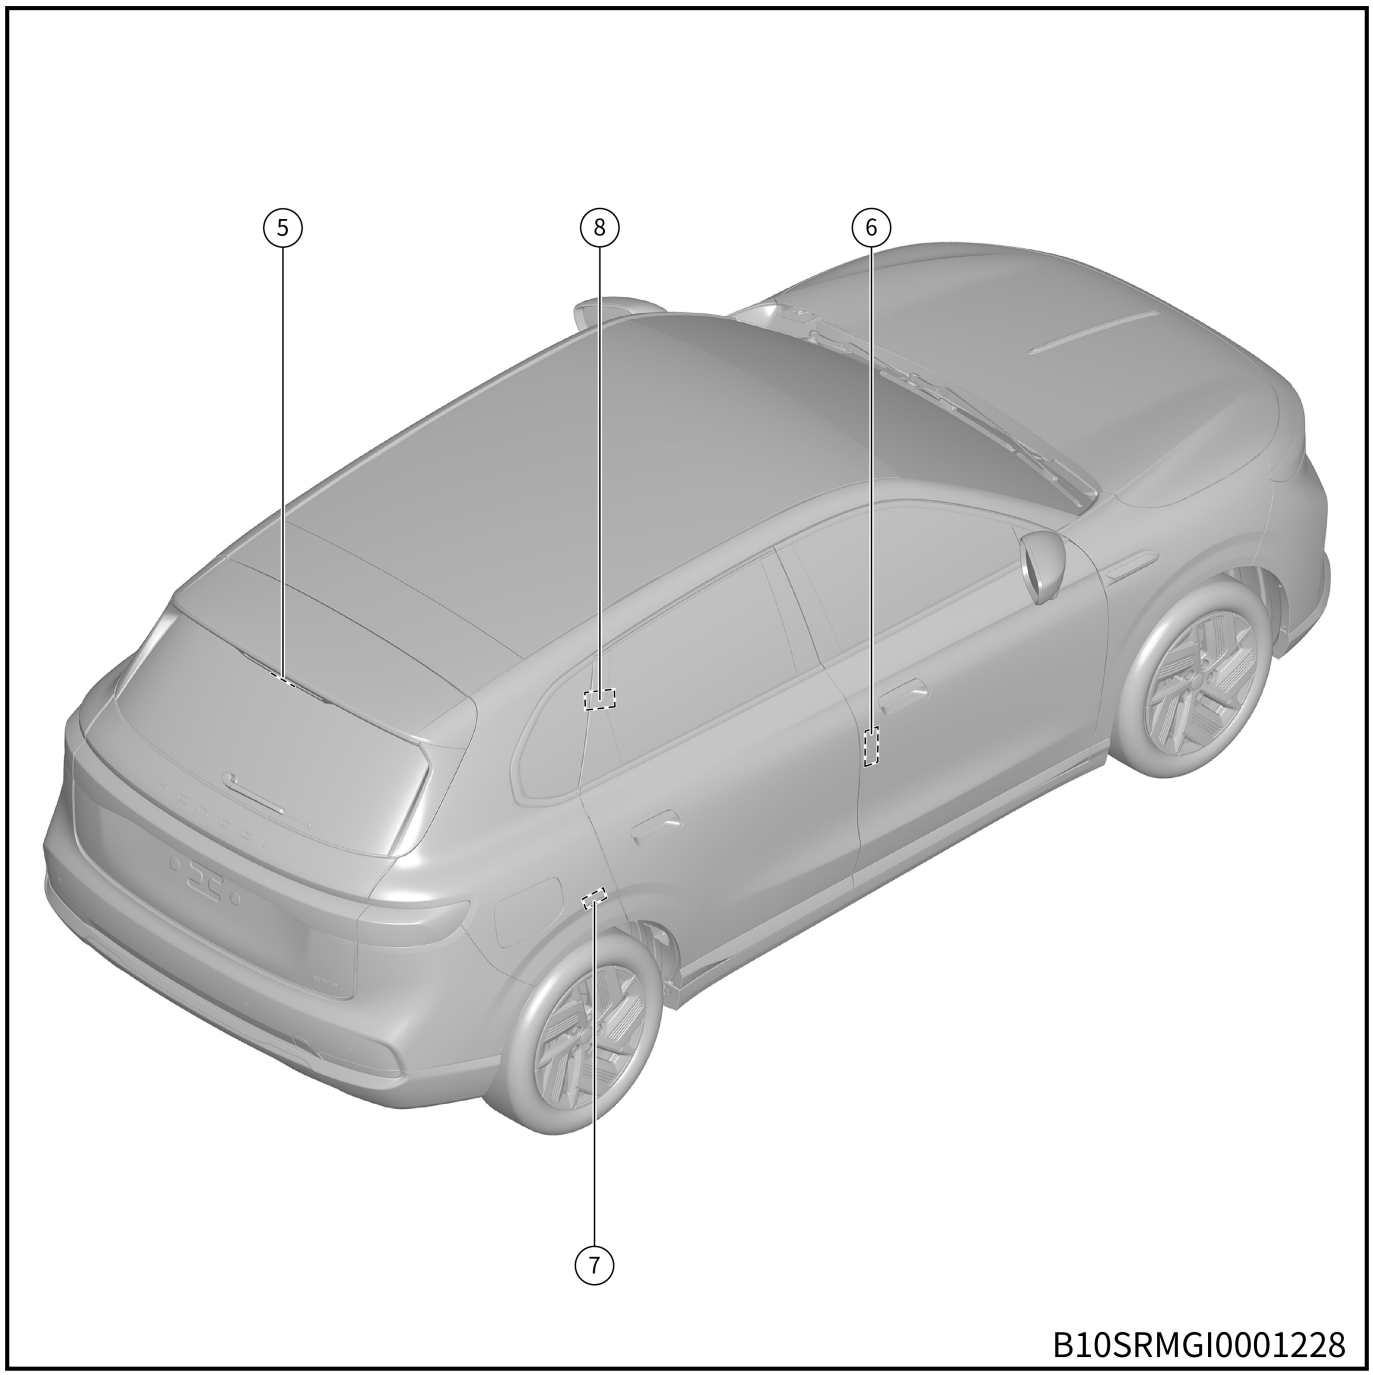
Vehicle Identification Number



- The Vehicle Identification Number (VIN) consists of 17 characters and includes information such as the country of manufacture, manufacturer, year, and vehicle feature codes, and is stamped or affixed to the following locations

- ①Located on the right side of the front hood latch (adhesive)
- ② Located on the sheet metal cross beam at the left lower side of the front windshield (pasted)
- ③ Located at the front of the left strut tower (paste)
- ④Left front door sheet metal (attached)

© 2026, All rights reserved

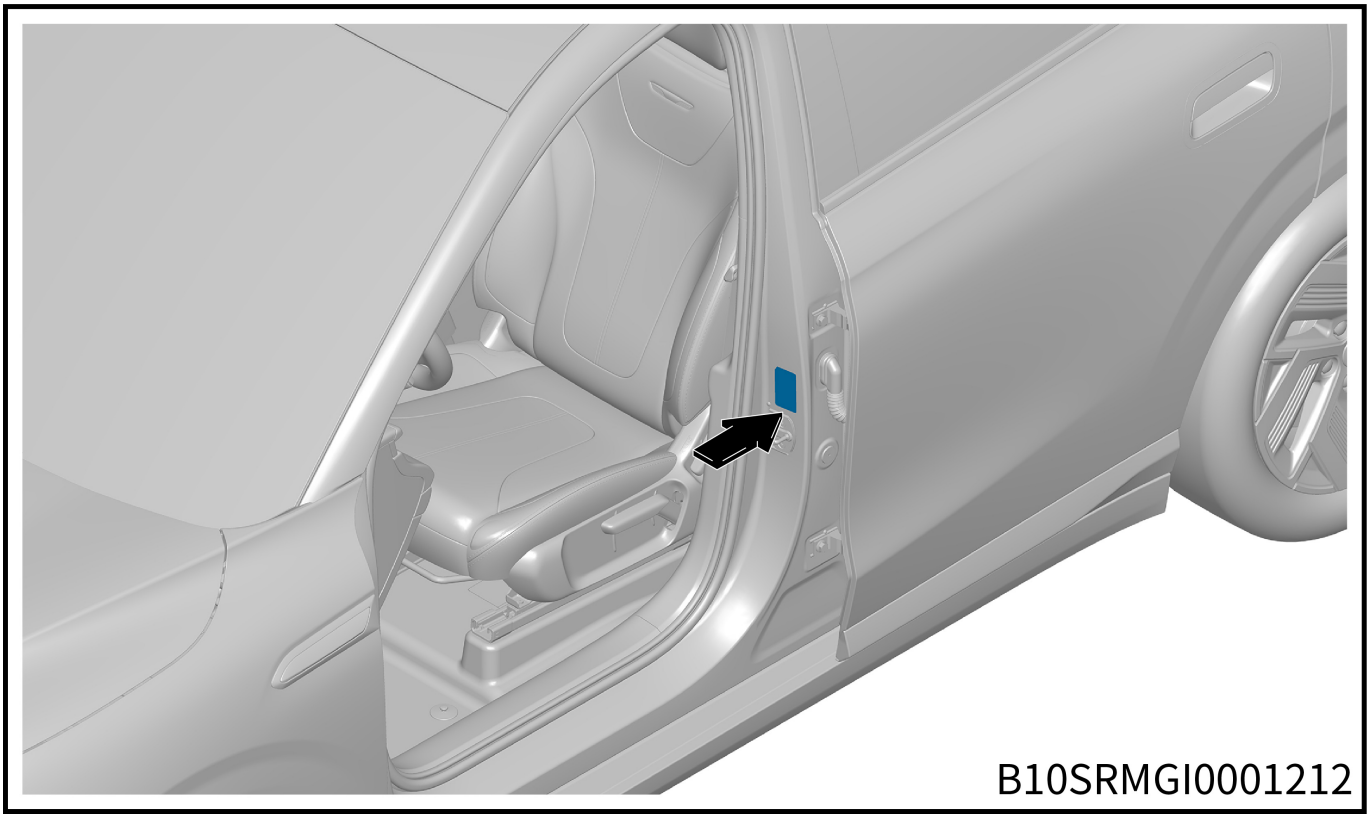


Non-Middle East

- ⑤Located on the liftgate inner panel (paste)
- ⑥Located on the right front door sheet metal (attached)
- ⑦On the sheet metal on the right rear wheel cover (paste)
- ⑧Located on the rear crossbeam of the right seat (stamped)

Middle East Region

© 2026, All rights reserved



- ⑤Located on the liftgate inner panel (paste)
- ⑥Located on the right front door sheet metal (attached)
- ⑦On the sheet metal on the right rear wheel cover (paste)
- ⑧ Located on the rear crossmember of the left seat (stamped)

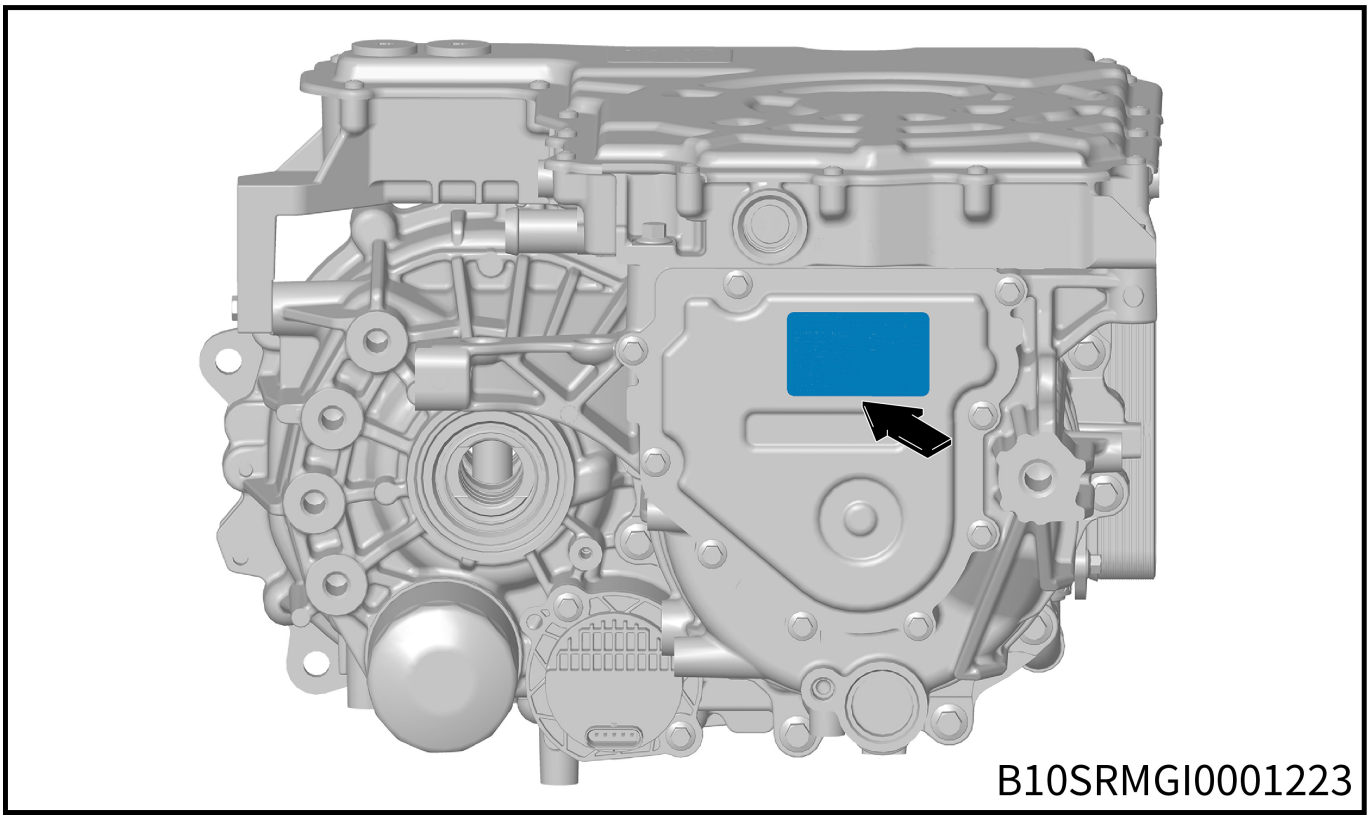
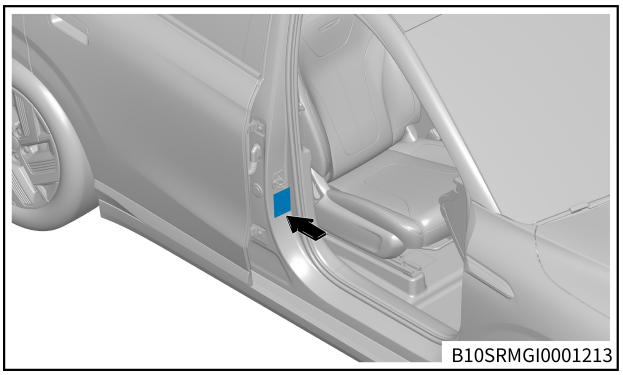
1.4.4 VEHICLE TIRE INFLATION LABEL



The tire inflation label is located on the outer panel of the left B-pillar.

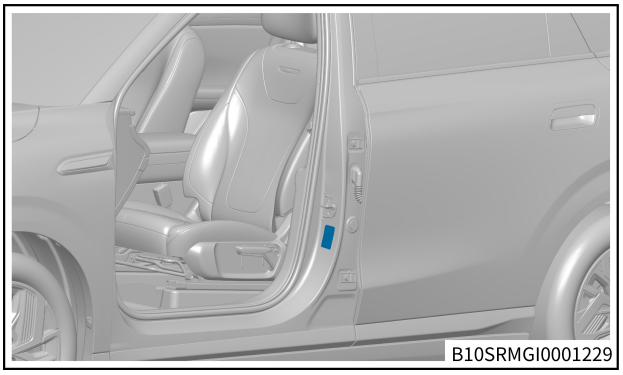
© 2026, All rights reserved

1.4.5 DRIVE MOTOR ASSEMBLY NAMEPLATE



The drive motor nameplate is located on the drive motor housing. The drive motor number is located on the drive motor nameplate - arrow -.

© 2026, All rights reserved



1.4.6 VEHICLE NAMEPLATE LABEL

Non-Middle East

a. The vehicle identification plate is located on the right B-pillar outer panel. The vehicle identification plate is marked with information such as the country of manufacture, date of manufacture, Vehicle Identification Number (VIN), drive motor parameters, and power battery parameters.

Middle East Region

a. The vehicle identification plate is located on the left B-pillar outer panel. The vehicle identification plate is marked with information such as the country of manufacture, month and year of manufacture, Vehicle Identification Number (VIN), drive motor parameters, and power battery parameters.

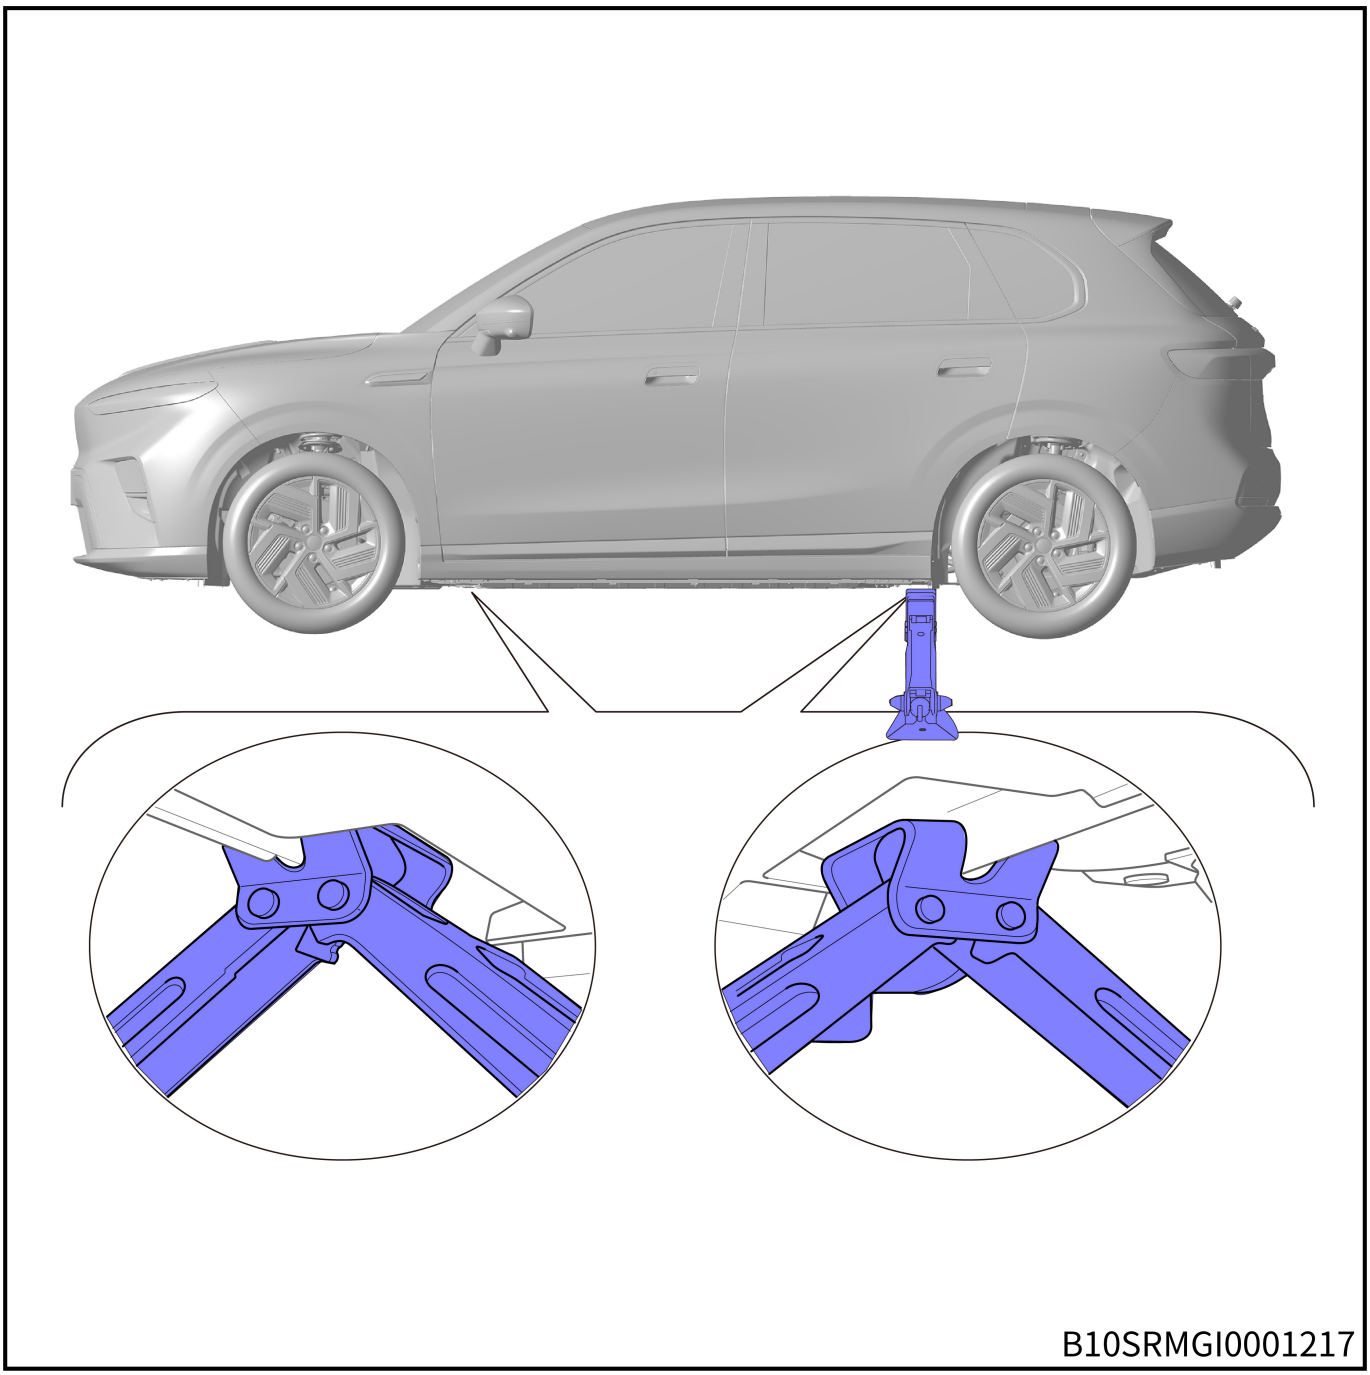
1.5 VEHICLE LIFTING AND SUPPORT

1.5.1 VEHICLE SUPPORT

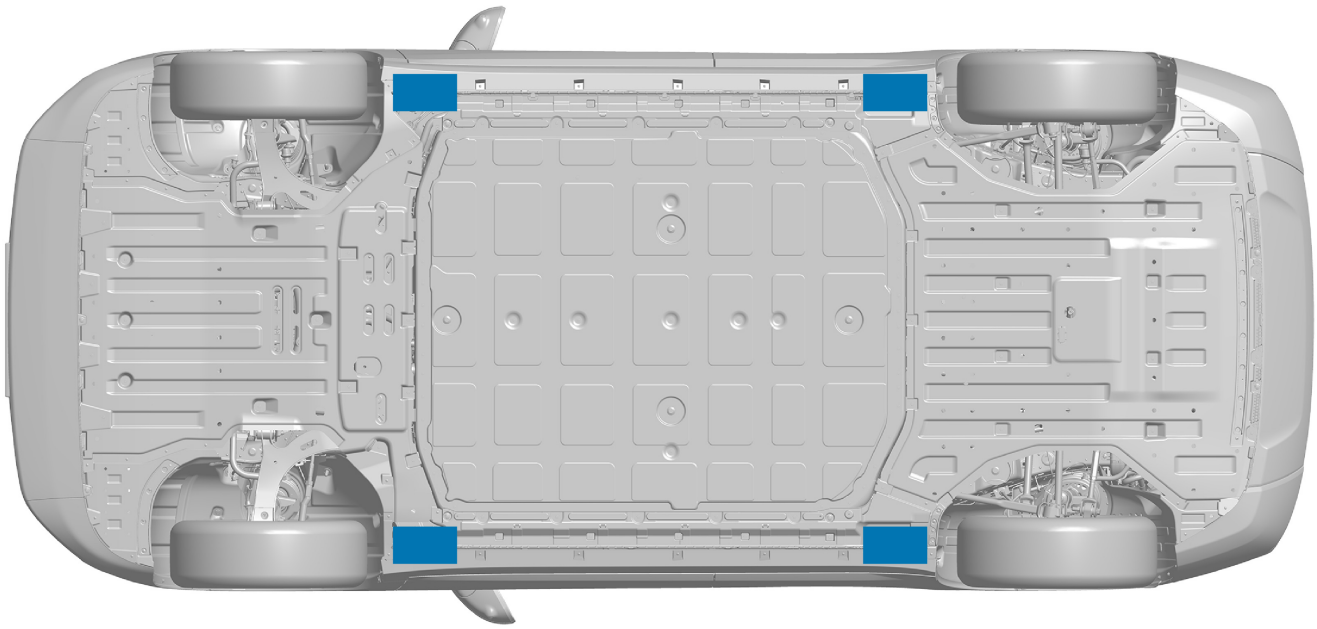


ATTENTION

Always park the vehicle on a hard, level surface. If the vehicle needs to be jacked up on soft ground, a load-spreading block must be placed under the jack. Always place wheel chocks diagonally opposite the jacking point. Failure to comply with these instructions may result in personal injury. When using a jack for vehicle maintenance, it is crucial to fully understand the following guidelines. The correct support points must be confirmed; these are typically located in the open area between the front and rear wheels, and ensure that the power battery pack is not contacted. When using the jack, use a protective pad to prevent damage to the vehicle paint.

© 2026, All rights reserved

© 2026, All rights reserved



© 2026, All rights reserved

1.5.2 VEHICLE LIFTING

ATTENTION

- The lifting points shown in the figure below are critical for safe lifting. Otherwise, vehicle damage or personal injury may occur.
- Before starting any lifting procedure at the frame rail or other designated lifting points, ensure that the vehicle is on a clean, solid, and level surface. Ensure that all lifting equipment meets the weight capacity and is in good working condition. Ensure that all vehicle loads are evenly distributed and securely fastened.
- When lifting the vehicle, ensure that the lift arm pads do not contact the high-voltage battery pack. Contact with the aforementioned parts may cause vehicle damage or reduced vehicle performance.
- When lifting the vehicle with a two-post lift, leveling pads must be used under the lifting points.

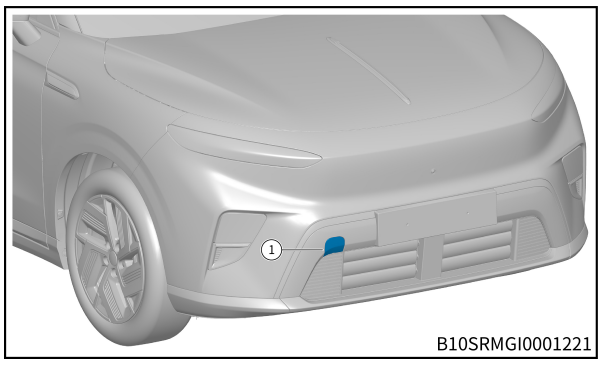
1.6 VEHICLE TOWING

1.6.1 TRAILER TOWING

1. If the vehicle needs to be towed, it should be towed by a Leapmotor Service Centre or a professional towing company.
2. It is recommended to use a platform truck for towing. If conditions are insufficient, it can also be towed by a wheel-lift truck as appropriate.
3. The towing method with all four wheels off the ground ①② must be used, and the towing methods ③④⑤ shown in the figure are prohibited.
4. Before towing, turn on the hazard warning lights and close all doors.
5. During towing, no one is allowed in the vehicle.

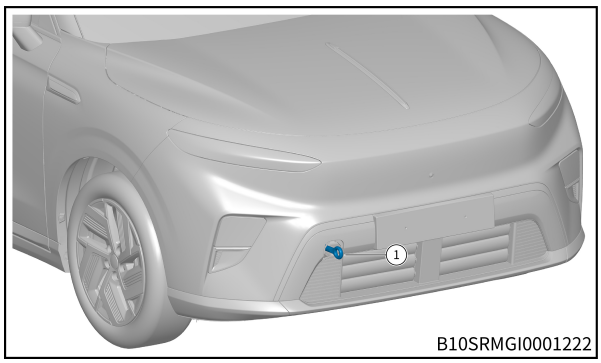
© 2026, All rights reserved

1.6.2 EMERGENCY TRACTION



In an emergency, if flatbed towing or wheel-lift towing is not possible, a tow rope or tow chain can be secured to the front tow hook of the vehicle for temporary towing. This method is only suitable for low-speed, short-distance towing on firm and level road surfaces.

Front and rear towing eye installation locations and methods:



ATTENTION

- When securing the vehicle with a tow rope or tow chain, do not secure it too tightly, otherwise the vehicle may be damaged.
- In the process of towing a vehicle, the driver must sit inside the vehicle and control the steering wheel and brake pedal to avoid personal injury and vehicle damage during towing.
- Don't drive at a high speed while towing the vehicle.
- When installing the tow hook on the vehicle, tighten it securely. If the tow hook is loose, it may detach during towing, resulting in serious personal injury or vehicle damage.

1. Front towing

a. Open the front tow hook cover ①.

b. Tighten the tow hook ① clockwise and secure the tow rope.

© 2026, All rights reserved

1.6.3 EMERGENCY TOWING REQUIREMENTS

- When towing, avoid sudden starts or erratic driving maneuvers.
- Drive slowly during towing, avoid abrupt operations, as excessive towing force may damage the vehicle.
- When towing, avoid keeping the distance between the vehicles too close.
- When towing, shift the gear selector to Neutral.
- The tow hook must be securely tightened into the threaded hole. Otherwise, the tow hook may slip out of the threaded hole during towing.
- The towed vehicle must be powered on. Turn the steering wheel back and forth to confirm that it can turn.
- Do not tow at a speed exceeding 30km/h.
- When towing a vehicle, both the towing and towed vehicles must turn on their hazard warning lights and comply with local traffic regulations.
- The driver must sit inside the vehicle and control the steering wheel and brake pedal to avoid personal injury and vehicle damage during towing.
- High-speed driving is prohibited while towing the vehicle.
- Inexperienced drivers should not attempt to tow other vehicles to avoid accidents.
- When towing a vehicle, the brake booster and power steering of the towed vehicle will not function. Apply the brakes earlier than under normal conditions.
- Drive slowly, do not drive too fast, avoid sudden acceleration, sudden deceleration, and sharp turns, as excessive traction may damage the vehicle.
- During towing operations, the tow rope must remain taut at all times.
- When towing the vehicle, maintain a straight-line tow as much as possible.

1.7 MAINTENANCE SETTINGS

1.7.1 FLASHING OF EACH CONTROLLER AFTER REPLACEMENT

ATTENTION

After the software flashing is completed, the vehicle must be locked and enter sleep mode for at least 1 min.

Components	Operation Items	Operation Procedure	Service and Repair Guidance
Power tailgate learning (manual learning)	Tailgate position learning	If the vehicle loses power while the power tailgate is open, or during the power opening or closing process, and is then powered on again, the power tailgate will not respond to operation. In this case, you need to manually close the tailgate to the first latch position. The soft-close latch will then automatically pull the tailgate from the first latch position to the fully latched position. Once the self-learning process is completed, the power opening and closing functions of the power tailgate will return to normal.	See:Power Liftgate Controller (page 6548)
Power Liftgate Controller	IMMO Key Injection	Diagnostic tool operation: Select the corresponding vehicle model-System Diagnostics-IMMO Key Injection	See:Power Liftgate Controller (page 6548)
	Sunshade Learning	Press and hold the sunshade button for 10s until the sunshade moves	
Window initialization (manual learning)	Window position learning	Close the door-Manually lower the window to the bottom limit-Manually raise the window to the top limit and hold for more than 3s-Release the button after the motor stops-Manually lower the window to the bottom limit to complete window initialization	See:Left front door power window regulator assembly (page 6428)
Sunshade (Manual Learning)	Sunshade Position Learning	If the sunshade fails to close properly or does not close tightly after a period of use, the sunshade needs to be initialized: The operation on the central control panel is as follows: In the "Settings-Doors & Windows" interface, long press the sunshade button for 10s-the sunshade starts to move (release the button once the sunshade starts moving)-the sunshade will move to the fully open position-then move to the fully closed position-record the fully closed position-the sunshade moves to the fully open position again and stops, completing the initialization-the central control panel will prompt whether the sunshade initialization is successful or failed, if the prompt indicate	See:Electric sunshade assembly (page 6575)

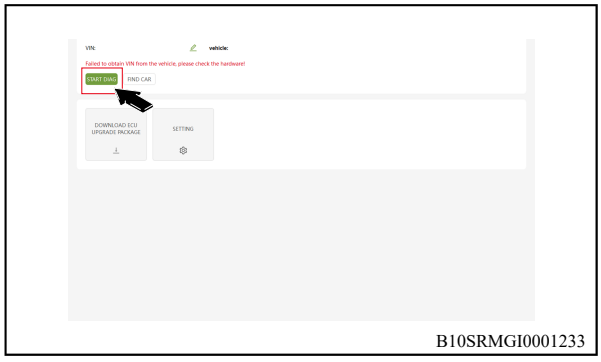
1. Enable diagnostic software

B10SRMGI0001225

a. Connect the diagnostic tool to the vehicle OBD port using the WDI cable, and power on the vehicle.

B10SRMGI0001233

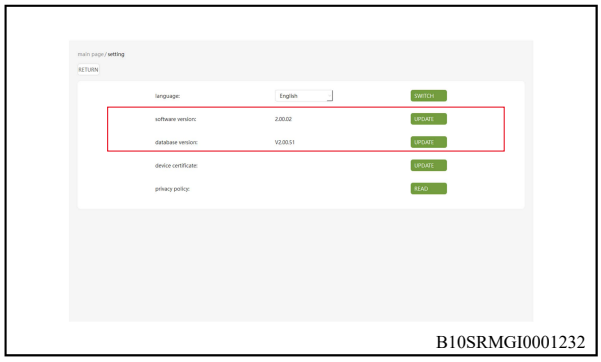
b. The connection method is the same as that of a traditional diagnostic tool. Connect to the OBD port for diagnostics.



2. Diagnostic Tool Login

B10SRMGI0001231

a. Log in to the diagnostic software, enter the account and password.



> **ATTENTION**
>
> To prevent malicious attacks by unauthorized users and reduce security risks, the current device will be locked after three incorrect password attempts.

B10SRMGI0001233

b. After logging in successfully, you will enter the main interface. Tap "Settings" to view the software version.

© 2026, All rights reserved

B10SRMGI0001232

3. Vehicle Diagnostics
   a. After entering the diagnostic page, tap "Leapmotor" - select the corresponding vehicle model.
   b. After entering the diagnostic page, you can perform operations such as "System Diagnostics", "One-Click Read", "Mode Switch", "Controller Upgrade", "Vehicle-side CAN Data Recording", and "IMMO Key Injection" on the vehicle.
4. Mode Switch
   a. Tap "Mode Switch" to perform functional operations such as "Enter Factory Mode", "Enter Delivery Mode", and "Exit Delivery Mode".
   b. Tap "Enter Factory Mode", and after entering Factory Mode, the diagnostic tool will prompt that Factory Mode has been entered.
   c. Tap "Enter Delivery Mode". After entering the delivery mode, the diagnostic tool will prompt the delivery mode entry, and the IVI system will restart.
   d. Tap "Exit Delivery Mode", follow the prompts to operate the diagnostic tool to exit the delivery mode, and after exiting the delivery mode, the IVI system will restart. After exiting the "Exit Delivery Mode", the IVI settings will be restored to the factory settings.

> **ATTENTION**
>
> Use "Exit Delivery Mode" with caution, and use this function only when necessary after maintenance or part replacement.

5. Controller Upgrade
   a. The controller upgrade function allows the vehicle to be upgraded to a newer version, and also supports upgrading the replaced controller after an after-sales part replacement. The ZhiLing Diagnostic Tool supports single-component upgrades, full-vehicle upgrades, and FCT upgrades, meeting the needs of after-sales/R&D/production. Meanwhile, when performing the upgrade function, the ZhiLing Diagnostic Tool automatically matches the required upgrade package based on the vehicle's current version information and releases it from the cloud, eliminating the need to import the upgrade package offline. Users can simply click Upgrade and wait for the upgrade to complete successfully.

1.9 WATER LEAKAGE REPAIR INSTRUCTIONS

1.9.1 REPAIR OF WATER LEAKAGE IN FIXED WINDOWS

> **NOTE**
>
> When repairing a leak, depending on the location of the water leak, it may be necessary to remove certain trim panels or components.

1. Determine the exact location of the water leak.
2. If there is water leakage around the edges of the fixed window, repair it with a special adhesive or replace it with a new window.

© 2026, All rights reserved

1.9.2 DIAGNOSTIC INFORMATION AND PROCEDURES

DIAGNOSIS OF WATER LEAKAGE

NOTE

All leaks must be found before proceeding with further repairs, random repairs may only temporarily stop the leak, but could make future repairs more difficult. Continue performing localized tests throughout the entire system to ensure all leak points are identified.

Proper testing and diagnosis of the vehicle are required when repairing body water leaks. Adjust misaligned components and repair the water leak using appropriate repair materials. First, determine the conditions under which the water leak occurs. For example: the leak only occurs when the vehicle is parked on a slope. Second, if the approximate leak area is identified, use a water hose or an air hose to pinpoint the exact leak location. If the leak location is not obvious, use a rain test rig to determine the specific leak area. It may be necessary to remove some interior trim panels or certain components to locate the exact leak point.

PREPARATION FOR WATER LEAK TEST

1. This vehicle is designed to operate under normal environmental conditions.
2. The design standards for the sealing materials and components of this vehicle have already taken into account the sealing strength required under natural environmental conditions. However, these specifications cannot account for all man-made conditions.
3. The water leak test procedure is related to natural environmental factors and can determine the vehicle's driving performance under normal conditions.
4. The first step in diagnosing a leak is to determine the conditions under which the leak occurs. If the approximate area of the leak can be identified, a water hose or an air hose can be used to isolate the exact point of water ingress. When repairing the leak, it may be necessary to remove some trim panels or components.
5. If a leak occurs at the door, tailgate, window, or when the door/window glass is raised, it is not necessarily caused by poor sealing of the weatherstrips. Adjusting these components may resolve the water leakage issue.

WATER FLOW HOSE TEST

ATTENTION

Do not use a water hose with a nozzle.

1. Have the assistant identify the exact location of the leak inside the vehicle.
2. Start the inspection from the windows or the bottom of the windshield.
3. Slowly move the hose upward until it passes through the entire roof.

BREATHER PIPE TEST

ATTENTION

© 2026, All rights reserved

The vent hose test can only be performed on fully cured adhesive. Otherwise, using this testing method will damage the adhesive layer and increase the number of leak points.

1. Dilute the liquid cleaner at a specific ratio and pour it into a spray bottle, then spray it onto the window edges. Spray from the bottom up, starting at the bottom and gradually moving upward across the entire top.

   ATTENTION

   The compressed air pressure must not exceed 205 kPa.

2. Have an assistant bring an air hose into the vehicle.
3. Have the assistant direct compressed air at the suspected water leak area. If there is a leak, bubbles will form in the liquid cleaner at the leaking area.

© 2026, All rights reserved

1.9.3 REPAIR OF VEHICLE BODY WATER LEAKAGE

NOTE

When repairing a leak, depending on the location of the water leak, it may be necessary to remove certain trim panels or components.

1. From inside or outside the vehicle, cut open a section of the seam adhesive in the leak area.
2. Clean and remove all old adhesive residue from the leakage area.
3. Apply body and seam sealant to the cleaned leak area.
4. Wait several hours for the seam adhesive to fully cure.
5. Check whether there is still a leak.
6. Install the trim panels or components removed before installation.

© 2026, All rights reserved

1.10 NOISE, VIBRATION AND UNUSUAL NOISES

1.10.1 DESCRIPTION AND OPERATION

1. This section is intended to assist in the diagnosis, testing, and repair of noise, vibration, and abnormal sound issues.
   a. Noise is defined as sound unrelated to the operation of equipment in the cabin and unacceptable to passengers.
   b. Vibration is defined as the pulsation felt by the occupants that is not caused by road surface variations.
   c. Roughness is a ride quality issue where passengers can clearly feel the reactions transmitted from the road surface.
2. Diagnostic Principles
   a. Diagnosis is not merely following a series of related steps to resolve a specific problem. It is a method of examining a system that fails to function as intended and identifying the cause. It should also enable an understanding of how the system works and whether it is operating normally. Diagnosis follows some basic rules. If these rules are followed, the cause of the problem can usually be identified on the first attempt.
3. Understanding the System
   a. Understand how the parts are assembled.
   b. Understand the operation and limitations of the system, and what happens in the event of a system failure.
   c. Sometimes it is necessary to inspect a potentially faulty system by comparing it with a known-good system.
4. Understanding System History
   a. Any clues regarding the following items can save diagnostic time:
      - How up-to-date is the system?
      - What kind of processing has it undergone?
      - Has it been repaired in the past, and is the current condition related to the previous repairs?
      - What is its service record?
5. Understanding Status History
   a. Any clues regarding the following items can save diagnostic time:
      - Did it occur suddenly, or did it develop gradually?
      - Is it related to any other events, such as a collision or part replacement?
      - Understanding how the condition was discovered may be an important clue to finding the cause.
6. Understanding the likelihood of certain conditions
   a. Pay attention to simple issues rather than complex ones. For example:
      - Circuit problems typically occur in the connections rather than the components themselves.
      - The motor failing to start is more likely caused by loose wiring or minor adjustments rather than a mechanical failure.
      - Understand the difference between impossible and improbable. Faults in certain systems, although improbable, can still occur.
      - New parts are indeed new. However, this does not mean that their functionality is necessarily good.
7. Eliminate the symptoms without finding the root cause of the fault, for example:
   a. Reducing the tire pressure of one front wheel may resolve the issue of the vehicle leaning to one side, but this does not address the root cause.
8. Confirm that the cause of the fault has been identified.
   a. Reconfirm the identified issues.

© 2026, All rights reserved

   b. What causes component wear?
9. Diagnostic Chart
   a. Diagnostic tables provide a simple method for illustrating the relationship between basic logic and the system. They help identify the cause of a problem in the shortest possible time. Diagnostic tables consolidate a wide range of diagnostic areas into a single table.

© 2026, All rights reserved

1.10.2 DIAGNOSIS AND TESTING

1. Operate the vehicle to reproduce the condition, then verify the issue reported by the customer.
2. Perform a visual inspection to see if any obvious cause of the fault can be found.
3. If an obvious cause is identified during a visual inspection or from the customer's description of the problem, repair it first before proceeding to the next step (if possible).
4. Road tests and customer descriptions provide relevant information that helps identify the issue and provides direction for initiating an accurate diagnosis.
5. If the problem persists after inspection, troubleshoot according to the fault symptoms.
6. Noise, vibration, and harshness typically occur in 3 areas:
   a. Tire
   b. Suspension
   c. Drive System
7. The source of Noise, Vibration, and Harshness issues should be identified as soon as possible. The simplest and quickest method is to conduct a road test. Use an appropriate and approved Noise, Vibration, and Harshness diagnostic detector to support diagnostic and testing procedures.

© 2026, All rights reserved

1.11 HEALTH AND SAFETY

1.11.1 BRAKE FLUID

- Avoid direct contact of brake fluid with skin and eyes as much as possible. If brake fluid splashes on the skin, it may cause slight irritation; wash immediately with plenty of cold water. If it splashes into the eyes, rinse immediately with plenty of cold water and seek medical attention as soon as possible.
- Regularly replace the brake fluid with the specified type in accordance with the requirements of the maintenance manual.

© 2026, All rights reserved

1.11.2 LUBRICANTS AND GREASES

- Avoid prolonged and repeated contact with mineral oils and greases, all lubricating oils and greases, are irritating to the eyes and skin.
- Prolonged and repeated contact with mineral oils and greases can cause the loss of natural skin oils, resulting in dryness, irritation, and dermatitis. Always use skin protection equipment and ensure that appropriate washing facilities are available.
- Health Protection Safety Guidelines
  - Wear protective clothing, including impermeable gloves.
  - First aid treatment for open wounds should be readily available.
  - When working, apply barrier cream to your skin as much as possible.
  - Clean with soap and water. Apply a protectant containing lanolin to help replace the natural oils removed from the skin.
  - If skin lesions occur, seek medical attention immediately.
  - If there is a risk of direct contact with the eyes, safety goggles, such as chemical splash goggles or a face shield, should be worn; additionally, an eyewash station should be available.
- Environmental Precautions
  - It is illegal to pour used oil directly into the ground, sewers, drainage facilities, or water pipes.

© 2026, All rights reserved

1.11.3 AIR CONDITIONING REFRIGERANT

- Skin contact with refrigerant may cause frostbite.
- Observe the instructions provided by the manufacturer, and wear appropriate safety goggles and protective gloves.
- If the skin or eyes come into contact with the refrigerant, immediately flush the affected area with clean water. Flush the eyes with an appropriate flushing solution without rubbing, and seek medical attention if necessary.
- Operations to avoid for air conditioning refrigerant.
  - Do not store refrigerant in direct sunlight or near heat sources.
  - When charging, do not hold the refrigerant cylinder upright; keep the valve pointing downward.
  - Do not expose the refrigerant cylinder to frost or snow.
  - Do not drop the refrigerant cylinder.
  - Do not discharge the refrigerant directly into the atmosphere under any circumstances.
  - Do not mix refrigerants. Use only R134a.

© 2026, All rights reserved

1.11.4 AIRBAG

- For highly flammable and explosive materials - observe the no-smoking regulations.
- Airbags are installed in the steering wheel, front passenger seats, A-pillars, roof, and passenger instrument panel as an active safety system.
- The airbag inflator contains a high-energy propellant that produces gas at extremely high temperatures when ignited. This propellant is hermetically sealed within a closed assembly, and the gas will fill the entire airbag cushion upon airbag deployment. It is strictly prohibited to open the airbag during maintenance, as this may result in hazardous contact with the propellant. If the gas generator is found to be ruptured, full-body protective clothing must be worn when handling the spilled materials.
- After normal deployment of the airbag, safety goggles and gloves should be worn during maintenance and handling.
- Deployed airbags should be disposed of in accordance with applicable local laws and regulations.
- After coming into direct contact with gas derivatives, you should:
  - Rinse the contact area thoroughly with clean water.
  - Seek medical attention if necessary.
- Airbags—Actions to be taken.
  For your safety, please wear protective equipment as much as possible before performing the following operations; when removing the airbag, be sure to turn off the vehicle and disconnect the negative battery terminal, and wait for 10min before proceeding with the removal work.
  - Store the airbag assembly in an upright position.
  - Keep the airbag assembly dry during storage.
  - When handling the airbag assembly, take care not to touch the terminals and keep the airbag as far away from your body as possible.
  - When placing the airbag assembly, keep the cover facing up.
  - Carefully inspect the airbag module for damage.
  - When connecting the airbag, first disconnect the negative battery terminal, wait for 10 min, and stand to the side of the airbag module.
  - Accurately calibrate and maintain all equipment.
  - After handling a deployed airbag, be sure to wash your hands. Avoid improper operations.
  - Do not store flammable materials together with components and gas generators.
  - Do not submerge the airbag assembly in water or expose it to other liquids.
  - Do not store the component upside down.
  - Do not attempt to open the inflator housing.
  - Do not expose the gas generator to open flames or heat sources.
  - Do not place other objects on the component cover.
  - Do not use damaged components.
  - Do not touch the airbag module or the inflator within 10 minutes after deployment.
  - Do not use any electrical probes on the circuit.

© 2026, All rights reserved

1.11.5 ELECTRIC SHOCK

- Improper use of electrical equipment not in accordance with the instructions may result in electric shock.
- Ensure that electrical equipment is maintained within the specified time and tested regularly. Faulty equipment shall be labeled and, preferably, moved and stored outside the work area.
- Do not subject wires, cables, plugs, and sockets to abrasion, kinking, cutting, cracking, or other damage, and never allow electrical equipment and wires to come into contact with water.
- Ensure that electrical equipment is protected by the correct fuse.
- Do not misuse electrical equipment, and never use any equipment with potential faults, as it may result in personal injury.
- Ensure that the cables of electrical equipment are not pinched or damaged during movement.
- Basic first aid training must be provided to designated electrical operators.
- In the event of an electric shock:
  - Before touching the victim, turn off the power.
  - If the power supply cannot be turned off, use a dry insulating material to remove the victim from the power source.
  - If you have received specialized first aid training, administer first aid on-site immediately.
  - Request medical assistance.

© 2026, All rights reserved

1.11.6 FIRE

- Many materials related to vehicle repair are extremely flammable. When burned, some materials can produce toxic and harmful gases.
- When storing and handling flammable materials or solvents, strictly observe fire safety precautions, especially in the vicinity of electrical equipment or where welding operations are in progress.
- Before using electrical and welding equipment, you must first ensure that there is no fire hazard.
- When performing welding or using heating equipment, ensure that a fire extinguisher is readily available in the vicinity of the work area.

© 2026, All rights reserved

1.11.7 SAFETY INSTRUCTIONS

- Many operations related to vehicle maintenance and repair may pose risks to personal safety or health. This section lists certain hazardous operations, materials, and equipment, and provides safety guidelines to prevent such hazards.
- This section does not cover all health and safety matters. Therefore, all operations and procedures, as well as material handling, must be carried out with safety and health as the top priority. Before using any product, please refer to the product instruction manual provided by the manufacturer or supplier.

© 2026, All rights reserved

1.11.8 ASBESTOS

- Inhaling asbestos dust can cause lung damage and even lead to cancer.
- Asbestos dust waste should be moistened during disposal, placed in a sealed container, and clearly labeled on the container surface for safe handling. If cutting or drilling on materials containing asbestos is necessary, the material should first be moistened, and only hand tools or low-speed power tools should be used.

© 2026, All rights reserved

1.11.9 BATTERY ACID

- It is strictly forbidden to reverse the polarity when connecting the battery.
- The gases released during battery charging are explosive. Do not use open flames near a charging battery or a recently charged battery.
- Good ventilation must be maintained.

© 2026, All rights reserved

1.11.10 DUST

- Powders, dust, and dirt may be irritating, harmful, or toxic, avoid inhaling powdered chemicals and dust generated by dry friction operations, and if ventilation is inadequate, wear a respiratory protective mask to prevent dust inhalation.
- Fine dust from combustible materials may pose an explosion hazard, keep away from ignition sources.

© 2026, All rights reserved

1.11.11 CHEMICAL MATERIALS

- Chemical materials such as solvents, sealants, adhesives, paints, resin foams, battery acid, brake fluid, and lubricating oils and greases must be handled with extreme care during use, storage, and disposal. They may be toxic, harmful, corrosive, irritating, or highly flammable, and may emit highly hazardous odors and dust.
- The effects of prolonged overexposure to chemical environments can be immediate or chronic, temporary or permanent, cumulative, superficial, life-threatening, or may affect life expectancy.
- Operations for Chemical Materials
  - Carefully read and follow the warnings and precautions on the material containers, as well as any accompanying leaflets, posters, or other instructions for use. Health and Safety Data Sheets for the materials are available from the manufacturer.
  - If chemical materials come into contact with skin or clothing, remove them as soon as possible. Immediately replace heavily soaked clothing and wash thoroughly.
  - Strictly follow the operating instructions and wear protective clothing to avoid direct contact with skin and eyes.
  - When handling chemical materials, you must wash your hands before taking a break, eating, drinking, smoking, or using the restroom.
  - Keep the work area clean and tidy, and do not spill chemicals.
- Operations to Avoid When Handling Chemical Materials
  - Unless otherwise specified by the manufacturer, do not mix chemicals arbitrarily; certain chemicals may form other toxic or harmful chemical substances, and mixing them may release other toxic or harmful gases, potentially causing explosions or other accidents.
  - Do not spray chemical materials in an enclosed environment.
  - Unless otherwise specified by the manufacturer, do not heat chemical materials, as some are highly flammable and others may release toxic and harmful gases.
  - Do not leave containers of chemical materials open, as the escaping vapors may accumulate to toxic, harmful, or explosive levels.
- Certain gases are heavier than air and may accumulate in enclosed spaces.
  - Do not put chemicals into unlabeled containers.
  - Do not use chemical agents, especially solvents and fuels, to clean your hands and clothing. These substances can cause skin dryness, allergic reactions, and skin inflammation, or allow toxic and harmful substances to be directly absorbed through the skin, thereby affecting your health.
  - Unless the container has been thoroughly cleaned under supervision, do not use empty containers to store other chemicals indiscriminately.
  - Do not casually sniff or smell chemical materials. Brief exposure to high concentrations of gas may still pose a risk of poisoning or injury.

© 2026, All rights reserved

1.11.12 FIBER ISOLATION

- Used to isolate noise and sound.
- Its fibrous nature and sharp edges may cause skin allergies.
- During operation, follow the operating procedures and wear gloves to avoid excessive skin contact with fibers.

© 2026, All rights reserved

1.11.13 ACIDS AND BASES

- For example, corrosive sodium carbonate and sulfuric acid.
- Used for cleaning batteries and other materials.
- Irritating or corrosive to eyes, skin, and respiratory tract. It may cause burns to the body and damage ordinary protective clothing. Avoid splashing into eyes, on skin, and on clothing. Wear appropriate protective clothing, gloves, and goggles, and avoid inhaling the spray.
- Ensure that flushing equipment is readily available nearby, such as: eyewash bottles, showers, and soap, to ensure timely assistance in the event of a splash incident.
- Place the eye hazard warning sign in a prominent position.

© 2026, All rights reserved

1.11.14 FOAM-POLYURETHANE

- Cured foam is used as cushioning pads for seats and trim.
- The manufacturer's instructions should be followed.
- Components that have not undergone chemical reactions are irritating, and may be harmful to the skin and eyes, requiring gloves and safety goggles to be worn during operation.
- Individuals with chronic respiratory diseases, asthma, bronchial problems, or hereditary allergies should not handle or be near uncured materials.
- Its spare parts, vapors, or sprays may cause direct irritation and allergic reactions, and may be toxic and harmful.
- Never inhale vapors or spray, these materials must be used in a well-ventilated area with respiratory protection. Do not remove the respirator immediately after spraying, wait until the vapors and spray have completely dissipated before removing it.
- The combustion of uncured components and cured foam produces toxic and harmful gases. During foam operations, smoking, open flames, and the use of electrical equipment are prohibited unless vapors and mists have been completely cleared. Any hot cutting of foam materials or special foam materials should be performed in a well-ventilated area.

© 2026, All rights reserved

1.11.15 NOISE

- Certain operations may generate extremely high-decibel noise, which could cause hearing damage. In such cases, appropriate hearing protection equipment should be worn.

© 2026, All rights reserved

1.11.16 ADHESIVES AND SEALANTS

IMPORTANT PRECAUTIONS FOR USING ADHESIVES/SEALANTS

- Before applying the adhesive/sealant, ensure the application surface is clean and wipe it with a dedicated cleaner to avoid compromising the bonding performance. When applying the sealant, do not allow the room temperature curing sealant to enter threaded blind holes. If the room temperature curing sealant enters a threaded blind hole, it will create a hydraulic lock effect during fastener tightening, potentially damaging the fastener and/or other components. Additionally, it will prevent the fastener from achieving the proper clamping force during tightening, thereby compromising the sealing performance. This can result in improper fastening, causing components to loosen or separate, and ultimately leading to severe damage to body components.
- Health and Safety The materials used in adhesives/sealants contain harmful substances, and prolonged exposure may cause acute and chronic poisoning, occupational diseases, skin diseases, and other illnesses. When applying adhesives/sealants, use ventilation equipment to maintain ventilation in the workspace; during operation, wear protective gloves, masks, protective clothing, etc., and after completing the work, wash your hands thoroughly, keeping the workspace clean, tidy, and hygienic.
  - Waste rubber or solvent-contaminated waste shall be cleaned up promptly and must not be left to accumulate for extended periods.
  - The product should generally be stored in a smoke-free area, cleanliness should be ensured during use, and an applicator or container should be used for application whenever possible.

ADHESIVE/SEALANT REPAIR

- When a vehicle experiences a malfunction or is involved in an accident, it typically results in body deformation, steel panel cracking, and weld spot detachment. It may also cause localized damage to other assembled components such as the body and chassis, leading to the detachment or failure of certain adhesive/sealant products. During vehicle repair, adhesives with equivalent performance must be selected based on the material and functional requirements of the components. The following lists the adhesives/sealants available for use during vehicle repair, which can be selected as needed.

BODY REPAIR

- When the body interior and steel panels are deformed or cracked, the adhesive applied to the vehicle body may peel off or break. During the repair process, the adhesive-coated areas need to be repaired.
  - First, use a tool to remove the adhesive from the vehicle body surface. Residual adhesive can be wiped clean with alcohol.
  - Wipe the adhesive application area with a dedicated cleaner to prevent residual adhesive and other contaminants from remaining on the surface to be bonded.
  - Then, apply the repair adhesive to the original adhesive application area to achieve bonding and sealing.

PARTS REPAIR

- If certain interior components, the reducer, or other parts are damaged, bonding and sealing repairs are required. When applying the sealant, ensure the bonding surfaces are thoroughly cleaned to prevent burrs and cracks from compromising the bonding quality.

CONSTRUCTION PRECAUTIONS

- The function of the adhesive/sealant is to prevent water and dust from entering the vehicle, and it also provides anti-corrosion protection. The original sealed joints are readily apparent; if these seals are

© 2026, All rights reserved

damaged, they must be resealed. When using an adhesive/sealant to seal open joints, a high-consistency filler should be selected. Follow the instructions for the selected material.

- When spraying adhesive/sealant materials, precautions must be taken to avoid spraying into component openings (such as door locks, window run channels, window regulators, and seat belt retractors) as well as any moving or rotating parts. After spraying the adhesive/sealant, ensure that all drain holes on the body are open.
- When performing construction operations, wear dedicated protective goggles and gloves to prevent injury.
- When the vehicle leaves the factory, the body sheet metal has been painted. After repairs and part replacements, all exposed metal surfaces must be treated with an anti-rust primer before sealant application.

© 2026, All rights reserved

1.11.17 GENERAL WORKSHOP AND EQUIPMENT

- It is very important to always keep all tools and equipment in good working condition and to operate them correctly during use.
- Never use tools or equipment for purposes contrary to their intended design. Do not subject equipment such as cranes, jacks, axle and chassis stands, or slings to loads exceeding their maximum rated capacity. Damage caused by overloading may not be immediately apparent and could result in a serious accident during subsequent use.
- Do not use damaged or malfunctioning tools or equipment, especially certain high-speed equipment, such as: grinding wheels. A damaged grinding wheel may shatter without warning and cause severe personal injury.
- When using grinding wheels, chisels, or sandblasting equipment, wear appropriate eye protection.
- When using sandblasting equipment, handling asbestos-containing materials, or operating spray equipment, you must wear an appropriate respirator.
- Ventilation equipment capable of controlling the levels of dust, spray, and smoke in the environment must be available.

© 2026, All rights reserved

1.11.18 FIRST AID

- In addition to complying with legal regulations, it is highly recommended to have personnel trained in professional first aid in the workplace.
- If eyes are splashed, flush with clean water for at least 10 min.
- If the skin is contaminated, wash the contaminated area with soap and water.
- In case of frostbite, immerse the affected area in ice water or cold water.
- Persons who have inhaled toxic gas should be immediately moved to an area with fresh air, and if adverse symptoms persist, they should be immediately taken to a hospital for medical attention.
- If liquid is accidentally ingested, inform the physician of the information indicated on the container or label. Do not induce vomiting unless instructed on the label.

© 2026, All rights reserved

2 MAINTENANCE AND SERVICE

2.1 MAINTENANCE MANUAL

2.1.1 PRECAUTIONS

MAINTENANCE PRECAUTIONS

MAINTENANCE PRECAUTIONS

1. Preparation Before Maintenance
   a. Operators must wear safety shoes, gloves, safety goggles, and other personal protective equipment.
   b. Ensure the work area is well-ventilated and clean, keep tools and instruments neatly arranged, and equip it with fire extinguishers, etc.
   c. Check the safety condition of instruments and equipment during use, such as inspecting hoists, jacks, etc.
   d. Check the vehicle's safe driving operation status to ensure that maintenance can proceed smoothly.
2. Precautions During Maintenance
   a. Before driving the vehicle onto the lift frame, ensure sufficient clearance between the vehicle's underbody and sides and the lift frame to avoid scraping.
   b. Before lifting the vehicle, ensure that the vehicle weight does not exceed the rated load capacity of the lift.
   c. When lifting the vehicle, the correct lifting points must be selected.
   d. When lifting the vehicle, always pay close attention to the lifting condition to prevent uneven lifting and avoid accidents.
   e. Operators must strictly comply with all safety and operating rules during maintenance.
   f. When replacing parts, you must use genuine original parts provided by a Leapmotor authorized service center or its approved products to ensure the safety and performance of the vehicle.
   g. Check the operation of the horn and turn signal lights.
   h. Check the operation of the front wipers and washers, and the windshield washer fluid level.
   i. Check the operation of the door locks.
   j. Check if the interior and exterior rearview mirrors are functioning properly.
   k. Check the clarity of the vehicle license plate.
   l. Check the coolant level.
   m. Check the operating condition of the steering mechanism.
   n. Check the brake pedal travel and the brake fluid level.
   o. Check the tire pressure and wear condition.
   p. Check whether the hood latch mechanism is functioning properly.
   q. Check the wear of the brake discs and brake pads.
3. Precautions After Maintenance
   a. After maintenance is completed, determine whether a test drive is required based on the maintenance items performed, paying special attention to the inspection of the electric drive system, braking system, and occupant protection system.
   b. The fault memory stored in the electronic control unit must be cleared before the vehicle can be handed over to the customer.
   c. Scheduled maintenance intervals depend on the odometer reading or time interval, whichever comes first. For specific intervals, please refer to the maintenance schedule in the Scheduled Maintenance section.

© 2026, All rights reserved

d. The next maintenance interval should be the same as the previous maintenance interval.
e. For the maintenance intervals of various components, please refer to the maintenance schedule in the scheduled maintenance section.
f. Certain parts require special attention during each maintenance. If hoses show signs of aging or damage, they should be replaced immediately (rubber hoses will age over time with use, resulting in swelling, interference, or cracking).

© 2026, All rights reserved

2.1.2 MAINTENANCE SCHEDULE

FLUID SPECIFICATIONS AND CAPACITIES

Item	Specifications	Usage
Coolant	Monoethylene glycol-based coolant with Organic Acid Technology (OAT) formulation. Meets and exceeds the requirements of ASTM D3306, GB 29743.1, and CUNA NC 956-16.	9±0.45L
Brake fluid	DOT4；GB 12981 HZY4；FMVSS NO116 DOT4；ISO 4925 Class4	360±50mL
Air conditioning refrigerant	HFC-123a	1300±20
	HFC-1234yf	1250±20
Reducer gear oil	Idemitsu Lubricant LI-004C	1.75±0.05L
Windshield washer fluid	Ethanol washing fluid freezing point -30℃	0.8±0.2L

Note:

- Please select coolant and windscreen washer fluid with appropriate freezing point according to the actual temperature of the vehicle environment to avoid damaging the vehicle.
- The fluid capacities listed above are design values, actual quantities may vary slightly due to factors such as product, equipment, and climate conditions, please refer to the actual vehicle.
- For detailed vehicle information and fluid specifications, please consult a Leapmotor Service Center or an authorized service dealer.

© 2026, All rights reserved

MAINTENANCE SCHEDULE

Maintenance interval	×1,000 km(621 miles)	20	40	60	80	100	120	140	160	180	200
Maintenance Items	Months	12	24	36	48	60	72	84	96	108	120
Traction battery	Battery box	J	J	J	J	J	J	J	J	J	J
	High and low-voltage connectors and grounding harnesses	J	J	J	J	J	J	J	J	J	J
	Battery box and chassis bolts	J	J	J	J	J	J	J	J	J	J
	Lower case outer surface cleaning	J	J	J	J	J	J	J	J	J	J
	Housing air pressure balance valve and water pipe connector	J	J	J	J	J	J	J	J	J	J
	Battery Parameters	J	J	J	J	J	J	J	J	J	J

Maintenance interval	×1,000 km(621 miles)	20	40	60	80	100	120	140	160	180	200
Maintenance Items	Months	12	24	36	48	60	72	84	96	108	120
	Water cooling system piping and water pump	J	J	J	J	J	J	J	J	J	J
	Compressor	J	J	J	J	J	J	J	J	J	J
	Air conditioning system	J	J	J	J	J	J	J	J	J	J
	Cabin air filter	Must be replaced every 2 years (to ensure good filtration, it is recommended to replace it every 1 year).									
	Controller software version	J	J	J	J	J	J	J	J	J	J

The meaning of codes in the table:

- J: "Check, adjust or add if necessary".

ATTENTION

- It is recommended to perform vehicle maintenance according to the above maintenance schedule to ensure the vehicle remains in optimal condition, and if any fault is caused by improper maintenance, Leapmotor will not assume the "Three Guarantees" liability.

NOTE

- To keep the power battery in optimal condition, it is necessary to fully charge and discharge the vehicle regularly (at least every 6 months or 7,000 kilometers (4,350 miles)). If the vehicle is not used for a long time, it is recommended to perform AC slow charging at least once a month and charge the battery to 100% to achieve battery self-calibration.

© 2026, All rights reserved

- The maintenance schedule is based on whichever comes first in terms of time or mileage.

© 2026, All rights reserved

MAINTENANCE CONTENT

Maintenance Items		Content
Traction battery	Battery box	Check for any irritating, burnt, or other abnormal odors around the battery box.
	High and low-voltage connectors and grounding harnesses	Check whether the high- and low-voltage connectors are clean, free of corrosion or damage, and whether the connections are secure; check whether the grounding wire harness is firmly secured and free from loosness.
	Battery box and chassis bolts	Check the torque of the bolts between the battery box (including the rear hanging beam) and the vehicle chassis, and check the bolts for corrosion and rust.
	Lower case outer surface cleaning	Check the lower housing for corrosion, deformation, etc.; Check the bottom of the lower housing for scratches, corrosion, damage, etc.; Remove dust from the housing to ensure good cleanliness.
	Housing air pressure balance valve and water pipe connector	Check whether the housing air pressure balance valve is secure and undamaged; check whether the water pipe connections have any traces of coolant leakage or deformation.
	Battery Parameters	Check the status parameters (alarm information, fault information), SOC, temperature, cell voltage, Pack insulation resistance, and software version.
	Battery pack locating hole sealing plug	Check whether the seal of the battery pack locating hole sealing plug is intact, detached, or loose.
	Battery Pack Nameplate and Warning Labels	Check whether the battery pack nameplate and warning labels are missing, fallen off, or have incomplete information.
Body, chassis and accessories	Exposed bolts and nuts	Check the torque of exposed bolts and nuts, and tighten them in place as specified.
	Brake pad	Check the wear condition of the brake pads. If the thickness of the friction material is less than 2 mm, replacement is recommended. If a warning sound is generated, replace them immediately.
	Brake disc	Check the brake discs for wear. If the brake disc thickness is less than 23 (front) / 8 (rear) mm, replacement is recommended.
	Brake hose and pipe	Check the brake lines for oil leakage, damage, and tightness.

© 2026, All rights reserved

Maintenance Items		Content
	Brake fluid	Check the brake fluid level and top up with Leapmotor genuine DOT4 brake fluid if it is low; the brake fluid must be replaced every 2 years or 40,000 kilometers (24,855 miles), and should be replaced earlier under particularly severe conditions.
	Steering gear dust cover	Check if the dust cover is damaged or leaking oil.
	Drive shaft boot	Check if the dust cover is damaged or leaking oil.
	Door, hood and trunk lid hinges	Check the fastening bolts for tightness and clean off any dust. If the movement is not smooth, apply oil or add lubricant.
	Door check	Check the fastening bolts for tightness and clean off any dust. If the movement is not smooth, apply oil or add lubricant.
	Charging port cover	Check the automatic pop-up speed of the charging port cover. If the automatic pop-up speed is slow, clean the dust from the charging port housing. If necessary, apply oil to the internal pivot of the charging port housing or add lubrication (spray WD-40).
	Tire	Check whether the cold tire inflation pressure is normal, unloaded (front/rear wheels): 230/230 kPa, loaded (front/rear wheels): 250/250 kPa; it is recommended to replace the tires when any of the following conditions is met: 3 years of driving, 40,000 km (24,855 miles), or a tread depth of less than 3 mm; if abnormal tire wear, vehicle pulling, or other abnormalities are found, please check the wheel alignment.
	Door cover limit block, gas spring	Check and clean dust.
	Coolant	Check the coolant level to ensure it is within the standard range. Add coolant if insufficient. Replace the coolant every 5 years or 100,000 kilometers (62,137 miles). The specifications of the newly added coolant must be consistent with the original vehicle model.
	Wiper blade	Check the wiper blade for wear or deterioration. It is recommended to replace it every year.
Drive motor	Safety grounding harness	Safety grounding harness tightness inspection.
	External attachment fixing bolt	Check the tightness of external attachment fixing bolts.
	Drive motor	Check the drive motor mounting bolt torque, the drive motor breather plug, and the oil leakage hole under the drive motor.

© 2026, All rights reserved

Maintenance Items		Content
	Reducer	Check the reducer mating surface and the oil filler/drain bolt for oil leakage; check the reducer vent plug torque and the oil traces on the reducer output end housing.
	Position and Temperature Sensors	Check the position and temperature sensors, and measure the sensor resistance and insulation resistance.
	Reducer oil	Replace the reducer oil every 4 years or 100,000 kilometers (62,317 miles).
	Filter	Replace the filter every 4 years or 100,000 kilometers (62,317 miles).
	Assembly housing	Clean and inspect the appearance housing of the drive motor; check whether the drive motor runs smoothly and has any abnormal noise when the vehicle is lifted and unloaded and in driving state.
	Controller fixing bolt and grounding harness	Check the drive motor controller fixing bolts for tightness; check the grounding harness for tightness.
	High and Low Voltage Wiring Harnesses and Connectors	Check the harness/connector surfaces for damage, secure attachment, and looseness; check the harness corrugated tube for aging, cracking, or falling off; check the harness terminal bolts for looseness.
Thermal Management	Water cooling system piping	Check the water cooling system hoses and pipes for aging, deformation, or leakage.
	Super Integrated Module	Check whether the clips on the wiring harness connector of the super integrated module are loose; check whether the super integrated module has any leakage, whether there is scale in the water tank, whether the water pump is working normally, and whether there is any oily fluid leakage at the joints between the integrated module body, refrigerant lines, and valve components.
	Cooling Module	Check the radiator surface for dirt or foreign objects, and clean it if necessary.
Automotive Electronics	Lights, Horn, Wiper, Washer	Check and confirm the functions of all lights, horn, wipers, and washers.
	Door, Door lock	Check the door and door lock functions, and adjust if necessary.
	Moving parts, connectors and wiring harness	Check for interference and wear between moving parts and the wiring harness; check that connectors are fully seated; check that the wiring harness is properly secured; measure the insulation resistance.
	Compressor	Test the insulation resistance value of the compressor; test the grounding resistance value at the compressor grounding wire location.

© 2026, All rights reserved

Maintenance Items		Content
	Air conditioning system	Check that the air conditioning functions properly and check for refrigerant, air conditioning pipeline, and compressor leakage and abnormal noise.
	Cabin air filter	Must be replaced every 2 years (to ensure good filtration, it is recommended to replace it every 1 year).
	Controller software version	Check if the controller software version is up to date, and refresh it if necessary.

For vehicles frequently driven under the following severe conditions, additional maintenance items are required or maintenance intervals should be shortened:

- Driving in high-dust environments such as construction sites and deserts.
- Driving in extremely cold (below 0°C) or hot (above 40°C) temperatures.
- Driving in wet conditions or frequently driving through water.
- Driving on roads with high salt or corrosive materials.
- Driving in mountainous conditions with frequent rapid acceleration and deceleration.
- Used as a taxi or engaged in other operational activities, or often used for special purposes such as high-load use.
- Engaged in racing or competitive activities.
- Installation of accessories or modifications without authorization from Leapmotor.

NOTE

- The maintenance content is based on whichever comes first in terms of time or mileage.

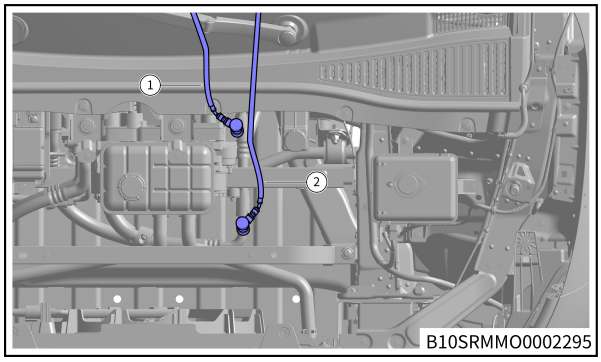
2.1.3 VEHICLE MAINTENANCE INSPECTION



ADDING REFRIGERANT OIL

FILLING PROCEDURE

NOTE

- Only after evacuation can the refrigerant oil be added.

1. Evacuate the air conditioning system.
   See:Evacuating the A/C system (page 225)
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Install the charging bottle and add refrigerant oil according to specifications.

a. Connect the high- and low-pressure lines ②, ① of the refrigeration circuit, and open the equipment high-pressure valve ② and the refrigerant oil filling switch.
   Recommended tool: Refrigerant recovery and recharge equipment
   - Connect the red hose connector of the refrigerant recovery and recharge equipment to the A/C high-pressure service port.
   - Connect the blue hose connector of the refrigerant recovery and recharge equipment to the A/C low-pressure service port.

b. Turn on the refrigerant recovery and charging equipment, and observe the oil level in the charging bottle until the required amount of oil is reached.

c. Close the high-pressure valve ②.

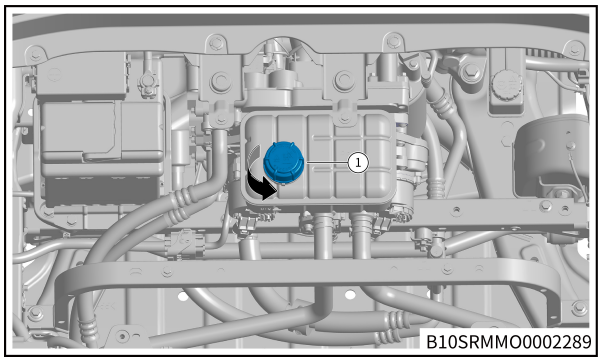
ATTENTION

- If replacing the compressor, extract 50g of refrigerant oil from the new compressor.
- If the following air conditioning components are replaced, a certain amount of refrigerant oil must be replenished:
  - Replace the evaporator core assembly, add 25g

© 2026, All rights reserved

- Replace the outdoor heat exchanger assembly, add 50g.
- Replace the integrated gas separation module, adding 80g.
- Replace the liquid-cooled condenser and add 20g.
- Replace the Chiller high/low pressure lines, add 25g.

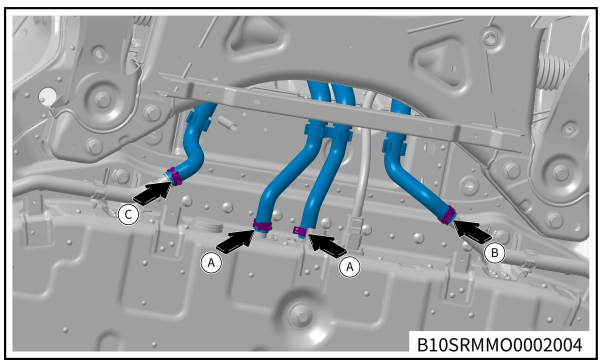
© 2026, All rights reserved



REPLACE THE COOLANT FOR THE AIR CONDITIONING, DRIVE MOTOR, AND POWER BATTERY

EMISSION PROCEDURES

ATTENTION



- Before draining the coolant, wait until it has completely cooled. Opening the coolant reservoir pressure cap may release hot steam; take precautions to prevent eye injury and skin burns. Before opening the pressure cap, cover the coolant reservoir cap with a cloth, then carefully unscrew it.
- When replacing the coolant, the old coolant must be completely drained before adding the new coolant.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the front hood assembly.
3. Remove the front compartment storage box.
   See:Front compartment storage box assembly (page 5302)
4. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
5. Open the expansion tank cap.

a. Unscrew the expansion tank cap ① in the direction of the arrow.

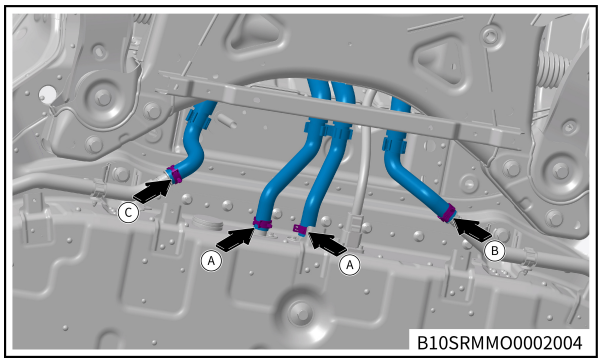
6. Lift the vehicle.
7. Remove the front compartment lower cover
   See:Front compartment lower shield assembly (page 5321)
8. Drain the air conditioning, drive motor, and power battery coolant.

a. Place the coolant collection container under the vehicle.
b. Release the 2 fixing clamps - Arrow A - connecting the battery pack inlet and outlet water pipes to the power battery pack assembly, and disconnect the connection.
   Recommended tool: Slip-joint pliers
c. Remove the 1 fixing clamp -arrow B- connecting the rear motor water inlet hose 1 to the rear motor nylon water inlet pipe, and disconnect the connection.
   Recommended tool: Slip-joint pliers

© 2026, All rights reserved

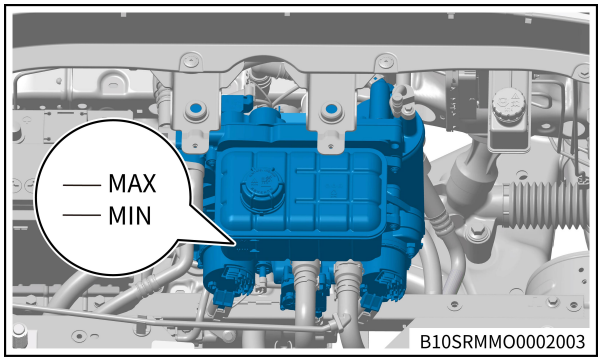
d. Remove the 1 fixing clamp -Arrow C- connecting the rear motor water outlet hose 2 to the rear EDU water outlet nylon tube, and disconnect the connection.
Recommended tool: Slip-joint pliers

ATTENTION



- When the coolant cannot be completely drained, the cooling circuit can be pressurized with compressed air to force the coolant out.

FILLING PROCEDURE



1. Add coolant.

ATTENTION

- Do not dilute the coolant arbitrarily. Coolant must not be reused or mixed, nor can it be replaced with coolant of a different color.
- Coolant protects against freezing, corrosion damage, and scale formation, and also raises the boiling point; therefore, the coolant must be filled according to specifications. Do not use coolants containing phosphates and nitrates as corrosion inhibitors.
- Recovered coolant must be disposed of in accordance with relevant national regulations.

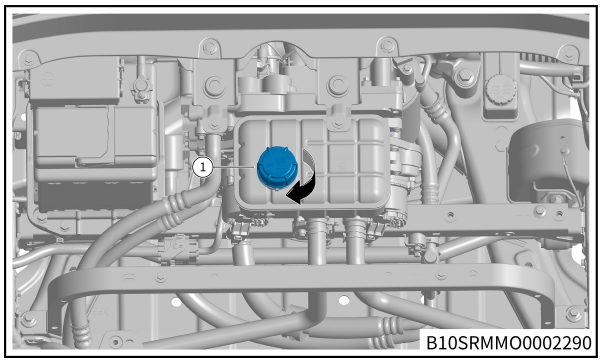
a. Install the 2 fixing clamps connecting the battery pack inlet and outlet water pipes to the power battery pack assembly -Arrow A-.
Recommended tool: Slip-joint pliers
b. Install 1 retaining clamp - arrow B - connecting the rear motor water inlet hose 1 to the rear motor nylon water outlet pipe.
Recommended tool: Slip-joint pliers
c. Install 1 fixing clamp connecting the rear motor water inlet hose 2 and the rear EDU water outlet nylon hose - Arrow C -
Recommended tool: Slip-joint pliers

d. Fill the coolant to the MAX (maximum) level.
e. Connect the negative battery terminal to restore power to the vehicle.
f. Coolant Filling Mode Function Definition:
Set a specific A/C mode on the central control panel. Once the setting is complete, proceed with the charging. After the charging is complete, manually operate the A/C settings

© 2026, All rights reserved

on the central control panel to exit the charging mode.

g. **Pretreatment (The following pretreatment must be performed before activating the filling mode):**
   - 1. Set the A/C to cooling mode (illuminated).
   - 2.Set the A/C temperature to the left set temperature LO (18℃).
   - 3. Set the A/C temperature to the right set temperature LO(18℃).
   - 4. Set the A/C air distribution mode to windshield.
   - 5.Set the A/C air volume to level 3.



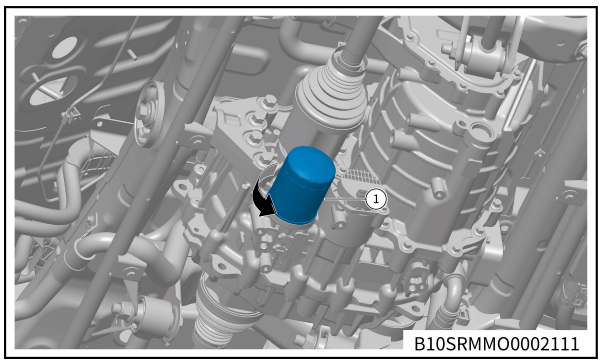
h. **Enter refill mode:**
   - 1.Set the A/C to automatic mode (illuminated).
   - 2. Set the A/C to cooling mode (illuminated).
   - 3. Set the A/C to automatic mode (illuminated).
   - 4.Set the A/C to cooling mode (illuminated).
   - 5. Set the A/C to automatic mode (illuminated).
   - 6. Set the A/C to cooling mode (illuminated).
   - 7. Set the left A/C temperature to 19℃.
   - 8.Set the A/C air distribution mode to Foot and Face.
   - 9. Set the A/C fan speed to level 5.

© 2026, All rights reserved

ATTENTION

- When performing the above sequential button operations, the operation should not be performed too quickly (greater than 1s) or too slowly (within 3s). If the refill mode is successfully activated, the fan speed will abruptly change to level 7. During the refill process, please open the reservoir cap.
- During the filling mode operation, monitor the coolant level at all times and keep it at the MAX (maximum) position.

i. **Exit filling mode (When in filling mode, the filling mode will be exited if any of the following conditions is met):**
   - 1. Lock the vehicle and power off.
   - 2. The operating time of the filling mode is ≥30 minutes.
   - 3.Turn off the A/C.
   - 4. Switch mode.
   - 5. Switch temperature.

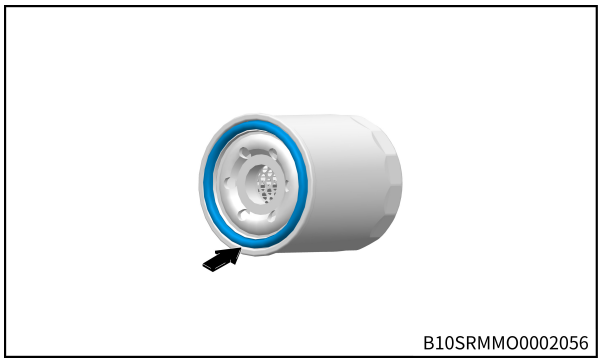


j. Tighten the coolant reservoir pressure cap ① in the direction of the arrow.

© 2026, All rights reserved

REPLACING THE FILTER

REMOVAL PROCEDURE



1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Drain the rear reducer gear oil.
   See:Replace Rear Reducer Gear Oil (page 219)
6. Replace the filter.

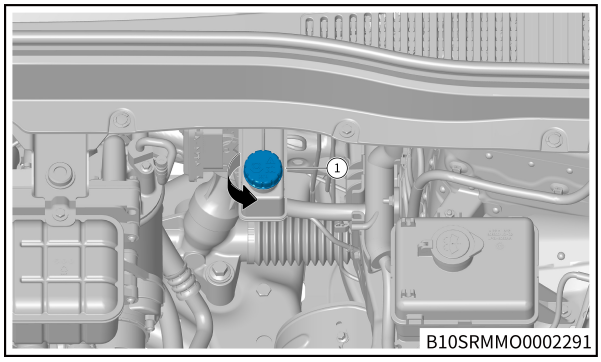
a. Use an oil filter wrench to unscrew filter ① in the direction of the arrow.
   Special tools: Oil filter wrench (C01DT300304/ C01ST300304)
   Torque: 20±1.5 N·m

SETUP

1. Perform the installation procedure in reverse order, and note the following:

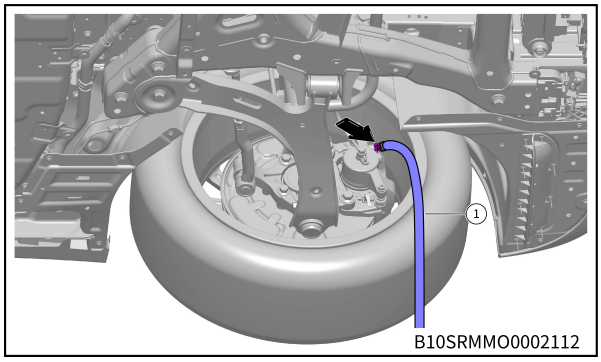
a. Clean the contact surface of the filter.
b. Before installing the new filter, apply a small amount of reducer gear oil to the surface of the sealing ring - arrow -.

© 2026, All rights reserved



REPLACE BRAKE FLUID

ATTENTION

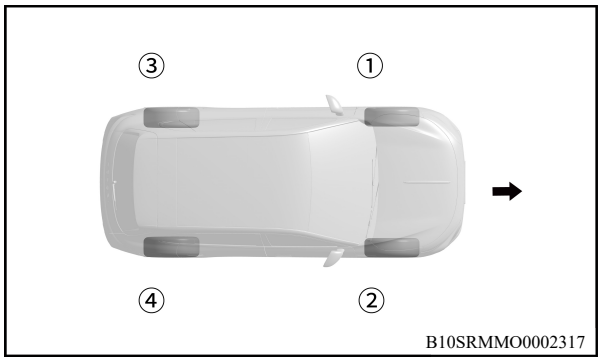


- When replacing the brake fluid, you must use the brake fluid approved by our company.
- When replacing the brake fluid, the old fluid must be completely drained before adding the new fluid. Do not mix old and new brake fluid.
- Brake fluid is toxic and corrosive, so do not allow it to come into contact with the vehicle paint. Brake fluid is highly hygroscopic and absorbs moisture from the surrounding environment, so it must be stored in a tightly sealed container.

REMOVAL PROCEDURE

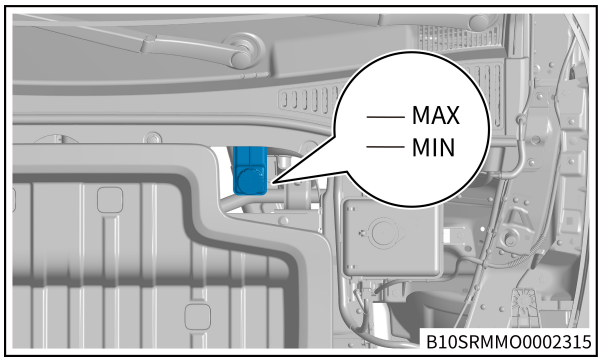
1. Remove the left/right rear wheel assembly.
   See:Wheel Assembly (page 2962)
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Replace Brake Fluid

a. Unscrew the brake fluid reservoir cap ① in the direction of the arrow.
b. Extract the brake fluid from the brake fluid reservoir.
c. Add new brake fluid to the brake fluid reservoir.



d. The brake fluid must be replaced by two technicians working together.
e. Lift the vehicle.
f. Remove the brake caliper seal cover and install the collection container ①.
   Recommended tool: Fluid collection bottle
g. Loosen the bleed screw of the left front brake caliper assembly, with one technician pressing the brake pedal inside the vehicle and another technician underneath loosening/tightening the bleed screw -arrow- until new brake fluid flows out from the bleed port.
   Recommended tool: 10mm flare nut wrench

© 2026, All rights reserved



Torque: Front 10±1, Rear 11±2N m

ATTENTION

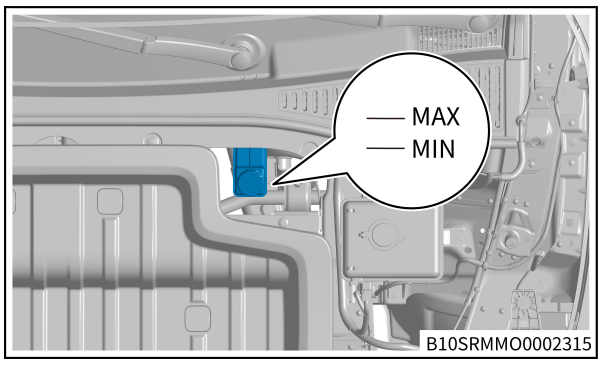
- When replacing the brake fluid, ensure that the level of the newly added brake fluid in the reservoir does not fall below the "MIN" (minimum) mark.

h. Following the sequence from ① to ④ as shown in the figure, perform the brake fluid replacement operation on each brake wheel cylinder in turn until the brake fluid is completely renewed.

i. After replacing the brake fluid in the four wheel cylinders, bleed the brake system. See:Brake System Bleeding (page 214)

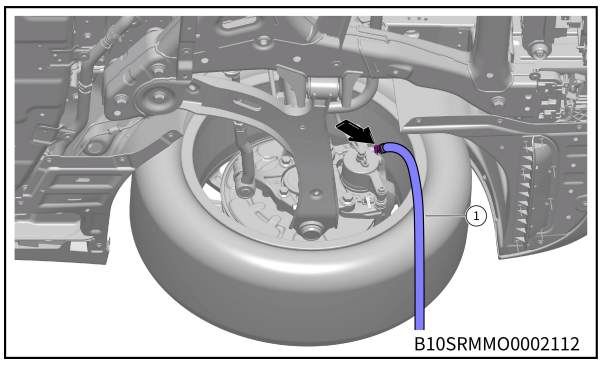
j. Add brake fluid to the reservoir until the fluid level reaches the "MAX" (maximum) mark.

© 2026, All rights reserved



BRAKE SYSTEM BLEEDING

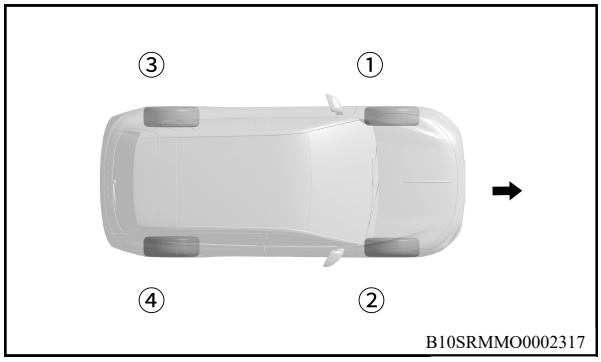
NOTE



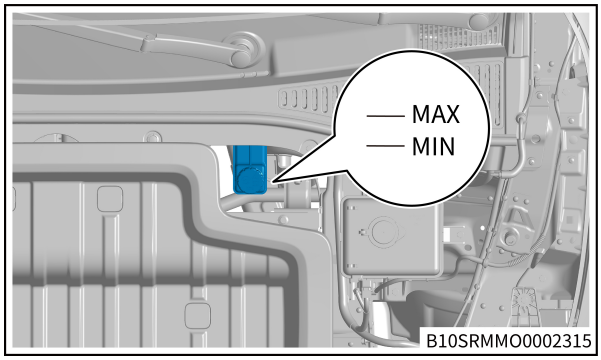
- Before bleeding, confirm that the brake fluid is not contaminated by foreign objects. Do not splash brake fluid on the vehicle, otherwise it may damage the paint. If brake fluid is accidentally splashed on the paint surface, please clean it with water immediately.
- Before starting the bleeding process, the brake fluid level in the brake fluid reservoir must be at the MAX mark. After the bleeding process, each brake caliper must be checked for leaks.

EXHAUST PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the negative battery terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left/right rear wheel assembly.
   See:Wheel Assembly (page 2962)
4. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
5. Basic Brake Bleeding



a. Confirm that the brake fluid level in the reservoir is above the MAX mark.



b. Lift the vehicle.
c. Remove the brake caliper seal cover and install the collection container ①.
   Recommended tool: Fluid collection bottle
d. Have a technician slowly depress the brake pedal several times, then apply steady pressure.
e. Another technician loosens the brake caliper bleed screw - arrow - to release air from the system.
f. Tighten the bleed screw.
g. Repeat the above steps until no air remains in the system.
   Recommended tool: 10mm flare nut wrench
   Torque: Front 10±1, Rear 11±2N m

© 2026, All rights reserved

h. Following the sequence ① to ④ as shown in the illustration, perform the above bleeding operation on each wheel in turn until no air remains in the brake fluid.

> **ATTENTION**
>
> - When performing the brake bleeding operation, ensure that the brake fluid level in the reservoir does not fall below the "MIN" (minimum) mark.

i. Add brake fluid to the reservoir until the fluid level reaches the "MAX" (maximum) mark.

6. Brake System Maintenance Bleeding
   - The maintenance bleeding routine is performed after basic bleeding to remove air from the lines caused by part replacement.

Precautions

- When using the diagnostic tool, the vehicle must be powered on to ON3 (Ready), and the high voltage must not be disconnected.
- During the entire bleeding process, the diagnostic tool must not be disconnected, first perform manual pedal bleeding, then proceed with the service bleeding.
- During the bleeding process, monitor the brake fluid level, and top it up promptly.
- Upon completion, disconnect the diagnostic tool to exit diagnostics.

Diagnostic Tool Operation Sequence

a. Connect the negative battery terminal, and after the vehicle enters the READY state, connect the diagnostic tool.

b. Diagnostic scanner operation steps: Select the corresponding vehicle model - System Diagnostics - Intelligent Integrated Brake System (IBC) - Routine Control - Service Bleeding.

> **ATTENTION**
>
> - When a dialog box pops up, the operator must not press the brake pedal unless prompted by the diagnostic tool to do so, until the process is complete.
> - During operation, open the brake fluid reservoir cap, monitor the brake fluid level in the reservoir, and top up the brake fluid as needed when the level is low.

c. The entire bleeding process mainly consists of the following steps: DAP Bleeding-Pedal Bleeding 1-Pedal Bleeding 2-MC Bleeding 1-MC Bleeding 2-MC Bleeding 3-MC Bleeding 4. Each step must be performed according to the prompts on the diagnostic tool, and the entire cycle must be repeated five times.

© 2026, All rights reserved

> **ATTENTION**
>
> MC Bleeding 1-4: Upon receiving the prompt to press the pedal, please press the pedal as soon as possible, depress it fully to the floor, and hold for 2s. Do not pump the pedal. You may click OK after depressing the pedal.

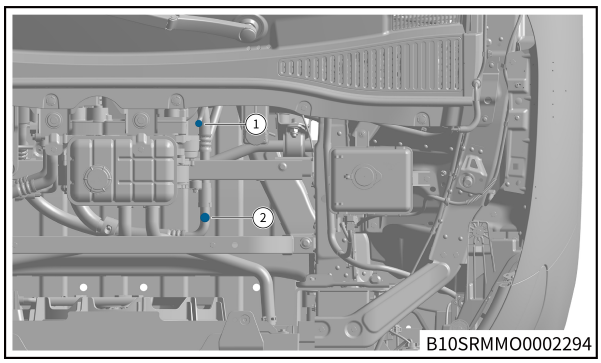
7. Leak Test & Travel Test

> **ATTENTION**
>
> The following operations must be performed when the vehicle is parked on a level surface.

   a. Leak Test & Stroke Test. Diagnostic tool operation: Select the corresponding vehicle model - System Diagnostics - Intelligent Integrated Brake Control (IBC) - Routine Control - Leak Test & Stroke Test.

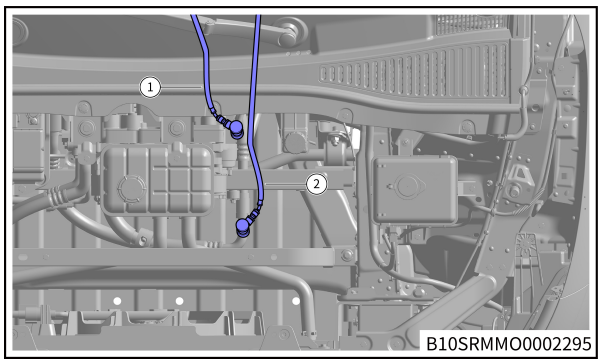
> **ATTENTION**
>
> A dialog box appears. At this point, the brake pedal must not be pressed, and the EPB must be in the released state.

   b. Result verification: The system leakage value must be less than 2.5, and the stroke value must be less than 32.
   c. If the requirements are not met, repeat the repair and bleeding process until the requirements are met.
8. Confirm Vehicle Status
   - Upon completion of the above operations, clear the diagnostic trouble codes, then read them to ensure the system is functioning normally. The vehicle can be delivered only after confirming that no diagnostic trouble codes are present. If any diagnostic trouble codes are present, troubleshoot the issue according to the specific diagnostic trouble code definitions.



© 2026, All rights reserved

REFRIGERANT RECOVERY



RECYCLING PROCEDURE

- The refrigerant recovery and recharge equipment is an integrated unit.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the front hood assembly.
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Connect the power to the refrigerant recovery and charging equipment.
5. Refrigerant Recovery

a. Unscrew the A/C low-pressure valve cap ① and the high-pressure valve cap ②.

b. Connect the refrigerant recovery and charging equipment to the A/C high and low pressure line fittings ② and ①.
   Recommended tool: Refrigerant recovery and recharge equipment
c. Select the "Refrigerant Recovery" option on the refrigerant recovery and recharging equipment, turn on the equipment, and begin the recovery process.

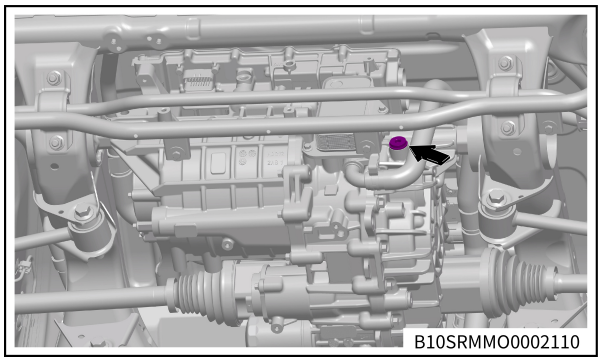
© 2026, All rights reserved

d. Open the low-pressure valve switch ① and high-pressure valve switch ② of the refrigerant recovery and recharge equipment.

> **ATTENTION**
>
> - Connect the red hose connector of the refrigerant recovery and recharge equipment to the A/C high-pressure service port.
> - Connect the blue hose connector of the refrigerant recovery and recharge equipment to the A/C low-pressure service port.

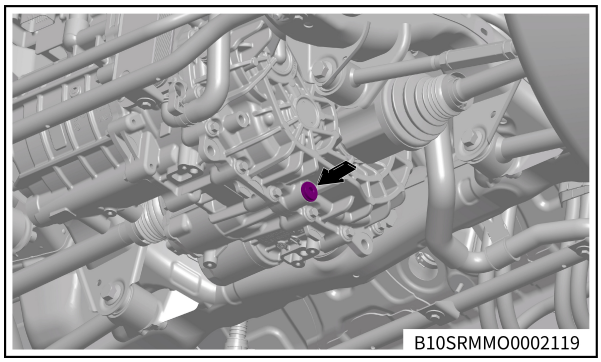
e. The refrigerant recovery and recharge machine will begin to recover the refrigerant and lubricating oil from the A/C system. The refrigerant is recovered into the storage tank, while the refrigeration oil is diverted to a removable oil storage tank.
f. Check the pressure reading on the low-pressure gauge of the refrigerant recovery and recharge equipment, and when the gauge reaches a vacuum level of -34kPa, turn off the equipment and stop recovery.
g. Check the oil storage tank for the recovered refrigerant oil and record the recovered amount, as the same amount of refrigerant oil will need to be added to the air conditioning system later.

© 2026, All rights reserved



REPLACE REAR REDUCER GEAR OIL

EMISSION PROCEDURES



ATTENTION

- Please note the disposal regulations! The filler plug sealing gasket and the drain plug sealing gasket must not be reused.
- When replacing the rear reducer gear oil, the specified type of lubricating oil must be used, and the old oil must be completely drained before adding new oil.
- The oil drain plug is magnetic and may attract metal particles and other contaminants, and after removing the drain plug, be sure to clean any metal particles and other contaminants from it.
- When replacing the rear reducer gear oil, the filter must be replaced.

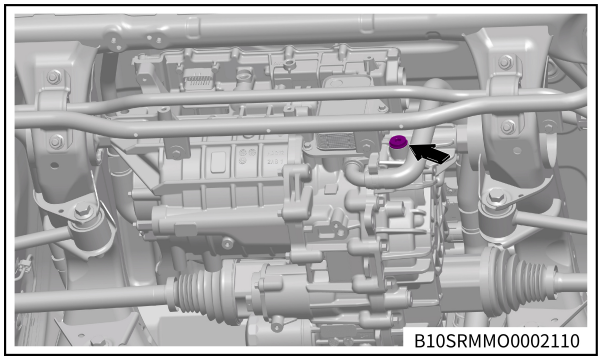
1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Lift the vehicle.
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Drain the rear reducer gear oil.

a. Clean the fuel filler port and the surrounding area.
b. Unscrew the oil filler plug of the rear reducer -arrow-.
   Recommended tool: 8mm hex socket
   Torque: 42±4 N m

c. Place a graduated container under the reducer drain port.
d. Unscrew the reducer drain plug - arrow - to drain the rear reducer gear oil.
e. After draining, install and tighten the drain plug -arrow-.
   Recommended tool: 8mm hex socket
   Torque: 42±4 N m

ATTENTION

- The oil drain plug is equipped with an aluminum washer, which must be replaced with a new one after removal.



© 2026, All rights reserved

FILLING PROCEDURE

ATTENTION

- The internal structure of the electric drive powertrain requires extremely high fluid cleanliness. If the fluid is contaminated with impurities, dust, etc., once it is filled into the electric drive powertrain, it can easily cause vehicle failure and render the vehicle undrivable.
- When filling the rear reducer with gear oil, a metered gear oil filling device must be used. Underfilling or overfilling the rear reducer with gear oil will affect the performance of the electric drive powertrain.

1. Fill the rear reducer with gear oil.

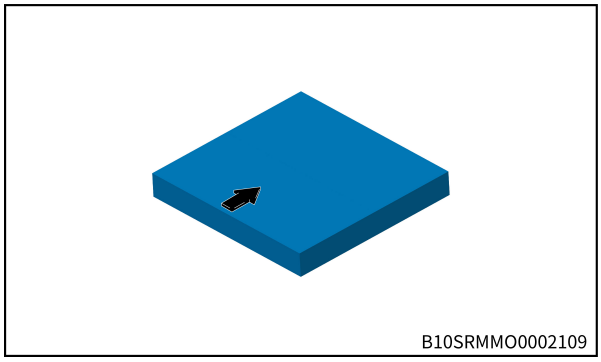
B10SRMMO0002110

a. Insert the gear oil filling equipment into the reducer filler port to fill the reducer with gear oil.
b. After filling is completed, install and tighten the filler plug -arrow-.
Special tools: Drain plug removal tool (T03ST214201), torque wrench (C01ST300303)
Torque: 42±4 N m

ATTENTION

- Install the filler plug, and a new aluminum washer must be replaced after removal.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved

CHECK AND CLEAN THE AIR FILTER

INSPECTION PROCEDURE

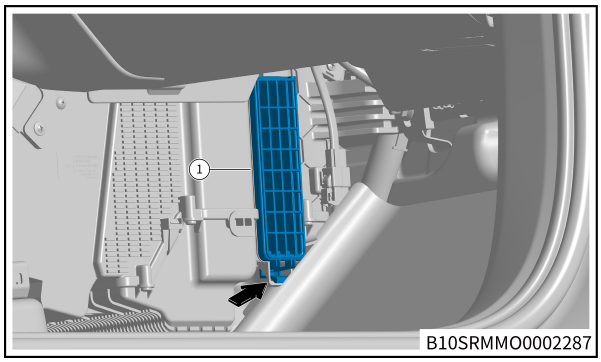
1. Remove the air filter.
   See:Replace the air filter (page 222)
2. Check and clean the air filter.

a. Visually inspect the filter. If there is only a small amount of dust and debris on the surface of the filter element, you can use a low-pressure air gun or a blower to blow air from the inside of the filter element outward to blow away the debris and dust on its surface.

ATTENTION

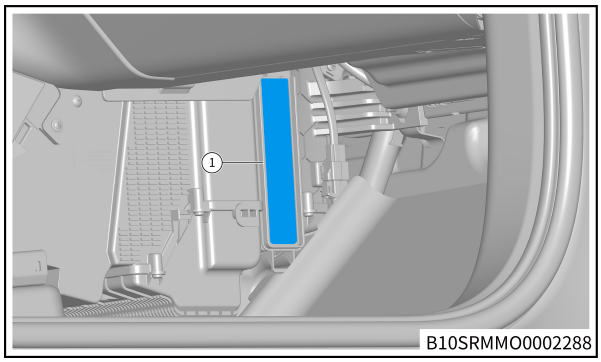
- Do not blow continuously at the same spot. Use a side-blowing angle and avoid blowing vertically.
- If the filter is heavily soiled, it is recommended to replace it with a new one.

SETUP



1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



REPLACE THE AIR FILTER

REMOVAL PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the right extension panel body of the center console.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the air filter.

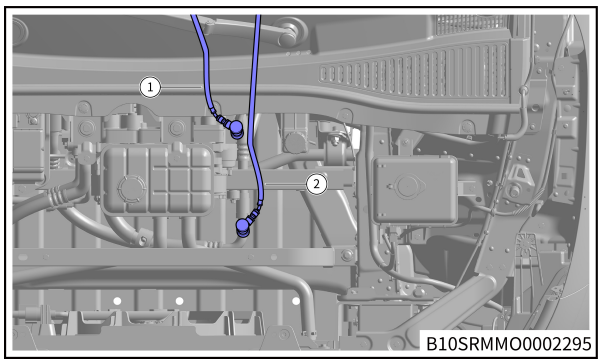
a. Release the 1 retaining clip -arrow- of the filter cover, and remove the filter cover ①.

b. Remove the air filter ①.

SETUP

1. The installation procedure is performed in reverse order.

© 2026, All rights reserved



RECHARGING REFRIGERANT

FILLING PROCEDURE

NOTE

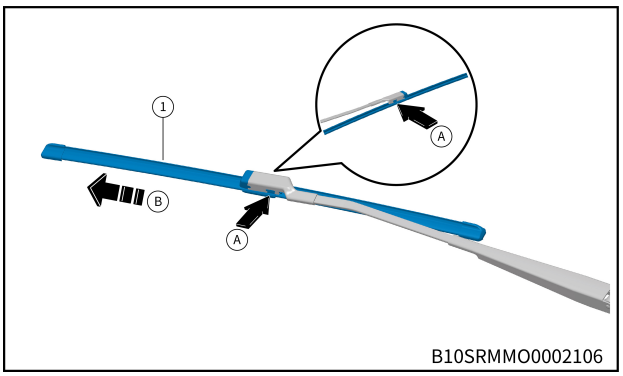
- Before recharging the refrigerant, the A/C system must be evacuated.
- Recharging the refrigerant should be performed after replenishing the air conditioning compressor oil.

1. Evacuate the air conditioning system.
   See:Evacuating the A/C system (page 225)
2. Fill with refrigerant oil.
   See:Adding Refrigerant Oil (page 205)
3. Recharging refrigerant

a. Select the "Refrigerant Replenishment" option on the device, and adjust the charge amount. **Recommended tool: Refrigerant recovery and recharge equipment**
b. Open the low-pressure valve switch ②, close the high-pressure valve switch ①, and start the equipment for filling.
c. Observe the device display screen. When the filling amount reaches the set value, the device screen will display that filling is complete.
d. Close the valve, filling is complete.

If the device indicates that the filling speed is too slow, please refer to the following filling methods:

- Disconnect the high-pressure connector of the refrigeration circuit, and connect only the low-pressure side.
- Close the high and low pressure valves of the equipment.
- Shift the vehicle into neutral, start the vehicle, turn on the A/C, and set it to low temperature mode.
- Open the low-pressure valve of the equipment, and the refrigerant will be injected into the refrigerant circuit from the low-pressure side.
- Once the pressure gauge reads the specified low-pressure value, disconnect the low-pressure side connector.
- Refrigerant charging completed.



© 2026, All rights reserved

REPLACE MAIN WIPER BLADE

NOTE

- This section describes the removal and installation of the main wiper blade, and the removal and installation of the secondary wiper blade can generally follow the same procedure as the main wiper blade.

REMOVAL PROCEDURE

B10SRMMO0002106

1. On the settings interface of the central control panel, turn on the front wiper maintenance mode.
2. Lift the wiper arm.
3. Press the lock buttons on both sides of the main wiper blade with your finger -Arrow A-, and remove the main wiper blade ① in the direction of -Arrow B-.

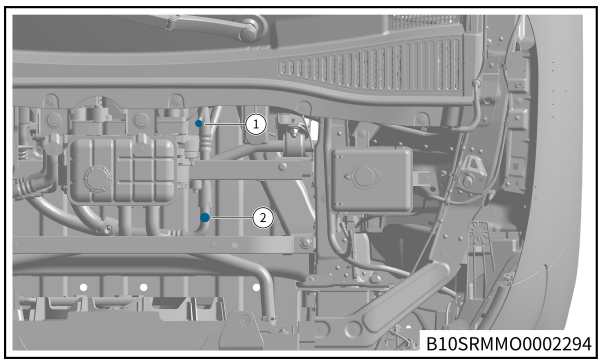
ATTENTION

- After removing the main wiper blade, wrap the end of the main wiper arm with a cloth and gently place it on the windscreen to avoid damaging the windscreen.
- After installation is complete, exit the front wiper maintenance mode.

SETUP

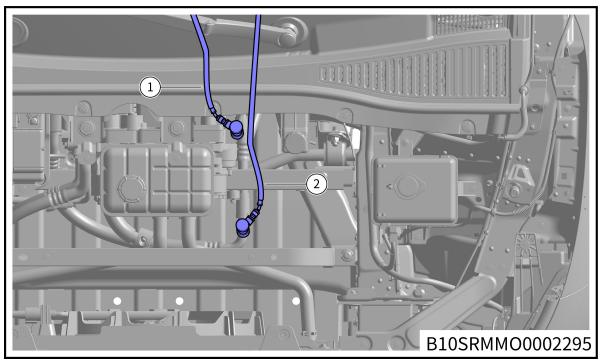
1. Perform the installation procedure in reverse order, and note the following:
   a. After installation, power on the vehicle and turn on the wiper washer mode. Check whether the wipers operate normally to ensure proper installation, then turn off the wiper switch.

© 2026, All rights reserved



EVACUATING THE A/C SYSTEM

EVACUATION PROCEDURE



NOTE

- The refrigerant recovery and recharging equipment used is an all-in-one unit. First, fully recover the refrigerant, and then evacuate the air conditioning system.

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Open the front hood assembly.
3. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
4. Evacuate the air conditioning system.

a. Unscrew the A/C high-pressure valve cap ① and low-pressure valve cap ②.

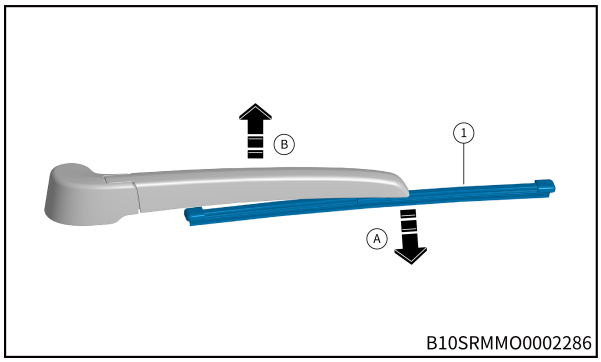
b. Connect the refrigerant recovery and charging equipment to the A/C high and low pressure line fittings ② and ①.
Recommended tool: Refrigerant recovery and recharge equipment

ATTENTION

- Connect the red hose connector of the refrigerant recovery and recharge equipment to the A/C high-pressure service port.
- Connect the blue hose connector of the refrigerant recovery and recharge equipment to the A/C low-pressure service port.

c. Open the low-pressure valve ① and high-pressure valve ② of the equipment, select the "Evacuate" option, and set the time to 15 minutes. Start the equipment evacuation, and the equipment will automatically stop when the set time is reached.

© 2026, All rights reserved



d. Close the high-pressure valve ② of the equipment, and check the pressure value on the low-pressure gauge.
e. If the pressure reaches the set value and does not rise again after a period of time, it can be confirmed that there is no leakage in the refrigeration circuit, and compressor lubricating oil and refrigerant can be added.
f. If the pressure value rises, check the refrigerant circuit for leaks.

© 2026, All rights reserved

REPLACE REAR WIPER BLADE ASSEMBLY

REMOVAL PROCEDURE

1. Replace the rear wiper blade assembly.

a. In the Settings interface of the central control panel, turn on the rear wiper maintenance mode.
b. Lift the wiper arm in the direction of arrow B, and remove the rear wiper blade assembly ① in the direction of arrow A.

ATTENTION

- After removing the rear wiper blade assembly, wrap a cloth around the end of the main wiper arm and gently place it on the windshield to avoid damaging the windshield.
- After installation is complete, exit the rear wiper maintenance mode.

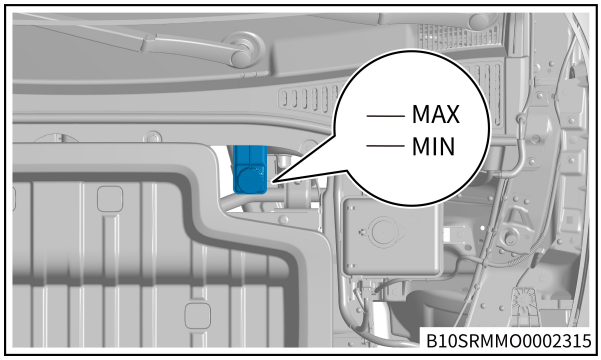
SETUP

1. The installation procedure is carried out in reverse order, while noting the following:

ATTENTION

After installation, power on the vehicle and turn on the wiper washer mode. Check whether the wipers operate normally to ensure proper installation, then turn off the wiper switch.

© 2026, All rights reserved



2.1.4 VEHICLE FLUID CHECK

CHECK THE BRAKE FLUID

NOTE

- Only use brake fluid approved by our company. Never mix brake fluid with mineral oil (engine oil, gasoline, and cleaning agents), as mineral oil will damage the seals and sealing boots of the braking system. Brake fluid is corrosive, so it must not come into contact with the vehicle paint.

1. Open the front hood assembly.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Check the brake fluid level.

a. The brake fluid level should be between the MAX (maximum) and MIN (minimum) marks.

ATTENTION

- To prevent brake fluid from overflowing from the reservoir, do not fill the brake fluid above the MAX mark.

4. Brake fluid level check during routine maintenance.

ATTENTION

- Check the brake fluid level, and also check the wear condition of the brake pads on all four wheels (including inner and outer pads).

a. Recommended brake fluid level when brake friction pad wear approaches the limit:
   - When the fluid level is at the minimum mark or slightly above the MIN (minimum) mark, it is recommended that the customer replace the brake pads with new ones and then observe the final change in the fluid level.

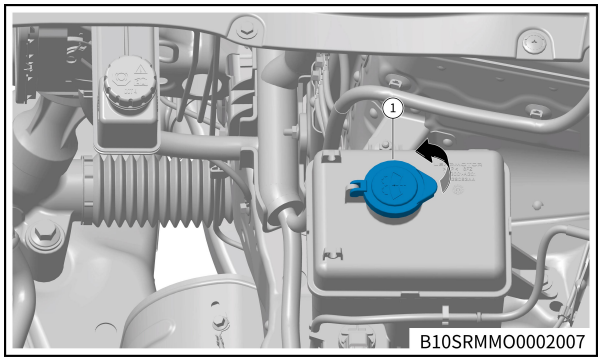
b. Recommended brake fluid level when the brake friction pads are new or far from their wear limit:
   - The brake fluid level should be between the MIN (minimum) mark and the MAX (maximum) mark.

ATTENTION

- During actual vehicle operation, the fluid level in the brake fluid reservoir may drop slightly due to the wear of the brake friction pads, requiring topping up. If the fluid level has dropped below the MIN (minimum) mark, you must check for leaks before adding brake fluid. Brake fluid is corrosive and can damage the paint finish. If brake fluid spills during topping up, immediately absorb it with an absorbent cloth and clean the area with vehicle cleaner and clean water.
- Use only new brake fluid from a sealed container (brake fluid is hygroscopic; brake fluid from an opened container or previously drained from the system has absorbed moisture from the air,

© 2026, All rights reserved

which can adversely affect braking performance). Brake fluid is toxic. Keep the container sealed and store it out of reach of children. If accidental ingestion occurs, seek medical attention immediately. Avoid contact of brake fluid with skin or eyes. If contact occurs, flush immediately with plenty of water. Do not drive the vehicle if the brake fluid level is below the minimum mark on the reservoir. If the customer reports an unexpected increase in brake pedal travel or a noticeable drop in the brake fluid level, check for brake fluid leaks. Observe waste disposal regulations.



© 2026, All rights reserved

CHECK WINDSCREEN WASHER FLUID

1. Check the windshield washer fluid level and refill.

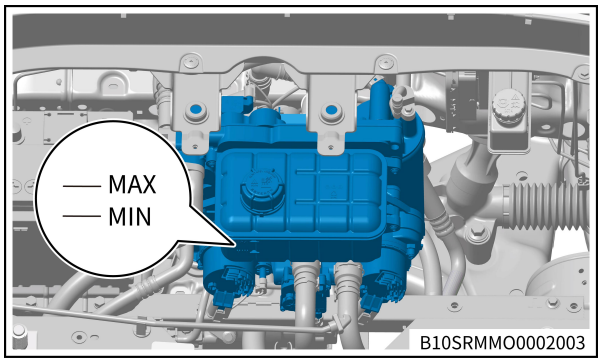
NOTE

- Windscreen washer fluid is a consumable fluid. Please check it regularly (every two weeks or one month). If the level is low, please add windscreen washer fluid.

a. Open the front hood assembly.
b. In the direction of the arrow, open the filler cap ①, and fill the washer fluid to the visible area below the filler neck. Do not overfill.

ATTENTION

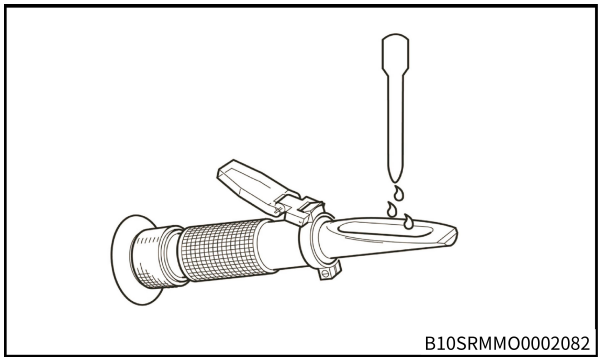
The washer fluid prevents the nozzles, reservoir, and connecting hoses from freezing. The washer fluid consists of 50% ethanol or isopropanol and 50% water with a hardness of no more than 205g/t. Washer fluid must also be added during warm seasons; its powerful cleaning performance can remove wax and oil residues from the windscreen. It must be ensured that the windscreen washer system does not freeze at temperatures as low as approximately -10℃.



© 2026, All rights reserved

CHECK THE COOLANT FOR THE A/C, DRIVE MOTOR, AND POWER BATTERY

ATTENTION

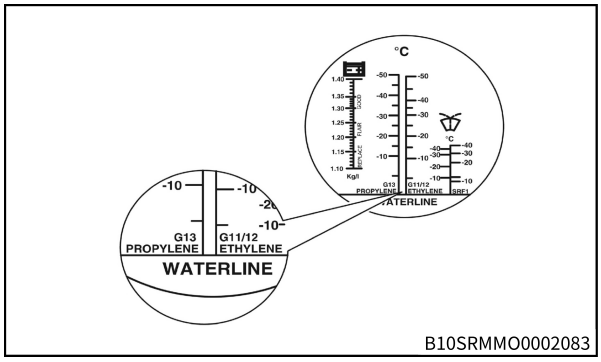


When topping up the coolant, ensure it matches the color of the original coolant; mixing coolants of different colors is strictly prohibited. Mixing coolants of different colors will cause corrosion of the associated components in the coolant circuit, severely affecting their service life or directly leading to their scrapping.

1. Open the front hood assembly.
2. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
3. Check the coolant level.

a. When the engine is cold, check the coolant level in the reservoir integrated module.
b. The coolant level should be between the MAX (maximum) and MIN (minimum) marks.
c. The coolant level is too low. Add coolant and check the system for leaks.

4. Check the freezing point of the coolant.



a. Use a dropper to place drops of coolant on the refractometer glass, and observe the freezing point reading of the coolant.

ATTENTION

Please read the relevant measured values at the cutoff line. To better distinguish the cutoff line, calibrate the instrument before use. Then, wipe the surface of the instrument's refractometer glass clean with a clean tissue.

© 2026, All rights reserved

b. Read the coolant freezing point value.

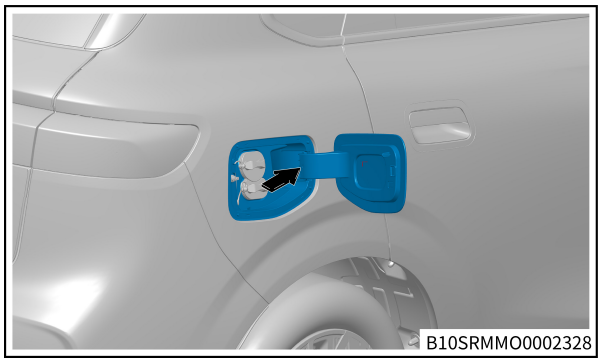
ATTENTION

- Ensure that the freezing point of the coolant is below -40°C (or the freezing point may vary depending on the region and climate). If the freezing point of the coolant does not meet the specified value, the coolant must be replaced.
- Coolant is corrosive and can damage the paint finish. If coolant spills during filling, immediately absorb it with an absorbent cloth and clean the area with vehicle cleaner and water.
- When the cooling system is hot, do not open the coolant reservoir pressure cap; otherwise, hot steam or boiling coolant may splash out from the rear drive coolant reservoir and cause personal injury.
- Coolant is toxic. Keep the container sealed and store it out of reach of children. If ingested, seek medical attention immediately.
- Prevent coolant from coming into contact with skin or eyes. If contact occurs, immediately flush with plenty of water. Do not add any corrosion inhibitor to the coolant, as it may be incompatible with the coolant. Do not mix with other coolants. The freezing point of the coolant selected for the vehicle should be 10 to 15°C lower than the local minimum temperature.

© 2026, All rights reserved

2.1.5 AUTOMOTIVE ELECTRONICS MAINTENANCE INSPECTION

OBD MONITORING DATA READING AND UPLOADING

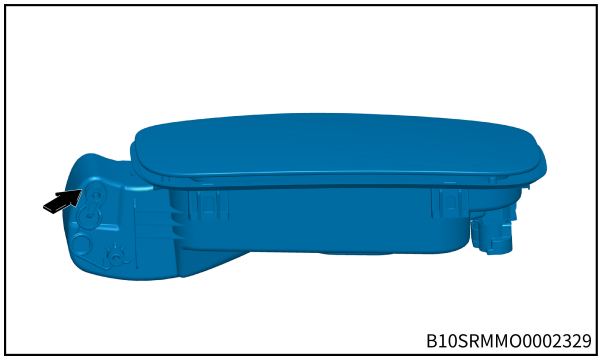


1. Confirm that the software version of the diagnostic tool is the latest version, if not, please upgrade the software while connected to the internet.
2. Ensure the vehicle battery is sufficiently charged and the voltage is stable (the battery must not be disconnected during the entire process).
3. Ensure the diagnostic computer has sufficient battery power (it must not lose power, enter standby mode, or go to sleep during the entire process).
4. During the entire flashing process, ensure that the diagnostic computer is securely connected to the vehicle's OBD interface and the computer's USB interface.
5. During the entire flashing process, ensure the diagnostic tool is connected to the network for data upload.

© 2026, All rights reserved

CHECK THE CHARGING PORT DOOR

INSPECTION PROCEDURE

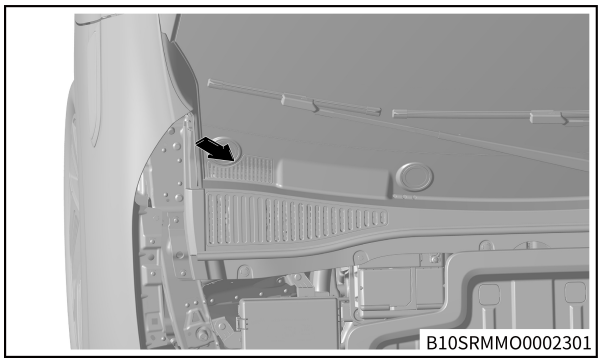


1. Check the charging port door.

a. Use a soft, dry cotton cloth to remove dirt and dust from the surface of the charging port flap -arrow-.

ATTENTION

- Do not open the charging port cover to clean the charging port terminals, to avoid electric shock.



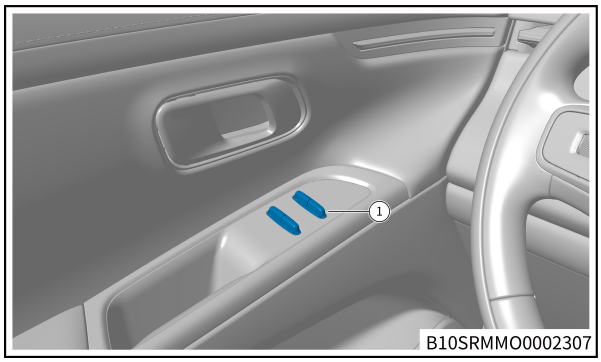
b. Repeatedly open and close the charging port flap to check for abnormal noise, sticking, slow opening speed, or other issues.
c. If the above phenomena occur, remove the charging port flap. See:Charging port housing assembly (page 6367)
d. Use a small brush to remove dirt and debris from the surface of the charging port door gear, and apply an appropriate amount of grease at the gear position -arrow- position.
e. After applying the grease, install the charging port door, check whether the issue with the charging port door has been resolved, and replace it with a new one if necessary.

© 2026, All rights reserved

CLEAN THE WINDSHIELD WATER TROUGH DRAIN HOLES

CLEANING PROCEDURE

1. Open the front hood assembly.
2. Clean the drain holes of the windshield water trough.



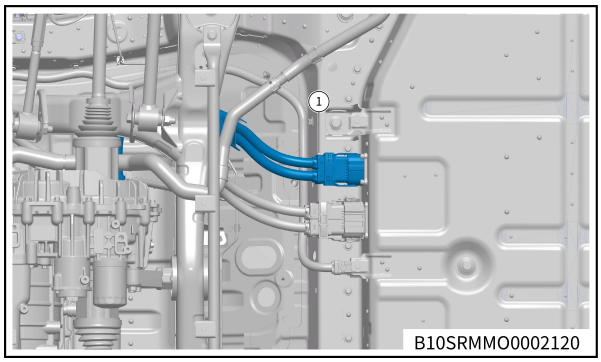
a. Clean the drain holes of the left and right water troughs -arrow-.

© 2026, All rights reserved

CHECK FRONT AND REAR DOOR AND WINDOW ASSEMBLIES

INSPECTION PROCEDURE

1. Check the front and rear doors and windows.



a. Use the switch ① on the front left door control panel to raise and lower all four door windows, and check for any abnormal noises, vibrations, sticking, or other issues throughout the entire window operation. If any are found, remove foreign objects and lubricate, and replace the window regulator mechanism if necessary.
b. Check whether the anti-pinch function of the doors and windows is functioning properly.

© 2026, All rights reserved

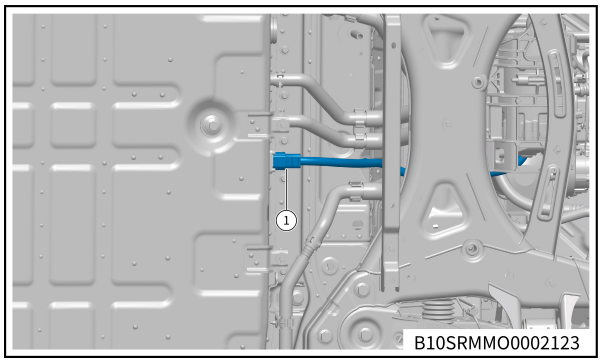
CHECK REAR MCU CABLE ASSEMBLY

INSPECTION PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Inspect the rear MCU cable assembly.

a. Check whether the connection plug between the rear MCU cable assembly ① and the power battery is loose.
b. Check the outer insulation rubber of the rear MCU cable assembly ① for any rubbing against the vehicle body or other components.
c. Check the surface insulating rubber of the rear MCU cable assembly ① for wear or aging.

ATTENTION



- Rectify all faults found during inspection.

© 2026, All rights reserved

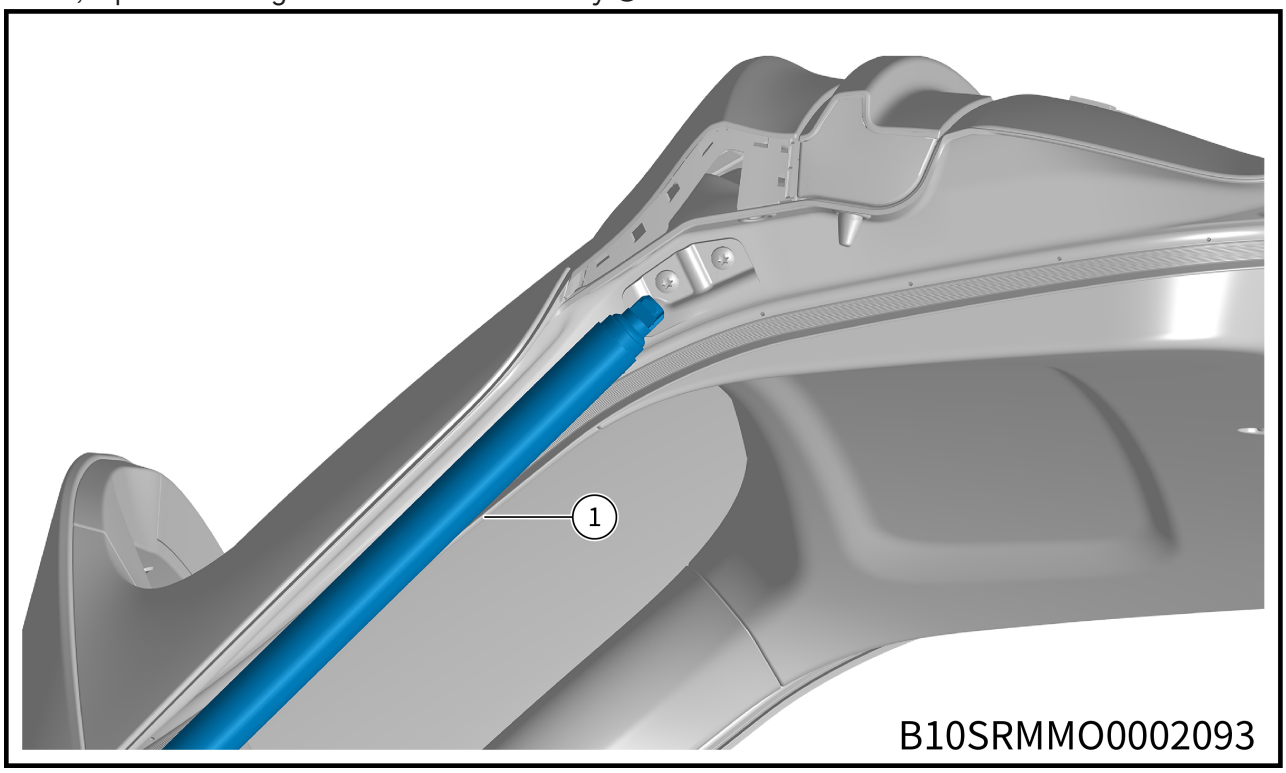
CHECK COMPRESSOR CABLE ASSEMBLY

INSPECTION PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
4. Check the compressor cable assembly.

a. Check whether the connection plug between the compressor cable assembly ① and the power battery is loose.
b. Check whether the connection plug between the compressor cable assembly ① and the compressor assembly is loose.
c. Check the outer insulation rubber of the compressor cable assembly ① to see if it rubs against the vehicle body or other components.
d. Check the outer insulating rubber of the compressor cable assembly ① for wear and aging.

ATTENTION



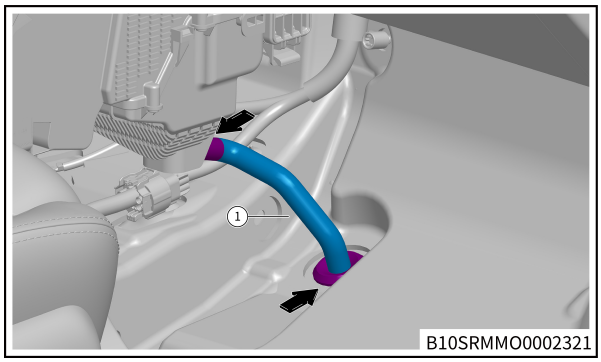
- Rectify all faults found during inspection.

© 2026, All rights reserved

CHECK TAILGATE POWER STRUT ASSEMBLY

INSPECTION PROCEDURE

1. Follow the steps below to perform the operation.
   a. Open the tailgate assembly, and check whether the tailgate electric strut assembly provides normal support and whether the clips are properly installed.
   b. Check the tailgate electric strut assembly for pressure loss, deformation, and oil leakage. If any are found, replace the tailgate electric strut assembly ①.



© 2026, All rights reserved

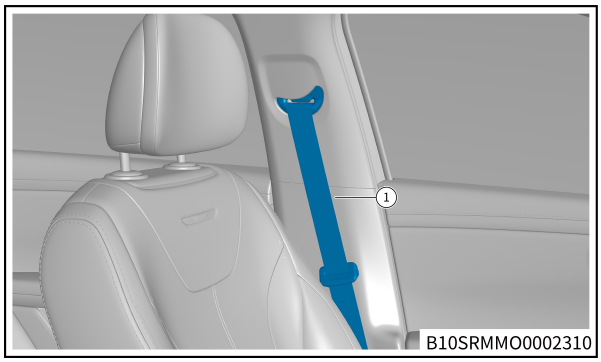
CLEAN THE DRIP TUBE

REMOVAL PROCEDURE

1. Lift the vehicle.
2. Remove the front lower undercover assembly.
   See:Front compartment lower shield assembly (page 5321)
3. Remove the center console right extension panel assembly.
   See:Left extension plate assembly of the auxiliary instrument panel (page 5468)
4. Remove the instrument panel right end cover assembly.
   See:Instrument Panel Left End Cover Assembly (page 5433)
5. Remove the right A-pillar lower trim panel assembly.
   See:Left A-Pillar Lower Interior Trim Panel Assembly (page 5398)
6. Lift up the front part of the front passenger floor carpet.
7. Remove the drip tube.

a. Disconnect the drip tube - arrow -, and remove the drip tube ①.
b. Use a compressed air gun to clean the debris and scale inside the A/C drain hose ①.

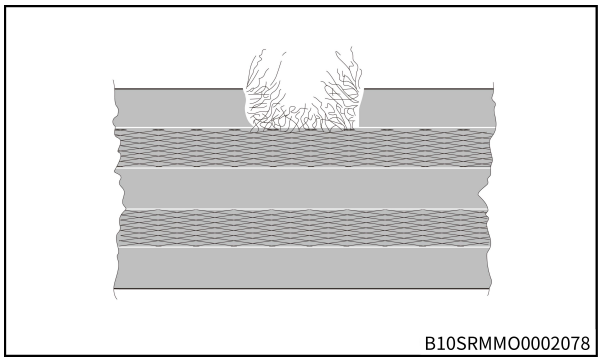
SETUP



1. The installation procedure is carried out in reverse order, while noting the following:
   a. After installation, check whether the drip tube is properly installed.

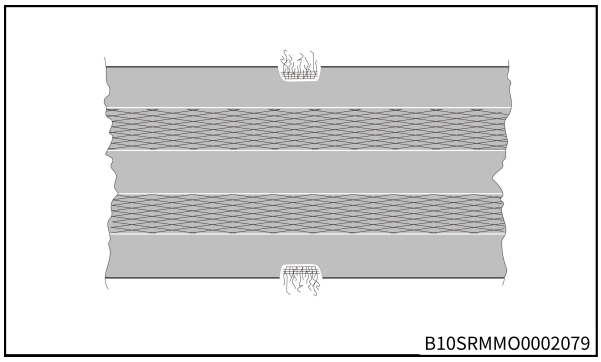
© 2026, All rights reserved

SEAT BELT MAINTENANCE CHECK

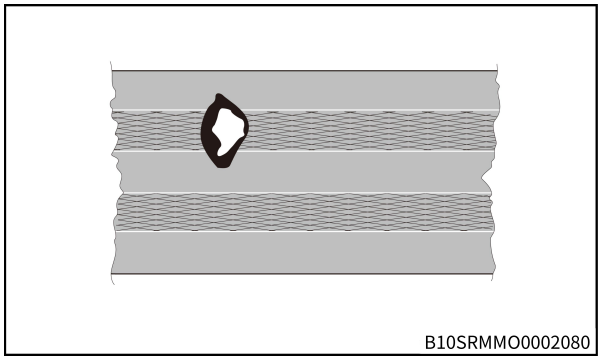


INSPECTION PROCEDURE

1. Check the seat belt.

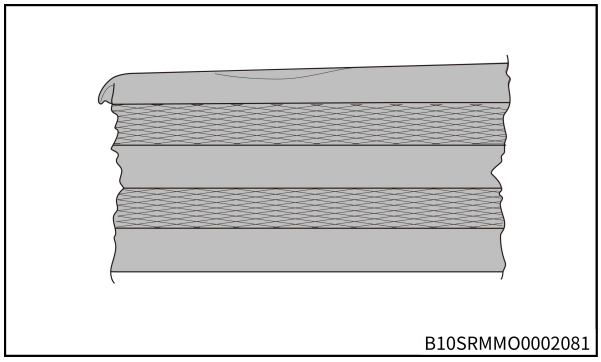


a. Pull the seat belt ① completely out of the automatic retractor.
b. Check the seat belt for dirt and clean it with a mild soap solution if necessary.



> **ATTENTION**
>
> If the seat belt fails to retract automatically, check the seat belt for damage and replace the seat belt assembly if necessary.

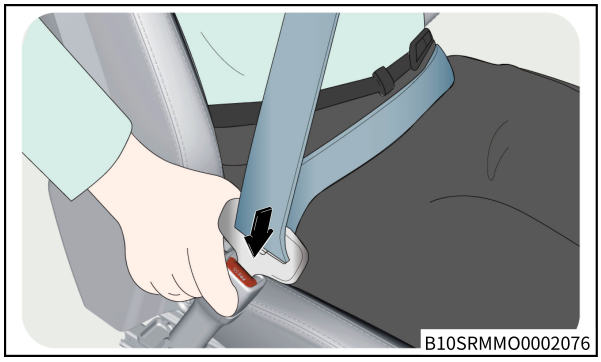
c. If the seat belt is broken, torn, or frayed, the seat belt assembly must be replaced.



d. If the fabric loop on the edge of the seat belt is torn, the seat belt assembly must be replaced.

e. If the seat belt has burn marks from cigarettes or similar sources, the seat belt assembly must be replaced.

© 2026, All rights reserved



f. The seat belt assembly must be replaced if one side of the seat belt edge is deformed or the seat belt edge is wavy.

2. Check the automatic retractor (locking function).
   Check: Pull the seat belt out quickly and forcefully from the automatic retractor.
   - If the locking function is not working, replace the seat belt assembly.
   - If a malfunction occurs during seat belt extension or retraction, first check whether the position of the automatic seat belt retractor has changed.
3. Visually inspect the seat belt buckle assembly.
   Check the seat belt buckle assembly for cracks or splits.

> **ATTENTION**
>
> - If damaged, the seat belt buckle assembly should be replaced.

4. Check the seat belt buckle assembly function.

a. Locking device: Check.
   Push the latch plate into the seat belt buckle assembly until you hear a click. Repeat the operation 5 times by pulling the seat belt firmly to check whether the locking mechanism is engaged.

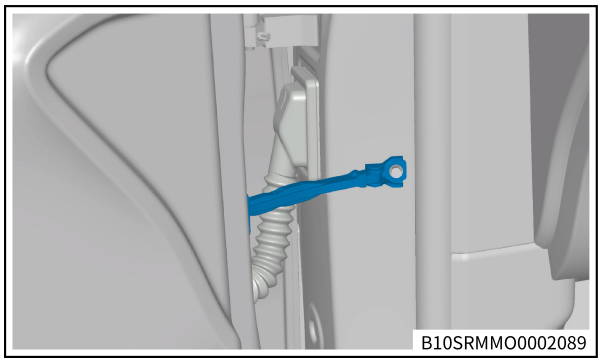
> **ATTENTION**
>
> During more than 5 tests, if the latch plate fails to lock into the seat belt buckle assembly even once, the seat belt buckle assembly must be replaced.

b. Unlocking device: Detection.
   Press the button on the seat belt buckle assembly in the direction of the arrow to release the seat belt.

© 2026, All rights reserved

When the seat belt is loose, the latch plate must automatically eject from the seat belt buckle assembly.

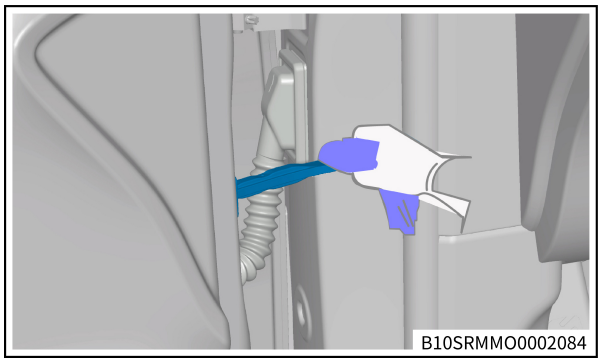
ATTENTION



- If it is determined that these parts are damaged, the entire seat belt and seat belt buckle assembly, along with the anchor point bolts, must be replaced. For damage not caused by a traffic accident, such as wear, only the corresponding damaged parts need to be replaced.
- It is strictly prohibited to apply lubricant to the button of the seat belt buckle assembly to eliminate noise or stiffness when operating the seat belt. For safety reasons, the test must be conducted with the vehicle stationary to avoid posing a danger to other vehicles or pedestrians.

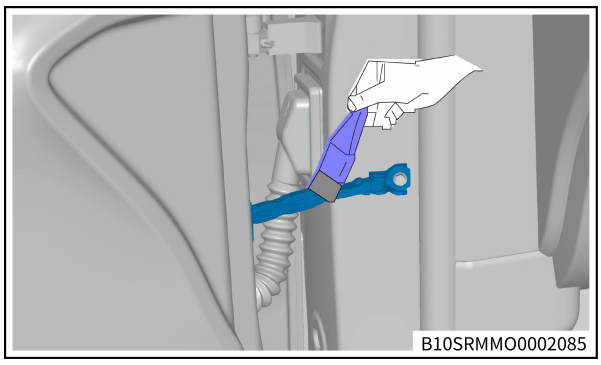
© 2026, All rights reserved

CHECK THE DOOR CHECK AND DOOR LOCK.



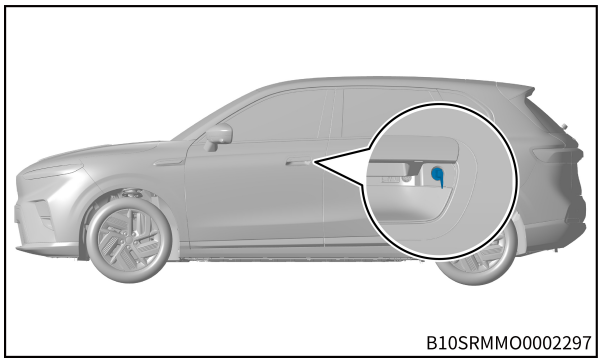
INSPECTION PROCEDURE

1. Check the door check.



a. Open and close the door repeatedly, and check for any abnormal noise from the door check.
b. Open the door to its maximum position.

2. Lubricate the door check.



a. Use a soft cotton cloth to clean the surface of the black rod of the limiter and remove any dirt.

b. Use a small brush to apply the specified grease to the upper and lower parts of the sliding surface of the limit arm.

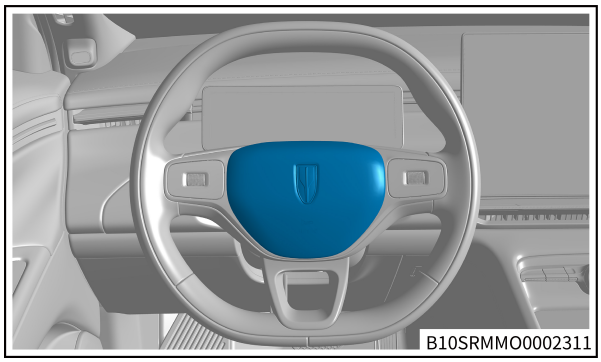
3. Check the lock cylinder.

a. Pull the door handle.
b. Insert the car key into the door lock, turn the key left and right, and the lock cylinder should rotate smoothly.

© 2026, All rights reserved

CHECK FOR REFRIGERANT LEAKS

OPERATING PROCEDURES



1. Visual leak check.
   a. Visually inspect the lines. If oil traces are found anywhere in the system, this area may be the leakage point.
      - Pros and cons: Visual leak detection is simple and easy to perform, at no cost, but it has significant limitations, unless there is a major leak caused by a sudden rupture in the system, and the leaking medium is a colored liquid, visual leak detection cannot pinpoint the leak, because typical leaks are very subtle, and many parts of the automotive air conditioning system are barely visible.
2. Check for leaks using soapy water.
   a. Charge the system with nitrogen gas at a pressure of 1~2MPa, then apply soapy water to various parts of the system, and the location where bubbles form is the leak point.
      - Disadvantage: The reach of human arms is limited, and the field of vision is restricted. In many cases, the leak point cannot be seen at all.
3. Halogen lamp leak detection.
   a. Light the leak detector lamp, hold the air hose of the halogen lamp, when the tip of the hose approaches the system leak, the flame color turns purplish-blue, indicating a large leak at this location.
      - Disadvantage: This method generates an open flame, which is not only highly dangerous, but the open flame combined with the refrigerant will also produce harmful gases. Furthermore, it is difficult to accurately locate the leak point.
4. Fluorescent leak detection.
   a. Add the fluorescent dye to the system in a certain proportion, after the system has been running for 20 min, put on the special glasses, illuminate the exterior of the system with a leak detection lamp, and any area showing yellow fluorescence indicates a leak.
      - Advantages: Accurate positioning, leakage points can be directly seen with the naked eye, easy to carry, and low maintenance costs.

© 2026, All rights reserved

AIRBAG MAINTENANCE CHECK

INSPECTION PROCEDURE

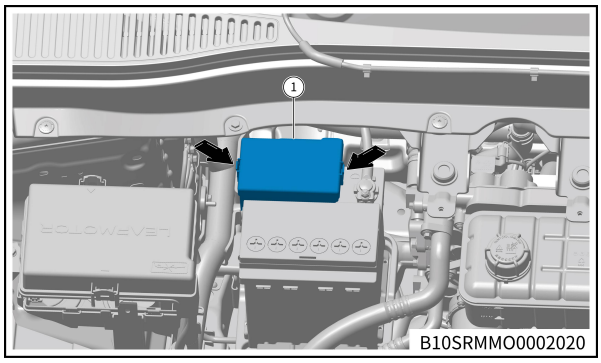
1. Driver airbag.

a. The airbag identification mark is the word "AIRBAG" on the steering wheel pad.
b. Visually inspect the plastic housing for damage, and replace if necessary.

ATTENTION

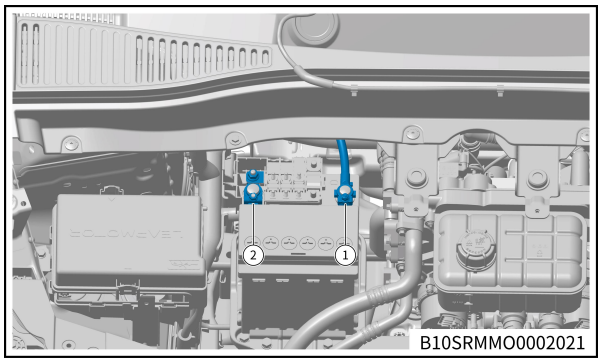
- To ensure the proper functioning of the airbag, please note that the airbag housing must not be glued, pulled out, or subjected to any other processing operations. The airbag housing may only be cleaned with a dry or slightly damp cloth.

© 2026, All rights reserved



BATTERY MAINTENANCE CHECK

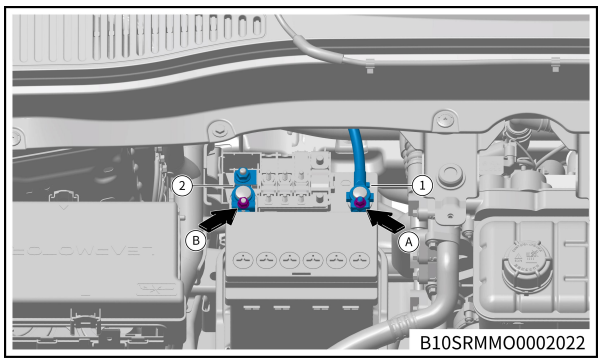
INSPECTION PROCEDURE



NOTE

- Turn off all electrical accessories before inspection, and tap "Vehicle Maintenance Power Off" on the central control screen.
- If the battery is disconnected and other maintenance operations are performed, after reconnecting the battery, it is necessary to check whether the positive and negative terminals are tightened securely.
- After powering on again, unlock the vehicle, tap "Vehicle Maintenance Power On" on the central control panel, and check the "one-touch up/down" function of the door and window glass. If the function is missing, initialization settings must be performed.

1. Remove the front compartment storage box assembly.
   See:Front compartment storage box assembly (page 5302)
2. Follow the steps below to perform the operation.



a. Detach the 2 retaining clips - arrows - of the battery positive terminal cover ①, and remove the battery positive terminal cover ①.

b. Rock the terminal clamps of the battery negative pole ① and positive pole ② left and right to check whether they are securely fastened.

3. If the positive battery terminal is not secured.

a. Loosen the fixing nut -arrow A- and disconnect the negative battery terminal ①.
b. Loosen the fixing nut -arrow B-, and disconnect the positive battery terminal ②.
c. Reinstall the positive battery terminal ② and tighten the fixing nut -arrow B-.
   Recommended tool: 10mm socket
   Torque: 6±1N m
d. Install the negative battery terminal ① and tighten the fixing nut -arrow A-.

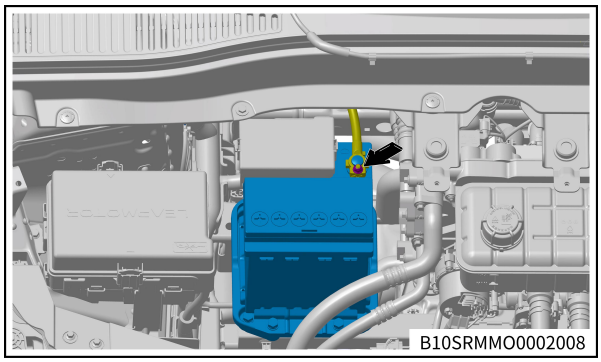
© 2026, All rights reserved

Recommended tool: 10mm socket
Torque: 6±1N m

4. Perform a visual inspection of the battery.
   Before performing a comprehensive inspection, be sure to visually inspect the external condition of the battery, its connections, and whether it is securely mounted.

   ATTENTION

   - Failure to properly secure the battery may result in damage. Vibration damage can reduce the service life of the battery, pose an explosion hazard, and potentially damage the battery casing. Check whether the battery is securely installed, and if necessary, tighten the fixing bolts to the specified torque.
   - Check whether the battery case is damaged. A damaged case can cause acid leakage, and the leaked battery acid may cause severe damage to the vehicle. Any vehicle parts that come into contact with the electrolyte should be promptly treated with an electrolyte diluent or soapy water.
   - Check whether the battery terminals are damaged. If the battery terminals are damaged, proper contact cannot be guaranteed. If the battery terminals are not properly connected and tightened, it may cause an electrical fire, leading to severe electrical system malfunctions and thereby compromising the safe operation of the vehicle.



5. Use a multimeter to check the battery voltage. The battery voltage should be 12-14V.

© 2026, All rights reserved

BATTERY DISCONNECTION OPERATION

POWER-OFF PROCEDURE

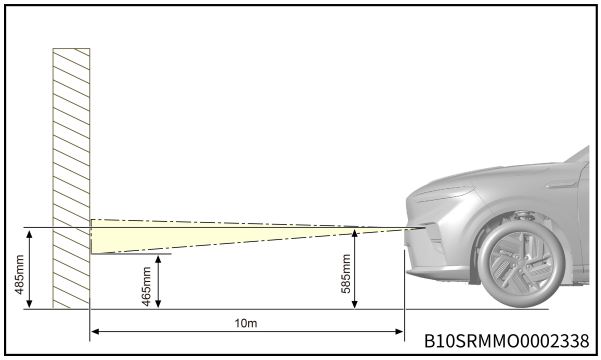
1. Battery disconnect operation.

a. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
b. Open the front hood assembly.
c. Loosen the negative terminal fixing nut -arrow-, and disconnect the battery negative terminal.
Recommended tool: 10mm socket
Torque: 6±1N m

> **ATTENTION**
>
> - After disconnecting the negative battery terminal, wait for 5 minutes before proceeding with the operation.

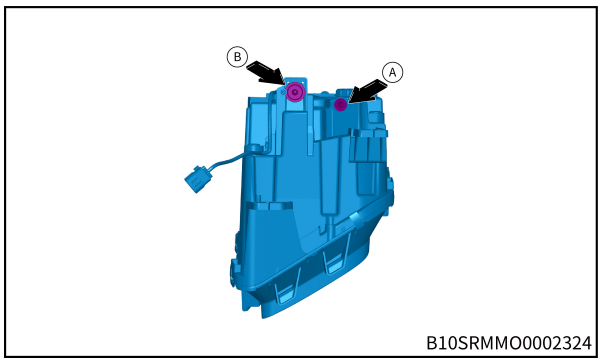
SETUP

1. The installation procedure is performed in reverse order.



© 2026, All rights reserved

ADJUST FRONT COMBINATION LAMP BEAM HEIGHT

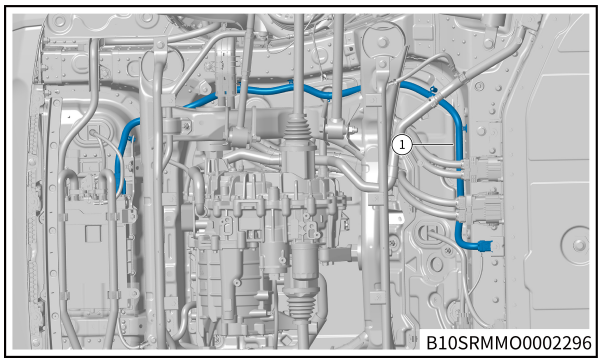


ATTENTION

- Please adjust the lights in accordance with local laws and regulations.

1. Preparation
   a. Inspect the vehicle. The vehicle and the area around the headlamps should be free from damage and deformation.
   b. Vehicle lubricating oil and coolant levels are at the standard level.
   c. The vehicle tire pressure meets the standard.
   d. The vehicle must be unloaded, and no other items shall be placed inside. The factory-equipped on-board tools shall be stored in their designated locations.
   e. Park the vehicle on a level surface and rock the vehicle body from side to side to stabilize the chassis suspension.
   f. Operate the central control panel to adjust the headlight height to the initial position, gear 0.
2. Adjustment procedure.

a. Drive the vehicle to a clean, vertical wall at a distance of 10m.



b. Open the front cover assembly. Rotate the bolt - Arrow A - to adjust the light vertically; rotate the bolt - Arrow B - to adjust the light horizontally. Adjust the corner of the low beam cutoff line to a height within the range of 517.1~567.1mm.
Recommended tool: 6mm hex socket

© 2026, All rights reserved

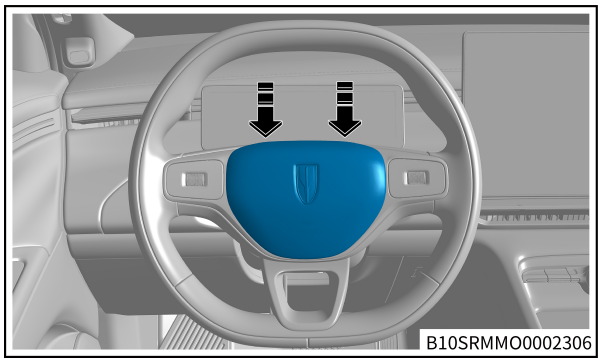
CHECK THE OBC CABLE ASSEMBLY

INSPECTION PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
4. Check the OBC cable assembly.

a. Check whether the connection plug between the OBC cable assembly ① and the power battery is loose.
b. Check the outer insulation jacket of the OBC cable assembly ① to see if it rubs against the vehicle body or other components.
c. Check the outer insulation rubber of the OBC cable assembly ① for wear and aging.

ATTENTION



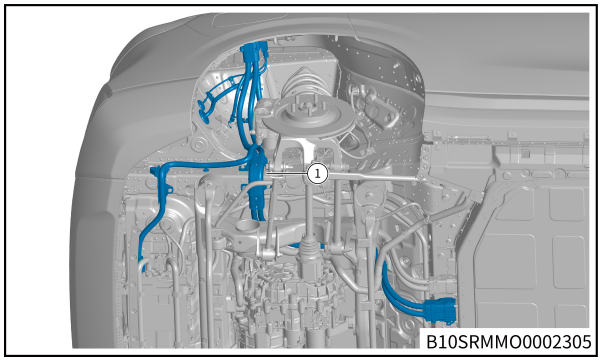
- Rectify all faults found during inspection.

© 2026, All rights reserved

CHECK THE HORN

INSPECTION PROCEDURE

1. Check the horn.



a. Press the horn switch in the direction of the arrow, and if it fails to sound even once during more than 5 tests, the horn system must be serviced.

© 2026, All rights reserved

CHECK THE FAST AND SLOW CHARGING CABLE ASSEMBLY

INSPECTION PROCEDURE

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the left rear wheelhouse liner assembly.
   See:Left rear wheelhouse trim panel assembly (page 5322)
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Check the fast and slow charging cable assembly.

a. Check the outer insulation rubber of the AC/DC charging cable assembly ① to see if it is rubbing against the vehicle body or other components.
b. Check the surface insulation rubber of the fast and slow charging cable assembly ① for wear and aging.
c. Check whether the connection plug between the fast and slow charging cable assembly ① and the electric drive powertrain is loose.
d. Check whether the bolts connecting the fast and slow charging cable assembly ① and the electric drive powertrain are properly tightened.
e. Check whether the grounding bolt of the fast and slow charging cable assembly ① is securely tightened.

ATTENTION

- Rectify all faults found during inspection.

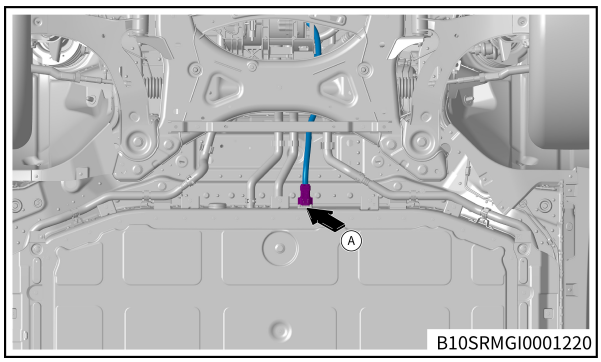
HIGH-VOLTAGE POWER-OFF OPERATION

POWER-OFF PROCEDURE

ATTENTION

- Do not charge when the high-voltage power is disconnected, please read the relevant precautions carefully before disconnecting the high voltage.

1. Read "Danger" and "Warning" carefully.
   See:DANGER, WARNING (page 116)
2. Read the "Safety Precautions for Electric Vehicle Repair" carefully.
   See:Safety Measures for Electric Vehicle Repair (page 104)
3. Read the "Safety Precautions for Maintenance Operations" carefully.
   See:Safety Precautions for Maintenance Operations (page 106)
4. Read "Insulating Protective Clothing and Insulated Tools" carefully.
   See:Insulating Protective Clothing and Insulated Tools (page 110)
5. Read "Identification and Handling of High-Voltage Wiring Harnesses and Components" carefully.
   See:Identification and Handling of High-Voltage Harness and Components (page 121)
6. Please read the "Maintenance Precautions" carefully.
   See:Maintenance Precautions (page 192)
7. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
8. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
9. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
10. Remove the rear compartment lower cover assembly.
    See:Rear compartment under cover assembly (page 5327)
11. High-voltage power disconnection operation.



a. Disconnect 1 connector - arrow A - between the rear MCU cable assembly and the power battery pack.
b. Disconnect 1 connection plug between the fast and slow charging cable assembly and the power battery pack - arrow B -.
c. Disconnect 1 connection plug between the OBC cable assembly and the power battery pack -Arrow C-.

© 2026, All rights reserved

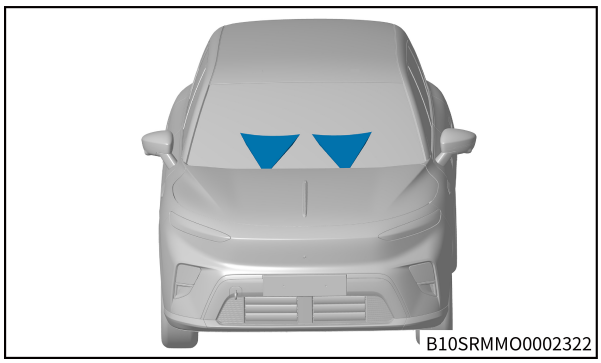
d. Disconnect 1 connector - arrow D - between the floor wiring harness assembly and the power battery pack.

> **WARNING**
>
> - Only qualified personnel (high-voltage electricians) can disconnect the power supply of the high-voltage system. Operations can only be performed after the high-voltage cable has been disconnected for 10 minutes.

e. Disconnect 1 connector of the compressor cable assembly from the power battery pack -arrow-.
f. After disconnecting the high-voltage cable for 10 minutes, use an insulation tester at the 1000Vdc range to apply voltage for 1 minute to measure the insulation resistance between the terminals of the power battery and the housing. The standard value is ≥10MΩ.

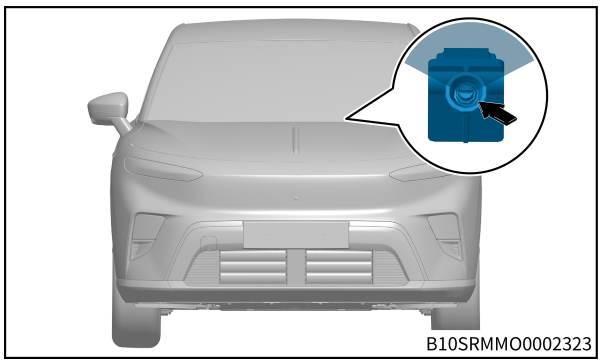
SETUP

1. The installation procedure is performed in reverse order.



© 2026, All rights reserved

CHECK AND ADJUST THE WINDSHIELD WASHER DIRECTION



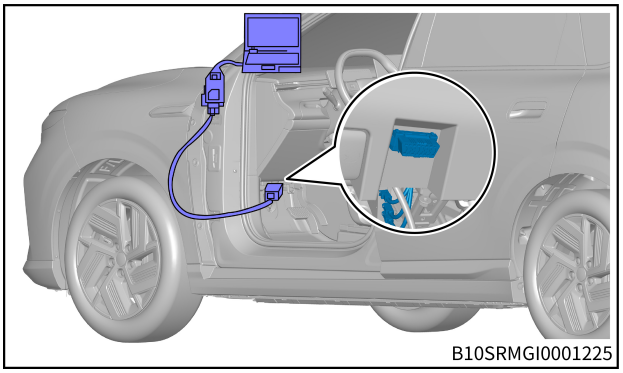
ATTENTION

- If impurities in the nozzle cause an uneven spray pattern, remove the nozzle and flush it with water in the direction opposite to the spray. Then, use compressed air to blow it clean in the direction opposite to the spray. When cleaning the nozzle, carefully remove the internal sealing rubber ring to prevent it from being lost and causing water leakage.

1. Check the windshield wiper and washer system.

a. Turn on the windshield washer function, and check whether washer fluid is sprayed from the 2 nozzles.

b. If no washer fluid sprays from the washer nozzles, check whether there is washer fluid, whether the hoses are properly installed, and whether the hoses are blocked.
c. If the spray areas of the two nozzles are not at the same height, adjust at the -arrow- position to adjust the spray direction of the nozzles.



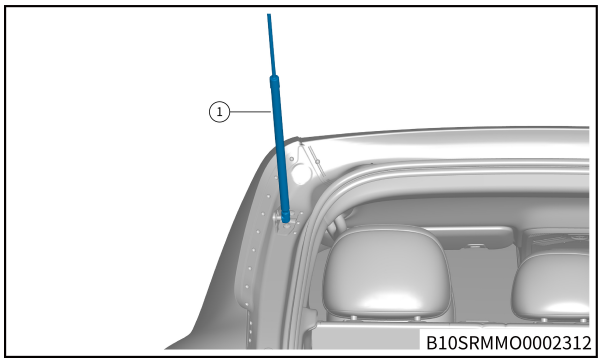
NOTE

- The figure below shows the left wiper nozzle, and for the right side, please refer to the left side.

© 2026, All rights reserved

SELF-DIAGNOSIS: CHECK FAULT CODES

When conducting a test drive, the diagnostic equipment must always be installed on the rear seat. During the test drive, the diagnostic equipment must be operated by another technician.



1. Connect the vehicle diagnostic tool.
2. Power on the vehicle, and follow the prompts on the diagnostic tool to query fault information.
3. If a fault code is currently displayed, troubleshooting is required.
4. Clear fault information, and clear historical fault information.
5. Power off the vehicle and wait for 1 minute.
6. Power on the vehicle again, re-read the fault information to ensure there are no current fault codes, and the fault has been completely cleared.

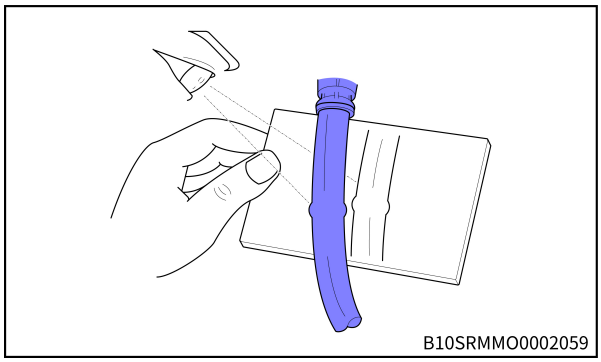
© 2026, All rights reserved

CHECK TAILGATE GAS SPRINGS

INSPECTION PROCEDURE

1. Follow the steps below to perform the operation.

a. Open the tailgate assembly, check whether the tailgate gas springs provide normal support, and check whether the clips are properly installed.
b. Check the tailgate gas spring for pressure loss, deformation, or oil leakage. If any are found, replace the tailgate gas spring ①.



© 2026, All rights reserved

2.1.6 BODY, CHASSIS, AND ACCESSORY SYSTEM MAINTENANCE CHECK

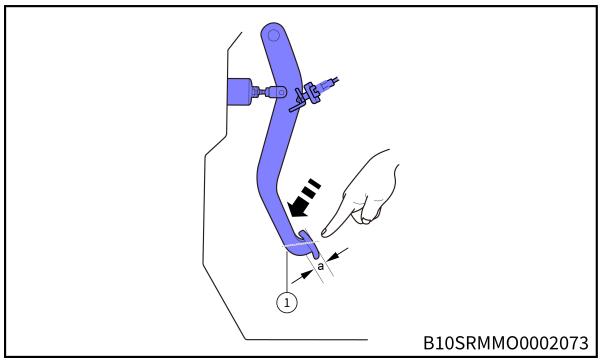
CHECK THE BRAKE LINES

INSPECTION PROCEDURE

1. Check the brake lines.

a. Check the brake lines (hoses) for cracks, deterioration, or other damage.
b. Power on the vehicle, fully depress the brake pedal and hold it for approximately 5s. Check for any brake fluid leakage.

ATTENTION

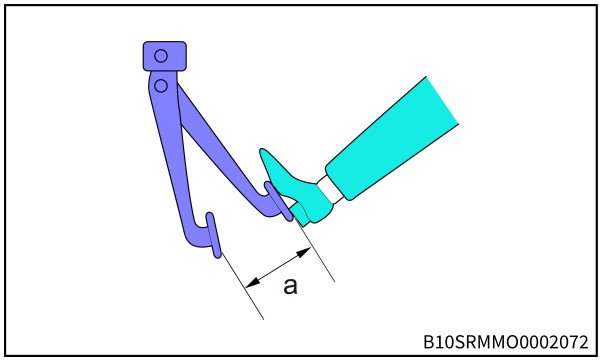


If there is a leak at the fittings of the brake hard lines and brake hoses, retighten them, or replace any damaged components. At the maximum steering angle, the brake lines must not interfere with vehicle components.

© 2026, All rights reserved

CHECK BRAKE PEDAL FREE PLAY AND HEIGHT

TEST PROCEDURE

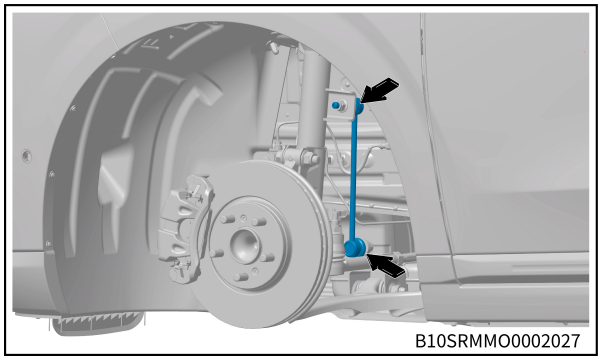


1. Check the brake pedal free play.

a. Turn off all electrical equipment, and tap Maintenance on the central control screen.
b. From the natural position of the brake pedal, press the brake pedal by hand in the direction of the -arrow- until resistance is felt, and use a straightedge to measure the free travel position value of the brake pedal -a-.
Recommended tool: Ruler
Brake pedal free travel: <10mm

> **ATTENTION**
>
> - If the free travel of the brake pedal does not meet the specified value, adjust it as necessary.

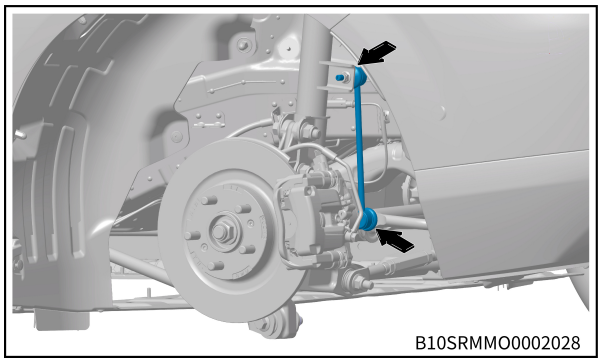
2. Check the brake pedal height.



a. Remove the brake light switch so that it no longer contacts the brake pedal.
b. The distance from the highest point to the lowest point of the brake pedal -a-.
Recommended tool: Ruler
Maximum brake pedal travel: 100mm

> **ATTENTION**
>
> - If the brake pedal height does not meet the specified value, check the cause and replace the brake pedal if necessary.

© 2026, All rights reserved



CHECK THE BALL JOINTS OF THE FRONT AND REAR STABILIZER BAR LINKS.

1. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
5. Front stabilizer bar ball joint.

   a. Check the ball joint of the front stabilizer bar link - arrow - for damage, and if damaged, replace the front stabilizer bar link assembly.
   See:Front stabilizer bar link assembly (page 2889)

6. Rear stabilizer bar link ball joint.

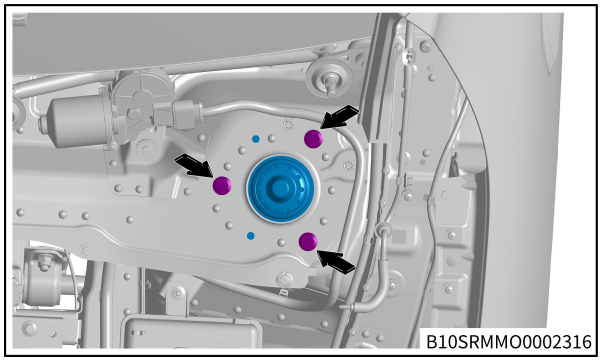
   a. Check the rear stabilizer bar ball joint - arrow - for damage, if damaged, replace the rear stabilizer bar link assembly.
   See:Rear stabilizer bar link assembly (page 2933)

© 2026, All rights reserved

MAINTENANCE CHECK OF WHEEL NUTS

1. Check the wheel nuts.

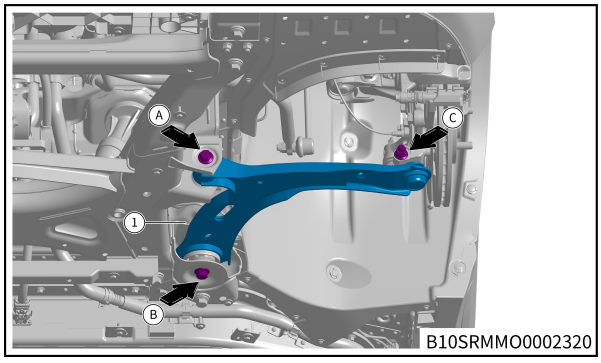
a. Check whether the wheel fixing nuts ① to ⑤ are missing or damaged.
b. Tighten the wheel nuts ① to ⑤ in a diagonal cross pattern.
Recommended tool: 21mm socket
Torque: 170±15N m



© 2026, All rights reserved

TIGHTEN VEHICLE CHASSIS BOLTS AND NUTS

ATTENTION



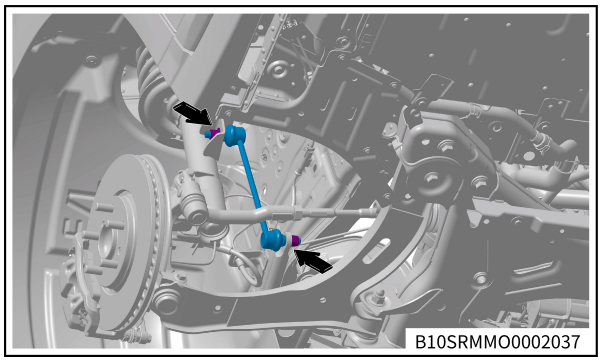
- This section describes the tightening of bolts and nuts on the vehicle chassis. The left and right sides are generally similar and can be referenced interchangeably.

1. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the ventilation window cover assembly
   See:Cowl Grille Assembly (page 5311)
4. Tighten the mounting bolts securing the front strut upper mount assembly to the vehicle body.

B10SRMMO0002316

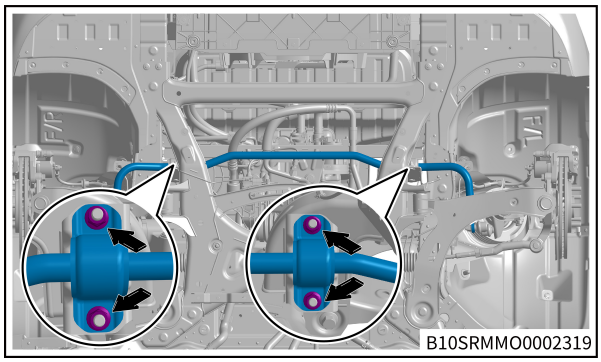
a. Tighten the 3 fixing bolts connecting the front strut upper mount assembly to the body -arrow-.
   Recommended tool: 13mm socket
   Torque + angle: 25N m (55±5)°

5. Lift the vehicle.
6. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
7. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
8. Check the chassis bolts.



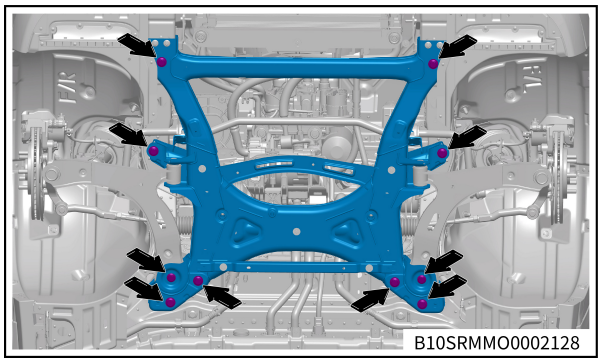
B10SRMMO0002320

a. Tighten the 1 fixing bolt/nut -arrow A- connecting the front left lower control arm assembly ① to the front subframe assembly.
   Recommended tools: 18mm socket, 21mm wrench
   Torque: 130N m + (65±5)°
b. Tighten the 1 fixing bolt/nut connecting the front left lower control arm assembly ① to the front subframe assembly - arrow B -.
   Recommended tools: 18mm socket, 21mm wrench
   Torque: 130N m + (120±5)°
c. Tighten the 1 fixing bolt/nut - Arrow C - connecting the front left lower control arm assembly ① of the front suspension to the front left steering knuckle assembly, and disconnect the connection.

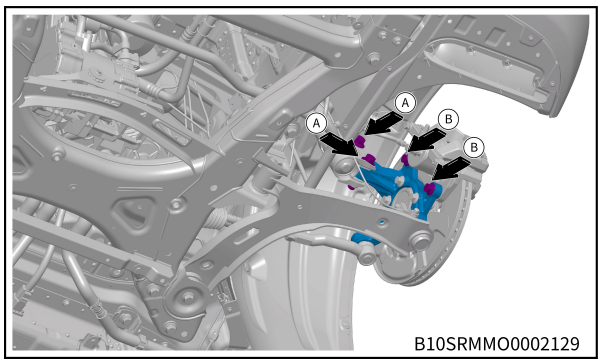


© 2026, All rights reserved

Recommended tools: 15mm socket, 18mm socket
Torque: 80N m+(70±5)°

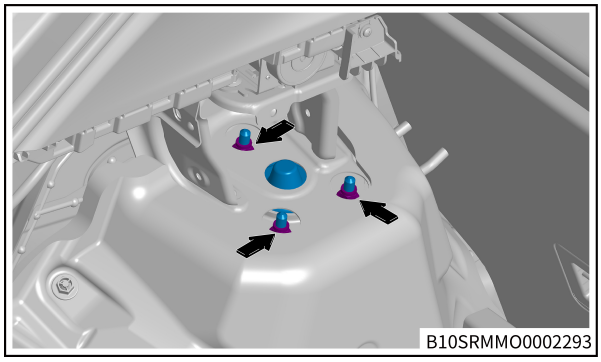


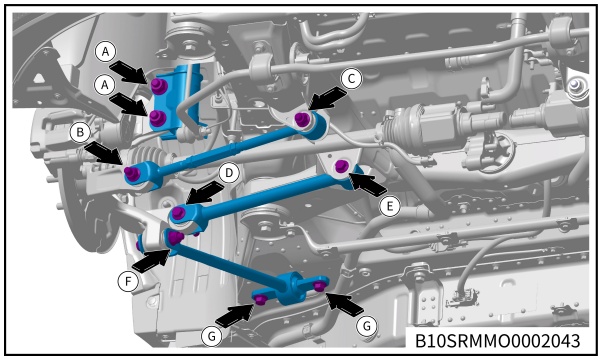
d. Tighten the 2 fixing nuts of the front stabilizer bar link assembly -arrow-.
Recommended tools: T40mm hex socket wrench, 18mm wrench
Torque: 125±10N m



> **ATTENTION**
>
> - Use an Allen wrench to secure the top of the ball joint on the connecting rod, then use an open-end wrench to tighten the ball joint nut.

e. Tighten the 4 fixing nuts connecting the front stabilizer bar assembly to the front subframe assembly -arrow-.
Recommended tool: 15mm socket
Torque: 70±5N m





f. Tighten the 10 mounting bolts connecting the front subframe assembly to the vehicle body - arrow -.
Recommended tools: 18mm socket, 21mm wrench
Torque: 130N m + (65±5)°
Recommended tool: 18mm socket
Torque + Angle: 140N m (150±5)°

g. Tighten the 2 fixing bolts/nuts of the front steering knuckle assembly - arrow A -.
Recommended tool: 21mm socket
Torque + angle: 200N m (75±5)°
h. Tighten the 2 fixing bolts connecting the front steering knuckle assembly to the front brake caliper bracket assembly -Arrow B-.
Recommended tool: 18mm socket
Torque: 130±10N m

© 2026, All rights reserved

i. Remove the left/right lower C-pillar interior trim panel assembly.
See:Left lower C-pillar interior trim panel assembly (page 5392)

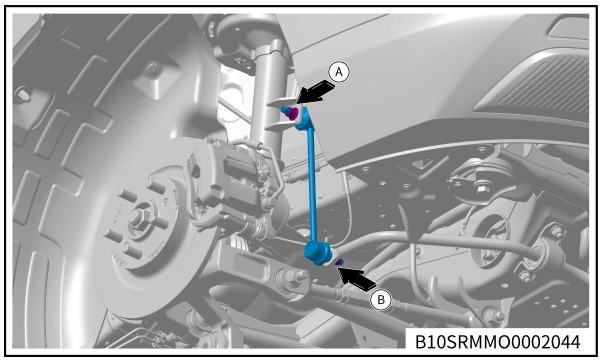
j. Tighten the 3 mounting bolts securing the rear strut upper mount assembly to the body -arrow-.
Recommended tool: 13mm socket
Torque + angle: 45N m + (22±5)°

k. Tighten the 2 mounting bolts/nuts connecting the rear shock absorber assembly to the rear steering knuckle assembly - Arrow A -.
Recommended tool: 21mm socket
Torque + Angle: 200N m + (75±5)°

l. Tighten the 1 fixing bolt/nut connecting the rear suspension toe link and the rear steering knuckle assembly - Arrow B -.
Recommended tools: 18mm wrench, 21mm socket
Torque + angle: 130N m + (65±5)°

m. Tighten the 1 fixing bolt/nut connecting the rear suspension toe link to the rear subframe assembly - Arrow C -.
Recommended tools: 18mm wrench, 21mm socket
Torque + Angle: 130N m + (55±5)°

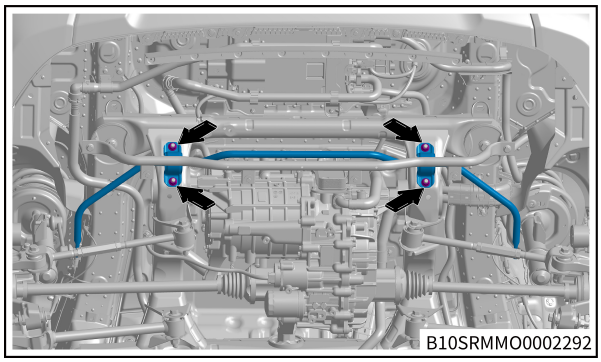
n. Tighten the 1 fixing bolt/nut connecting the rear suspension front link assembly to the rear steering knuckle assembly - Arrow D -.
Recommended tools: 18mm wrench, 21mm socket
Torque + angle: 130N m + (65±5)°



o. Tighten the 1 mounting bolt/nut connecting the rear suspension front link assembly to the rear subframe assembly - Arrow E -.
Recommended tools: 18mm wrench, 21mm socket
Torque + Angle: 130N m + (55±5)°

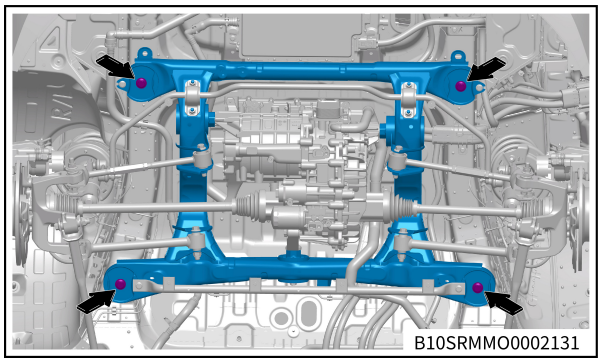
p. Tighten the 1 fixing bolt/nut connecting the rear suspension link assembly to the rear knuckle assembly - Arrow F -.
Recommended tools: 18mm wrench, 21mm socket
Torque + Angle: 130N m + (70±5)°

q. Tighten the 2 mounting bolts/nuts connecting the rear suspension link assembly to the body - arrow G -.

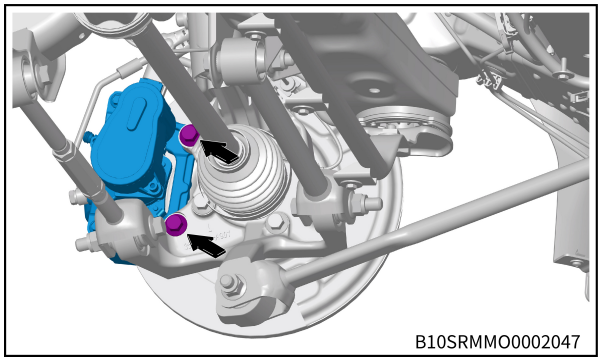


© 2026, All rights reserved

Recommended tools: 18mm wrench, 21mm socket
Torque + Angle: 130N m+(45±5)°

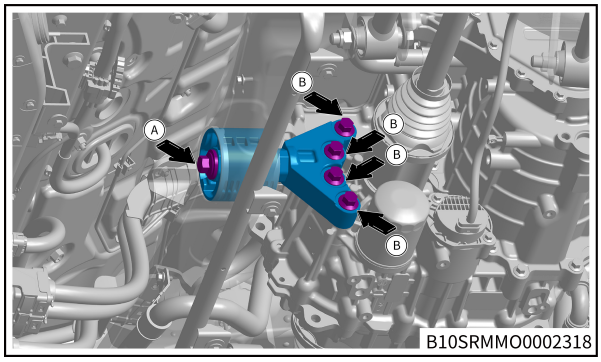


r. Tighten the 1 fixing nut connecting the rear stabilizer bar link assembly to the rear shock absorber assembly - Arrow A -.
Recommended tools: T30mm socket, 15mm wrench
Torque: 65±5N m

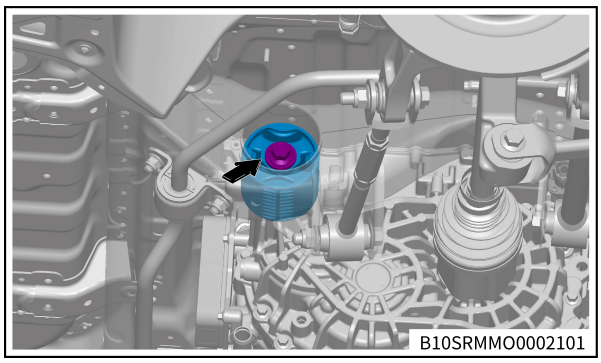


s. Tighten the 1 fixing nut connecting the rear stabilizer bar link assembly to the rear stabilizer bar assembly - Arrow B -.
Recommended tools: T30mm socket, 15mm wrench
Torque: 65±5N m

t. Tighten the 4 mounting nuts connecting the rear stabilizer bar assembly to the rear subframe assembly -arrow-.
Recommended tool: 15mm socket
Torque + Angle: 45 N m + 25°

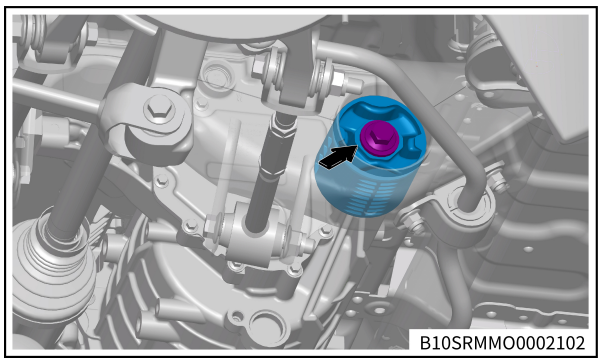


u. Tighten the 4 mounting bolts connecting the rear subframe assembly to the vehicle body -arrow-.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (105±5)°



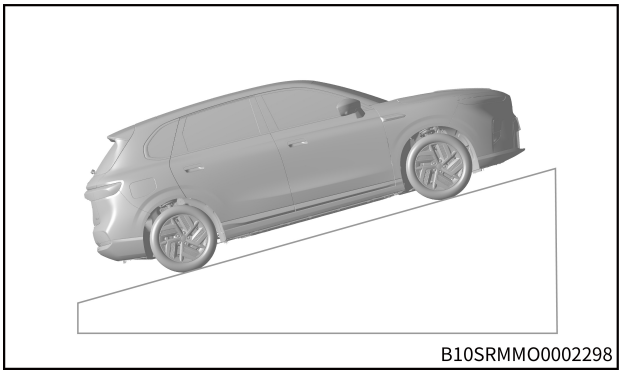
v. Tighten the 2 mounting bolts securing the rear brake caliper bracket assembly to the rear steering knuckle assembly -arrow-.
Recommended tool: 15mm socket
Torque: 110±10N m

© 2026, All rights reserved



w. Tighten the 1 fixing bolt connecting the rear motor front mount cushion assembly to the rear motor front mount bracket assembly - Arrow A -.
Recommended tool: 18mm socket
Torque + Angle: 140N m + (135±5)°

x. Tighten the 4 fixing bolts connecting the rear motor front mounting bracket assembly to the electric drive powertrain - Arrow B -.
Recommended tool: 15mm socket
Torque + angle: 80N m + (50±5)°



y. Tighten the 1 fixing bolt connecting the rear motor right rear mount cushion assembly to the rear subframe assembly - arrow -.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (55±5)°

z. Tighten the 1 fixing bolt connecting the rear left mounting cushion assembly of the rear motor to the rear subframe assembly - arrow -.
Recommended tool: 18mm socket
Torque + Angle: 130N m + (55±5)°

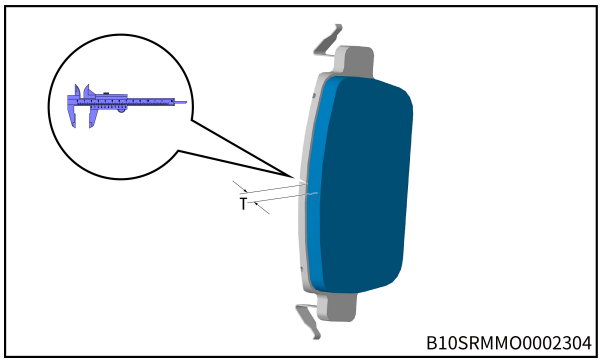
CHECK THE ELECTRONIC PARKING BRAKE

B10SRMMO0002298

1. Check whether the electronic parking brake function is functioning normally.
   - Perform a hill parking check to confirm whether the braking efficiency has decreased.
   - The driver's seat belt is fastened, the vehicle is driven onto a 15% grade, and brought to a stop by braking.
   - Shift into N.
   - Engage the electronic parking brake, and after parking is complete, release the service brake pedal.
   - Observe whether the vehicle is securely parked, if any movement occurs, it indicates reduced parking efficiency.
2. Check the electronic parking brake for drag.
   - Normal release of the electronic parking brake.
   - If a red indicator light illuminates or flashes while driving, indicating excessive residual force, please have it inspected and serviced.



© 2026, All rights reserved

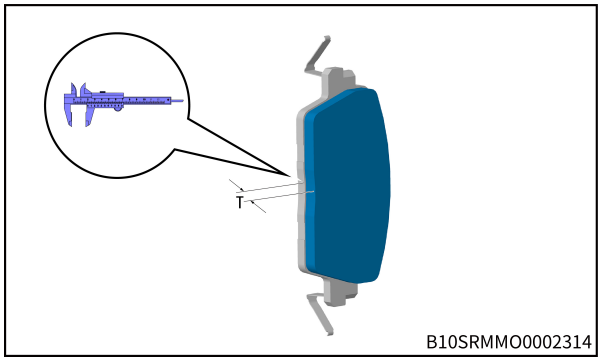
CHECK THE FRICTION PLATES

ATTENTION

- If the thickness of the brake discs and brake pads reaches the wear limit, the customer must be informed to replace them.

1. Lift the vehicle.
2. Remove the repair kit - front friction plates.
   See:Repair Kit - Front Friction Plates (page 3117)
3. Check the working condition of the front brake pads.

a. Inspect the friction surface of the brake pads for rust spots, oil stains, and other debris, and remove them if present.



ATTENTION

- If the brake friction pads are soaked with oil, they must be replaced, and the brake wheel cylinders and brake hoses must be checked for oil leaks.

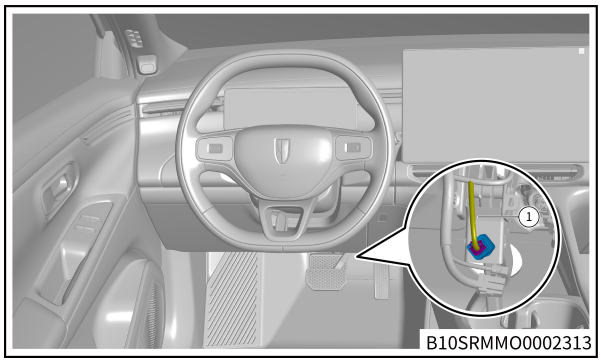
b. Check the friction surface of the friction plate for cracks, fractures, or damage, and replace it if any are found.
c. Check the friction plate guide plate for looseness. If loose, reinstall or replace it.
d. Use a vernier caliper to measure the thickness of the friction plate (without backing plate) -T-, and replace it if it exceeds the wear limit.
   Recommended tool: Vernier caliper
   Wear limit thickness: 2mm

4. Check the working condition of the rear brake friction pads.

© 2026, All rights reserved

a. Inspect the friction surface of the brake pads for rust spots, oil stains, and other debris, and remove them if present.

> **ATTENTION**
>
> - If the brake friction pads are soaked with oil, they must be replaced, and the brake wheel cylinders and brake hoses must be checked for oil leaks.



b. Check the friction surface of the friction plate for cracks, fractures, or damage, and replace it if any are found.
c. Check the friction plate guide plate for looseness. If loose, reinstall or replace it.
d. Use a vernier caliper to measure the thickness of the friction plate (without backing plate) -T-, and replace it if it exceeds the wear limit.
Recommended tool: Vernier caliper
Wear limit thickness: 2mm

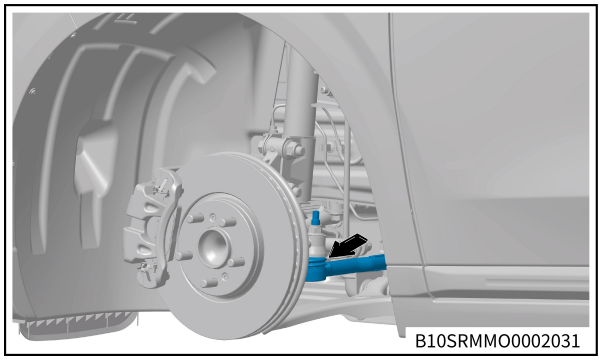
CHECK THE BRAKE SWITCH

INSPECTION PROCEDURE

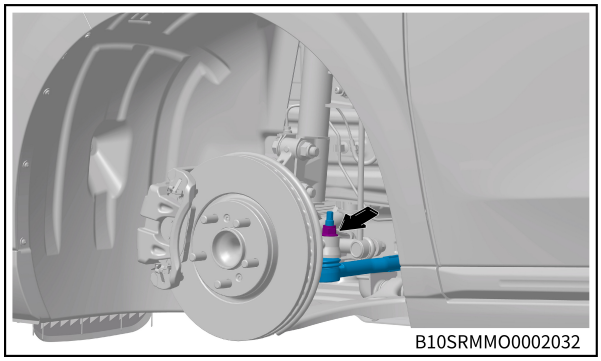
1. Check the brake switch.

a. Check whether the connector of the brake switch ① is securely connected.
b. Check whether the brake switch ① is properly installed.
c. One technician depresses the brake pedal while another technician observes whether the brake lights illuminate.



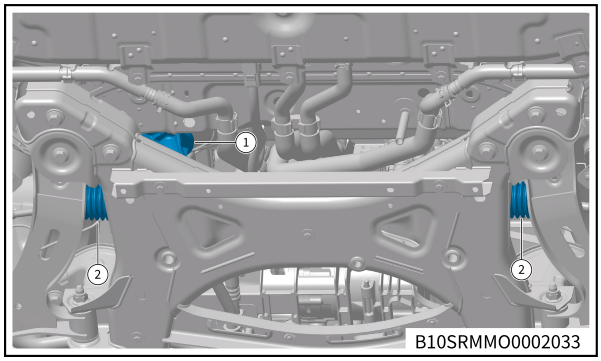
NOTE

- Rectify all faults found during inspection.



© 2026, All rights reserved

CHECK TIE ROD ENDS AND DUST BOOTS



1. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Remove the left/right front tires.
   See:Wheel Assembly (page 2962)
6. Check the steering tie rod ball joint.

B10SRMMO0002031

a. Lift the vehicle to a suitable height, and shake the left/right tie rod ball joint by hand to check for any play.
b. Check the tie rod dust cover ball joint -arrow- for damage. If damaged, replace the tie rod.

B10SRMMO0002032

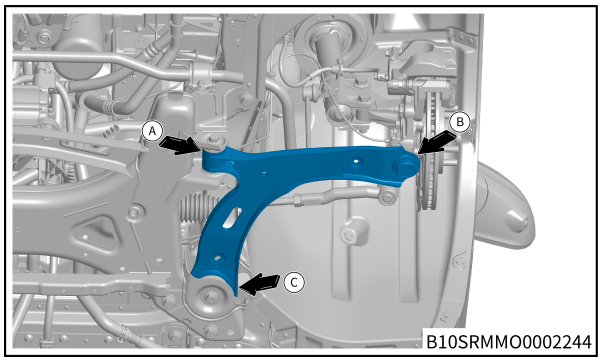
c. Check the fixing nut of the left tie rod ball joint and tighten it to the specified torque -arrow-.
   Recommended tool: 21mm socket
   Torque: 90±9N m

B10SRMMO0002033

d. Check whether the dash panel dust cover is properly installed and inspect it for any damage. If damaged, replace the dash panel dust cover ①.
e. Check the fixing clamp of the tie rod dust boot for looseness, check the tie rod dust boot ② for damage, and if damaged, replace the steering gear body.

© 2026, All rights reserved

CHECK THE SHOCK ABSORBER BEARING



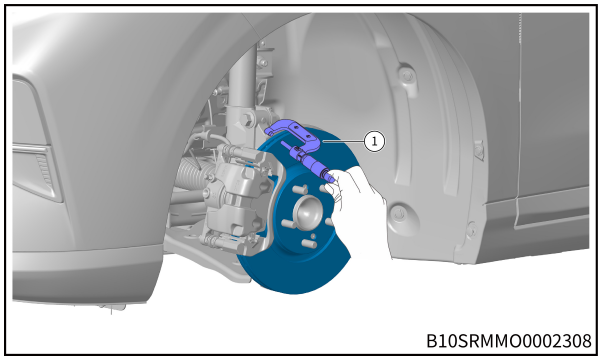
1. Check the front shock absorber bearing.
   a. Park the vehicle on a relatively level surface.
   b. Turn the steering wheel back and forth, and listen carefully for any abnormal noise at the front shock absorber bearing position.
   c. Drive the vehicle over a speed bump and listen carefully for any abnormal noise at the front shock absorber bearing position.

> **ATTENTION**
>
> - When driving over speed bumps during a road test, do not drive at excessive speeds. If any abnormal noise is heard, please identify the cause and replace the relevant components.

© 2026, All rights reserved

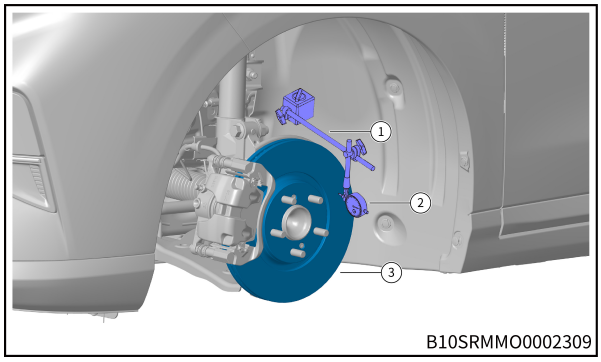
INSPECT THE BUSHINGS AND BALL JOINT ASSEMBLY OF THE FRONT LOWER CONTROL ARM ASSEMBLY OF THE FRONT SUSPENSION.

1. Lift the vehicle.
2. Inspect the bushings of the front lower control arm assembly and the ball joint assembly of the front suspension.



a. Check the front suspension front lower control arm assembly bushings -Arrow A-, -Arrow B-, -Arrow C- for damage or looseness. If damaged, replace the front suspension front lower control arm assembly. See:Front Suspension Front Left Lower Control Arm Assembly (page)

© 2026, All rights reserved

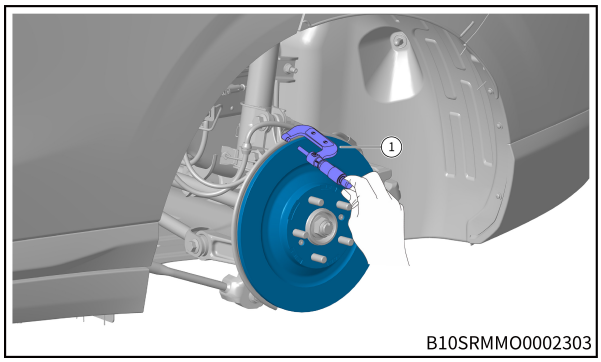


CHECK THE BRAKE DISC

1. Lift the vehicle.
2. Remove the wheel assembly.
   See:Wheel Assembly (page 2962)
3. Check the front brake discs.

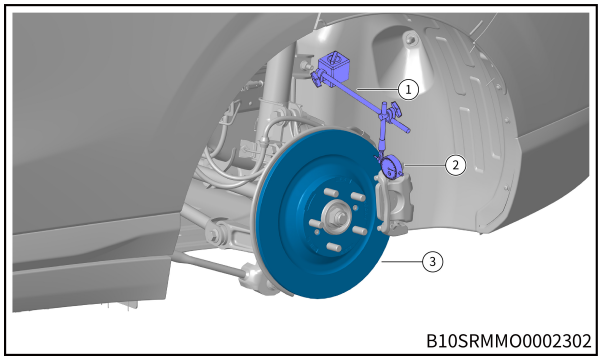
a. Before measurement, clean the friction surface of the brake disc with industrial alcohol or brake cleaner.
b. Use the outside micrometer ① to measure and record the minimum thickness at 4 or more points evenly distributed along the circumference of the brake disc. Ensure that measurements are taken only within the contact area of the brake pad assembly, and that the distance between the outside micrometer ① and the outer edge of the brake disc is the same for each measurement.
Recommended tool: Micrometer
Front brake disc service limit: 26mm

> **ATTENTION**
>
> - When brake disc wear exceeds the specified limit, the brake disc must be replaced.



c. Install the dial indicator base ① onto the steering knuckle and position the dial indicator measuring head ② so that it contacts the friction surface of the brake disc at a 90° angle, 10mm from the outer edge of the brake disc.
d. Rotate the brake disc ③ until the dial indicator reading reaches the minimum, then reset the dial indicator to zero.
e. Rotate the brake disc ③ until the dial indicator reading reaches its maximum, then mark and record the axial runout.
f. Compare the axial runout of the brake disc after assembly with the standard value.
g. If the axial runout of the brake disc after assembly exceeds the specification, the brake disc ③ must be replaced.
Recommended tool: Dial indicator

© 2026, All rights reserved

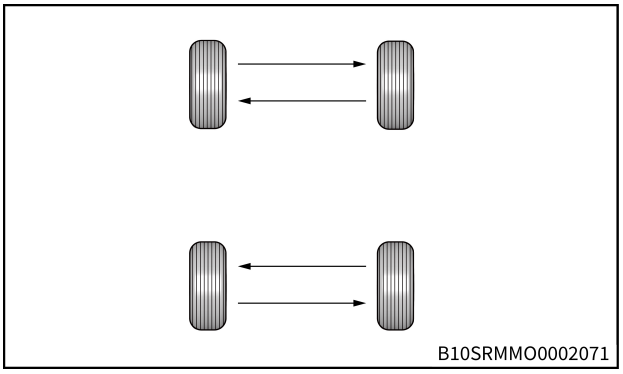


Front brake disc flatness standard value: 0.025mm

4. Check the rear wheel brake disc.

a. Before measurement, clean the friction surface of the brake disc with industrial alcohol or brake cleaner.
b. Use the outside micrometer ① to measure and record the minimum thickness at 4 or more points evenly distributed along the circumference of the brake disc. Ensure that measurements are taken only within the contact area of the brake pad assembly, and that the distance between the outside micrometer ① and the outer edge of the brake disc is the same for each measurement.
Recommended tool: Micrometer
Rear brake disc service limit: 16mm

> **ATTENTION**
>
> - When brake disc wear exceeds the specified limit, the brake disc must be replaced.



c. Install the dial indicator base ① onto the steering knuckle and position the dial indicator measuring head ② so that it contacts the friction surface of the brake disc at a 90° angle, 10mm from the outer edge of the brake disc.
d. Rotate the brake disc ③ until the dial indicator reading reaches the minimum, then reset the dial indicator to zero.
e. Rotate the brake disc ③ until the dial indicator reading reaches its maximum, then mark and record the axial runout.
f. Compare the axial runout of the brake disc after assembly with the standard value.
g. If the axial runout of the brake disc after assembly exceeds the specification, the brake disc ③ must be replaced.
Rear brake disc flatness standard value: 0.025mm

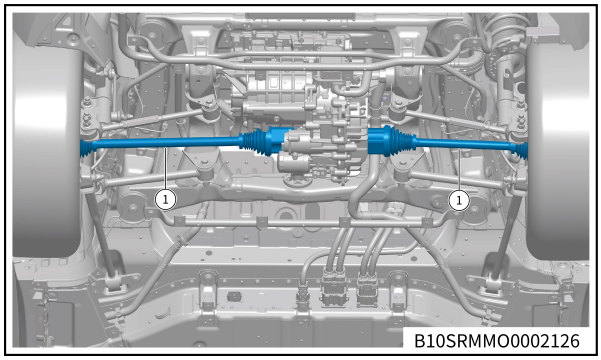
© 2026, All rights reserved

TIRE ROTATION

ATTENTION

- If uneven tire wear is clearly evident, the cause of the fault resulting in this wear should be eliminated.
- If performing tire rotation, it is recommended to also check the balance of the tire and wheel assembly.
- After the tire rotation is completed, the tire pressure monitoring system must be recalibrated.

1. Since the front and rear wheels bear different loads during operation, their wear patterns will also differ significantly. Therefore, to prevent unidirectional tire wear, regular and timely tire rotation is necessary to ensure even wear and extend tire life. It is recommended to rotate the tires every 10000km. The main purpose of tire rotation is:
   a. Ensure even tire wear for stability and fuel economy.
   b. Check the condition of the tires during tire rotation, promptly detect any damage, and prevent accidents.
2. As shown in the left figure, swap the left and right wheel assemblies.



ATTENTION

As shown in the left figure, perform a left-to-right tire rotation.

© 2026, All rights reserved

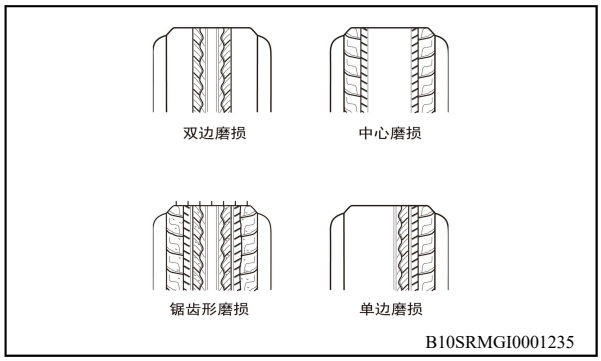
CHECK THE DRIVESHAFT AND DUST BOOT

1. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
5. Visually inspect the driveshaft and dust boot.

a. Check the driveshaft and dust boots for any damage or leakage.
b. If damaged, replace the driveshaft assembly ①.

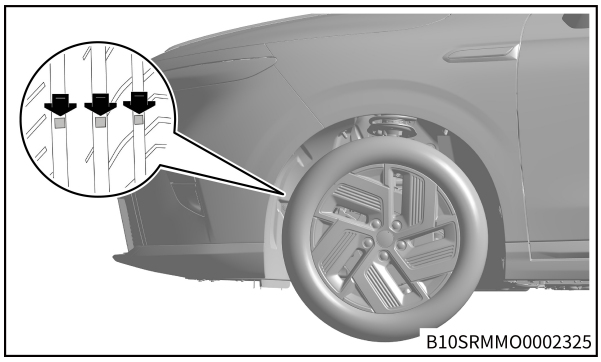
© 2026, All rights reserved

CONDUCT A TEST DRIVE



The following ranges depend on the vehicle equipment and road conditions (city / rural). Evaluate the following ranges during a test drive:

- Service brake: Function, free play, effectiveness, distance, judder, and brake noise.
- Steering system: Functions, steering play, steering wheel in the center position when driving straight.
- Radio, Navigation System: Functions, Reception, Interference Noise.
- Air conditioning: Test function (test the air conditioning function at low temperatures).
- Wheels: Pulls to one side during straight-line driving (on a level road surface).
- Imbalance: wheels, driveshafts.
- Wheel bearing: Abnormal noise.
- Seat belt: Operation of the automatic retractor.
- Instrument cluster: The operating status of all instruments.



© 2026, All rights reserved

TIRE MAINTENANCE CHECK

1. Lift the vehicle.
2. Check the tires.

a. Check tires for abnormal wear.

b. Check the tire tread for damage and foreign objects.
c. If wear on both edges or the center of the tire tread is found, adjust the tire pressure.
Recommended tool: Tire pressure gauge
d. If one-sided wear or sawtooth wear is found on the tire tread, check the wheel toe and camber, and adjust them if necessary.

> **ATTENTION**
>
> - When the tire is found to have reached the wear limit or is damaged, affecting safe driving, the customer must be informed, and it is recommended to replace the tire.

e. Check the tire tread and sidewall for damage and foreign objects, and check whether the sidewall is porous, has cuts, or is punctured by foreign objects.
f. Check the tire tread depth to ensure that the tread groove depth is greater than the wear indicator thickness, and that the triangular wear indicators on the sidewall, as indicated by the arrow in the figure, are not completely worn down.

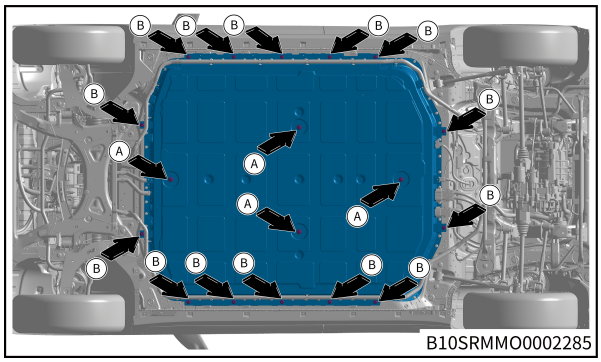
2.1.7 POWER MODULE MAINTENANCE CHECK

CHECK THE APPEARANCE OF THE BATTERY PACK

POWER-OFF PROCEDURE

1. Turn off all electrical appliances, and tap "System - Maintenance - Power Off for Maintenance" on the central control screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Remove the front compartment lower cover assembly
   See:Front compartment lower shield assembly (page 5321)
4. Remove the rear compartment bottom cover assembly
   See:Rear compartment under cover assembly (page 5327)
5. Remove the left/right lower cover assembly.
   See:Left lower undercover assembly (page 5320)
6. Lift the vehicle.
7. Check the appearance of the battery pack.



a. Check the high-voltage connection plug of the battery pack ① for damage, ensure the plug is securely and reliably connected, and inspect the high-voltage wiring harness for aging or damage.
b. Check the overall appearance of battery pack ① for any dents, deformation, or unusual odors.
c. Check the inlet and outlet of battery pack ① for any leakage, and check the hoses for aging or damage.

© 2026, All rights reserved

CHECK THE MOUNTING BOLTS OF THE POWER BATTERY PACK ASSEMBLY

1. Turn off all electrical equipment, tap Vehicle Maintenance Power Off on the center screen.
2. Disconnect the battery negative terminal.
   See:Battery Disconnection Operation (page 249)
3. Lift the vehicle.
4. Remove the front compartment bottom shield assembly.
   See:Front compartment lower shield assembly (page 5321)
5. Remove the rear compartment lower cover assembly.
   See:Rear compartment under cover assembly (page 5327)
6. Remove the left/right lower cover assembly.
   See:Left lower undercover assembly (page 5320)
7. Check the power battery bolts.

a. Check the 4 fixing bolts of the power battery - arrow A -.
   Recommended tool: 16mm socket
   Torque: 60±6N m
b. Check the 14 fixing bolts of the power battery - arrow B -.
   Recommended tool: 8mm socket
   Torque: 10±1N m

© 2026, All rights reserved

2.2 BODY MANUAL

2.2.1 ABOUT THIS MANUAL

OVERVIEW

1.

   b. This manual provides body repair guidelines for the EHS4 model for use by body repair technicians. All information, illustrations, and descriptions in this manual are accurate as of the time of publication. If any discrepancies are encountered during actual repairs, body repair technicians should contact the manufacturer at any time for updates.

2.

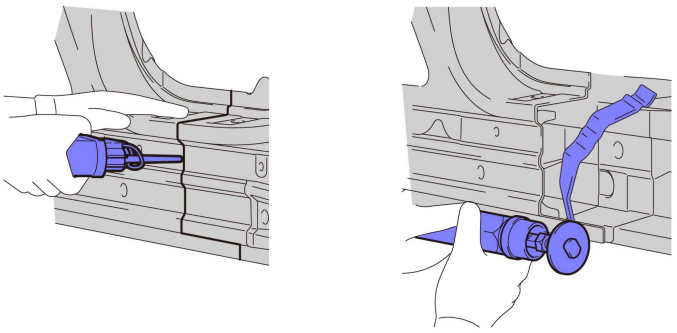
   b. This manual is provided by the manufacturer and is intended for qualified professional technicians. Attempting maintenance operations without proper training and appropriate tools and equipment may cause injury to the technician or others, and may also damage the vehicle or lead to accidents due to improper maintenance.

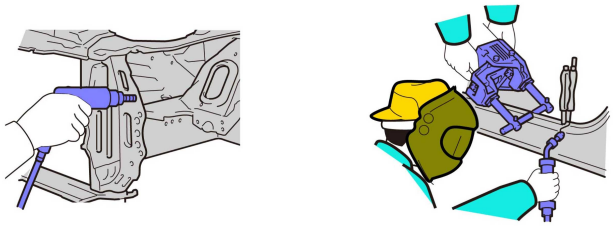
3.

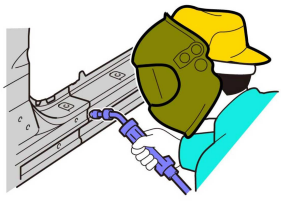
   b. The manual includes various "Warnings", "Cautions", and "Notes", which must be strictly observed to prevent personal injury and safety hazards to the vehicle caused by improper maintenance.

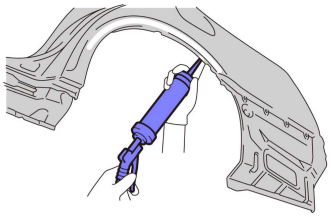
4.

   b. Proper vehicle repair is of great importance to the personal safety of the maintenance personnel and the safety of the vehicle. If a part needs to be replaced or repaired, please use genuine parts, and never use other non-genuine parts for replacement or repair.









5.

   b. The repair procedures in this manual are effective methods for replacement and repair, some of which require the use of specialized tools and equipment, and if repairs are performed without following the procedures specified in this manual, it must first be ensured that there is no hazard to personal or vehicle safety.

DAMAGE DIAGNOSIS

1. Damage diagnosis must use the following criteria to diagnose the damage.
   a. Damaged location.
   b. The extent of the affected area.
   c. Damage extent: These three points are directly related to the quality, efficiency, and cost of damage repair and must be correctly determined.
2. Determine various collision conditions.
   a. The size, shape, position, stiffness, etc. of other vehicles involved in the collision.
   b. Speeds of both vehicles during a collision.
   c. Impact angle and direction.
   d. The number of occupants and their positions during a collision.
   e. Dimensions, shape, hardness, etc. of the load in the vehicle.
   f. Historical records of the damaged areas, date of occurrence, and extent of the affected areas.
3. Vehicle exterior inspection.
   a. Observe the entire vehicle:
      - Extent of impact damage.
      - Twisting, bending, and tilting of the entire vehicle.
      - Extent and location of damage: Check by inspecting the entire vehicle (e.g., cracked or stressed paint, cracked or broken glass, etc.).
   b. Inspect the vehicle in detail:
      - Check the panel welds for any gaps or misalignment, and the paint film, primer, or sealant for any cracks.
   c. Observe the fit:
      - Check door alignment (damage to the body and hinges).
      - Check the alignment of the front hood panel and the tailgate assembly.
      - Check the opening and closing of the doors, front compartment cover, and liftgate assembly.
      - Check whether the window glass raises and lowers smoothly.
   d. Check for any mechanical damage:
      - Damage analysis also involves inspecting mechanical, steering, and suspension components for damage.
      - When inspecting mechanical parts, please check for signs of damage (e.g., bent or damaged parts, fluid leaks, and stiffness or noise when turning the steering wheel).
   e. Key points when selecting repair methods:
      - When repairing panels, do not compromise their strength, avoid excessive hammering, which may cause the panels to stretch, and avoid prolonged heating.
      - Select the correct method for measuring the vehicle body.
      - Carefully inspect how previous collision damage was repaired, as this is essential for correctly determining the scope of repairs.
      - Do not repair high-strength steel parts by heating, otherwise the strength of the parts will be reduced.
      - Do not repair the front door impact beam. If it is damaged, the door assembly must be replaced.

© 2026, All rights reserved

EMERGENCY HANDLING OF UNEXPECTED SITUATIONS

During vehicle maintenance, if any unexpected situation arises, please follow the steps below to ensure safety and the smooth progress of the repair work:

1. Immediately turn off the vehicle power, remove the key, or disconnect the battery to prevent electric shock or fire.
2. Ensure all personnel stay away from the hazardous area. Maintenance personnel must wear necessary protective equipment, such as gloves, safety goggles, and dust masks.
3. Determine whether there are any remaining potential risks, such as fire or poisoning.

In the event of an accident, the following measures shall be observed and implemented:

- In the event of an oil or coolant leak, immediately cover the affected area with oil absorbent felt or sand to prevent slipping or fire. Locate the source of the leak and take measures to stop it.
- In case of an electrical fault, such as a short circuit or spark, immediately cut off the power and use a dry powder fire extinguisher to extinguish any open flames.
- If the tool is damaged, stop using it immediately, check for any injuries caused by flying debris, and clean up the area.
- If an electrolyte leak is detected, immediately cover the affected area with absorbent pads or sand to prevent it from spreading.
- If the battery starts to smoke or catch fire, immediately extinguish it using a dry chemical or carbon dioxide fire extinguisher. Never use water to extinguish the fire, as water may cause electric shock or exacerbate the fire.
- Keep the area well ventilated to avoid inhaling harmful gases.

GENERAL INFORMATION

1. Scope of Maintenance Operations

   b. This manual provides instructions for replacing welded panels when the vehicle is in the body-in-white state. For the removal and reinstallation of components in the body-in-white state, as well as the installation, inspection, adjustment, and final inspection of components after replacing the welded panels, please refer to the relevant service manual.

   c. When cutting and joining parts (except outer panels), do not cut or join any parts not indicated in this manual or use any repair procedures not indicated in this manual.

   > NOTE
   >
   > Only perform operations on specified items to maintain body strength.

   d. When cutting and joining the outer panel, cut the necessary area according to the damaged part, but ensure that the following precautions are observed.

   > NOTE
   >
   > When cutting the outer panel, do not cut the reinforcements or other inner panels.
   > When welding the outer panel, do not apply heat that may affect the reinforcement or other inner panels.

2. The following procedures are omitted in this manual, but they must be performed.
   b. Use a jack or a lift to perform the operation.
   c. Clean all removed parts.
   d. Perform a visual inspection before and after the operation.

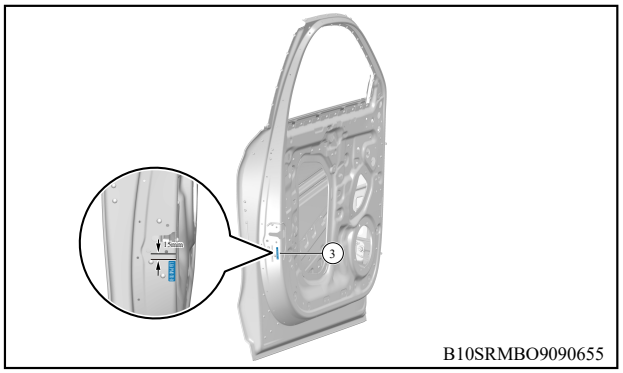
LABEL PLACEMENT LOCATION

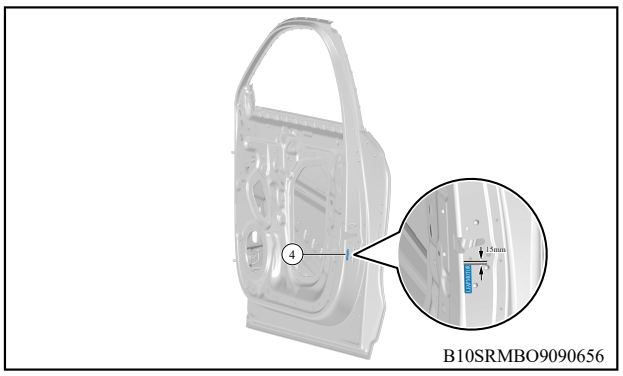
a. The vehicle VIN label ① is located near the lower left corner of the front windscreen, affixed to the sheet metal crossbeam, with the bottom of the characters facing down. Dimensions: 120mm×24mm



> **NOTE**
>
> The VIN characters are centered in the sheet metal pasting area, the VIN is centered vertically and horizontally when viewed through the front windshield and is not obscured by the black border of the front windshield, no sheet metal parts should be exposed when viewed through the front windshield, and there are no errors in the VIN.

b. The vehicle VIN label ② is stamped on the rear crossmember behind the right seat, with a clearance of 25±5mm from the edge of the waist hole, a character string length of 108±1mm, a character height of 8±1mm, and a stamping depth of ≥0.2,mm. The font is black, with start and end symbols. The characters are stamped from the left side to the right side of the vehicle, with the top of the characters facing the front of the vehicle. A VIN identifier is reserved on the carpet. Stamping area dimensions: 120mm×20mm.

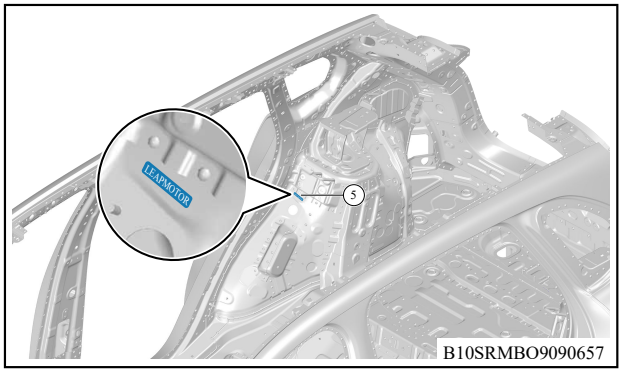
> **NOTE**
>
> The VIN stamped on the vehicle body has clear characters, uniform depth, and no errors.



© 2026, All rights reserved

c. The vehicle VIN label ③ is located on the sheet metal of the left front door, with the upper part of the characters flush with the sheet metal edge (tolerance 0-2mm), the upper part 15±10mm from the door lock mounting bolt hole, and the tail of the characters facing outward. Dimensions: 50mm×10mm.

NOTE

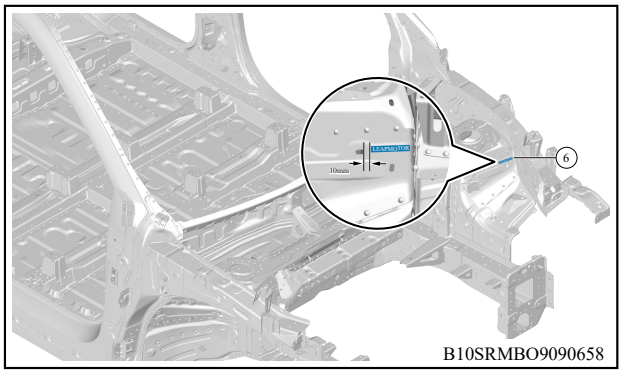


The label is applied flat without bubbles, the pasted surface is undamaged with no peeling edges, and the VIN is correct.

d. The vehicle VIN label ④ is located on the sheet metal of the right front door. The top of the text is flush with the sheet metal edge (tolerance 0-2mm) and 15±10mm from the door lock mounting bolt hole. The tail of the text faces outward. Dimensions: 50mm×10mm.

NOTE

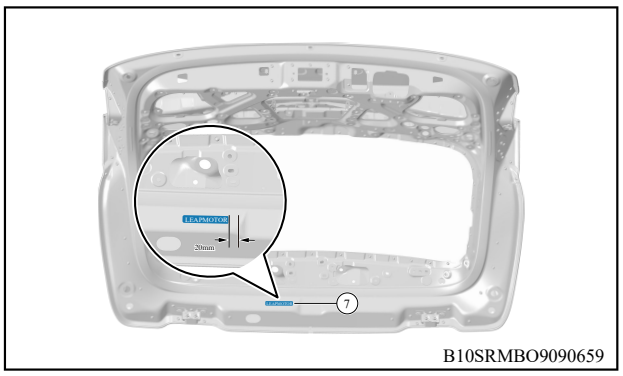
The label is applied flat without bubbles, the pasted surface is undamaged with no peeling edges, and the VIN is correct.



e. The vehicle VIN label ⑤ is located on the sheet metal of the right rear wheel guard, with the top of the characters flush with the sheet metal edge, centered horizontally, and the bottom of the characters facing downwards. Dimensions: 50mm×10mm.

NOTE

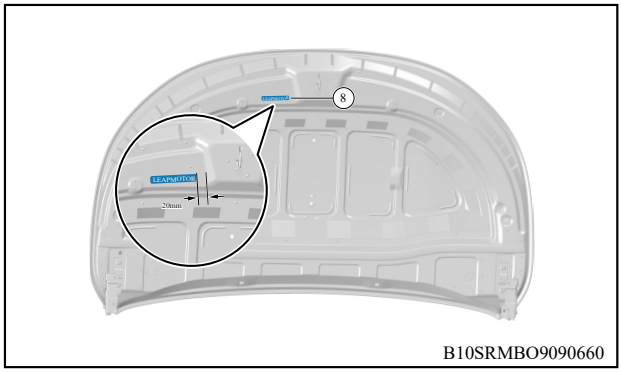
Center the pasting position front and back, apply it flat without bubbles, ensure the pasted surface is undamaged with no curled edges, and verify that the VIN is correct.



© 2026, All rights reserved

f. The vehicle VIN label ⑥ is located at the front of the left shock absorber tower. The top of the characters fits against the sheet metal edge, with a clearance of 10±3mm from the edge of the oblong hole, and the bottom of the characters faces downwards. Dimensions: 50mm×10mm.

NOTE

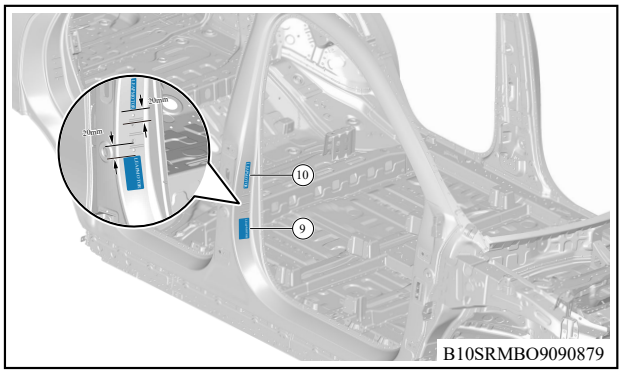


The label is applied flat without bubbles, the pasted surface is undamaged with no peeling edges, and the VIN is correct.

g. The vehicle VIN label ⑦ is located on the upper inner side of the back door, centered vertically, 20±10 mm from the lower rounded corner edge, with the bottom of the text facing down, dimensions: 50 mm × 10 mm.

NOTE

The label is applied flat without bubbles, the pasted surface is undamaged with no peeling edges, and the VIN is correct.



h. The vehicle VIN label ⑧ is located on the right side of the hood latch, with the lower part of the text tail flush against the sheet metal edge, 20±10mm from the rounded chamfer edge, and the text tail facing down. Dimensions: 50mm×10mm.

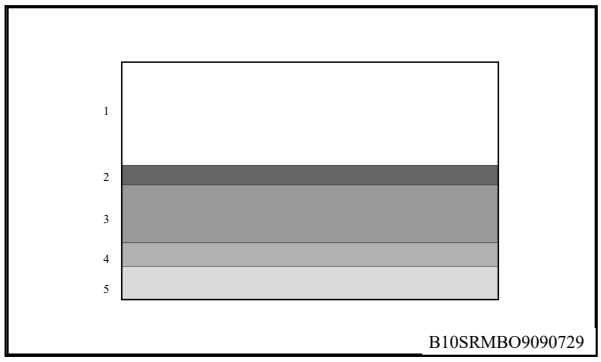
NOTE

Apply flat without bubbles, ensuring the applied surface is undamaged and the edges are not curled.

© 2026, All rights reserved

i. The vehicle nameplate is located on the outer panel of the right B-pillar and is affixed with adhesive. It is fixed 20±5mm below the striker hole of the right B-pillar, centered in the Y direction, with the bottom of the text facing outward.

> NOTE
>
> Apply flat without bubbles, ensuring the applied surface is undamaged and the edges are not curled.



j. The dealer nameplate ⑩ is located on the right B-pillar outer panel, affixed with adhesive 20±5mm above the right B-pillar striker, centered in the Y direction, with the text tail facing outward.

> NOTE
>
> Apply flat without bubbles, ensuring the applied surface is undamaged and the edges are not curled.

BODY COATINGS AND MATERIALS

1. Paint coating

a. Clear coat (clear outer coat).
b. Basecoat.
c. Mid-coat paint.
d. Electrodeposition primer.
e. Body sheet metal parts.
f. Paint is a liquid mixture that can be applied to various substrates. After drying, it forms a solid paint film to protect the substrate and enhance the appearance.
g. The vehicle is coated with four layers of paint at the factory (as shown in the figure above) to provide excellent corrosion resistance and gloss.

2. Main functions of the clear coat:

a. Contains UV-resistant materials, which can resist ultraviolet rays in sunlight.
b. Resists corrosion of the paint surface caused by environmental dust (acid rain).
c. Provides the paint surface with abrasion resistance.
d. Enhances the gloss of the paint surface.

3. Main function of the basecoat:

a. Add color.
b. Restore the gloss.

4. The main function of the intermediate coat:

a. Fillability.
b. Insulation/Sealing.
c. Contrast color paint.

5. Primary function of the electrodeposition primer:

a. Rust prevention.
b. Improve traction.
c. Improve the limited fillability.

2.2.3 SAFETY AND PROTECTION

SAFETY INSTRUCTIONS

SAFETY INSTRUCTIONS

Sheet metal repair: Welding machine required

1. Power off the vehicle and disconnect the power.
   SeeBattery Disconnection Operation (page 249)
2. During the body sheet metal straightening process, the power battery and high-voltage components may be subjected to stress. The power battery or high-voltage components that will be subjected to stress must be removed and stored safely before the straightening process.

No welding machine required

1. During the body sheet metal straightening process, the power battery and high-voltage components may be subjected to stress. The power battery or high-voltage components that will be subjected to stress must be removed and stored safely before the straightening process.

Surface sanding

1. Surface sanding must be performed using the dry sanding process; wet sanding is strictly prohibited.

General Workshop Tools and Equipment

1. It is important that all tools and equipment are well maintained and equipped with the correct safety equipment as required.
2. Never use tools and equipment for purposes other than their intended use, and do not overload hoists, jacks, lifting slings, or other equipment. Damage caused by overloading may not be immediately apparent and could result in fatal injuries during subsequent use of the equipment.
3. When using sandblasting equipment, handling asbestos-based materials, or using spray equipment, wear an appropriate respirator.
4. Ensure adequate ventilation to control dust, fumes, and gases.
5. When using a grinder, chisel, or sandblasting equipment, wear safety goggles.
   SeeSheet Metal Work Protection (page 312)

Warning labels for vehicles, equipment, or premises

1. Warning labels may be present on the surfaces of certain vehicle parts, equipment, and display areas.
2. Do not move these warning labels, and ensure that the text on them is clearly visible and unobstructed. The purpose of the warning labels is to alert relevant personnel. If they are not visible to relevant personnel, these warnings may be ignored, posing safety hazards.

© 2026, All rights reserved

SITE SAFETY AND VEHICLE PROTECTION

Site Safety

1. Before entering the workshop, maintenance technicians must familiarize themselves with the locations of safety passages and safety doors to ensure safe evacuation in the event of an emergency.
2. Maintenance technicians must maintain a good working environment during workshop operations to ensure safe and orderly work. Conversely, working in a dirty, cluttered, and substandard environment may lead to unpredictable hazards at any time.
3. When driving the vehicle, personnel must strictly comply with the driving requirements in the plant area and must not engage in traffic violations such as speeding or driving in the wrong direction.

Site Operation Requirements

1. The work environment must be cleaned and organized in a timely manner. Strictly implement the workshop "6S" standards, the definitions of which are as follows:
   - Sort: Distinguish between necessary and unnecessary items, remove unnecessary items from the work area, reduce waste, keep only necessary items, and lay the foundation for other 5S activities.
   - Set in order: Arrange and label necessary items in an orderly manner to ensure that anyone can quickly find the items they need and return them to their original places immediately, thereby improving work efficiency.
   - Cleaning: Regularly clean the work environment, including machines, tools, and workbenches, to remove trash, dust, and dirt, prevent equipment failure and deterioration of the work environment, and simultaneously inspect and identify potential issues.
   - Cleaning: Maintain the state of Sort, Set in order, and Shine, establish standards and systems, ensure the continuous implementation of the first 3 "S"s, and conduct continuous inspections to maintain workplace cleanliness.
   - Discipline: Cultivate a habit among employees to comply with rules and consistently implement the first four "S"s, enhance their initiative and self-discipline, and establish a good work culture and habits.
   - Safety: Building on all the above activities, it emphasizes the importance of safety, prevents accidents, protects employee health and safety, and creates a safe working environment. Although "Safety" was not originally included in the initial 5S, it was later widely incorporated, forming the current 6S management system.
2. Body technicians must be familiar with the location of the fire extinguisher and be able to use it properly.

Vehicle Protection

1. Use the three-piece maintenance kit to protect the vehicle interior.
2. When performing body and paint work, take such protective measures as required.

© 2026, All rights reserved

PERSONAL PROTECTION

SHEET METAL WORK PROTECTION

> **NOTE**
>
> Personal protection is the last line of defense to protect personnel safety and prevent injuries. As a supplementary preventive measure, protective equipment, when used correctly, can prevent or reduce the occurrence of work-related injuries and prevent hazards such as occupational diseases and occupational poisoning.

Occupational Disease Prevention

1. During vehicle maintenance operations, technicians use various tools and equipment and are exposed to toxic and hazardous substances, facing various potential hazards. Failure to implement protective measures may result in work-related injuries and occupational diseases. This section introduces the occupational health hazards and preventive measures in body and paint operations.
2. Factors contributing to occupational diseases include:
   - Inhaling harmful dust particles without proper protective equipment.
   - Staying in a radioactive environment for a long time without safety protection.
   - Exposure to hazardous chemicals without proper safety protection.
3. Precautions: Thoroughly understand potential scenarios involving personal injury during operations, as well as hazardous substances.
4. Use protective equipment properly.

Welding Protection

1. This section describes the potential hazards to operators during the welding process and the corresponding preventive measures.
2. Hazards generated during welding:
   - Strong light and radiation hazards.
   - Smoke, toxic gas hazard.
   - High Temperature and Splash Hazard
3. Hazardous area:
   - Ultraviolet radiation to the eyes.
   - Damage to the respiratory system caused by smoke.
   - Scalds and burns to the skin from splashing.
4. Avoidance method: Properly wear the following protective equipment.
   - Workwear.
   - Welding mask.
   - Long-sleeved welding gloves.
   - Smoke-proof mask.
   - Safety shoes.

Hand Shaping Protection

1. This section describes the potential hazards to operators during the manual shaping process and the corresponding preventive measures.

© 2026, All rights reserved

2. Hazards generated during manual shaping:
    - Scratches on the hand.
    - Sharp noise.
    - Foreign object enters the eye.
3. Hazardous area:
    - Damage to the operator's skin.
    - Damage to the operator's hearing.
    - Injury to the operator's eyes.
4. Avoidance method: Properly wear the following protective equipment.
    - Workwear.
    - Safety goggles.
    - Protective earplugs.
    - Cotton gloves.

Grinding Protection

1. This section describes the potential hazards to personnel during the grinding process and the corresponding preventive measures.
2. Hazards during the grinding process:
    - Paint dust inhaled into the lungs.
    - Inhalation of metal particles into the lungs.
    - Produces a sharp noise.
3. Hazardous area:
    - Damage to the operator's skin.
    - Damage to the operator's hearing.
    - Injury to the operator's eyes.
4. Avoidance method: Properly wear the following protective equipment.
    - Workwear.
    - Safety goggles.
    - Cotton gloves.
    - Dust mask.
    - Protective earplugs.
    - Safety shoes.

Cutting Protection

1. This section describes the potential hazards to personnel during the cutting process and the corresponding preventive measures.
2. Hazards during the pulling process:
    - Scratches on the hand.
    - Sharp noise.
    - Foreign object enters the eye.
3. Hazardous area:
    - Damage to the operator's skin.
    - Damage to the operator's hearing.
    - Injury to the operator's eyes.
4. Avoidance method: Properly wear the following protective equipment.
    - Workwear.
    - Leather gloves.

© 2026, All rights reserved

- Safety goggles.
- Protective earplugs.
- Safety shoes.

© 2026, All rights reserved

PROTECTION FOR SPRAY PAINTING OPERATIONS

Cleaning and Degreasing Process

1. Hazardous ingredients: Organic solvents.
2. Hazards present: Respiratory, skin, eyes.
3. Personal prevention and protection: Properly wear an organic vapor respirator, solvent-resistant gloves, and safety goggles.
   SeeSheet Metal Work Protection (page 312)

> NOTE
>
> Perform the operation in a well-ventilated environment or a workshop equipped with an exhaust system.

Protection for Body Filler Application Process

1. Hazardous components: Styrene, peroxides.
2. Hazards present: Inhalation of harmful dust or particles, skin and eye contact.
3. Personal prevention and protection: Properly wear an organic vapor respirator, solvent-resistant gloves, and safety goggles.
   SeeSheet Metal Work Protection (page 312)

> NOTE
>
> Perform the operation in a well-ventilated environment or a workshop equipped with an exhaust system.

Paint Preparation and Mixing Process

1. Hazardous ingredients: Organic solvents, isocyanates, synthetic resins.
2. Hazards present: Inhalation of harmful dust or particles, skin and eye contact.
3. Personal prevention and protection: Properly wear an organic vapor respirator, solvent-resistant gloves, and safety goggles.
   SeeSheet Metal Work Protection (page 312)

> NOTE
>
> Perform the operation in a well-ventilated environment or a workshop equipped with an exhaust system.

Painting process

1. Hazardous ingredients: Organic solvents, isocyanates, synthetic resins.
2. Hazards present: Inhalation of harmful dust or particles, skin and eye contact.
3. Personal prevention and protection: Properly wear an organic vapor respirator, solvent-resistant gloves, and safety goggles.
   SeeSheet Metal Work Protection (page 312)

© 2026, All rights reserved

NOTE

Perform the operation in a well-ventilated environment or a workshop equipped with an exhaust system.

Polishing and Waxing

1. Harmful ingredients: organosilicon compounds, dust, and particulates.
2. Hazards present: Inhalation of harmful dust or particles, skin and eye contact.
3. Personal prevention and protection: Properly wear an organic vapor respirator, solvent-resistant gloves, and safety goggles.
   SeeSheet Metal Work Protection (page 312)

NOTE

Perform the operation in a well-ventilated environment or a workshop equipped with an exhaust system.

© 2026, All rights reserved

2.2.4 TOOLS, EQUIPMENT AND CONSUMABLES

PAINTING TOOLS

> **NOTE**
>
> The tools in this manual are general-purpose tools and can be purchased as needed.

Spreading tool

1. Putty knife: Used to apply body filler to the vehicle body surface and perform initial leveling. Spreaders are available in various widths and shapes to accommodate surfaces of different sizes and shapes.

Sanding tools

1. Dust-free dry sanding system.
   - The dust-free dry sanding system consists of sanding tools, air supply and dust extraction hoses, dust extraction equipment, sanding pads and sandpaper, and auxiliary systems, and is primarily used for sanding paint surfaces and dried body filler.
2. Two types of grinders are provided:
   - Single-action sander: Also known as a single-direction rotary grinder, it is mainly used for rust removal and coating removal.
   - Random orbital sander: During operation, the sanding pad moves back and forth along an elliptical path. The grinding and cutting forces are relatively uniform, making it less likely to produce uneven sanding defects. It is mainly used for shaping and sanding body filler.
   - Dual-action sander: Also known as an eccentric orbital sander, the application type should be selected based on the orbit size. A larger orbit is more suitable for coarse grinding (body filler), while a smaller orbit is suitable for fine grinding (primer surfacer).

Polishing tools

1. Polishing machine: Used for finishing the paint film, divided into pneumatic polishers and electric polishers.
2. Polishing pad: After being installed on the polisher, it refines the paint film. There are two categories as follows:
   - Wool wheel: Strong grinding and cutting power, generally used for rough polishing.
   - Sponge polishing pad: Generally used for fine polishing.

Color Tuning Tool

1. Paint mixing cup: Used for weighing and mixing paint.
2. Paint mixing stick: It can measure paint through its scale and can be used for mixing materials.
3. Color test panel: Used for comparing paint color.
4. Color matching lamp: Simulates daylight effects, enabling the identification of different colors and the distinct hues of coatings containing metallic, pearlescent, and other pigment components, used for color comparison.

Spray tools

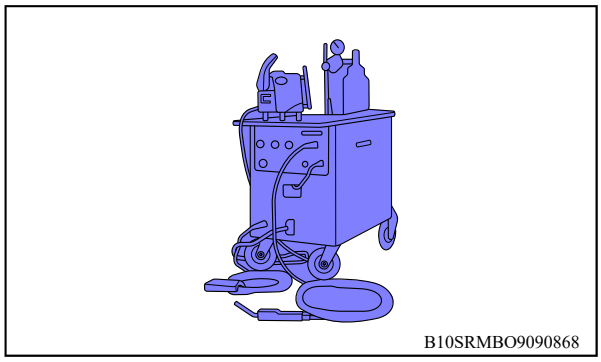
1. Topcoat spray gun: Mainly used for spraying single-stage topcoats, two-stage basecoats, and clearcoats.

© 2026, All rights reserved

    - Features: Atomization into fine particles and a relatively thin paint film thickness ensure that the topcoat film texture after spraying is relatively thin and uniform.
2. User Notice:
    - Recommended spray distance: 15–20cm.
    - The spray gun nozzle diameter is: 1.0–1.5 mm.
3. Primer spray gun: Primarily used for spraying rust-inhibitive primers and primer surfacers. It is suitable for spraying operations involving relatively high-viscosity materials and thick paint film coatings, such as primer application.
    - Characteristics: The paint is atomized evenly, but the fineness of atomization is inferior to that of a topcoat spray gun, the spray pattern is relatively concentrated, and the central wet area of the spray pattern is larger while the peripheral atomized area is smaller.
4. User Notice: It is recommended to maintain a spraying distance of 15–20cm.
5. Color test panel: Used for comparing paint color.
6. Color matching lamp: Simulates daylight effects, enabling the identification of different colors and the distinct hues of coatings containing metallic, pearlescent, and other pigment components, used for color comparison.

Drying Equipment and Tools

1. It is strictly forbidden to produce open flames in the paint booth, such as smoking.
2. Unauthorized personnel are prohibited from entering, and operators must wear appropriate personal protective equipment before entering the paint booth.
SeeProtection for Spray Painting Operations (page 315)
3. During spraying operations, keep the spray booth door closed and do not enter or exit at will. After the operation, remove all remaining paint from the spray booth. It is strictly forbidden to heat and bake paint inside the spray booth.
4. The illumination inside the paint booth is required to be above 800ix. Typically, multiple sets of daylight lamps are installed on both sides of the ceiling. In addition, the noise level during the operation of the paint booth should not exceed 80dB.
5. Maintenance and Service:
    - During maintenance, ensure the main power switch of the spray booth is disconnected.
    - The air inlet filter cotton should be cleaned and replaced regularly according to the manufacturer's requirements, and the general service life is: 350–400h.
    - The bottom filter cotton should be replaced regularly as required by the manufacturer, typically every 80–100h.
    - Regularly inspect the activated carbon filter in the activated carbon environmental protection cabinet every quarter. If the surface is covered with paint, replace it promptly to ensure unobstructed ventilation.
    - Inspect all wiring in the spray booth every six months, and promptly replace any aged wires or circuits.
    - Every six months, clean the entire spray booth, check the recirculation air dampers and the bearings of the intake and exhaust fans, inspect the exhaust flue of the burner, clean the sediment in the oil tank, and clean and respray the water-based protective film of the spray booth.
6. User Notice:
    - For vehicles repaired with low-temperature touch-up paint, the baking temperature is generally 60–80℃.
    - Spray booths generally use positive pressure air supply, with the air supply pressure generally maintained at 4–12 bar higher indoors than outdoors, and the positive pressure air supply ensures that outdoor air cannot enter the spray booth, keeping the interior clean.
    - The air supply pressure is adjusted by the air door.



© 2026, All rights reserved

- During spraying, the air velocity should reach 0.2–0.6/S, and during heating and baking, the air flow rate is generally 0.05/S.
- The optimal spraying environment for water-based paint is at a temperature of 25℃ and a relative humidity of less than 70%.

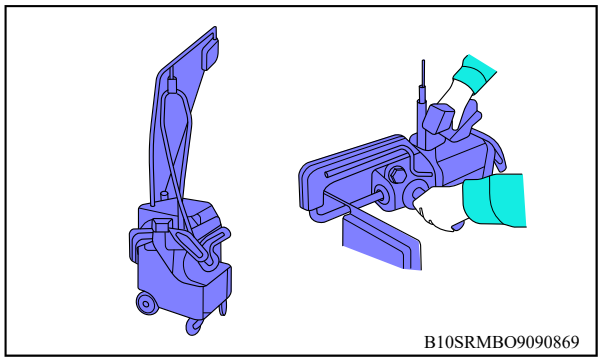
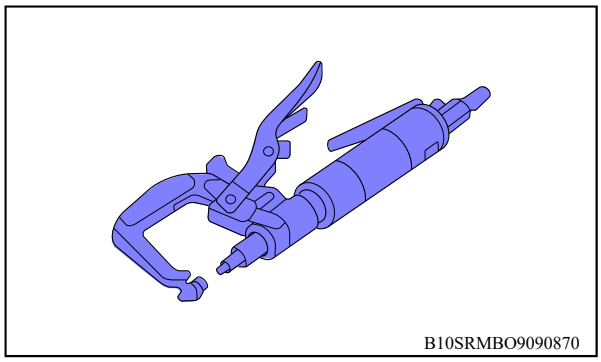
INTRODUCTION TO BODY COMPONENT REPLACEMENT TOOLS



1. MAG/MIG Welding Machine

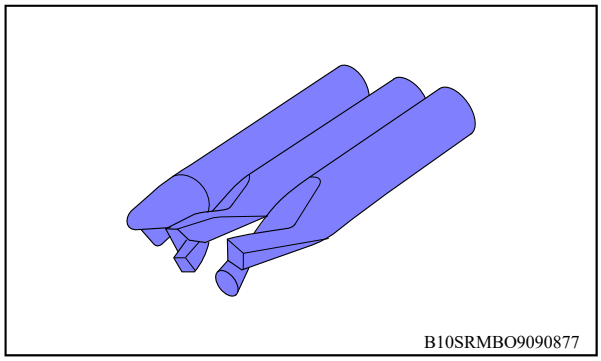
a. MAG welding for the vehicle body, or MIG welding for aluminum panels or copper.
b. High-quality welding can be achieved because the shielding gas prevents oxidation and nitriding, reducing distortion.
c. Since welding can only be performed from one side, it has a wide range of applications.



> **NOTE**
>
> The shielding gas used varies depending on the type of welding or brazing.

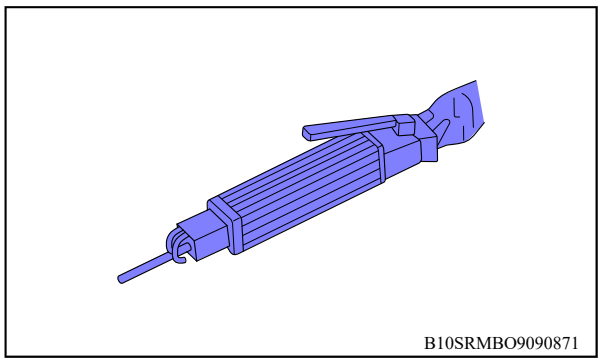
2. Spot welder

a. Used for clamping and welding steel plates.
b. Due to the short time required for welding, heat application is localized, minimizing the heat-affected zone and deformation.



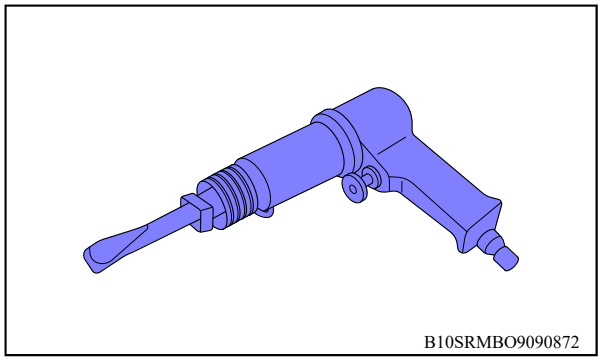
3. Spot weld drill

a. Specialized tool for spot weld removal.
b. Some models are specifically designed to cut spot welds on high-strength and ultra-high-strength steel sheets.
c. When cutting, maintain pressure and focus on the weld nugget.



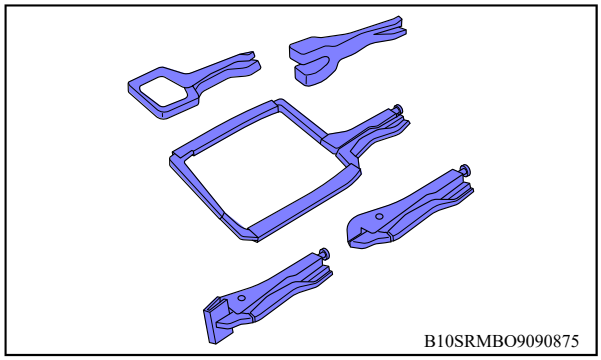
4. Spot Weld Cutter (Drill Type)

© 2026, All rights reserved



a. Use with an air drill to remove spot welds.
b. Its surface treatment is very easy because no weld nuggets are left on the base material.

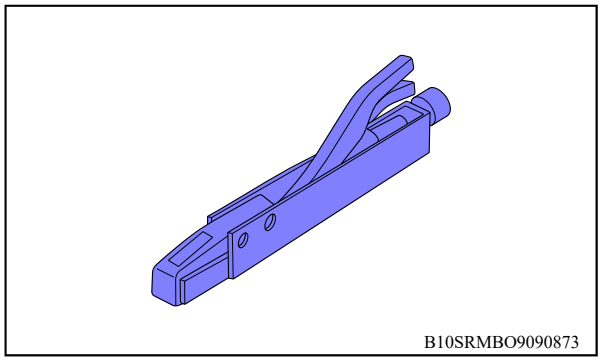
5. Air saw



a. Used for cutting the outer panel.
b. Allows for quick and clean cutting, but noise and vibration are noticeable.

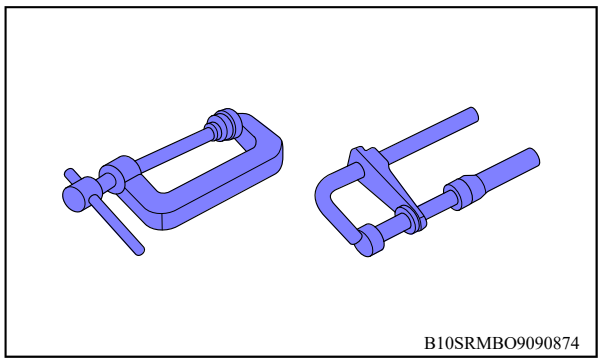
6. Air chisel

a. Used for rough cutting when removing damaged parts.
b. Compact and lightweight, it is ideal for hammering out damaged parts without damaging other components.
c. When cutting the panel, straight, curved, or stamping-line cuts can be made without generating chips.
d. Noise and vibration are noticeable.



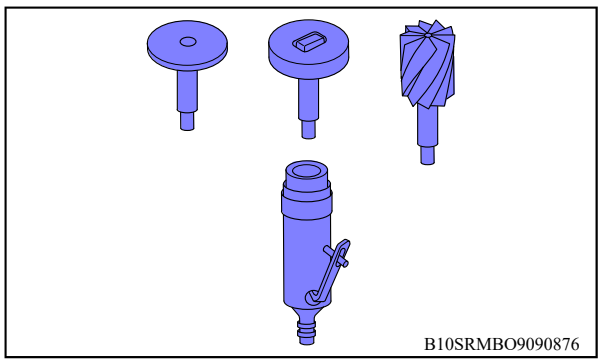
7. Vise clamp

a. Used to temporarily secure components during welding.
b. The opening and clamping force can be easily adjusted.



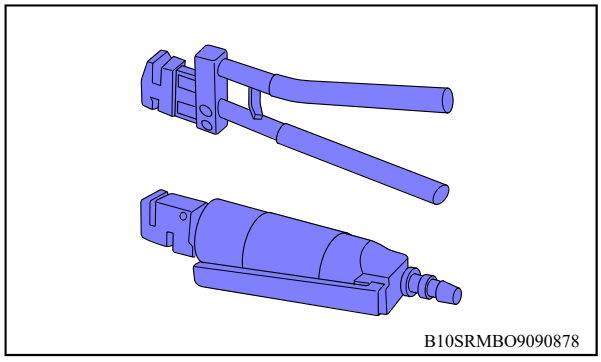
8. 90-degree vise clamp

© 2026, All rights reserved



a. Used to temporarily secure components during welding.
b. The opening and clamping force can be easily adjusted.
c. A 90-degree opening angle can be used to verify the door and liftgate assembly.

9. Spiral clip



a. Used for assembling panels and securing components during welding.
b. It is easy to adjust the spiral opening size and clamping force.
c. Compared to a vise grip, it is less likely to scratch the panel or leave marks on it.

10. Pneumatic disc grinder

a. The head can be changed according to the task type, making it a highly versatile tool.
b. Grinding wheels can be used to remove spot welds in areas where spot weld removal tools cannot operate due to space constraints.
c. A rotary wire brush can be used to remove sheet metal sealant, coatings, and rust.
d. A rotary cutting tool can be used to remove weld spatter from the aluminum alloy body.

11. Steel punch

a. Used for drilling holes for MAG plug welding.
b. Reduces the time required for drilling; no drilling is required.
c. Burr-free hole.
d. There are two types: manual type and pneumatic type.
e. It may be difficult to use on some higher-strength steel.

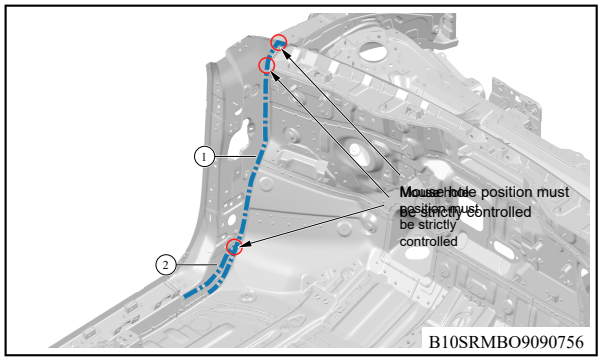
2.2.5 OPERATING CONSUMABLES

BODY PVC SEALANT SEALING AREA

Interior Section



1. Front windshield lower crossmember / Upper dash panel

a. Operating Instructions:
   - Use a straight round tube sealant gun to apply sealant to the sealing areas shown in the illustration, then after application, use a sealant brush to smooth out areas with excess buildup, inadequate sealing, or poor appearance, and for any process holes and bolts contaminated with PVC sealant, use gauze to wipe off the residual sealant.

Serial No.	Region	Length (mm)	Function	Left-right symmetry
1	Front windshield lower crossmember / Upper dash panel	1515	Sealing	/

2. Front compartment frame assembly / Front compartment subassembly / Left A-pillar inner panel assembly

a. Operating Instructions:
   - Use a straight round tube sealant gun to apply sealant to the sealing areas shown in the illustration, then after application, use a sealant brush to smooth out areas with excess buildup, inadequate sealing, or poor appearance, and for any process holes and bolts contaminated with PVC

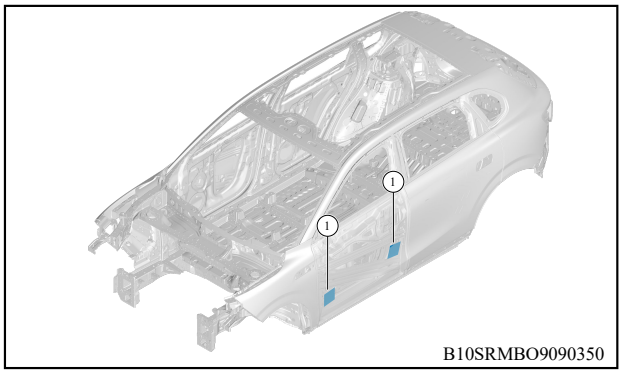
BODY SOUND INSULATION RUBBER BLOCK

a. Sound-deadening rubber blocks are installed in all body cavities

> **NOTE**
>
> Using foam can reduce the transmission of driving noise into the cabin.
> The exact location of the sound insulation block is described in the corresponding repair procedure.
> Measures to be taken during maintenance: Remove residual sound insulation adhesive blocks from the vehicle body.
> Follow the operating instructions in the repair procedure, and apply anti-corrosion treatment to the repaired area after completing the repair.



b. Sound-deadening rubber blocks are installed in all body cavities

> **NOTE**
>
> Using foam can reduce the transmission of driving noise into the cabin.
> The exact location of the sound insulation block is described in the corresponding repair procedure.
> Measures to be taken during maintenance: Remove residual sound insulation adhesive blocks from the vehicle body.
> Follow the operating instructions in the repair procedure, and apply anti-corrosion treatment to the repaired area after completing the repair.

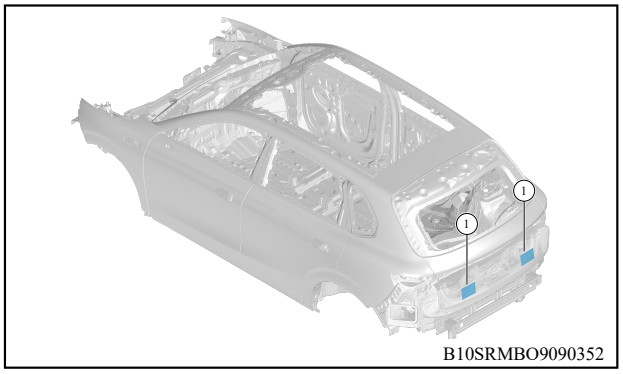
REINFORCEMENT PATCH INSTALLATION POSITION

Serial No.	Part number	Part Name	Quantity
①	6602209-CB01	Front door reinforcement patch	2

a. Assembly Instructions

> **NOTE**
>
> Wipe the sheet metal clean with a cloth to remove the anti-rust oil and dust.
> Align the reinforcement film with the red line, and slowly apply it along the surface as shown in the figure above.
> Ensure that no air bubbles are present between the bonding surfaces of the reinforcement patch and the sheet metal.
> Press the corners and edges of the reinforcement patch tightly against the sheet metal, and use a scraper to firmly smooth the entire surface, ensuring effective bonding with the sheet metal surface.



Serial No.	Part number	Part Name	Quantity
①	6602208-CA01	Side door reinforcement patch	1

DAMPER PAD INSTALLATION POSITION

a. Body Damping Pad Installation Specifications

NOTE

The spray width of the LASD damping material is 70mm, and the spray length is indicated by the numbers in the figure; a tolerance of 5mm is allowed.
Required application thickness of LASD damping material: wet film thickness 2±0.2mm.
Required dry film thickness of the LASD damping material: 3±0.5mm. Unless otherwise specified, the spray spacing of the LASD damping material is 10mm.
After the damping material is spray-applied, it must be baked and cured within half an hour.

© 2026, All rights reserved

SPRAY PAINTING CONSUMABLES

ATTENTION

- This section introduces the auxiliary materials involved in painting. The specific brands and models of the auxiliary materials shall be subject to the actual products.

PRIMER

Epoxy primer

1. Purpose:
   - Epoxy primer is primarily applied to bare metal to form a paint film with excellent adhesion, fill minor imperfections, and provide corrosion protection.
2. User Notice:
   - Stir thoroughly before use. A dedicated hardener must be used for the epoxy primer. Ensure that compatible products are selected and mixed in the specified proportion.
   - It dries slowly; during application, ensure a thin layer is applied to bare metal areas.
   - Ideal application conditions are: 20°C, humidity below 80%. Due to slow drying, it is not recommended for use in environments with an ambient temperature below 15°C.

Intermediate primer

1. Purpose:
   - Epoxy primer is primarily applied to bare metal to form a paint film with excellent adhesion, fill minor imperfections, and provide corrosion protection.
2. User Notice:
   - Stir thoroughly before use. A dedicated hardener must be used for the epoxy primer. Ensure that compatible products are selected and mixed in the specified proportion.
   - It dries slowly; during application, ensure a thin layer is applied to bare metal areas.
   - Ideal application conditions are: 20°C, humidity below 80%. Due to slow drying, it is not recommended for use in environments with an ambient temperature below 15°C.

BODY FILLER

1. Purpose:
   - Used to fill and repair surface defects such as pits, pinholes, grain marks, and minor welds, making the surface flat and smooth. Its main components are pigments, resins, and solvents.
2. User Notice:
   - Heavy application: Fill deep dents (3mm or more).
   - Primer surfacer: Fill shallow dents (less than 3 mm).
   - Thin coating: Fill pinholes, minor dents, and protrusions.

POLISHING

Sandpaper

1. Purpose:
   - Grind to fit.

© 2026, All rights reserved

2. User Notice:
    - For deeper scratches that have not caused metal deformation and where the paint coating is broken, a dual-action sander with P240-320 round sanding discs can be used to remove the paint film.

Abrasive sponge

1. Purpose:
    - Sand corners, edges, crevices, and other tight spaces.

POLISHING

Polishing wax

1. Purpose:
    - Polish the paint film using polishing tools.

INTERMEDIATE PRIMER

1. Purpose:
    - The primer surfacer is an intermediate coat applied between the primer and the topcoat, used to fill minor imperfections, prevent absorption from the underlying layers, provide a smooth base for the topcoat, and enhance the overall performance of the paint film.

PAINT

Waterborne colorant paint

1. Purpose:
    - The primer surfacer is an intermediate coat applied between the primer and the topcoat, used to fill minor imperfections, prevent absorption from the underlying layers, provide a smooth base for the topcoat, and enhance the overall performance of the paint film.

Solvent-based colorant paint

1. Purpose:
    - As part of the paint preparation, use the appropriate mixing ratio to ensure the paint reaches the correct parameters.

Clear coat and hardener

1. Purpose:
    - After applying the basecoat: a clearcoat must be applied to provide: gloss, hardness, and protection against coating aging.

Thinner

1. Purpose:
    - Adjust the paint viscosity to facilitate application.

MASKING MATERIALS

Masking paper

© 2026, All rights reserved

1. Purpose:
   - Used to mask areas of panels that do not require painting.
2. Features:
   - Solvents cannot penetrate, the masking paper produces no dust, and paint adhered to the paper will not flake off.

Masking tape

1. Purpose:
   - Used for securing masking paper, film, and masking boundaries.

Masking film

1. Purpose:
   - Used to cover larger areas than masking paper, improving masking efficiency and reducing costs.
2. Features:
   - It carries static electricity, making it easy to attract and adsorb paint dust on the vehicle body.

Thinner

1. Purpose:
   - Adjust the paint viscosity to facilitate application.

© 2026, All rights reserved

SHEET METAL AUXILIARY MATERIALS

ATTENTION

- This section introduces the consumables involved in sheet metal repair, and the specific brands and models of the consumables shall be subject to the actual ones.

REPAIRING PLASTIC PARTS

Resin adhesive

1. Purpose:
   - Used for filling dents and cracked areas.
2. User Notice:
   - To ensure repair quality, reinforcing cloth must be used when repairing cracked areas.

Reinforced fiber mesh

1. Purpose:
   - Used to reinforce cracked areas, applied to the reverse side of the cracked section for reinforcement.
2. User Notice:
   - When in use, place it over the damaged area, position it, and press it down into the adhesive until the fiber mesh is saturated.

Softening Additive

1. Purpose:
   - Mix with the paint to improve the flexibility of the primer surfacer and topcoat.
2. User Notice:
   - For the mixing ratio and drying time, please follow the manufacturer's instructions.

CORROSION PROTECTION

Anti-rust primer

1. Purpose:
   - Prevent panel corrosion.
2. User Notice:
   - After removing moisture and oil from the panel surface using a specialized cleaner, perform spray or brush coating on the bare metal panel.

Spot Weld Sealant

1. Purpose:
   - Primarily used at the lap joints of steel sheets, it is spot-welded together with the steel sheets, mainly serving the functions of sealing and corrosion protection.
2. Technical requirements:
   - High-temperature baking at 160℃ and 140℃ is required.

© 2026, All rights reserved

Structural adhesive

1. Purpose:
   - It is primarily used at steel-to-steel lap joints and steel-to-aluminum lap joints, working in conjunction with the spot welding process to significantly enhance the overall stiffness, strength, and durability of the vehicle body, serving as reinforcement.
2. Technical requirements:
   - High-temperature baking at 160℃ and 140℃ is required.

Hemming adhesive

1. Purpose:
   - Primarily used for the hemming areas of closures such as the four doors and two lids.
2. Technical requirements:
   - High-temperature baking at 160℃ and 140℃ is required.

Shock-absorbing rubber

1. Purpose:
   - Primarily used inside cavities to fill them and achieve shock absorption and sound insulation.
2. Technical requirements:
   - High-temperature baking at 160℃ and 140℃ is required.

Damping adhesive

1. Purpose:
   - It is primarily used for shock absorption and noise reduction, and is commonly applied to the floor.
2. Technical requirements:
   - High-temperature baking at 160℃ and 140℃ is required.

Conductive anti-rust zinc-rich paint

1. Introduction:
   - There are two types: aerosol spray and brush application.
2. Purpose:
   - It is primarily used for shock absorption and noise reduction, and is commonly applied to the floor.

© 2026, All rights reserved

CLEANING SUPPLIES

ATTENTION

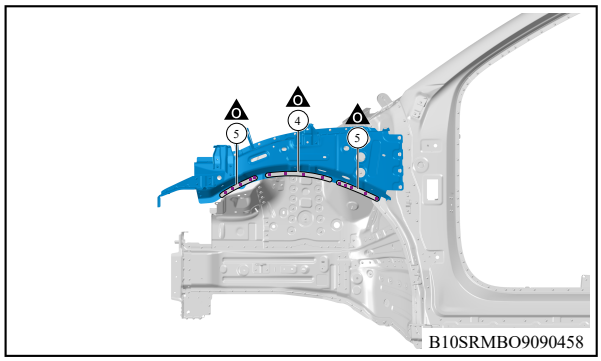
- This section describes the auxiliary materials involved in cleaning, and the specific brands and models of the auxiliary materials shall be subject to actual conditions.

Tack Cloth

1. Purpose:
   - Used to remove foreign matter or dust from painted surfaces.
2. User Notice:
   - Before using the tack cloth, unfold it and lay it flat, then fold it again to soften it.

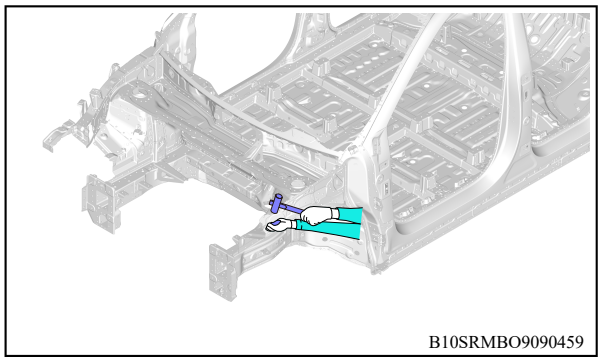
Degreaser

1. Purpose:
   - Clean and degrease the panels.
2. User Notice:
   - After spraying the degreaser using a solvent spray bottle, first wipe the panel with a damp wiping cloth, and then dry it with a dry wiping cloth.
   - When in use, select an appropriate degreaser based on the spraying environment in the paint booth and the type of paint.



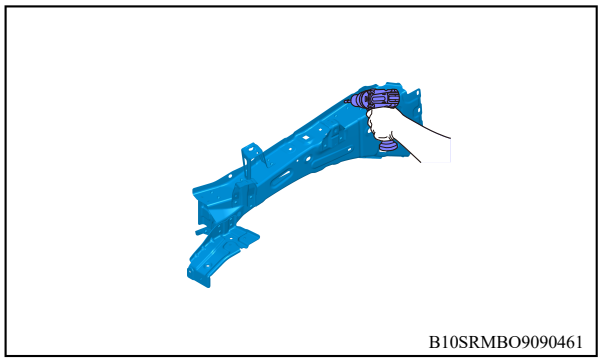
© 2026, All rights reserved

2.2.6 HOW TO REPAIR AND PAINT THE VEHICLE BODY



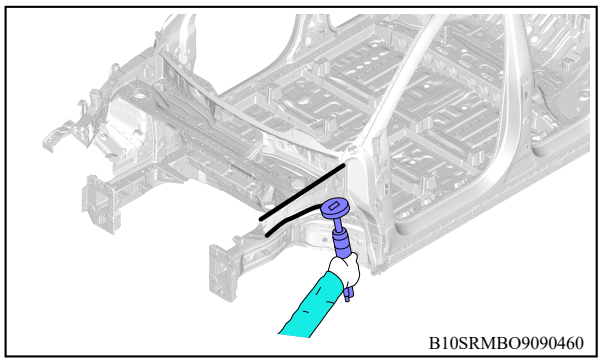
SHEET METAL REPAIR

MAINTENANCE PROCESS

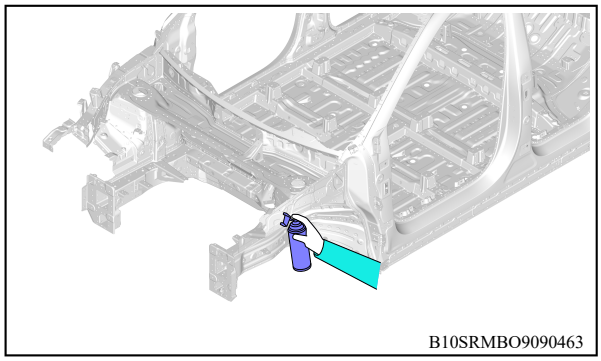


1. Remove the original part

a. Drill out all spot welds to separate the left side front connecting plate assembly from the body.

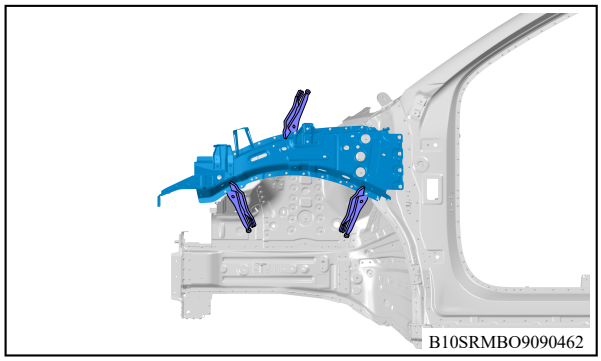


b. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

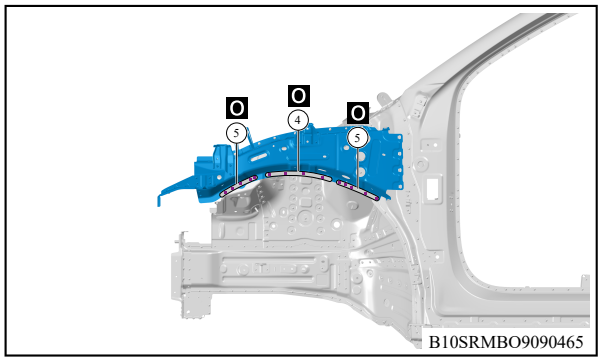


c. To perform plug welding, first drill holes in the left side front connecting plate assembly.

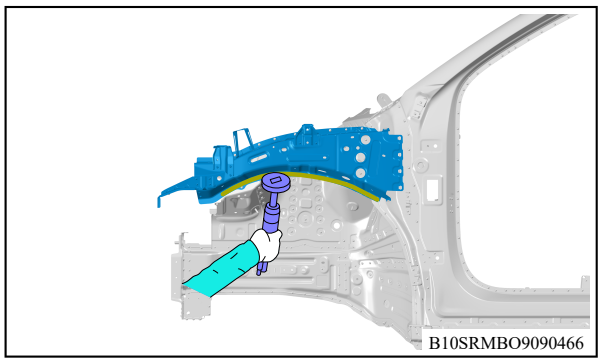
2. Welding



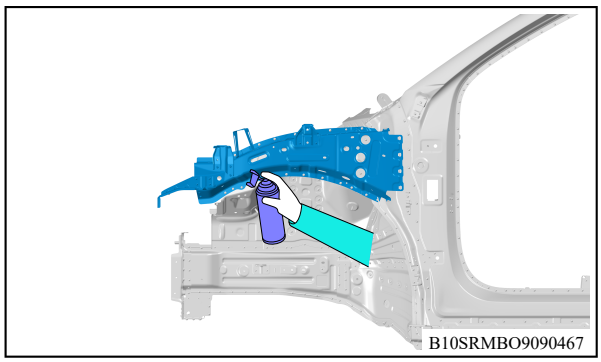
a. Use a grinder or similar tool to grind away the welding marks left on the body surface and grind the surface smooth (removing foreign objects, paint film, and rust), taking care not to damage other panels.



© 2026, All rights reserved

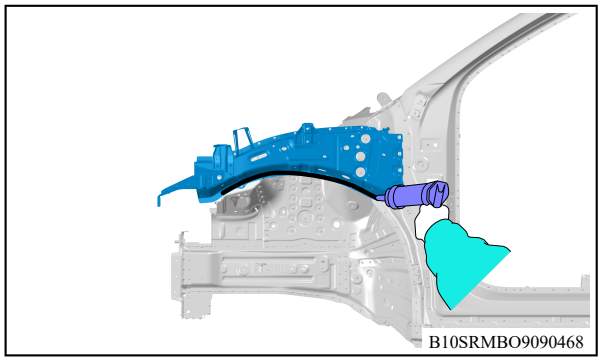


b. Before welding, apply zinc powder spray to the mating surfaces of the left side front connecting plate assembly for corrosion protection.



c. Install the left side front connecting plate assembly in place, flatten the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as vise-grip welding clamps.

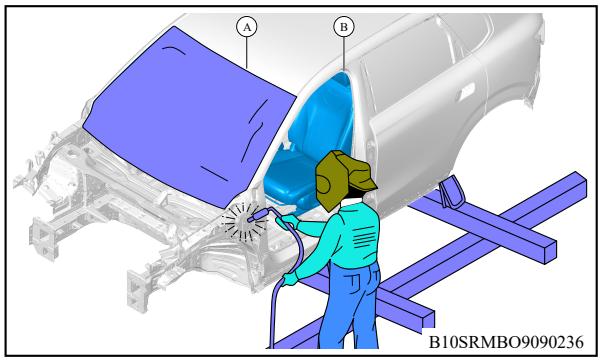
d. Use a MAG welder to perform plug welding at the joint between the left side front connecting plate assembly and the vehicle body.



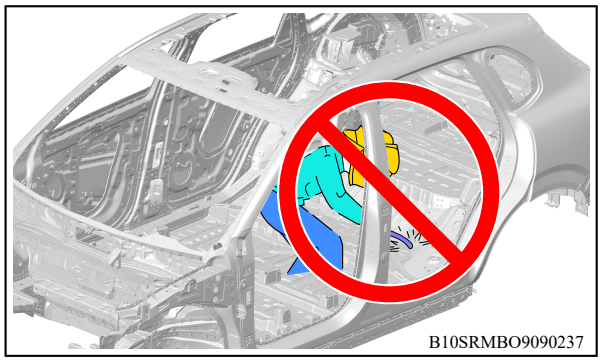
e. After welding, use a grinder to clean the welding area of the left side panel front connecting plate assembly, and do not overgrind.

f. After grinding the spot welds, the surface of the left side panel front connecting plate assembly shall be sprayed or brushed with epoxy primer for anti-corrosion treatment.

© 2026, All rights reserved

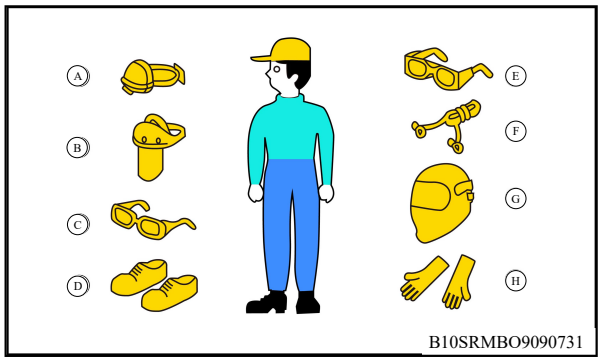


g. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.



© 2026, All rights reserved

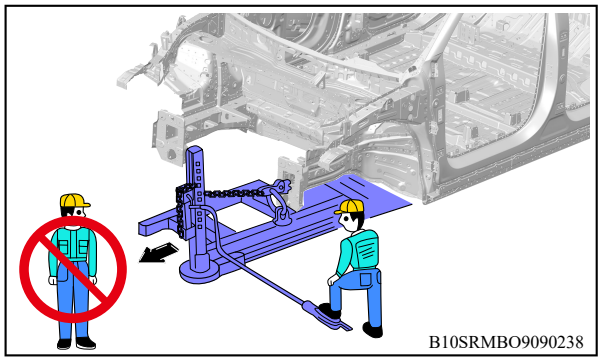
GENERAL MAINTENANCE SPECIFICATIONS



1. Vehicle Protection

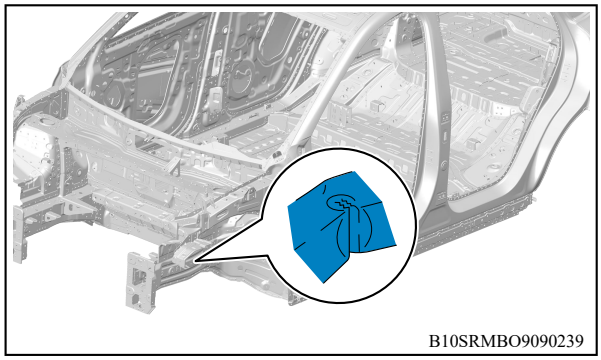
a. When performing welding operations, heat-resistant and fire-retardant protective covers must be used to cover the paint surface, windows, seats, and carpets, such as: Glass Protective Cover A, Seat Protective Cover B.

b. During body repair operations, relevant national safety regulations must be strictly observed. If you have any questions, please consult the relevant departments. It is prohibited to park unprotected vehicles in the body repair workshop (flying sparks may cause fires and damage the paint and windows).



c. All operations must be performed by technicians holding relevant national qualifications, and proper safety protection measures must be implemented.

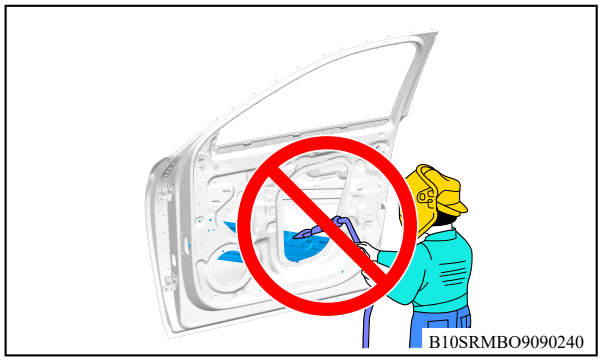
d. Depending on the specific situation, you must wear safety glasses, gloves, safety shoes, earplugs, etc.



Symbols	Name
A	Dust mask
B	Dust mask
C	Safety glasses
D	Safety shoes
E	Welding goggles
F	Earplugs
G	Welding shield
H	Welding gloves

© 2026, All rights reserved

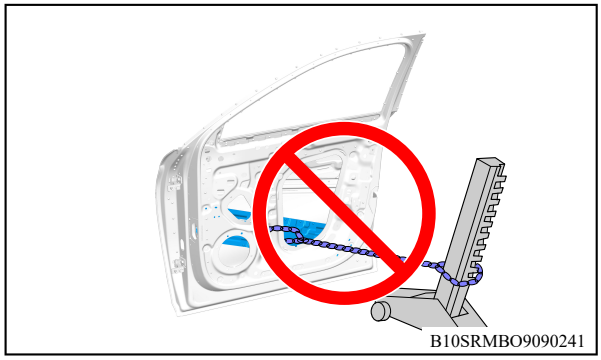
B10SRMBO9090238



e. When using the hydraulic equipment of a body frame or pulling devices to straighten a vehicle damaged in an accident, tremendous forces will be exerted on the vehicle body. These forces may cause injury to others; therefore, the safety of personnel in the work area must be ensured.

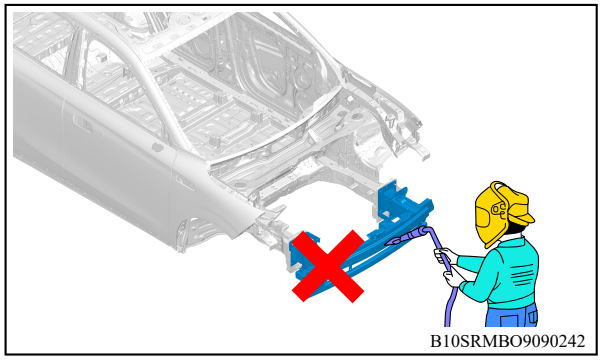
f. When using a puller to pull the body or frame, do not stand in a direct line with the pulling chain, and a safety cable must be used.

B10SRMBO9090239



g. According to design requirements, the body structure must conform to the original design shape. If the body structure is deformed in an accident, or if the deformed parts are repaired and reused, these steel panels may fail to meet the safety performance required by the original design.

h. If any bent steel plate is found, it must be replaced.



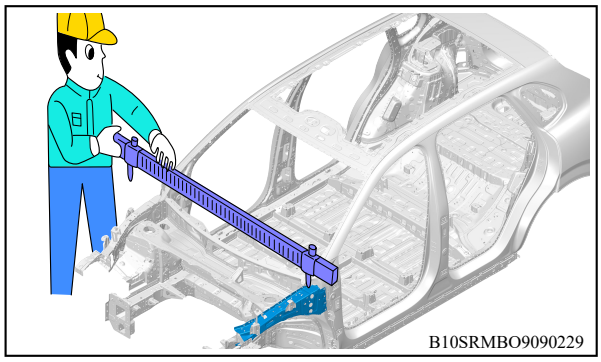
B10SRMBO9090240

i. Front door impact beams and brackets are critical components. In the event of a side impact, they can reduce the risk of injury to occupants. If the impact beam or bracket is damaged, the door assembly must be replaced.

j. Do not perform welding operations on the front door anti-collision beam.

B10SRMBO9090241

k. Do not perform pulling operations on the front door impact beam.

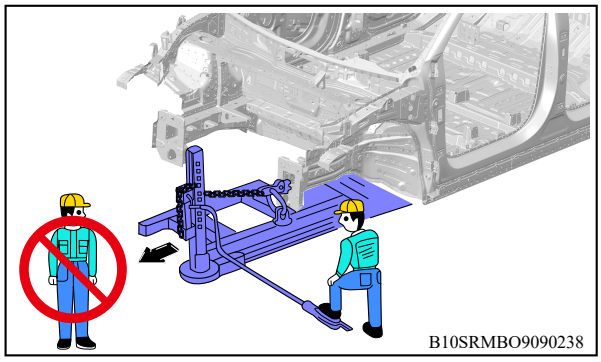


B10SRMBO9090242

l. Do not perform welding operations on the front bumper beam assembly. The front bumper beam assembly is designed to perform at its full potential only when in its original shape. If the front bumper beam assembly has been repaired, its performance will be compromised.

© 2026, All rights reserved

HOW TO MEASURE AND ALIGN THE VEHICLE BODY

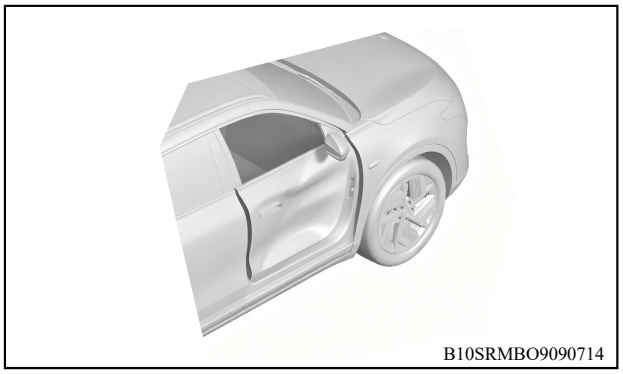


1.

a. When performing operations, please take safety precautions as required. Specific safety precautions.
SeeSheet Metal Work Protection (page 312)

b. Before performing any operations, please carefully read and comply with site safety and vehicle protection guidelines.
SeeSite Safety and Vehicle Protection (page 311)

c. Before installing the new part, dimensional measurements must be taken according to the body dimension diagram to ensure proper assembly, and after installation, verify that the assembly is proper.



d. When using the hydraulic device or pulling device of a frame rack to straighten accident-damaged vehicles, tremendous forces will be exerted on the vehicle body, which may injure others; therefore, the safety of personnel in the work area must be ensured.

e. When using a puller to pull the body or frame, never stand in line with the pulling chain, and safety cables must be used.

© 2026, All rights reserved

TYPES OF EXTERIOR PANEL DAMAGE

a. Elastic deformation damage: Refers to the deformation that can return to its original shape after the external force is removed. In sheet metal repair, the principle of elastic deformation can be utilized to first repair the dented areas that have undergone elastic deformation. When the panel deformation is relatively large, follow the repair sequence from the outside to the inside.

> **TIP**
>
> Most panel deformations involve elastic deformation, and this type of deformation damage can be repaired first during repair.
> Feature: It can return to its original shape after the external force is removed.

b. Cause of deformation: The applied external force did not exceed the elastic limit of the panel.

© 2026, All rights reserved

ANTI-CORROSION TREATMENT

Corrosion protection

- When spraying anti-corrosion materials, precautions must be taken to avoid spraying into the openings of relevant components (such as door locks, window regulator channels, and power window switches) and any moving or rotating parts, especially the parking brake cable. After spraying the material, ensure that the drain holes of the relevant components are not blocked and are free of anti-corrosion material residue.
- When performing this procedure, wear dedicated safety glasses, gloves, and safety shoes.
- When the vehicle leaves the factory, all sheet metal parts have been treated with an electrodeposition primer. After repair or part replacement, all exposed metal surfaces of the sheet metal parts must be sprayed with a rust-proof primer for corrosion protection.
- During welding operations, if the original electrodeposition coating or anti-corrosion materials on sheet metal parts are damaged, they must be cleaned and re-treated with anti-corrosion protection.
- During collision repair, bare metal is exposed. These surfaces must be repainted with specialized anti-corrosion materials.
- In addition to preventing water and dust from entering the vehicle, the sealant also provides corrosion protection. If the seal is damaged during maintenance operations, it should be corrected by resealing. The joints of newly replaced panels should be resealed.
- The sealant used must remain flexible after curing and painting. For open joints sealed with sealant, use a high-consistency filler and follow the instructions for the selected material.
- After vehicle maintenance or repair, waste materials must be collected by type.
- Sort the waste materials and check whether they can be reused.

Rust Prevention Precautions

General Requirements and Instructions for the Body Sealing and Anti-Corrosion Sealant Application Process:

- The primary function of the body sealing and anti-rust coating is to seal, prevent the infiltration of liquids and impurities, and enhance the corrosion resistance of the vehicle body.
- All welds requiring sealant are indicated by thick lines. For seams requiring sealant that are difficult to identify, cross-sectional views are used for illustration.
- The sealant must be applied continuously to cover the weld seam, ensuring the application is complete, neat, and free of any omissions.
- The performance of the sealant used must comply with the relevant material technical standards.

When applying weld seam sealant, the following precautions must be observed:

1. Follow the sheet metal seam sealer manufacturer's instructions.
2. Before applying the weld seam sealant, clean the area to be sealed with a degreaser.
3. When the sealed components are in the correct position, ensure that the sheet metal sealant is visible.
4. Ensure the sealing of the sealant application area and the aesthetics of the exposed areas.
5. Sealant applied under the floor allows for cracking that does not affect performance.

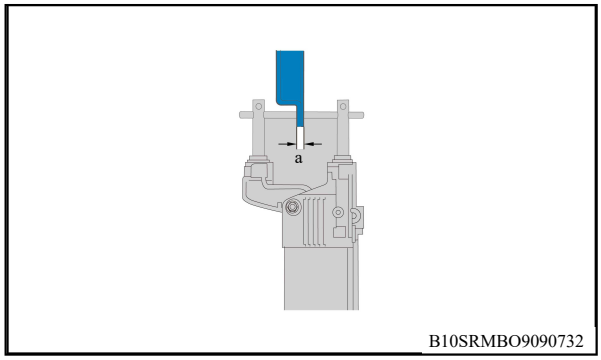
© 2026, All rights reserved

INSPECT THE QUALITY OF SHEET METAL REPAIR

Name	Solutions
Flatness Requirements	1. The highest point of the repaired surface in the straight direction must not protrude above the original surface. 2. After repair, the lowest point of the dent shall not be more than 1mm below the original surface, and the maximum area of each dent shall not exceed 5×5mm. 3. If the body filler in the work area exceeds 3mm in thickness or has quality defects, it must be removed before repair.
Circularity Requirements	1. The repaired curved surface should match the original curved surface, and after extensive repair, it should match the overall curved surface. 2. The repaired curved surface shall not have any protrusions extending above the original curved surface. 3. The area of each depression on the repaired curved surface shall not exceed 5cm × 5cm, and the lowest point shall not be more than 1mm below the original curved surface.
Surface Strength Requirements	1. When a 5 kg load is applied to any point on the repaired surface, the indentation shall not exceed 1 mm. 2. There should be no drum-shaped springback on the repaired surface.
Line Quality Requirements	1. After repair, the highest point of the line should not be higher than the original plane, 2. After repair, the lowest point of the contour should not be more than 2 mm below the original surface. 3. After repair, the maximum bending point of the line shall not deviate from the reference line by 1mm.
Edge Quality Requirements	1. After repair, the edge plane shall be flat in the vertical direction, with a maximum deformation of less than 1 mm. 2. After repair, the outer edge parallel to the plane shall not exhibit obvious bending, and the maximum deformation shall be less than 1mm. 3. After repair, the thickness of the outer edge shall be uniform, with a maximum difference of less than 1mm.
Gap Quality Requirements	1. The gap width must be the same as the original vehicle, with an error not exceeding 1 mm. 2. The width of the same gap should be consistent, and the difference between the widest and narrowest points should be less than 1 mm. 3. Both sides of the gap should be flush, with a maximum height difference of less than 1mm.
Sealing Requirements	1. Sealant should be applied to the lap joint of the sheet metal. 2. Repaired doors and windows must undergo a water tightness test, and no water or air leakage is allowed.

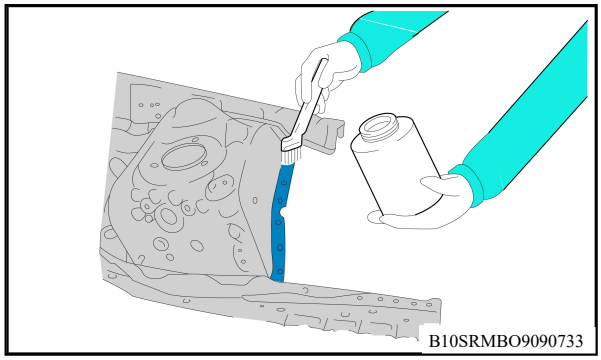
© 2026, All rights reserved

Name	Solutions
	3. After assembly, there should be no gaps at the mating surfaces of various trim parts , weatherstrips, and bonded components.
Protection Requirements for Non-Working Surfaces	1. Paint on non-working surfaces and finished painted surfaces shall not have scratches or scuffs. 2. Glass and painted surfaces must not be burned by welding slag. 3. Any excess adhesive must be completely removed after bonding.



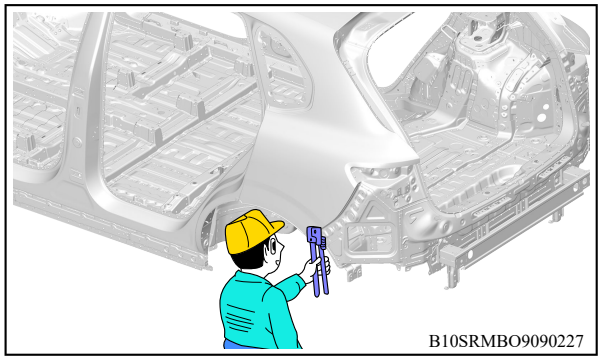
© 2026, All rights reserved

INTRODUCTION TO WELDING PROCESS



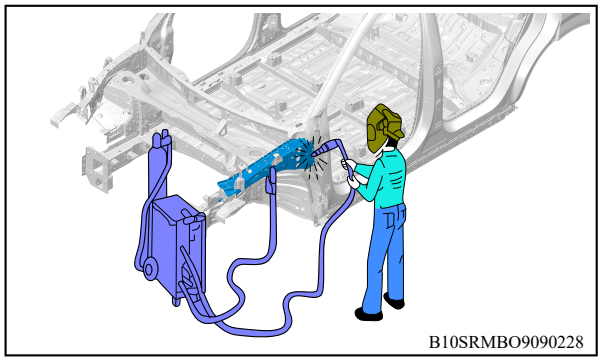
1. Important Components to Check

a. When performing operations, please take the required safety precautions.
SeeSheet Metal Work Protection (page 312)
b. Before performing any operations, please carefully read and comply with site safety and vehicle protection guidelines.
SeeSite Safety and Vehicle Protection (page 311)

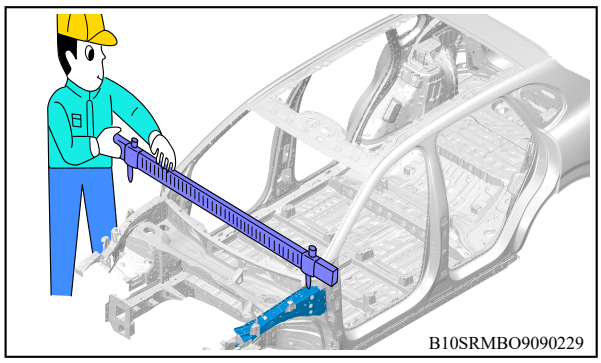


2. Spot Welding Precautions

a. In general, when the total thickness of the welded panels -a- exceeds 3mm, a MIG welder must be used for plug welding. If the total thickness of the steel plates exceeds 3mm, spot welding cannot guarantee sufficient durability.

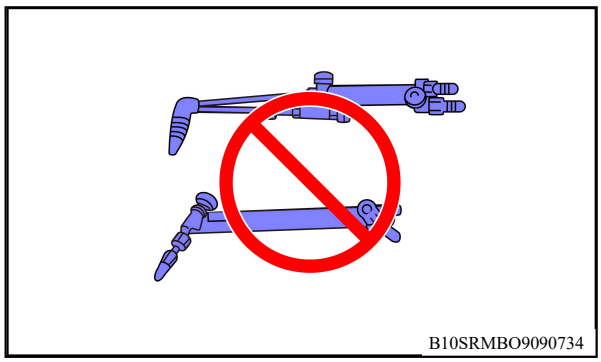


b. Remove the paint film from the new parts to be welded and the vehicle body, then apply weld-through sealant or weld-through primer, and do not apply the weld-through sealant or weld-through primer outside the contact surfaces.

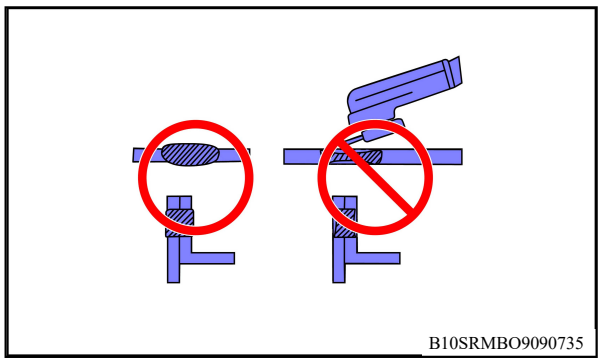


c. Use a hole punch to drill holes for plug welding, for areas where spot welding cannot be performed, use a hole punch or drill to make holes for plug welding operations.
d. Weld thickness: less than 1.0mm, plug hole size: greater than Φ5mm.
e. Weld thickness: 1.0-1.6 mm, plug hole size: greater than Φ6.5 mm.
f. Weld thickness: 1.7-2.3 mm, plug hole size: greater than Φ8 mm.
g. Weld thickness: greater than 2.4mm, plug weld hole size: greater than Φ10mm.

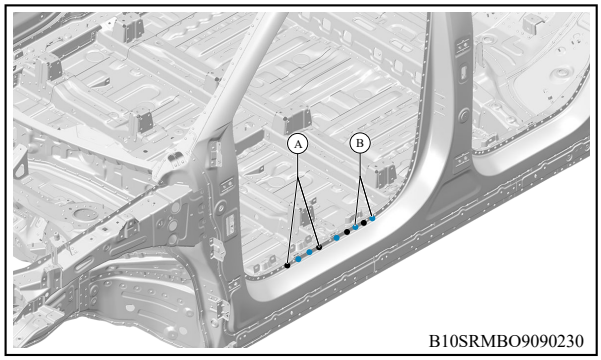
© 2026, All rights reserved



h. During welding, electronic components may be damaged by the current from the welder flowing through the vehicle body. Before starting welding, disconnect the negative battery terminal first, and establish a ground connection near the welding area on the vehicle body.

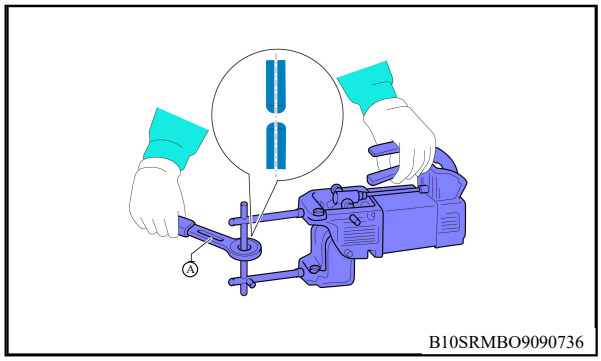


3. Installation

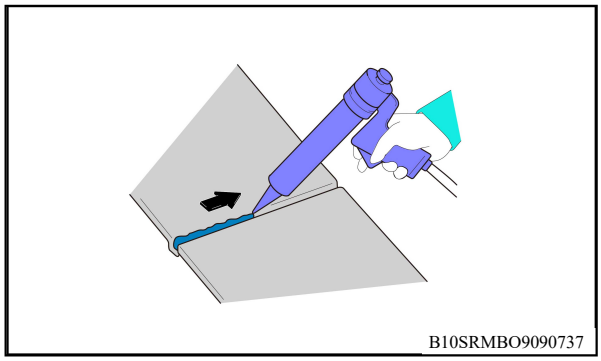


a. Before installing a new part, dimensional measurements must be taken according to the body dimension drawing to ensure correct assembly. After installation, verify that the assembly is proper.

b. Plug welding operations shall be performed using a MIG (Metal Inert Gas) welder. Gas welding or plug welding must not be used on areas of the vehicle body other than the specified locations.

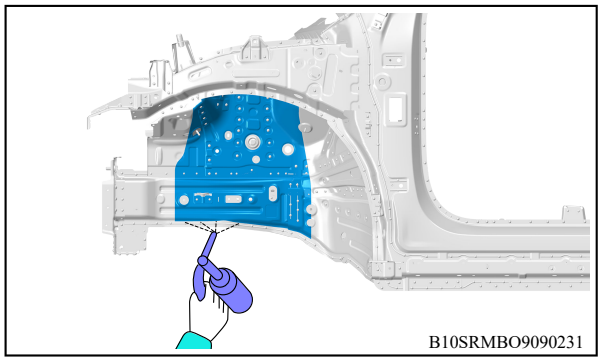


c. After welding, the weld area must be inspected to ensure a secure weld, and when using a disc grinder to grind the weld area, do not over-grind, otherwise the strength of the weld will be reduced.

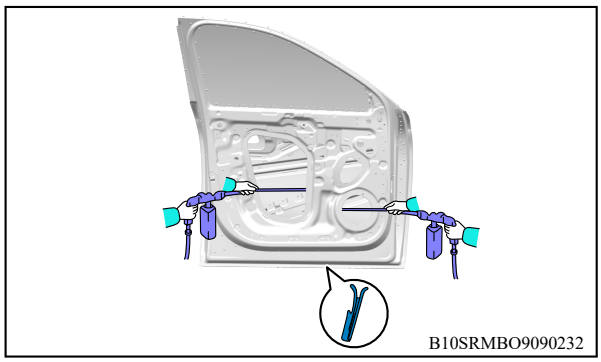


d. A: Old weld spot location, B: New weld spot location.

e. Welding precautions, the tip shape of the spot welder affects the weld strength, therefore, maintain the proper shape of the tip and allow it to cool after five or six spot welds.



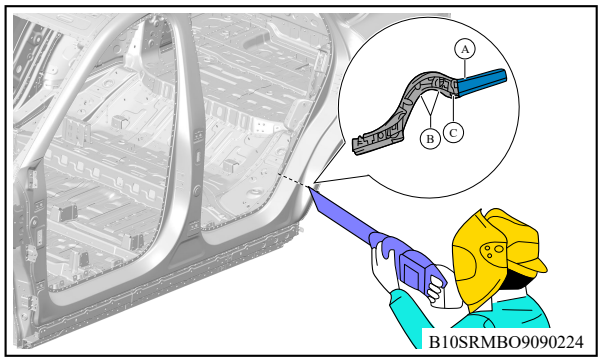
© 2026, All rights reserved



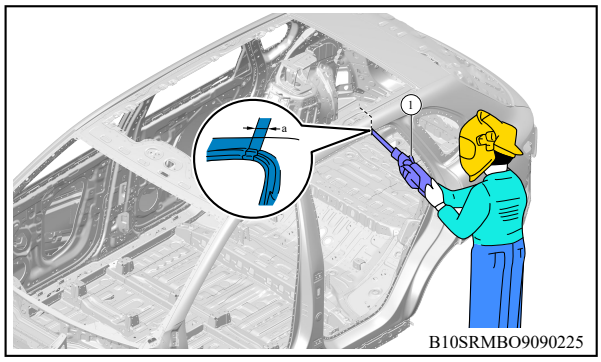
e. Completely remove the paint film from the spot welding areas, including the seams and surfaces in contact with the welding tips, and use a grinder to remove the burrs formed during the spot welding process. A: Spot welding tip scraper.

f. Rust prevention treatment (before painting) To prevent water ingress or corrosion of body panels, sheet metal sealant is applied at the seams of body panels and the edges of doors, hood assemblies, etc.

g. To prevent corrosion and protect the vehicle body from damage caused by stone impacts, be sure to apply a sufficient amount of anti-stone chip coating to the vehicle underbody and the inside of the wheel guards.

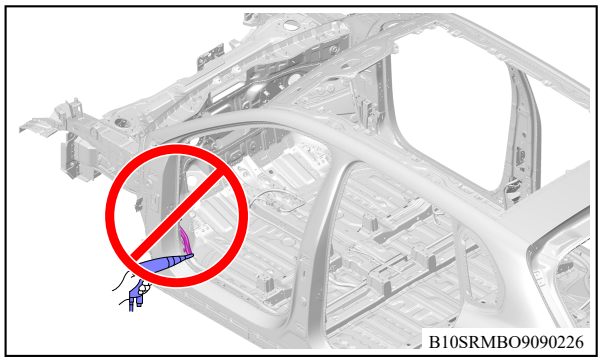


h. Rust prevention treatment (after painting): For areas difficult to spray (such as doors, hinges, and other enclosed cross-section structures), apply a sufficient amount of rust preventive agent (wax) through the inspection holes or mounting holes of the components.



© 2026, All rights reserved

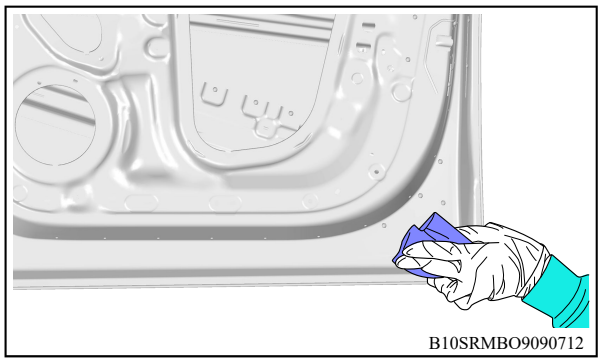
CUTTING PRINCIPLES FOR METAL PARTS



1. Cutting principles.

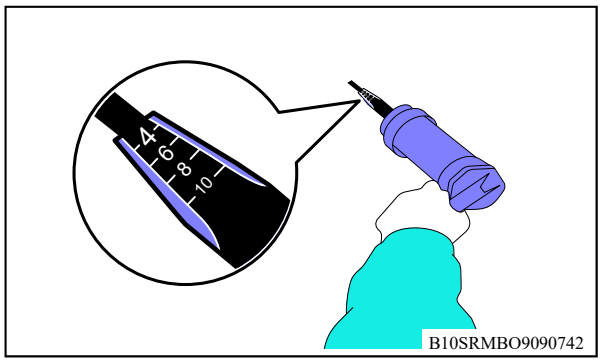
a. Cutting must be performed in a straight line, avoiding the reinforcement sections, as cutting will affect the body strength, and reliability and safety measures must be taken in accordance with the relevant specifications in the repair manual

b. Use repair tool ① to make a rough cut on the new part in the joint area, leaving an overlap of 20 to 30 mm for part -a-. When cutting the panel, be careful not to damage the surrounding panels or any panels underneath. If any panel is damaged, be sure to repair it.



c. Do not drill or cut in the wiring harness installation area.
d. Check the drilled or cut areas to ensure no hoses or wiring harnesses are damaged.

© 2026, All rights reserved



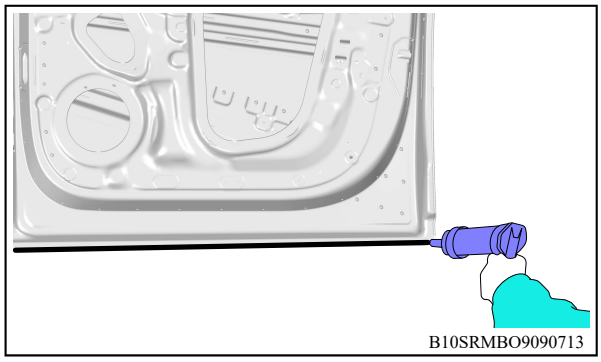
SEALANT APPLICATION SPECIFICATION

Tools and Equipment
Dovetail nozzle, sealant gun (manual or pneumatic), spatula, sealant (TEROSONPV 3558).
Application Location
Sheet metal mating surfaces, weld seam sealing, roof seams, wheelhouse seams, body floor, front engine compartment, door edges, hood assembly, and other sheet metal joints.

1. Operating Specifications

B10SRMBO9090712

a. Inspect and grind the sealing surfaces of sheet metal weld seams, and remove burrs and residues.
b. Use a sheet metal cleaner to wipe along the sheet metal welds, thoroughly cleaning the sealing surface to ensure it is clean and free of oil and grease.

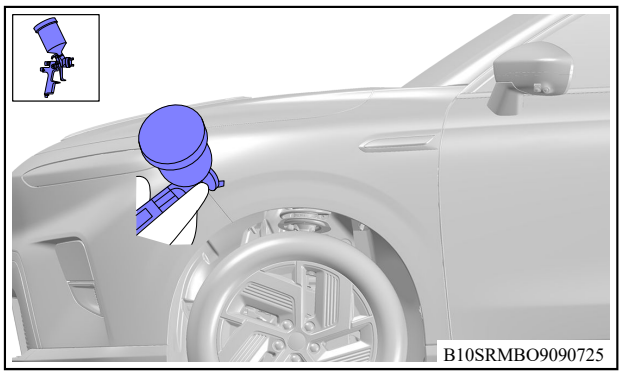


B10SRMBO9090742

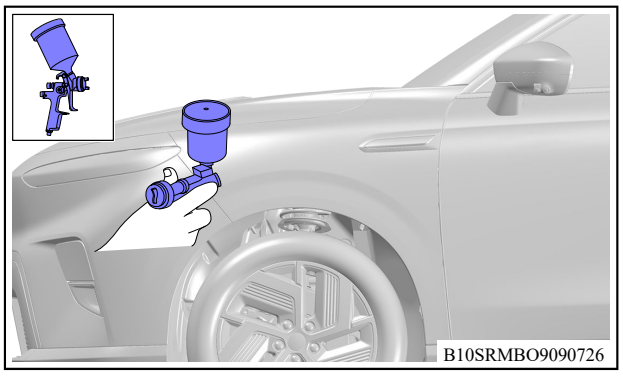
c. Select the width and positioning scale of the special dovetail sealant nozzle according to the width of the sheet metal parts and the weld edge, and cut it with a blade. Ensure the cut is flat and free of burrs.
d. Load the sealant (TEROSONPV 3558) into the sealant gun, adjust the nozzle angle to 75°, dispense a small amount of sealant, and observe its appearance and shape. It should form a uniform strip without any abnormalities (no visible bubbles or particles).

> **NOTE**
>
> When applying the sealant, you will feel slight resistance, and you can also familiarize yourself with and adapt to the tool pressure in advance.

© 2026, All rights reserved



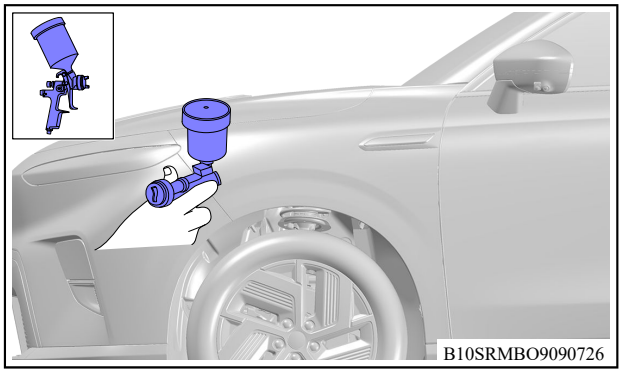
e. Carefully inspect the sheet metal parts to be worked on, and after confirming no abnormalities, start the sealant application. When applying the sealant, it is recommended to hold the nozzle at a 75° angle to the sheet metal surface and move it at a constant speed, keeping your hand steady and using the pull-bead technique to extrude the sealant to ensure a consistent sealant bead.
f. After the sealant application is completed, smooth the sealant joints to ensure proper bonding and overall appearance, and upon completion, use a cleaning cloth to wipe the edges of the joints clean.
g. After curing at room temperature for 2 hours, perform the paint spraying operation.



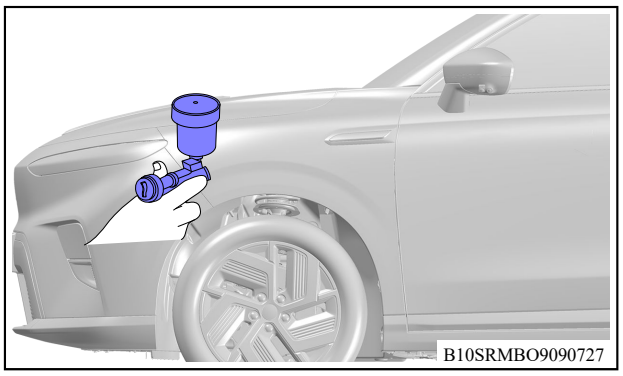
© 2026, All rights reserved

PAINT REPAIR

HOW TO SPRAY PAINT



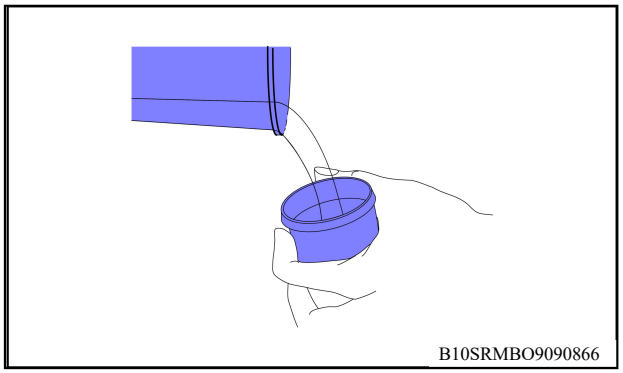
a. Set the air pressure to (150~200) kPa/ (21.8~29.0) psi, and the spraying distance to (20~30) cm/(7.87~ 11.81) in.



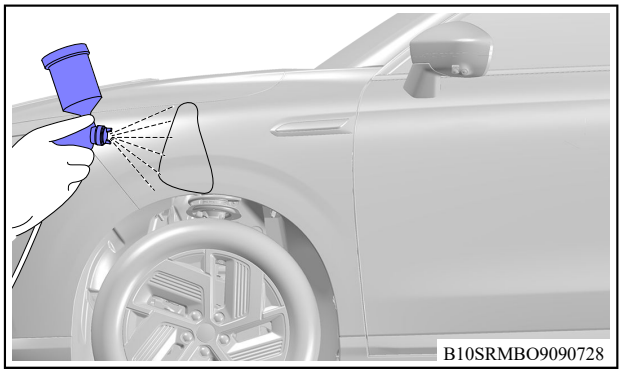
b. After air-drying for (2-3) min, spray the second coat of basecoat until the interface is no longer obvious.

> **NOTE**
>
> The air pressure is set to (150-200) kPa/ (21.8-29.0) psi, and the spray distance is (20-30) cm/(7.87-11.81) in.

c. Spray the clear coat, ensuring the spray area completely covers the base coat area.



> **NOTE**
>
> Set the air pressure to (150~200) kPa/ (21.8~29.0) psi, and the spray distance to (20~30) cm/(7.87~11.81) in.



d. Flash dry for (2-3) min, spray the second coat of clearcoat, ensuring the spray area completely covers the first clearcoat layer.

> **NOTE**
>
> The air pressure is set to (150-200) kPa/ (21.8-29.0) psi, and the spray distance is (20-30) cm/(7.87-11.81) in.

© 2026, All rights reserved

e. After spraying the clear coat, immediately add a blending additive or thinner to the original clear coat.

f. Spray (2-3) coats of thinned clear coat at the interface.

© 2026, All rights reserved

HOW TO SPRAY BODY FILLER

TIP

When performing operations, please ensure proper safety protection as required. For safety precautions, refer to "Spray Protection Tools".

When performing operations, please carefully read and comply with site safety and vehicle protection requirements.

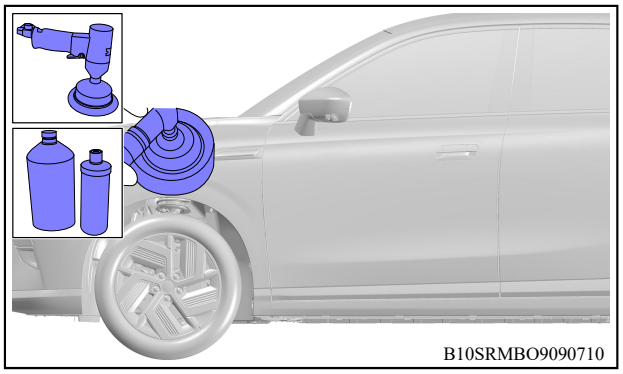
a. Stir the body filler.
b. When stirring, do not let the body filler adhere to the edge of the can, if it adheres, clean it with a solvent.
c. While stirring the body filler, move the stirring stick up and down.

d. Follow the manufacturer's instructions regarding the mixing ratio, and place the appropriate amounts of body filler and hardener separately on a clean mixing board, ensuring that they do not come into direct contact with each other.
e. While stirring the body filler, move the stirring stick up and down.
f. Use the edge of the scraper to pick up the hardener, then stir in a circular motion with the scraper until the mixing ratio of the hardener and body filler reaches 70% to 80%.
g. Scoop up about half of the body filler, spread it onto the remaining body filler, then press the body filler to flatten it, and mix until the color is uniform.

h. Apply a thin coat of body filler: Apply a thin layer of body filler on the epoxy primer-coated area to fill minor scratches or dents caused by welding.
i. Applying body filler: Apply the body filler in thin layers and in multiple coats. The applied height must be higher than the undamaged reference surface.
j. Press the putty knife against the steel panel to thin out the surrounding body filler layer, and

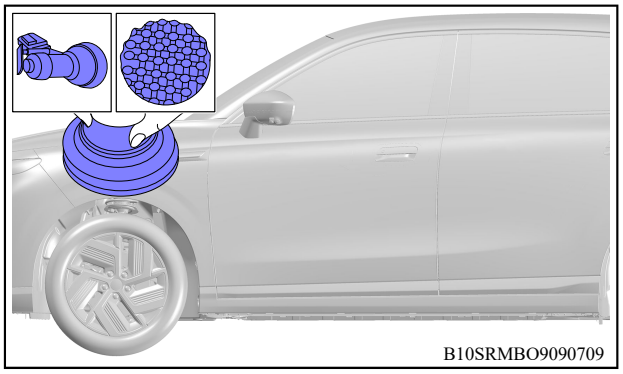
© 2026, All rights reserved

move the putty knife along the contour of the featheredge.



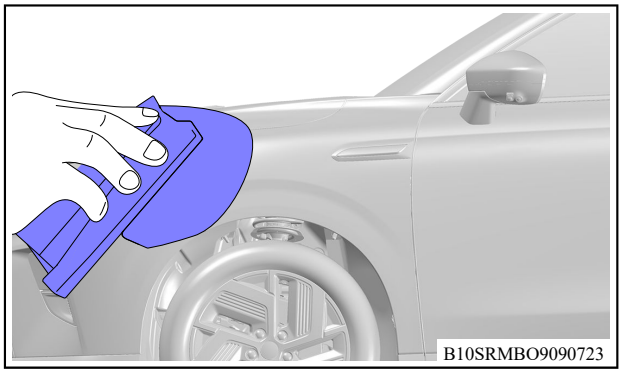
k. Trimming body filler: Trim all steps along the edges of the body filler, and remove all body filler that has spread beyond the sanded area.
l. Operation Instructions: Ensure there is no step between the body filler application area and the old coating.
m. Drying body filler: Force-dry the body filler to ensure it is ready for sanding.
n. Place the sandpaper on areas with a thinner coating. While sanding, observe whether the body filler turns into powder to determine if the body filler is dry.
o. Coarse sanding of body filler: Use 80- or 120-grit sandpaper to sand the rough body filler area to create a relatively smooth surface, ensuring that the body filler surface is free of steps, large depressions, and protrusions.

B10SRMBO9090747



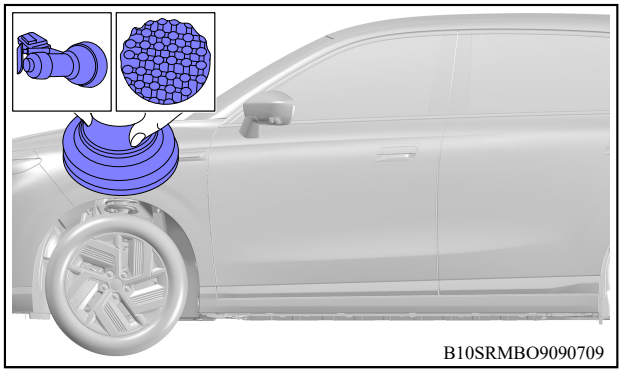
p. Fine sanding of body filler: Apply carbon powder to the surface of the body filler, then use a sanding block or sander equipped with 180-grit sandpaper to sand the body filler surface to 80% surface flatness, creating a natural and smooth transition between the old coating and the body filler application surface..

© 2026, All rights reserved



HOW TO POLISH

1. Use 2000-grit wet sandpaper to sand the damaged paint surface. Keep the sandpaper parallel to and in close contact with the surface to be sanded, and sand in a circular motion.



2.Apply an appropriate amount of polish to the paint surface to be polished, and adjust the speed of the polisher.

3. After attaching the wool polishing pad to the painted surface, turn on the machine, with a rotational speed of (2500-3000) r/min.

NOTE

Keep the machine moving smoothly and gently, avoid excessive grinding, and keep the grinding time as short as possible (3-5s) and the grinding area as small as possible.

4. First, thoroughly wet the foam polishing pad, squeeze out excess water, apply a small amount of polishing wax to the paint surface to be polished, place the foam pad against the paint surface before turning on the machine, set the speed to (2500-3000) r/min, and then apply light pressure for (3-5s) to perform the glazing process.

NOTE

During operation, keep the machine steady and move it gently. Avoid prolonged operation to prevent overheating, which may scorch the paint surface.

© 2026, All rights reserved

5.Wipe off the excess wax with a cleaning cloth.

© 2026, All rights reserved

HOW TO DRY

1. When performing operations, please take the required safety precautions.
   SeeProtection for Spray Painting Operations (page 315)
2. Before performing any operations, please carefully read and comply with site safety and vehicle protection guidelines.
   SeeSite Safety and Vehicle Protection (page 311)
3. The purpose of drying in vehicle paint repair operations.
   - Forms a hard protective layer: Through the drying and curing process, the solvents in the automotive paint evaporate, and the resin components in the coating cross-link or polymerize to form a hard, cohesive protective layer. This protective film can effectively prevent corrosion, UV damage, physical wear, and chemical erosion, protecting the vehicle body metal from environmental damage.
   - Enhancing aesthetics: During the drying process, the paint surface becomes smoother and flatter, with enhanced gloss and color saturation, making the vehicle's exterior more elegant and enhancing the overall aesthetics.
   - Enhanced adhesion: A proper drying process ensures good adhesion between the paint layers and the substrate, as well as between the paint layers themselves, preventing peeling or blistering of the paint surface.
   - Shorten the construction cycle: By accelerating the drying process, the time for the entire painting operation can be shortened, thereby improving work efficiency.
   - Reduce defects: Proper drying and curing prevents paint defects caused by improper drying, such as sagging, orange peel, pinholes, and cracks, ensuring paint finish quality.
   - Stability and Durability: A fully dried paint film exhibits superior physical properties and chemical stability, maintaining its appearance and protective performance over a long period, thereby extending the lifespan of the vehicle paint.
4. Air dry.
   - The environment must be kept dry, clean, and dust-free. After application, the panels are placed in the workshop environment to air-dry naturally. The drying time varies depending on the ambient environment and temperature.
5. Forced drying.
   - Use auxiliary drying equipment to accelerate the drying process. Allow sufficient curing time before drying; otherwise, pinhole defects may occur.
6. Common methods.

Drying in a paint booth: Use heating lamps to dry the paint finish.
Short-wave infrared lamps heat quickly and are easy to use, but the heating area is affected by the radiation range of the lamp.
After spraying is completed, the vehicle must be ventilated and left to stand in the bake booth for 10–20 minutes, and then dried at 60°C for about 30 minutes to force-dry the paint surface.
When spraying or touching up small painted areas, a heat lamp can be used for forced drying once the paint film surface is dry to the touch and dust-free.

© 2026, All rights reserved

COMMON ISSUES AND SOLUTIONS

Name	Cause	Solutions
Chalking	1. The paint film is severely degraded, such as by intense ultraviolet radiation. 2. The paint mixing ratio is incorrect during application. 3. Poor light and weather resistance of the coating. 4. The vehicle is not washed frequently or thoroughly. 5. The selected car cleaning agent is unsuitable, or the polishing wax is too coarse.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Spot paint repair.[√]
Paint peeling on plastic parts	1. Poor adhesion between the coating and the substrate, or the topcoat is too hard relative to the undercoat. 2. If the coating film is too thick, the paint film may be eroded by moisture, acidic substances, or alkaline substances in the air. 3. Poor recoatability or improper treatment of the undercoat; defects such as pinholes and strike-through in the topcoat.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Spot paint repair.[√]
Cracking	1. The primer paint was not thoroughly stirred before spraying. 2. The topcoat has been applied too thickly. 3. The intermediate coat is sprayed too thick.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep grinding, polishing, and refinishing treatment. [√] 4. Spot paint repair. [ ]
Bird Dropping Etching	1. Corrosion from bird droppings.	1. Polishing and detailing treatment (mild abrasion). [√] 2. Routine compounding and polishing detailing treatment (moderate abrasion). [√] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Spot paint repair (severe corrosion). [√]
Scuff marks	1. Low paint film hardness. 2. Scratched by hard objects.	1. Polishing and detailing treatment (minor scratches).[√] 2. Routine compounding and polishing detailing (coarse scratches). [√] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Spot paint touch-up (scratched). [√]

© 2026, All rights reserved

Name	Cause	Solutions
Corrosion	1. The paint film is relatively thin at the edges. 2. Chips and scratches lead to corrosion. 3. Corrosion by acidic or alkaline substances.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Touch-up painting (for severe rust, sheet metal repair is required before touch-up painting).[√]
Paint peeling	1. Poor adhesion between the coating and the substrate, or the topcoat is too hard relative to the undercoat. 2. If the coating film is too thick, the paint film may be eroded by moisture, acidic substances, or alkaline substances in the air. 3. Poor recoatability of the undercoat or improper treatment. 4. The topcoat has defects such as pinholes and exposed substrate.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Touch-up painting (for severe rust, sheet metal repair is required before touch-up painting).[√]
Blistering	1. This is caused by prolonged exposure of the paint film to a humid environment, allowing moisture to penetrate the paint film, and as the temperature rises, the moisture vapor expands and forms blisters. 2. The substrate is corroded by penetrating substances. 3. The paint film is attacked by acidic or alkaline substances.	1. Polishing and detailing treatment.[ ] 2. Routine compounding and polishing detailing treatment.[ ] 3. Deep compounding, polishing, and refinishing treatment.[ ] 4. Touch-up painting (for severe rust, sheet metal repair is required before touch-up painting).[√]

NOTE

A checkmark in parentheses in the table indicates the remedy for this type of defect.

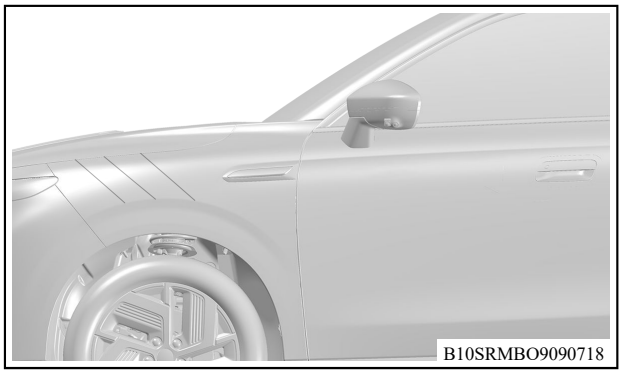
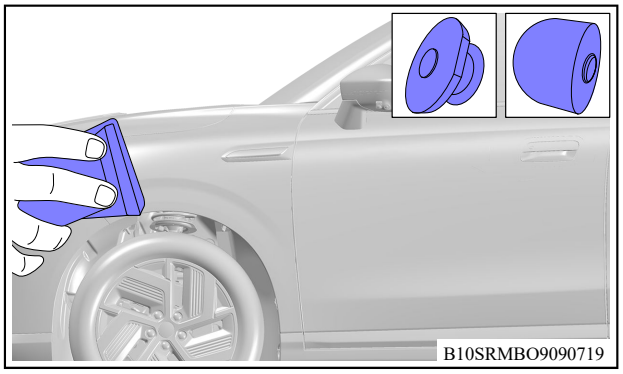
HOW TO MASK

1. Apply protective masking to the areas of the vehicle not being painted according to the requirements of painting operations.
   a. When masking, different materials should be selected according to different operational requirements.
   b. Masking operations must be standardized and rigorous to avoid damage or loosening after masking.
   c. The occlusion boundary requires special attention during operation.
   d. When performing operations, please take safety precautions as required. Specific safety precautions SeeProtection for Spray Painting Operations (page 315)
   e. Before performing any operations, please carefully read and comply with site safety and vehicle protection requirements.
   SeeSite Safety and Vehicle Protection (page 311)
2. Masking is required before painting to prevent overspray from adhering to unpainted areas such as glass and tires. This section describes the main masking methods used before applying the primer surfacer and topcoat.
3. Masking Method
   a. Before painting operations, mask the openings left after removing body components from the inside or outside to prevent paint from entering the vehicle interior through the openings.
   b. After masking, ensure that the masking tape will not be peeled off by air pressure.
   c. After masking, ensure that paint overspray does not enter the openings.
   d. Masking tape can be applied from either the inside or the outside.
   e. Masking the interior of body openings: Attach the masking material to the inside of the opening, ensuring that the masking tape can withstand the external air pressure.
   f. Masking the exterior of body openings: Attach the masking material to the outside of the opening, ensuring the masking material is applied tightly and securely.
4. Masking gaps
   a. Before painting operations, effectively mask the gaps between body steel panels. During the masking process, select appropriate masking materials according to the specific conditions and ensure the masking quality.
   b. When using gap tape, ensure there are no gaps between the tape and the steel panel. Pay special attention to the upper and lower edges when masking the front and rear door gaps. After masking, ensure that the spray paint mist will not enter the openings.
   c. Use masking paper to mask the gaps: First, clean the gaps to ensure a firm bond.
   d. Before masking the trim, ensure that the moisture in the gaps has been completely removed, cut the masking paper to an appropriate length, apply it respectively along the front door weatherstrip and the rear door edge step, ensure that the edges are properly masked, and pay attention to the treatment of the gap edges during the masking process.
5. Masking assembly
   a. Mask non-removable assemblies to ensure that paint does not adhere to the assemblies.
   b. Leave a gap equal to the coating thickness between the steel plate surface and the masking tape.
   c. When applying masking tape to curved areas, do not stretch the tape.
   d. Finally, use masking tape to mask the edges of the assembly.
6. Glass masking protective strip
   a. To maintain a gap between the glass weatherstrip and the steel plate, insert window edge masking tape between them and pull it backward, which will pull the weatherstrip away from the steel plate.
   b. For curved areas, make several notches in the tape with scissors before applying the window edge masking tape, bend the window edge tape along the edge, and use additional tape to patch any gaps.



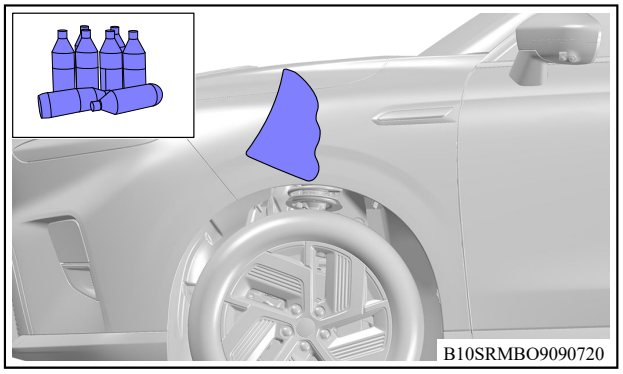
© 2026, All rights reserved

c. After the painting is completed and dried, remove the window edge masking tape while it is still warm, allowing the edge sealing rubber strip to return to its original shape.

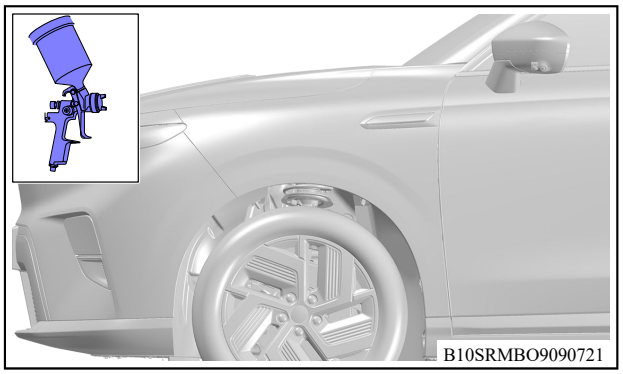


7. Reverse masking method
   a. It refers to folding back the masking paper during application, and the purpose of this method is to minimize the step marks caused by spraying.
   b. If there is a body crease in this area, reverse masking can be applied along the body crease.
   c. It is difficult to clean and degrease after reverse masking, so degreasing and cleaning preparations should be completed before masking.
   d. Use the reverse masking method before spraying the primer surfacer.

© 2026, All rights reserved

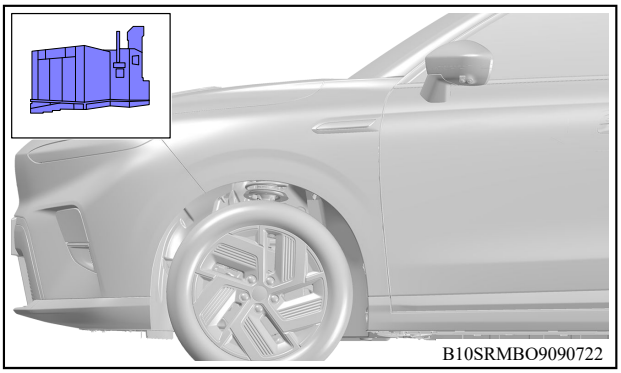


QUICK PAINT REPAIR

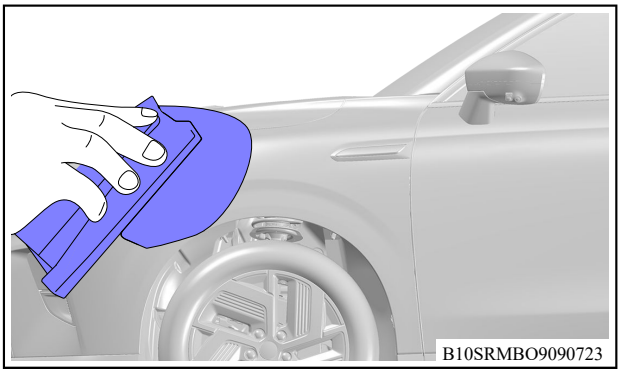


a. The scratches on the fender are relatively severe, and the spot painting (touch-up) process is adopted.

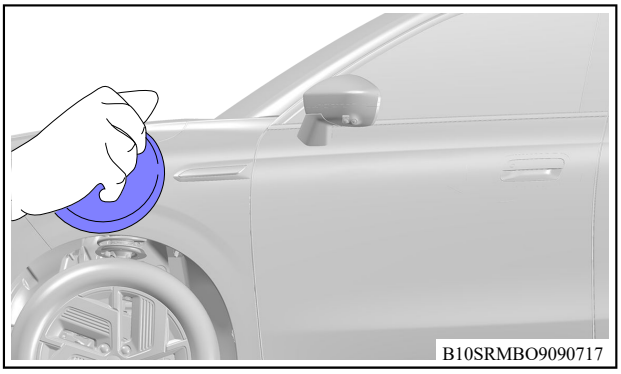
b. Use P500# wet sandpaper to sand the damaged paint surface (circular sanding).



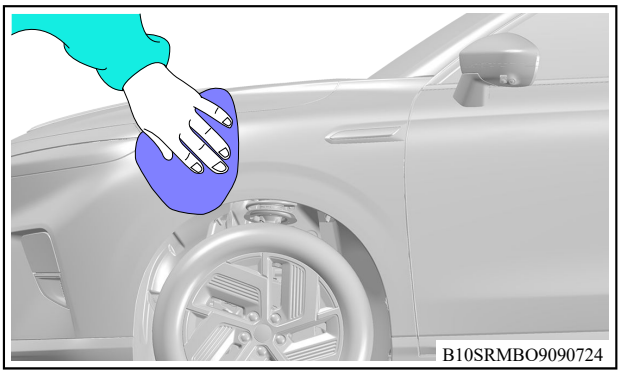
c. After grinding, degrease and clean using a degreaser.



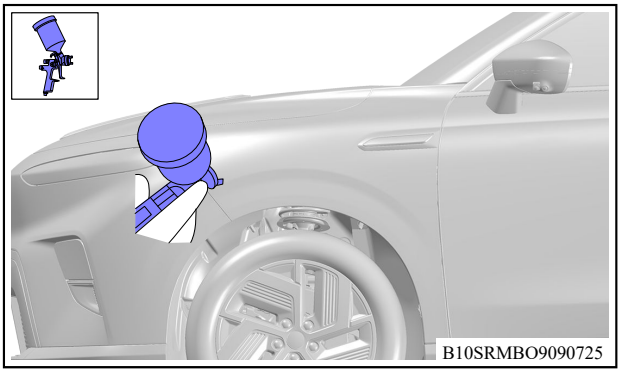
d. When spraying the primer surfacer, try to control the spray area of the primer as much as possible. The coating at the edges should be feathered gradually, avoiding a stepped appearance.



© 2026, All rights reserved

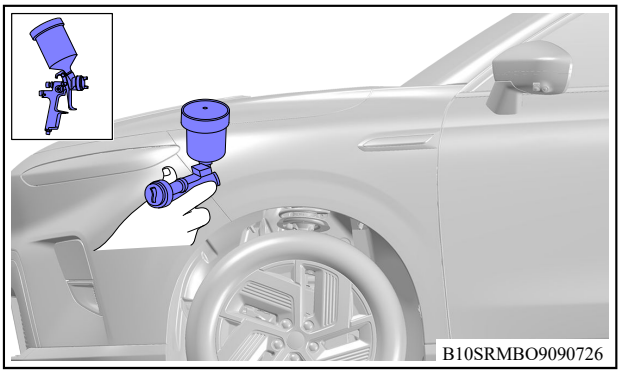


e. Flash dry for (4-5) min, then dry, and bake for (20-30) min.
f. The paint booth temperature is set to (70~80)°C/(158~176)°F.

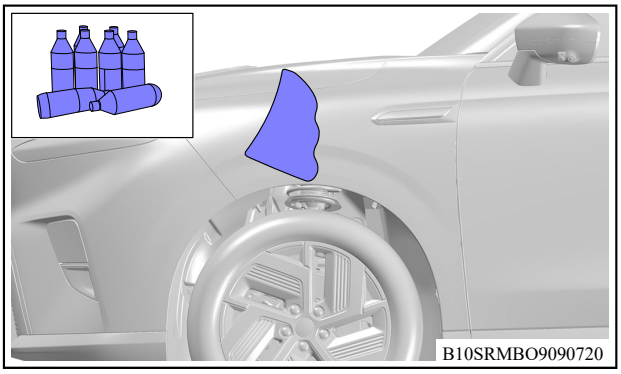


g. After drying, perform wet sanding with (P800~1000)# sandpaper.

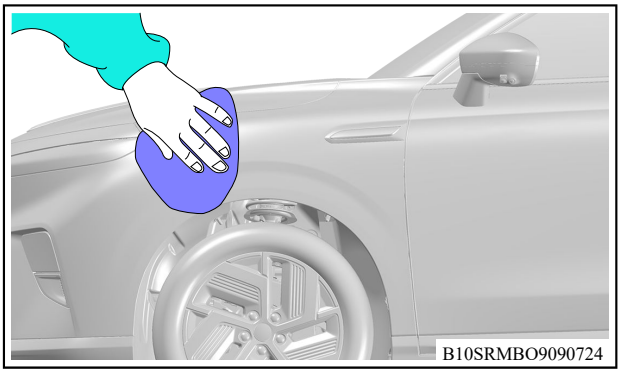
h. Use P2000# fine (wet) sandpaper for sanding, and expand the sanding area.



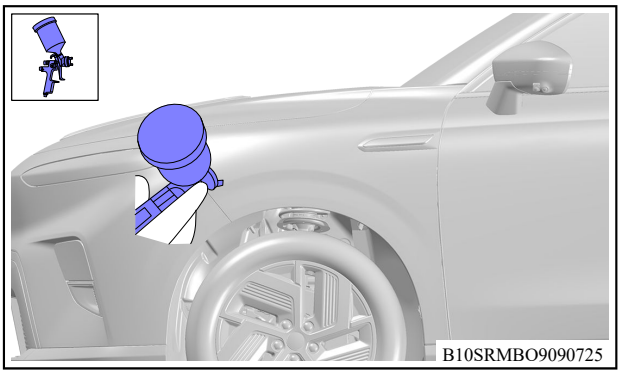
i. After sanding, use a tack cloth to remove dust before painting.



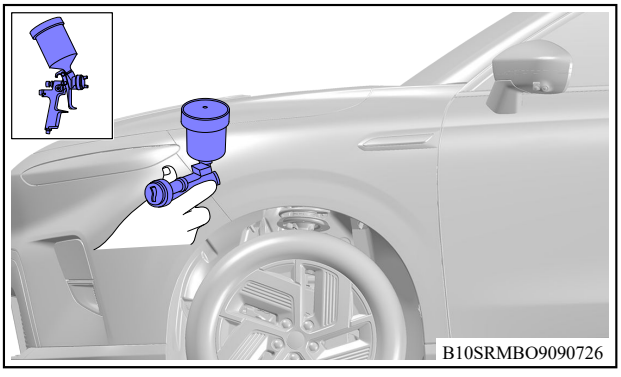
j. Spray the basecoat with the air pressure set to (150-200) kPa/(21.8-29.0) psi and a spray distance of (20-30) cm/(7.87-11.81) in.



© 2026, All rights reserved

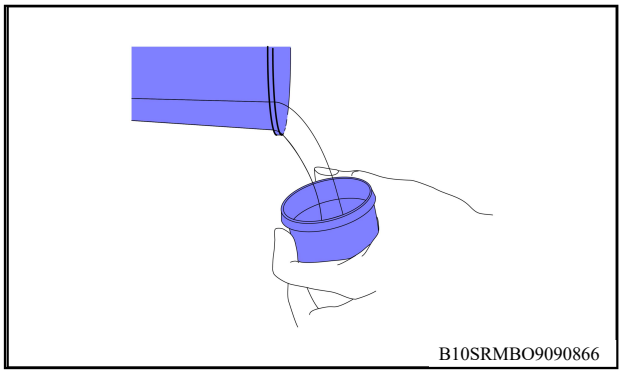


k. After air-drying for (2-3) min, spray the second coat of basecoat until the interface is no longer obvious.
l. The air pressure is set to (150-200) kPa/(21.8-29.0) psi, and the spray distance is (20-30) cm/(7.87-11.81) in.

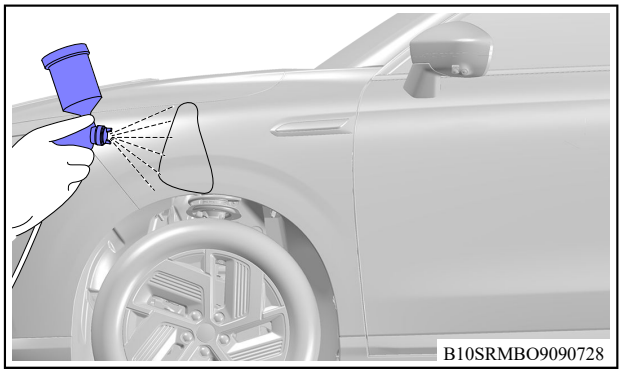


m.Flash dry for (4-5) min, then dry for (20-30) min.
n. The paint booth temperature is set to (70~80)°C/(158~176)°F.

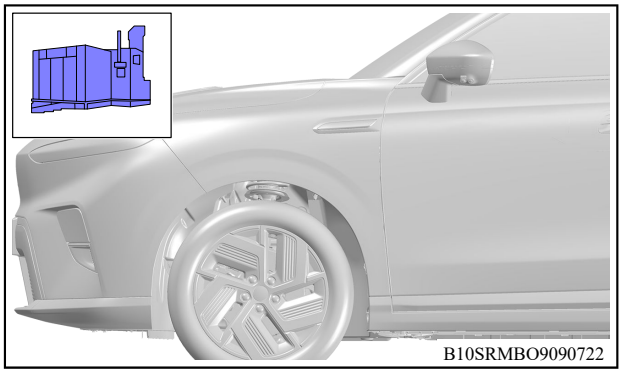
o. After drying, use a tack cloth to remove dust before spraying the clear coat.



p. Spray the clear coat, ensuring the spray area completely covers the base coat area.
q. Set the air pressure to (150~200) kPa/(21.8~29.0) psi, and the spray distance to (20~30) cm/(7.87~11.81) in.



r. Flash dry for (2-3) min, spray the second coat of clearcoat, ensuring the spray area completely covers the first clearcoat layer.
s. The air pressure is set to (150-200) kPa/(21.8-29.0) psi, and the spray distance is (20-30) cm/(7.87-11.81) in.



© 2026, All rights reserved

t. After spraying the clear coat, immediately add a blending additive or thinner to the original clear coat.

u. Spray (2-3) coats of thinned clear coat at the interface.

v. Bake in the paint booth for (20-30) min, with the paint booth temperature set to (70-80)℃/(158-176)℉.

© 2026, All rights reserved

DAILY PAINT SURFACE MAINTENANCE

When performing routine paint surface maintenance, please follow the following principles:

1. During vehicle maintenance and repair, take care not to touch the vehicle body paint surface with dirty, oily hands or wipe the paint surface with oily rags, do not place tools with oil stains or rags containing organic solvents on the vehicle body, and if any are found, wipe them clean immediately.
2. If severe scratches, dents, or paint chipping are found on the paint surface, they should be repaired promptly.
3. Promptly remove highly corrosive stains (such as tar, bird droppings, insects, etc.).
4. Promptly remove dust from the vehicle body before use to minimize dust attraction caused by static electricity.
5. Rinse the vehicle promptly after rain. Rain stains on the vehicle body will gradually shrink, and the concentration of acidic substances in the rainwater will gradually increase. If the rain stains are not rinsed off with clean water promptly, they will damage the topcoat over time.
6. When washing the vehicle, wait until the vehicle body has cooled down. Do not wash the vehicle under direct sunlight or at high temperatures.
7. Wax the paint surface as needed for protection, and regularly (once a quarter) visit an after-sales service store for maintenance to promptly restore the brilliant gloss of the vehicle's paint finish.

- Avoid washing the vehicle in direct sunlight.
- Do not use brushes or brooms to remove snow or ice from the vehicle body.
- Avoid using harsh soaps or chemical detergents containing acid or alkali.
- After a thorough wash, immediately wipe away any remaining rinse water to prevent it from drying on the surface. It is recommended to use a soft towel for drying.
- Only polish the vehicle when it is confirmed that the defects on the clear coat surface can be removed by polishing. If the defects are not severe, the polishing area should be minimized. Avoid removing excessive clear coat, otherwise it will cause premature damage to the clear coat.
- Strictly use the electric polishing equipment in accordance with the manufacturer's recommendations. Do not use wax or silicone-based products to cover up swirl marks (as the marks will reappear shortly, leading to customer dissatisfaction).

Please note the following points during preparation:

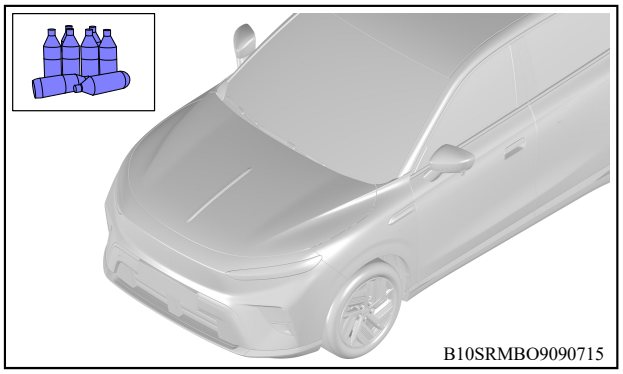
- Always use products provided by the brand manufacturer. Do not mix products from different brands.
- Color masterbatch must be stored and mixed in plastic containers free of mold release agents.
- The prepared colorant must be thoroughly stirred before use.
- The paint color must be determined using the method of color matching with sprayed test panels.
- Test panels for spray painting must be made of aluminum sheets or primed steel sheets with fully wrapped edges.
- Keep the electronic scale clean and avoid placing it in areas prone to vibration or airflow interference.

Do not mix paint systems or substitute products from different manufacturers. Mixing incompatible products will result in the following phenomena:

- The primer layer is peeling off.
- Poor intercoat adhesion.
- Opaque after curing.
- Reduce gloss.

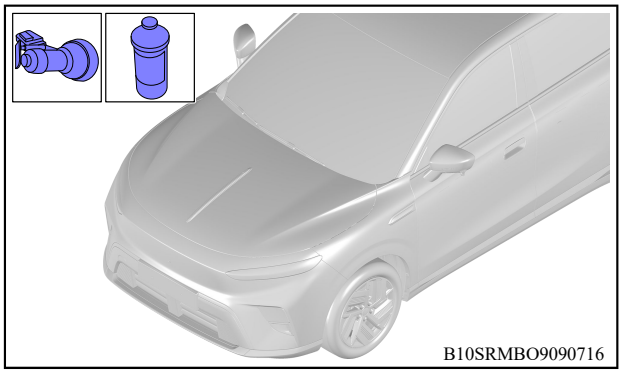
© 2026, All rights reserved

- Poor color accuracy.
- Coating damage (pitting, blistering, orange peel, loss of gloss).



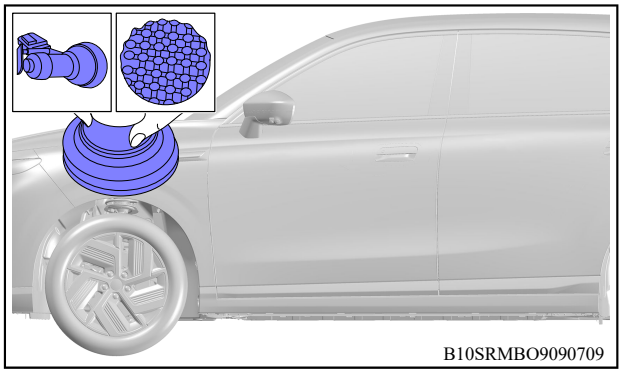
© 2026, All rights reserved

INSPECT PAINT REPAIR QUALITY



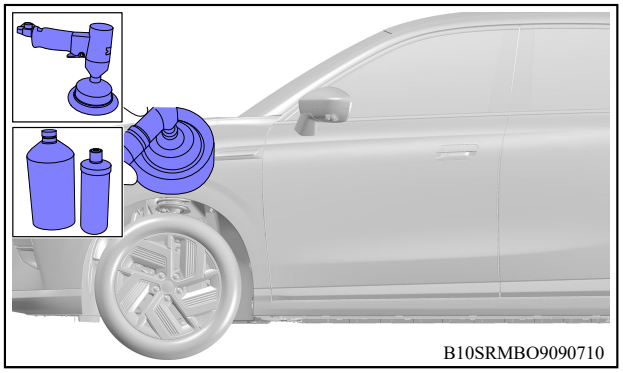
1. Flatness.
   - The surface should feel smooth to the touch, with no uneven areas visible when viewed from the front, and no unevenness apparent from any angle outdoors.
   - Lines should be straight and smooth; wavy or uneven surfaces are not allowed.
2. Paint surface quality.
   - The paint surface must be smooth, and defects such as runs, fisheyes, and bubbles are not allowed.
   - When observed from a distance of one meter, no defects such as dust spots or pinholes should be visible.
3. Color quality.
   - During full vehicle refurbishment, the color must be consistent, and there shall be no color difference.
   - Touch-up paint must match the color of adjacent parts, the color should appear consistent when viewed from within one meter, and no noticeable color difference should be visible when observed from a distance or multiple angles.
4. Paint film brightness.
   - The gloss of the paint surface should be rich and full, and the reflection should be consistent. A hazy appearance or uneven paint film texture is not allowed.
   - Unless otherwise specified, the solid paint surface shall not exhibit noticeable orange peel.
5. Basecoat quality.
   - The particle size, density, and reflectivity of the metallic paint must match the original paint finish.
   - Sanding marks shall not be visible on the basecoat.
6. Paint quality on the inner side of panels.
   - Before sheet metal assembly, inspect the inner surface, and the paint must match the original vehicle.
   - The paint finish on uncovered surfaces inside the cabin and trunk is the same as the exterior.
   - For covered areas in the interior and trunk, putty application and sanding are performed, and the paint finish requirements may be slightly lower than those for exterior surfaces.
   - For refurbished vehicles, wheel covers, wiper arms, washer nozzles, door handles, and other components must all be painted, and both the interior and exterior of the chassis must be painted.
7. Color bar quality.
   - The color stripes must be applied correctly, and the deviation shall not exceed 1 mm.
   - The color stripes must be straight, and no waviness is allowed.
   - No visible bubbles are allowed in the color stripes, the bubble diameter shall not exceed 1mm, and no more than 2 bubbles are allowed per color stripe.
8. Protection of unmachined surfaces.
   - Sandpaper marks are not allowed on electroplated and glass surfaces.
   - Unpainted surfaces must not exhibit scratches, paint overspray, or similar defects.
   - Exhaust pipes, trim panels, and weatherstrips must not be painted.
9. Cleaning quality.
   - Before handing over for sheet metal assembly, all sand, mud, and standing water inside the vehicle must be thoroughly cleaned.
   - During in-process inspection, the painted surface must be clean and free of dust, water droplets, residual wax, etc.
   - During final inspection, the entire vehicle interior and exterior must be clean.

© 2026, All rights reserved



MAINTENANCE PROCESS

1.Before polishing, clean the surface to be polished thoroughly with a degreaser.



2.Apply an appropriate amount of polish to the paint surface to be polished, and adjust the speed of the polisher.

3. After attaching the wool polishing pad to the painted surface, turn on the machine, with a rotational speed of (2500-3000) r/min.

NOTE

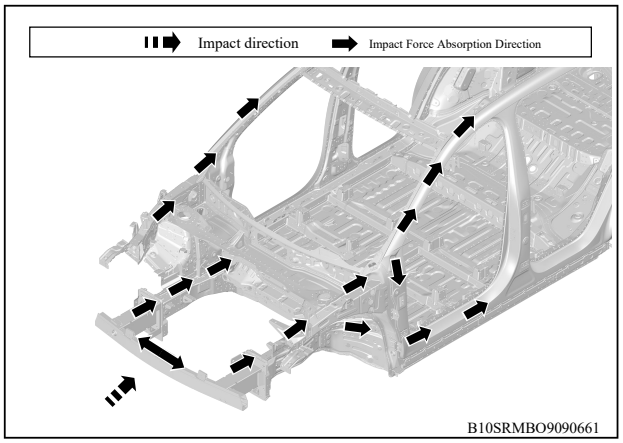
Keep the machine moving smoothly and gently. Avoid excessive grinding, and ensure the grinding time is as short as possible and the grinding area is as small as possible.

4. First, thoroughly wet the foam polishing pad, squeeze out excess water, apply a small amount of polishing wax to the paint surface to be polished, place the foam polishing pad against the paint surface before turning on the machine, set the speed to (2500-3000) r/min, and then apply light pressure for (3-5s) to perform the polishing process.

NOTE

During operation, keep the machine steady and move it gently. Avoid prolonged

© 2026, All rights reserved

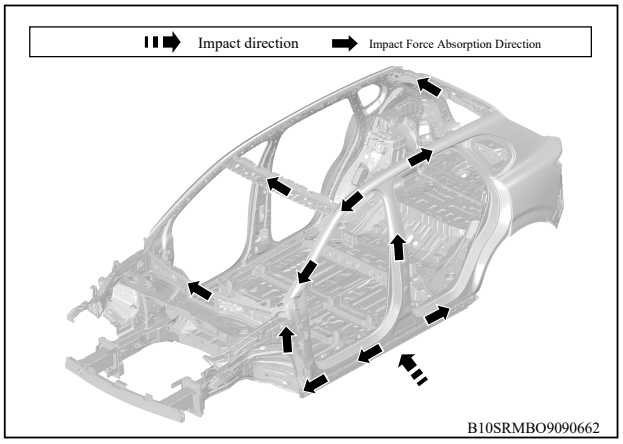


operation to prevent overheating, which may scorch the paint surface.

5.Wipe off the excess wax with a cleaning cloth.

© 2026, All rights reserved

2.2.7 BODY DATA AND STRUCTURAL INFORMATION

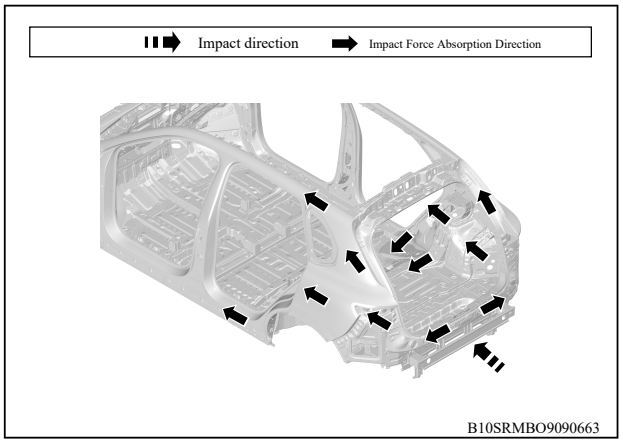


COLLISION FORCE TRANSFER PATH

a. Frontal collision of the vehicle body.

NOTE

The front body frame consists of the dash panel, front longitudinal rails, and front strut towers, and to accurately determine the extent of damage, it is necessary not only to check the components for deformation and cracks, but also to thoroughly inspect the deformation of the dash panel and A-pillars.
Visual inspection alone may overlook some critical damage. Therefore, it is recommended to use a professional high-precision measurement system to perform 3D coordinate measurements on the accident vehicle.
It may be necessary to install panels such as the front fender to inspect for damage. Please check whether the dash panel, left front wheel housing, right front wheel housing, left front longitudinal rail, and right front longitudinal rail are deformed.

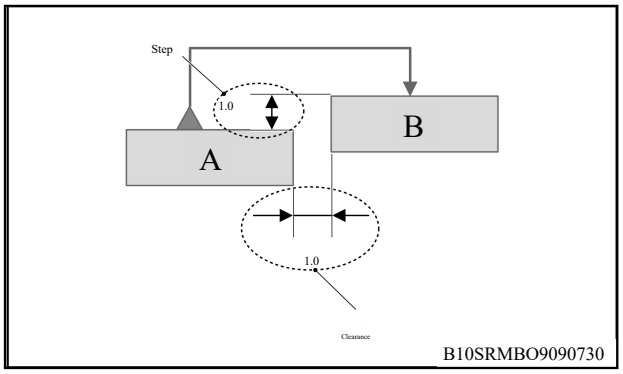


b. Side impact.

NOTE

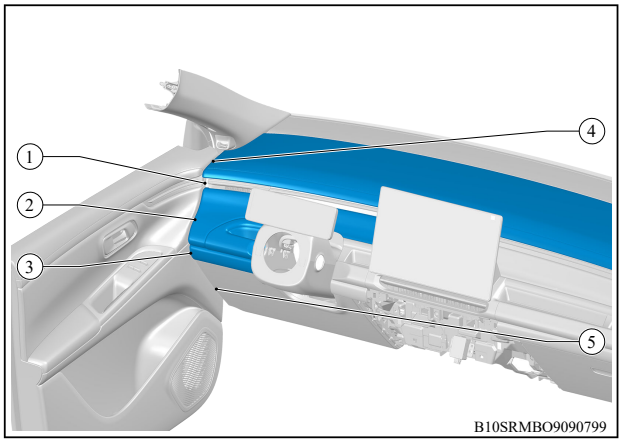
In addition to inspecting the exterior (such as the fit and integrity of the doors), you must also use a measuring system to measure the exact extent of damage, using undamaged components as reference points.
Check whether the side sill reinforcement panel, front/center/rear pillars, front floor assembly, and rear floor assembly are deformed.

© 2026, All rights reserved



c. Rear body collision.

NOTE



In addition to checking the exterior appearance (such as the fit and integrity of the tailgate and rear doors), also check for deformation on the side, horizontal, and vertical surfaces.
Check the rear pillar assembly, rear side panel assembly, roof system, and rear floor assembly for deformation.

© 2026, All rights reserved

INTERIOR CLEARANCE

1. Body gap and flush description: The gap between Component A and Component B in the illustration is 1.0 (mm).
2. In the illustration, Component A is the reference surface, and Component B is the measured surface. If the measured value is "+", Component B is higher than Component A; if the measured value is "-", Component B is lower than Component A.
3. Terminology: Parallel (Uniformity), denoted by "/"; Symmetry (Symmetry degree), denoted by "S"; Style dep (Style dependent); N/A (Not applicable); All around (All-round); F/A (Front/Rear); C/C (Left/Right or vehicle width direction); U/D (Up/Down); L&R (Left and Right).

EXTERIOR BODY CLEARANCE

1. Body gap and flush description: The gap between Component A and Component B in the illustration is 1.0 (mm).
2. In the illustration, Component A is the reference surface, and Component B is the measured surface. If the measured value is "+", Component B is higher than Component A; if the measured value is "-", Component B is lower than Component A.
3. Terminology: Parallel (Uniformity), denoted by "/"; Symmetry (Symmetry degree), denoted by "S"; Style dep (Style dependent); N/A (Not applicable); All around (All-round); F/A (Front/Rear); C/C (Left/Right or vehicle width direction); U/D (Up/Down); L&R (Left and Right).

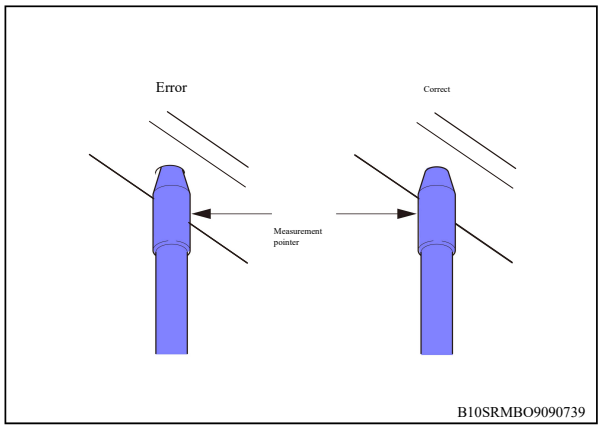
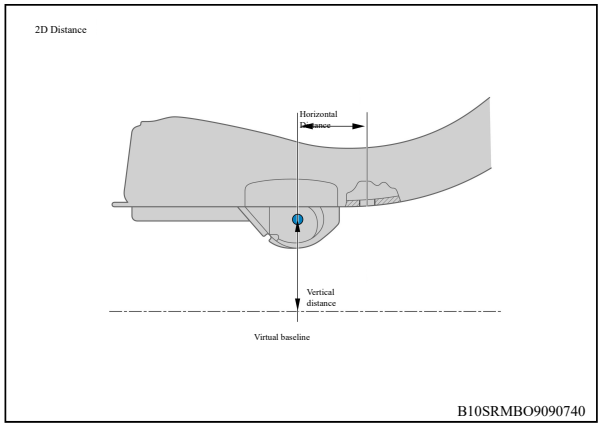
MEASUREMENT INSTRUCTIONS

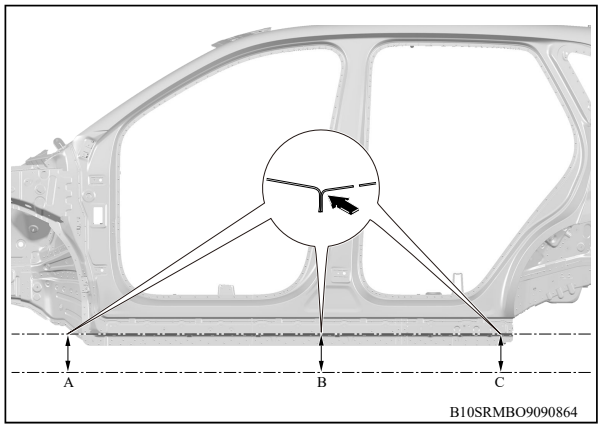


1. Preparation for Determining Vehicle Dimensions



a. The straight-line distance between the centers of the two measurement points.

b. All measurement tasks in maintenance operations must be performed using a track gauge. For tasks where a track gauge cannot be used, a tape measure should be used.
c. When using a tape measure, avoid twisting or bending it.

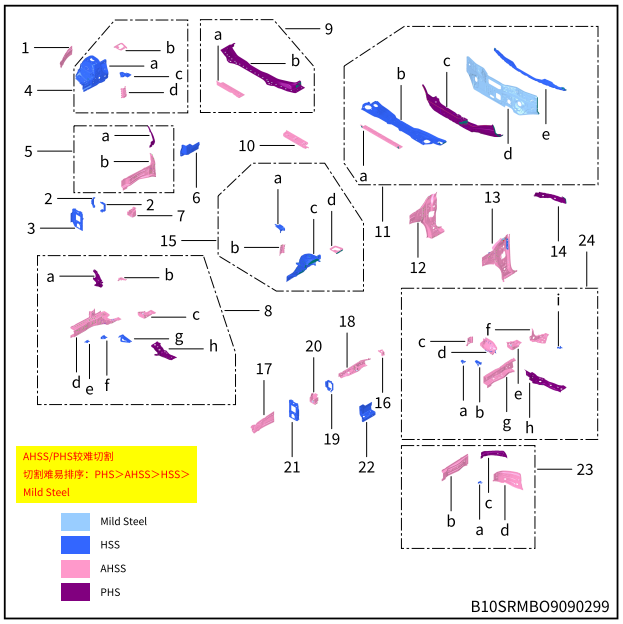


d. When using the track gauge, the gauge body, measuring plate, or measuring pointer must not be loose.
e. The left and right measuring pointers must be at the same height, before measurement or after adjusting the height of the measuring pointers, be sure to calibrate the track gauge, when using the track gauge, prevent it from falling or being affected by vibrations, and ensure the measuring pointers are securely fixed in the measuring holes.

f. The horizontal distance in the front/rear direction between the centers of the two measurement points, the perpendicular distance from the measurement points to the virtual reference line, if only one dimension is provided, it indicates left-right symmetry.

© 2026, All rights reserved

g. A: This point is located on the lower surface of the rocker panel at the center of the front body lifting point.
h. B: This point is located on the lower surface of the rocker panel, midway between the front body lifting point and the rear body lifting point.
i. C: This point is located on the lower surface of the rocker panel at the center of the rear lifting point.



2. Measurement symbols

a. Definition of Measurement Point Symbols.

Symbols	Definition
	Center of the circular hole
	Center of the oval hole
	Sheet metal part corners (arrows only)
 Fr	Front of the vehicle

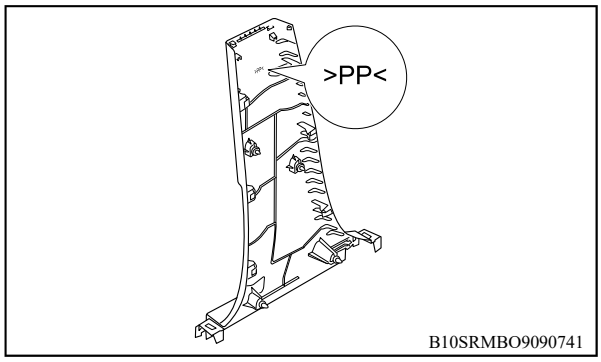
DESCRIPTION OF NON-CUTTABLE AREAS ON THE VEHICLE BODY

1.

a. Regarding the feedback on non-cuttable areas of the vehicle body, in principle, all body sheet metal can be cut for rescue operations (except for Zone 3). However, when high-voltage or high-temperature components are involved, please seek relevant professional advice.



NOTE

Front compartment area: High-temperature and high-voltage area of the vehicle, cutting-prohibited area, involving high-voltage wiring harnesses.
Sill area (below the floor): Involves the high-voltage battery area.
Liftgate gas strut (electric strut): Cutting at the liftgate gas strut position may cause the gas strut to explode, resulting in personal injury.
Rear floor area: Rear-wheel drive models, involving the electric drive and high-voltage wiring harness areas.

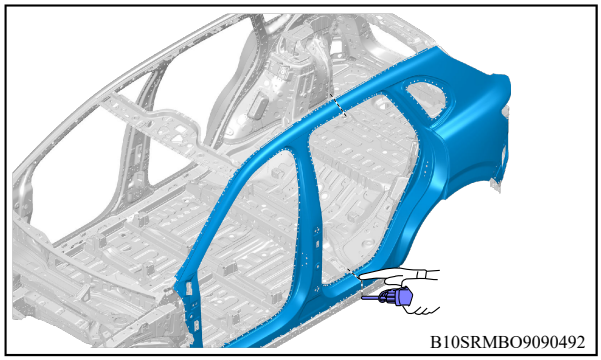
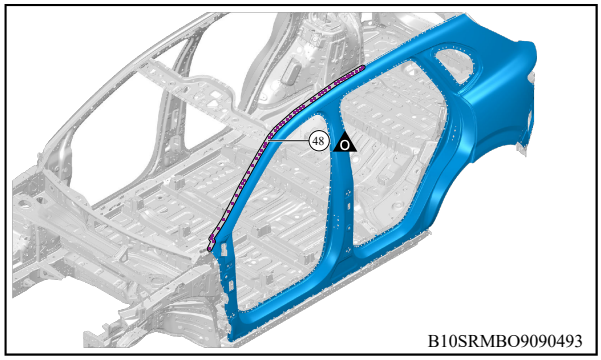
2.2.8 SHEET METAL REPLACEMENT



SIDE PANEL

REPLACEMENT OF THE FRONT SECTION OF THE LEFT SIDE OUTER PANEL

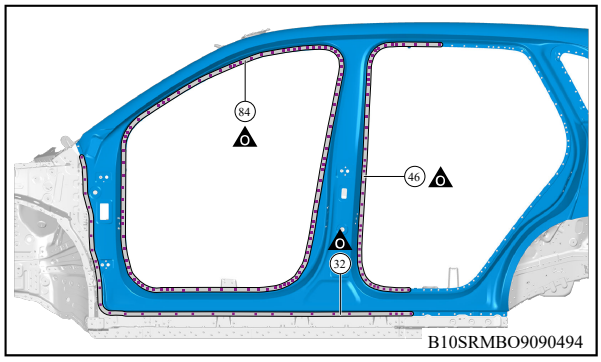
1. Tools



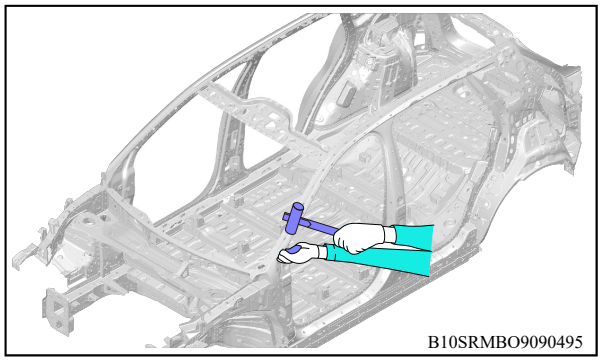
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part

a. Use a cutting machine to cut the front section of the left side outer panel along the dashed line area.



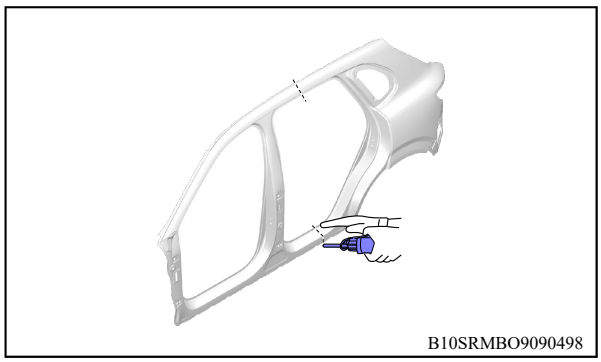
> **CAUTION**
>
> Operators may refer to the cross-sections of key areas to adjust the position and depth of the cut. Do not damage the inner reinforcement panels.



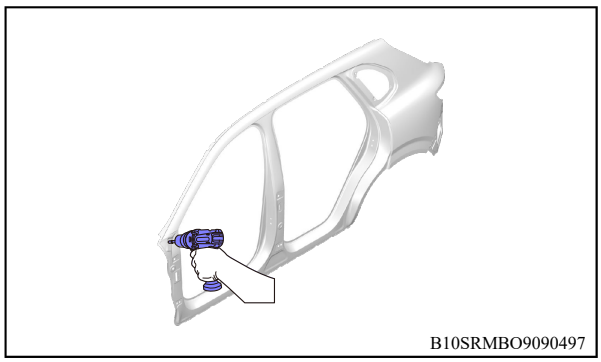
b. Drill out all spot welds to separate the front section of the left side outer panel from the left A-pillar upper side rail inner panel assembly and the left B-pillar upper side rail inner panel assembly.

> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

© 2026, All rights reserved



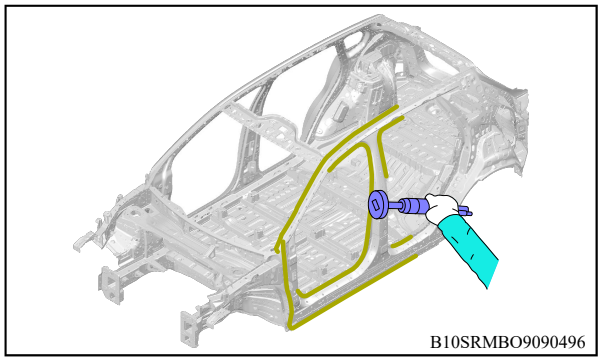
c. Drill out all spot welds to separate the front section of the left side outer panel from the left side door ring, and remove the front section of the left side outer panel.



d. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.

3. Prepare new parts

a. Mark the cutting line on the front section of the new left side outer panel, increase the lap length at the lap joint end, and cut along the marked line.

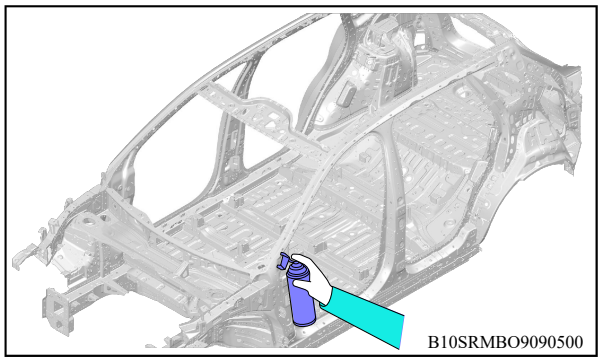


b. Prepare new parts and materials (front section of the left side outer panel, sealant, cleaner, sound insulation pads).

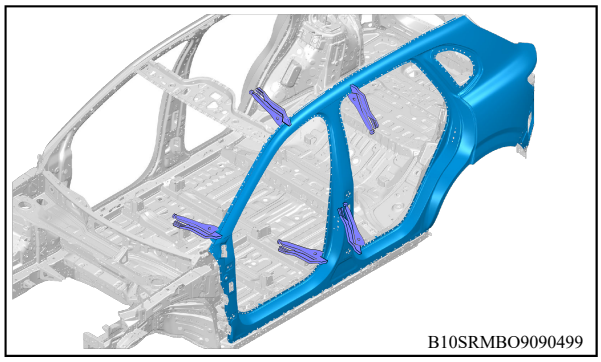
c. To perform plug welding, first drill a hole in the front section of the left side outer panel, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Front section of left side outer panel
Plug weld hole diameter (Φ)	8.0mm

4. Welding

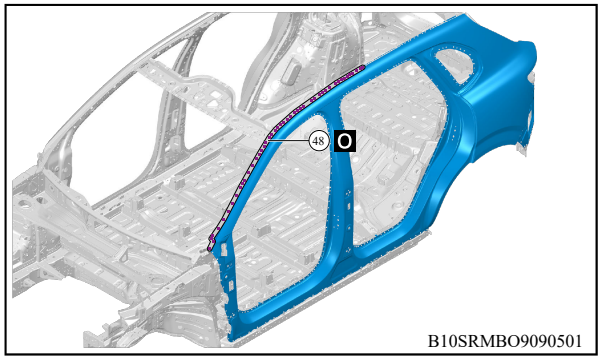


© 2026, All rights reserved



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

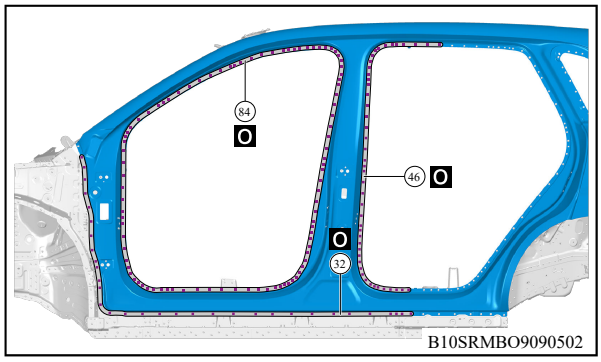
CAUTION



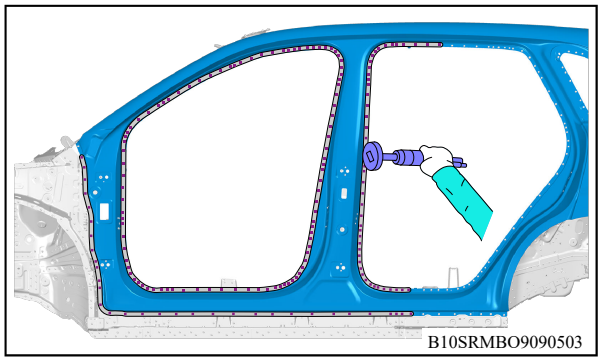
Clean the welding area by wiping, taking care not to damage other panels.

b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the front section of the left side outer panel in place, flatten the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as vise grips.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)

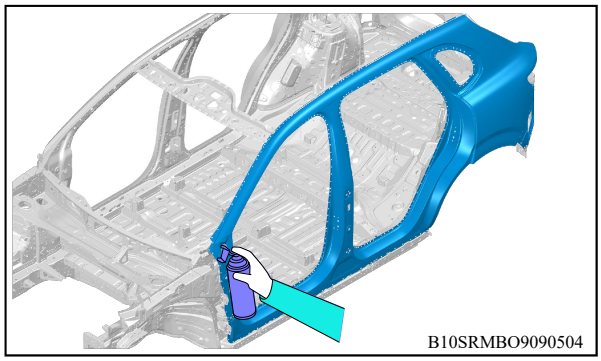


g. Use a MAG welder to perform plug welding on the front section of the left side outer panel, the left A-pillar upper side rail inner panel assembly, and the left B-pillar upper side rail inner panel assembly.



CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



© 2026, All rights reserved

h. Use a MAG welder to perform plug welding on the front section of the left side outer panel and the left side door ring.

i. After welding, use a grinder to clean the weld area at the front section of the left side outer panel, and avoid excessive grinding.

j. After grinding the spot welds, spray or brush epoxy primer onto the surface of the front section of the left side outer panel for anti-corrosion treatment.

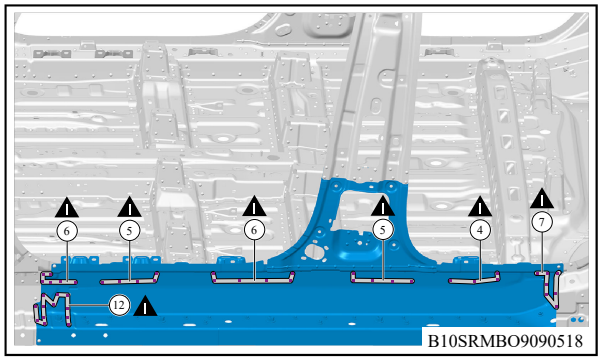
CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.



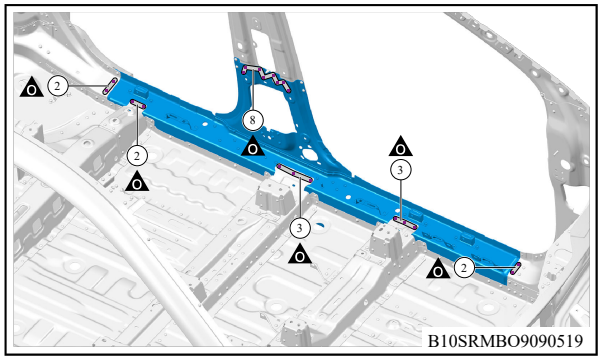
© 2026, All rights reserved

REPLACEMENT OF LEFT INNER ROCKER PANEL ASSEMBLY WITH BOLT STUD

1. Tools

Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

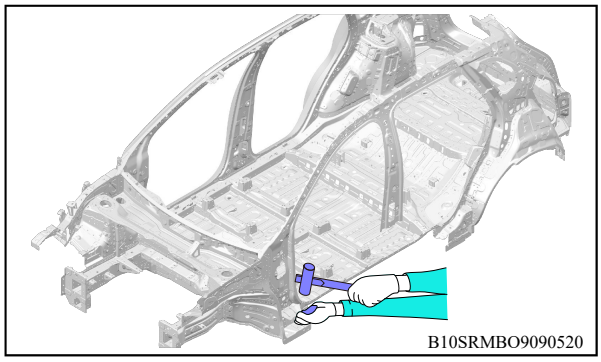
2. Remove the original part



a. Remove the front section of the left side outer panel.
SeeReplacement of the front section of the left side outer panel (page 699)

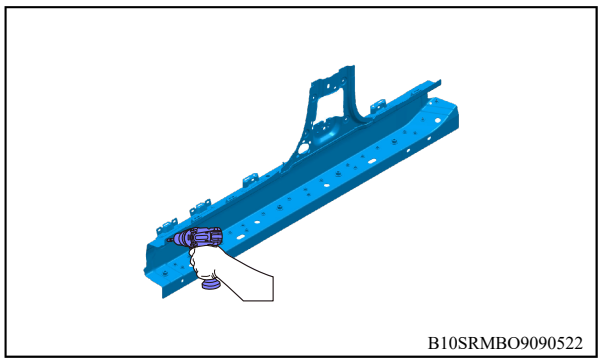
b. Remove the left side member reinforcement assembly.
SeeReplacement of Left Side Panel Reinforcement Assembly (page 716)

c. Drill out all spot welds to separate the left inner rocker panel with bolt stud assembly from the left side of the front floor panel assembly.



CAUTION

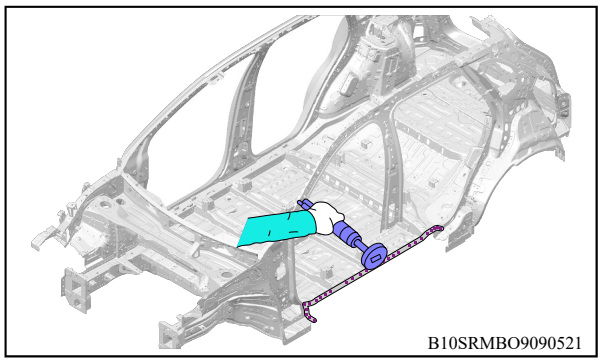
If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



d. Drill out all spot welds to separate the left inner rocker panel with bolt pillar assembly from the left A-pillar inner panel, seat crossmember, heel plate, B-pillar inner panel, and left rocker panel rear extension panel, and remove the left inner rocker panel with bolt pillar assembly.

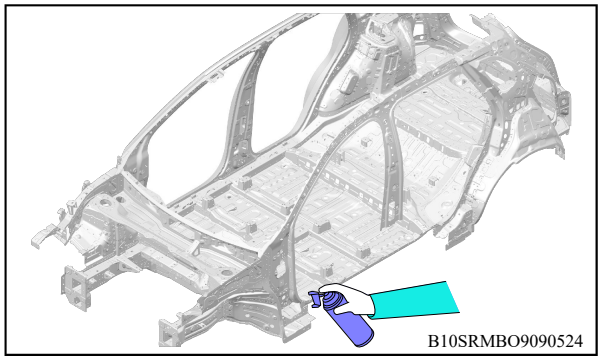
© 2026, All rights reserved

e. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.



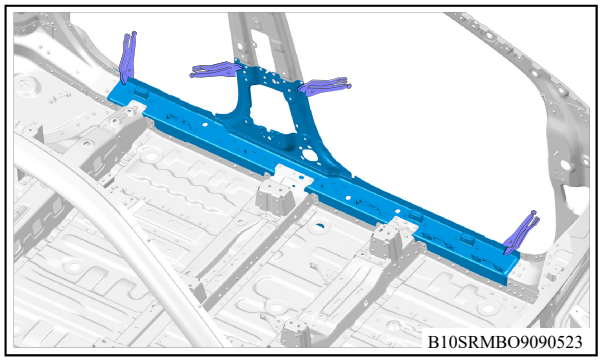
3. Prepare new parts

a. Prepare new parts and materials (left inner rocker panel with bolt stud assembly, sealant, cleaner, sound insulation block).
b. To perform plug welding, first drill holes in the new left inner sill with bolt stud assembly, and select the appropriate hole diameter based on the metal thickness.



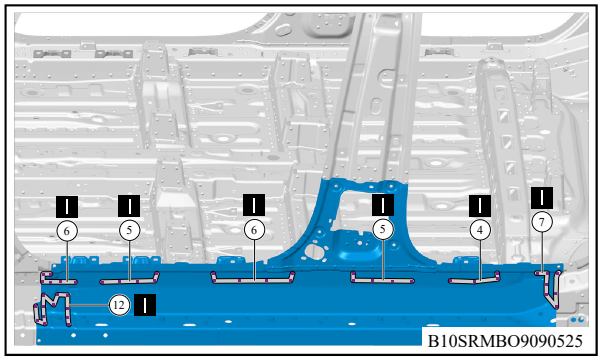
Plug hole diameter	
Name	Left inner sill assembly with bolt stud
Plug weld hole diameter (Φ)	8.0mm

4. Welding



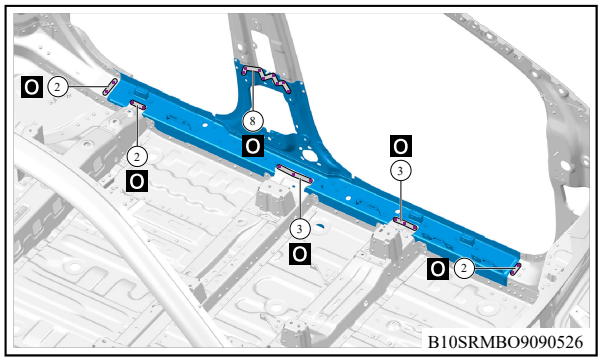
a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

> **CAUTION**
>
> Clean the welding area by wiping, taking care not to damage other panels.

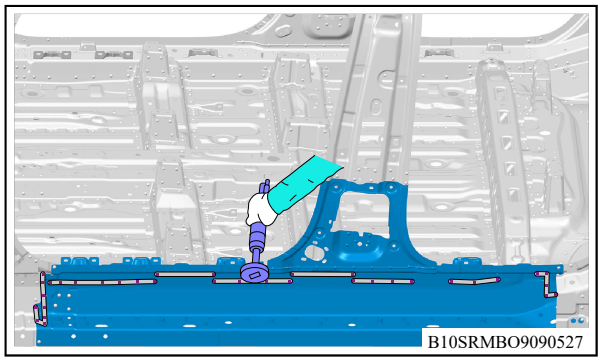


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



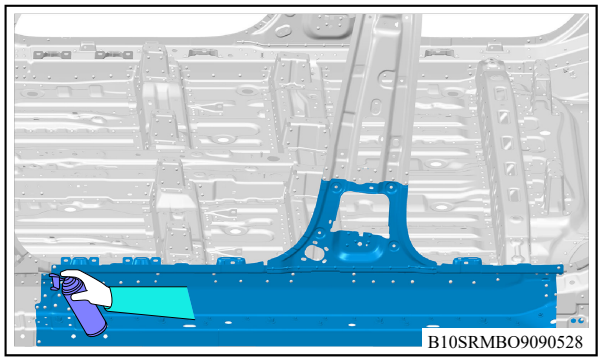
c. Install the left inner sill with stud assembly in position, flatten both surfaces to eliminate any gaps, and clamp the parts to be welded using tools such as vise-grip welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to plug weld the left inner rocker panel with bolt stud assembly and the left side of the front floor panel assembly.

CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



h. Use a MAG welder to plug weld the left inner rocker panel with bolt stud assembly to the left A-pillar inner panel, seat crossmember, heel panel, B-pillar inner panel, and left rocker panel rear extension panel.

i. After welding, use a grinder to clean the weld area of the left inner rocker panel with bolt stud assembly. Do not grind excessively.

© 2026, All rights reserved

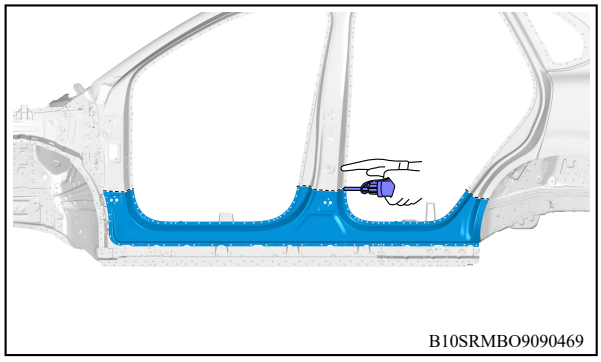
j. After grinding the spot welds, the surface of the left inner sill with bolt stud assembly must be sprayed or brushed with epoxy primer for anti-corrosion treatment.

> **CAUTION**
>
> The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

> **CAUTION**
>
> Apply the paint coating only after the sealant has dried.

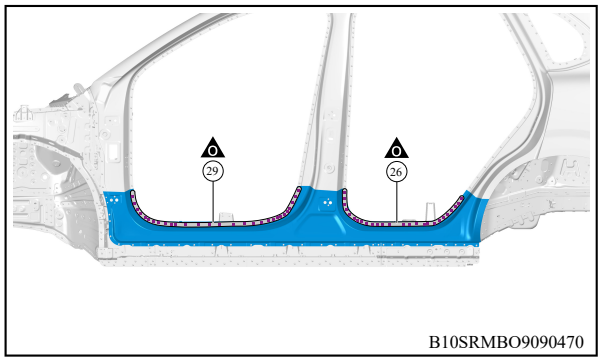
5. Install the left bodyside reinforcement panel assembly.
SeeReplacement of Left Side Panel Reinforcement Assembly (page 716)
6. Install the front section of the left side outer panel.
SeeReplacement of the front section of the left side outer panel (page 699)



© 2026, All rights reserved

REPLACEMENT OF THE LOWER SECTION OF THE LEFT SIDE OUTER PANEL

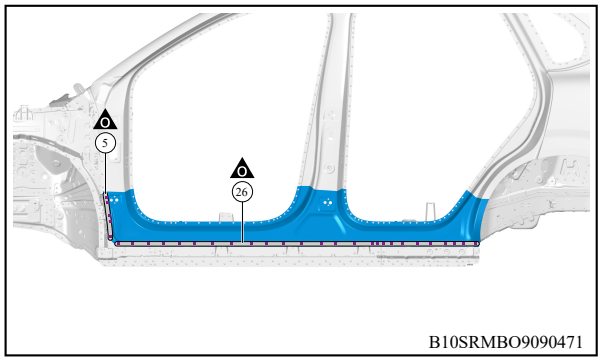
1. Tools



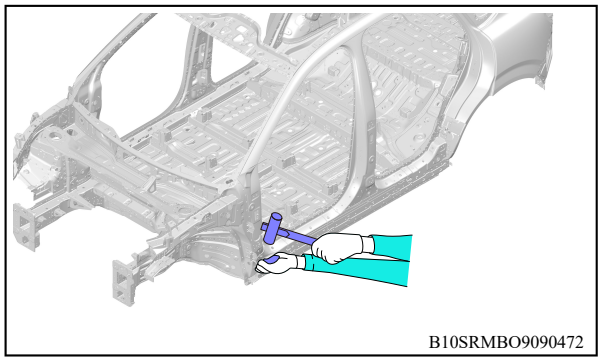
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part

a. Use a cutting tool to cut the lower section of the left side outer panel along the dashed line area.



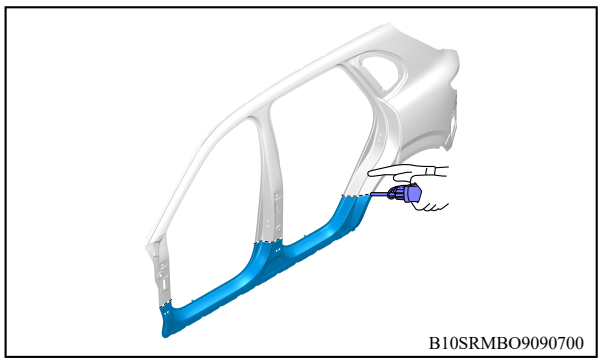
> **CAUTION**
>
> Operators may refer to the cross-sections of key areas to adjust the position and depth of the cut. Do not damage the inner reinforcement panels.



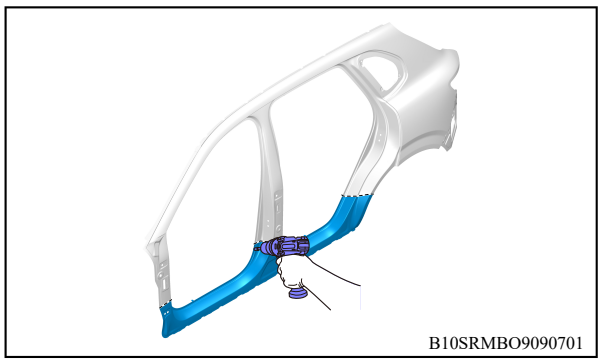
b. Drill out all spot welds to separate the lower section of the left side outer panel from the front section of the left inner rocker panel and the rear section of the left inner rocker panel.

> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

© 2026, All rights reserved



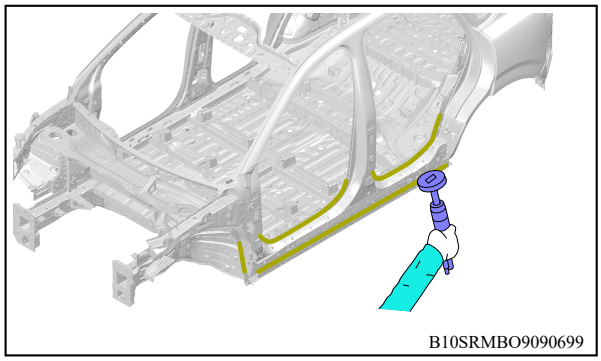
c. Drill out all spot welds to separate the lower section of the left side outer panel from the lower section of the left inner rocker panel and the lower section of the left A-pillar inner panel, and remove the lower section of the left side outer panel.



d. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.

3. Prepare new parts

a. Mark the cutting line on the lower section of the new left side outer panel, increase the lap length at the lap end, and cut along the marked line.

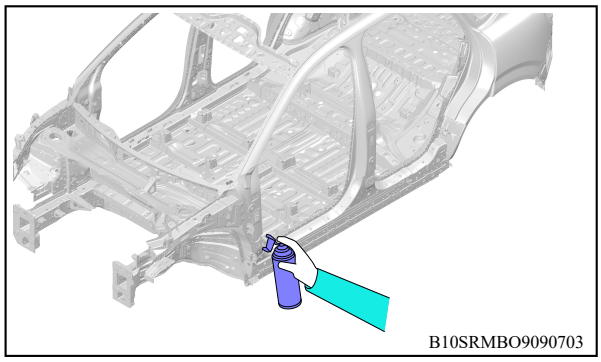


b. Prepare new parts and materials (lower section of the left side outer panel, sealant, cleaner, sound insulation rubber blocks).

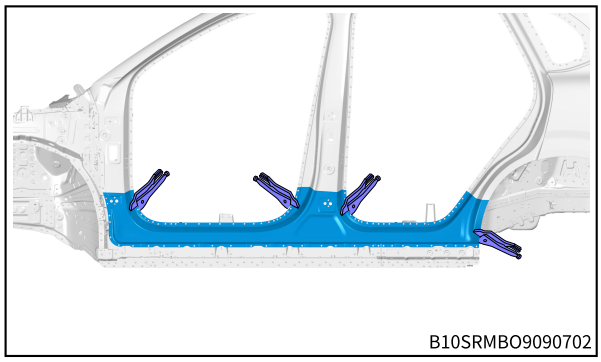
c. To perform plug welding, first drill holes in the lower section of the left side outer panel, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Lower section of left bodyside outer panel
Plug weld hole diameter (Φ)	8.0mm

4. Welding

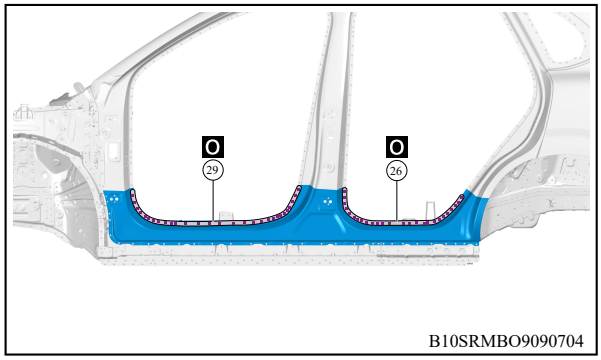


© 2026, All rights reserved



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

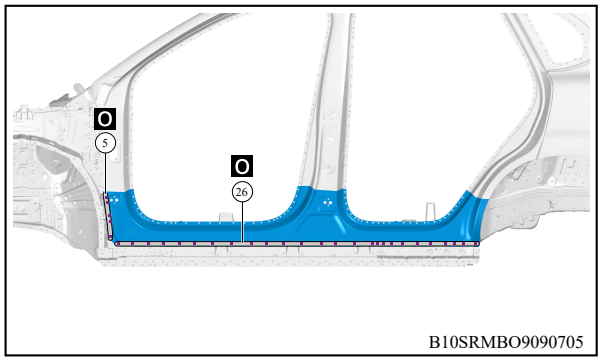
CAUTION



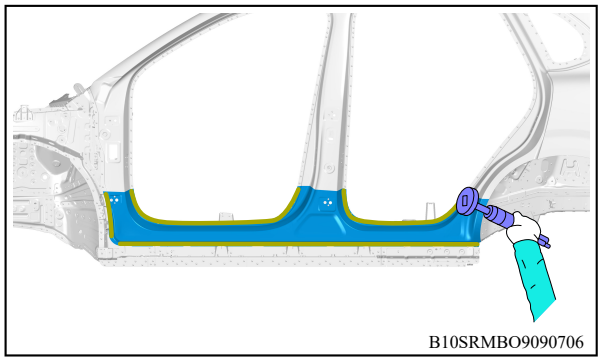
Clean the welding area by wiping, taking care not to damage other panels.

b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the lower section of the left side outer panel in position, flatten both surfaces to eliminate the gap, and clamp the parts to be welded using vise clamps or similar tools.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)

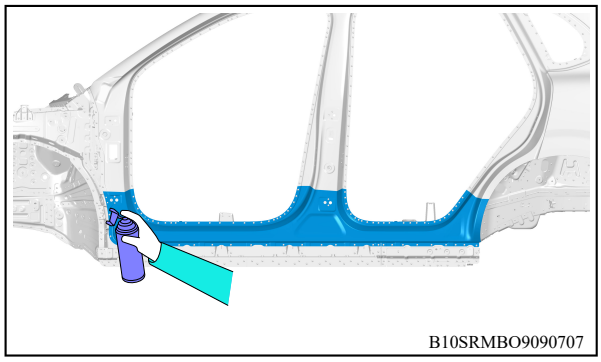


g. Use a MAG welder to perform plug welding on the lower section of the left side outer panel, the front section of the left inner sill, and the rear section of the left inner sill.



CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



© 2026, All rights reserved

h. Use a MAG welder to perform plug welding on the front section of the left side outer panel, the lower section of the left inner rocker panel, and the lower section of the left A-pillar inner panel.

i. After welding is completed, use a grinder to clean the welding area on the lower section of the left side outer panel. Do not over-grind.

j. After grinding the spot welds, the surface of the lower section of the left side outer panel should be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

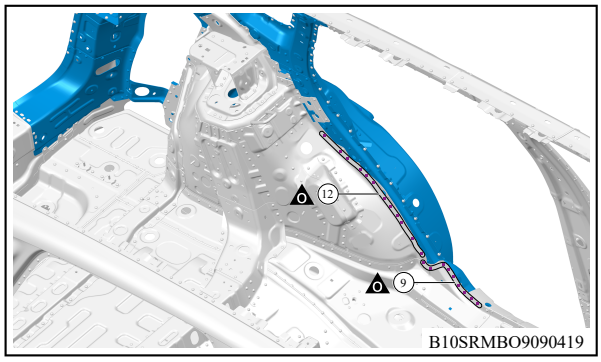
REPLACEMENT OF REAR SECTION ASSEMBLY OF LEFT SIDE FRAME REINFORCEMENT PANEL

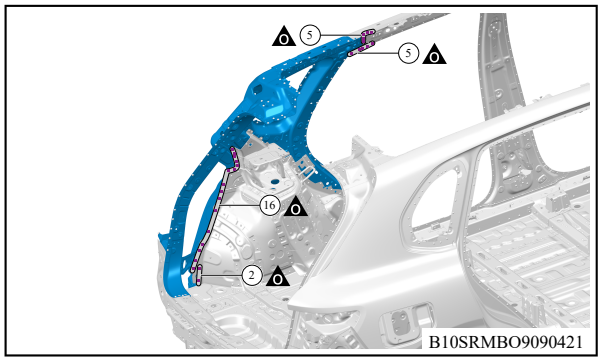
1. Tools

Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part

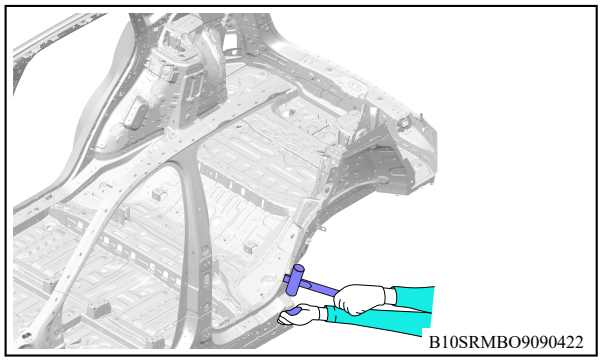


a. Remove the roof outer panel.
SeeReplacement of Roof Outer Panel (Panoramic Roof) (page 770)
b. Remove the roof rear crossmember assembly.
SeeReplacement of roof rear crossmember assembly (page 778)
c. Remove the rear section of the left side outer panel.
SeeReplacement of Rear Section of Left Side Outer Panel (page 721)
d. Drill out all spot welds to separate the rear section assembly of the left side member reinforcement from the rear panel and the upper section of the left rear wheelhouse.



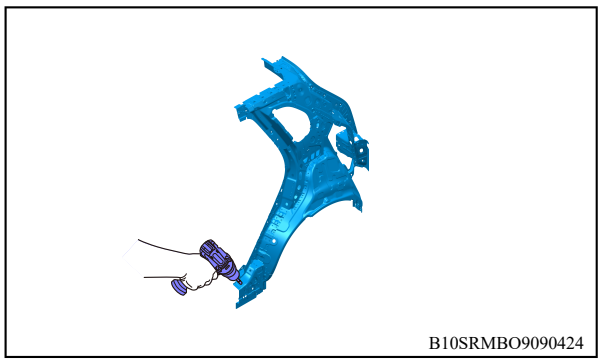
CAUTION

If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



© 2026, All rights reserved

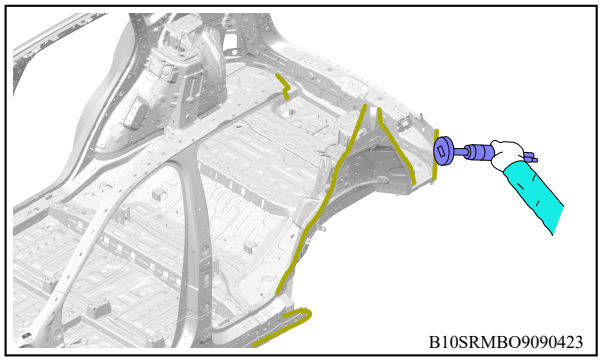
e. Drill out all spot welds to separate the rear section assembly of the left side panel reinforcement from the front section of the left rear wheelhouse and the rear extension panel of the left sill.



f. Drill out all spot welds to separate the rear section assembly of the left side panel reinforcement from the rear section of the left rear wheelhouse, the rear upper section of the left side panel reinforcement, and the inner panel of the left B-pillar upper side rail, and remove the rear section assembly of the left side panel reinforcement.

g. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.

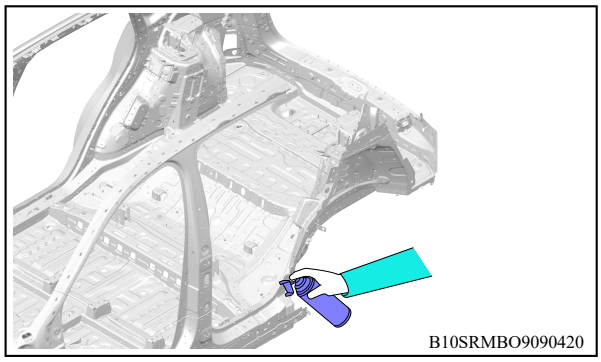
3. Prepare new parts



a. Prepare new parts and materials (rear section assembly of left side member reinforcement, sealant, cleaner, sound insulation pads).

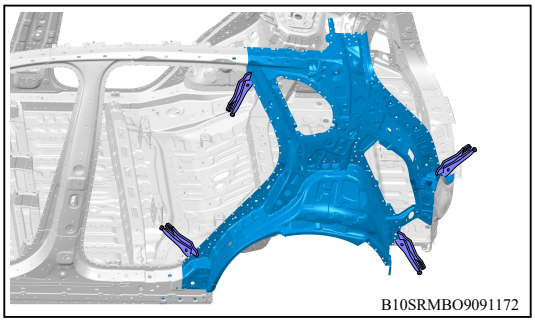
b. To perform plug welding, first drill holes in the rear section assembly of the left side panel reinforcement, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Left Side Panel Reinforcement Rear Section Assembly
Plug weld hole diameter (Φ)	8.0mm

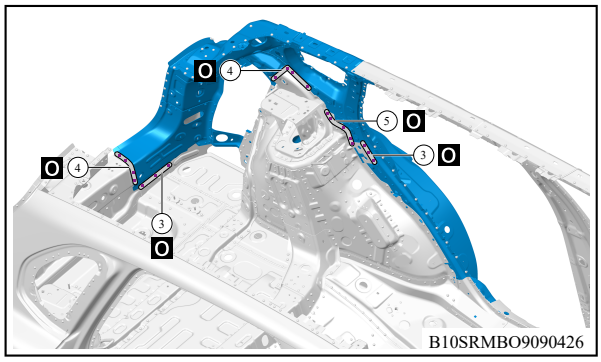


4. Welding

© 2026, All rights reserved

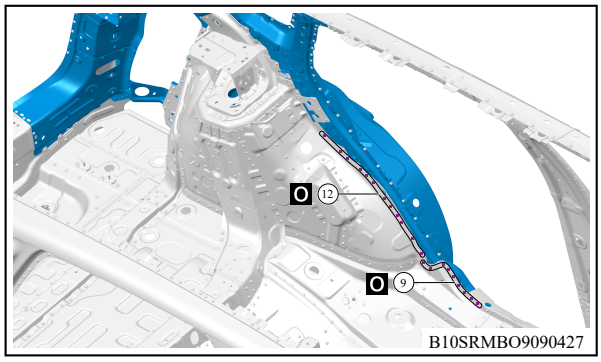


a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

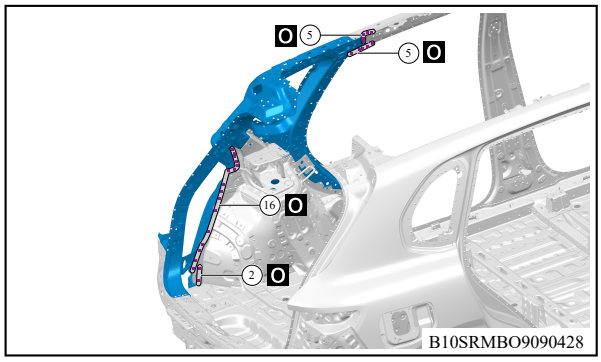


> **CAUTION**
>
> Clean the welding area by wiping, taking care not to damage other panels.

b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

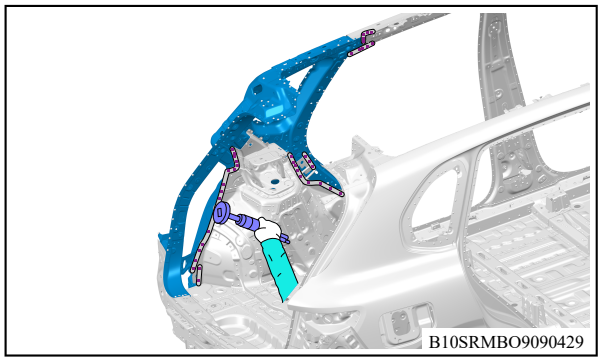


c. Install the rear section assembly of the left side member reinforcement in place, make both surfaces flush to eliminate the gap, and clamp the parts to be welded using tools such as vise clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)

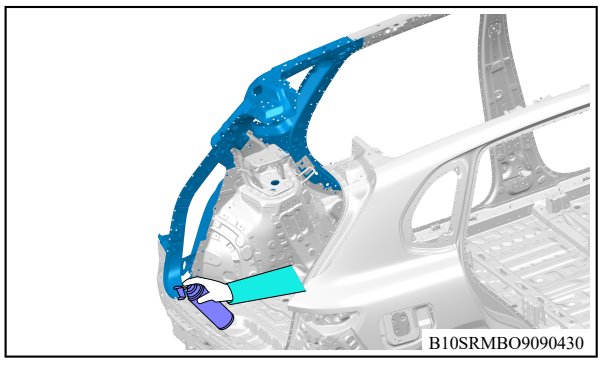


g. Use a MAG welder to perform plug welding on the rear section assembly of the left side panel reinforcement, the rear panel, and the upper section of the left rear wheelhouse.

> **CAUTION**
>
> When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



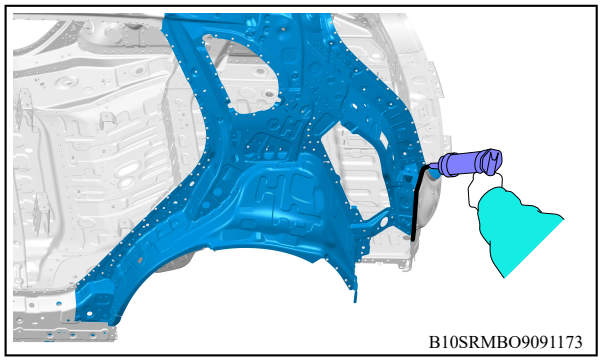
© 2026, All rights reserved



h. Use a MAG welder to perform plug welding on the rear section assembly of the left side panel reinforcement, the front section of the left rear wheelhouse, and the rear extension panel of the left rocker panel.

i. Use a MAG welder to plug weld the rear section assembly of the left side member reinforcement to the rear section of the left rear wheelhouse, the rear upper section of the left side member reinforcement, and the inner panel of the left B-pillar upper rail.

j. After welding is completed, use a grinder to clean the weld area of the rear section assembly of the left side panel reinforcement. Do not over-grind.



k. After grinding the spot welds, the surface of the rear section assembly of the left side member reinforcement needs to be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

© 2026, All rights reserved

l. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
See

CAUTION

Apply the paint coating only after the sealant has dried.

5. Install the roof rear crossmember assembly.
   SeeReplacement of roof rear crossmember assembly (page 778)
6. Install the roof outer panel.
   SeeReplacement of Roof Outer Panel (Panoramic Roof) (page 770)
7. Install the rear section of the left bodyside outer panel.
   SeeReplacement of Rear Section of Left Side Outer Panel (page 721)

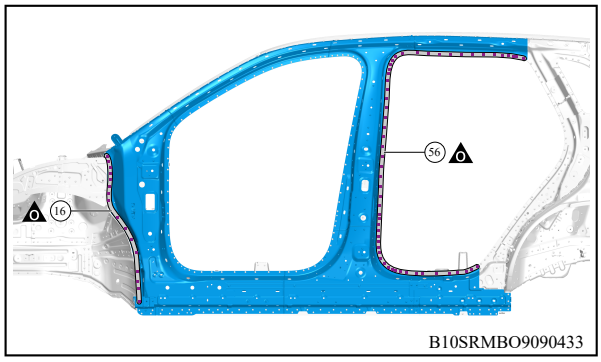
REPLACEMENT OF LEFT SIDE PANEL REINFORCEMENT ASSEMBLY

1. Tools

Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

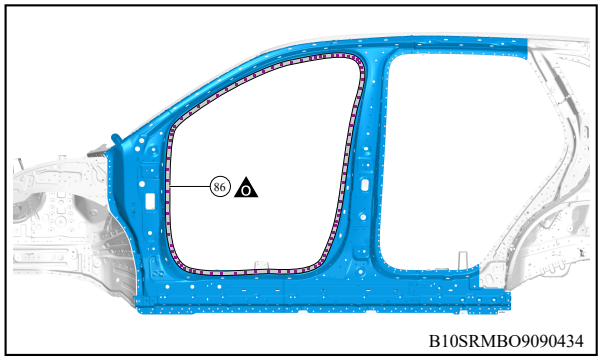
2. Remove the original part



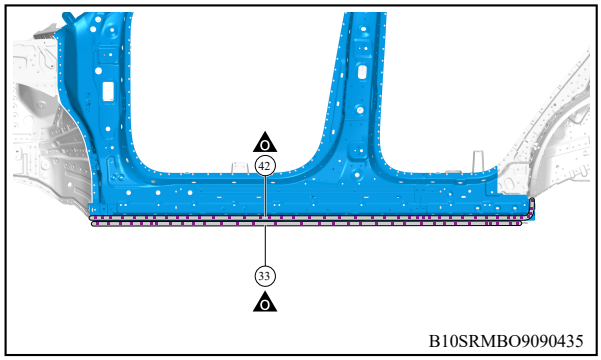
a. Remove the front section of the left side outer panel.
SeeReplacement of the front section of the left side outer panel (page 699)
b. Remove the roof cover assembly.
SeeReplacement of Roof Panel Assembly (with Sunroof) (page 774)
c. Remove the roof front crossmember sub-assembly.
SeeReplacement of roof front crossmember sub-assembly (page 782)
d. Drill out all spot welds to separate the left side panel reinforcement assembly from the left A-pillar upper side rail inner panel assembly and the left B-pillar upper side rail inner panel assembly.

CAUTION

If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

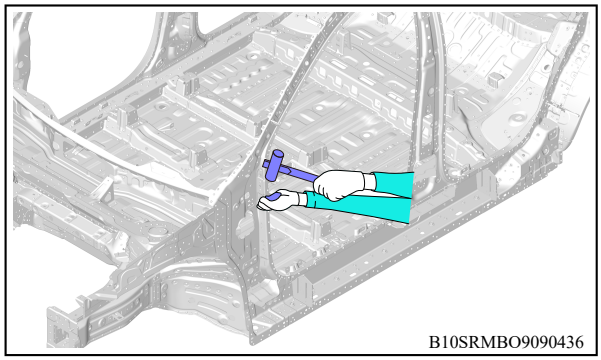


© 2026, All rights reserved



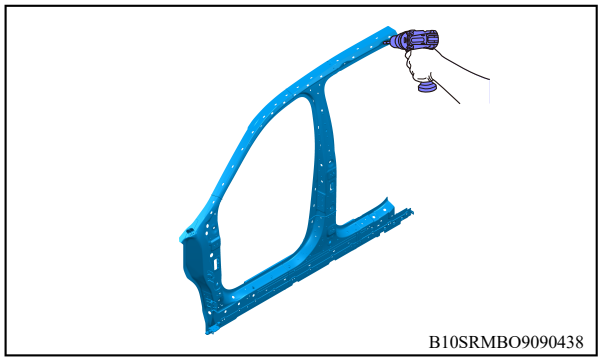
e. Drill out all spot welds to separate the left side member reinforcement panel assembly from the left A-pillar inner panel assembly, the left B-pillar upper inner panel assembly, and the left inner rocker panel rear upper section.

CAUTION



If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

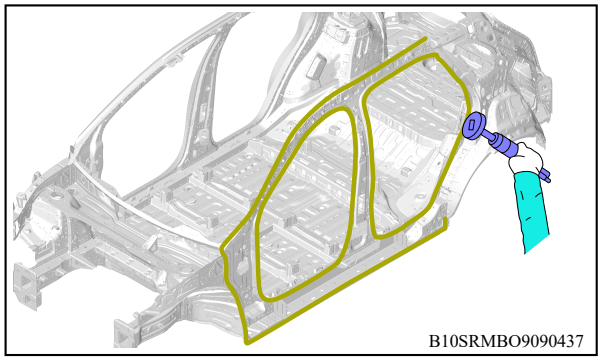
f. Drill out all spot welds to separate the left side panel reinforcement assembly from the left side inner panel sub-assembly, the left inner rocker upper section, and the left A-pillar inner panel assembly.



g. Drill out all spot welds to separate the left side panel reinforcement assembly from the lower section of the left inner rocker panel and the left inner rocker panel front connecting plate assembly, and remove the left side panel reinforcement assembly.

h. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.

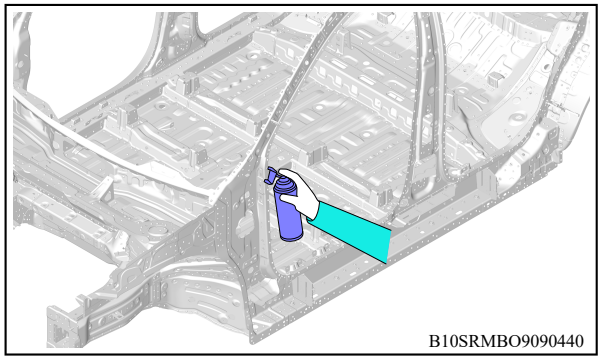
3. Prepare new parts



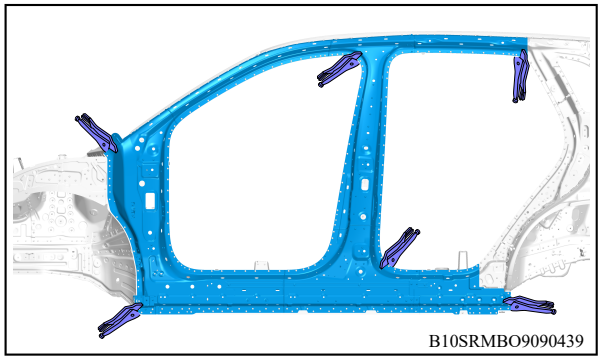
© 2026, All rights reserved

a. Prepare new parts and materials (left side panel reinforcement assembly, sealant, cleaner, sound insulation rubber block).
b. To perform plug welding, first drill holes in the left side panel reinforcement assembly, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Left side frame reinforcement panel assembly
Plug weld hole diameter (Φ)	8.0mm



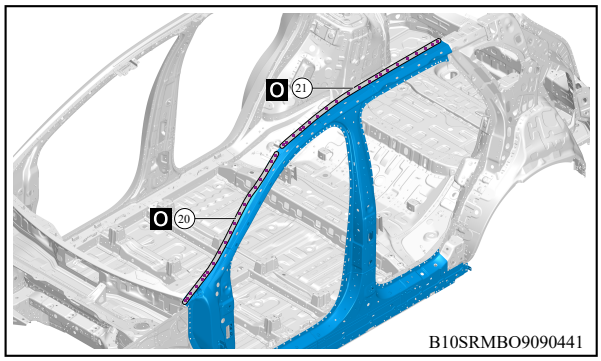
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

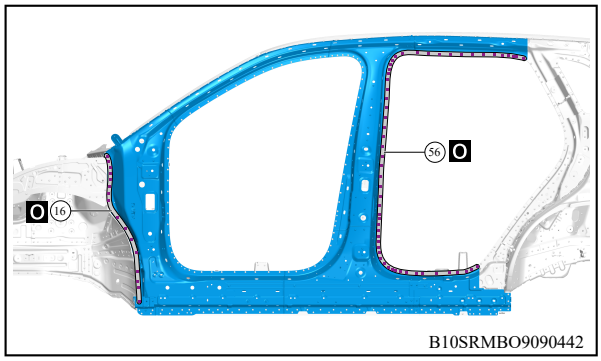
Clean the welding area by wiping, taking care not to damage other panels.



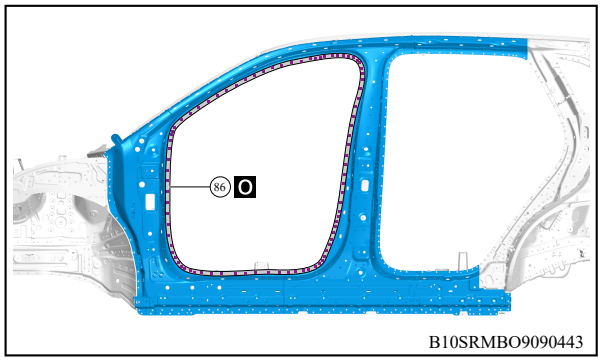
b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the left side member reinforcement assembly in position, align the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as locking pliers.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)

© 2026, All rights reserved

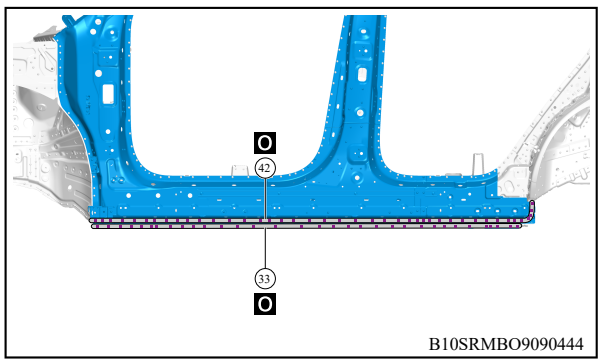


f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



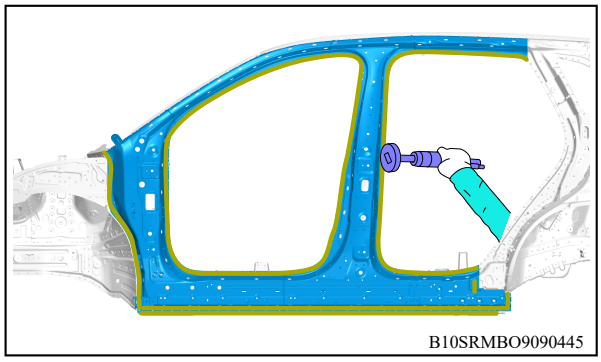
g. Use a MAG welder to perform plug welding on the left side member reinforcement assembly, the left A-pillar upper side rail inner panel assembly, and the left B-pillar upper side rail inner panel assembly.

CAUTION

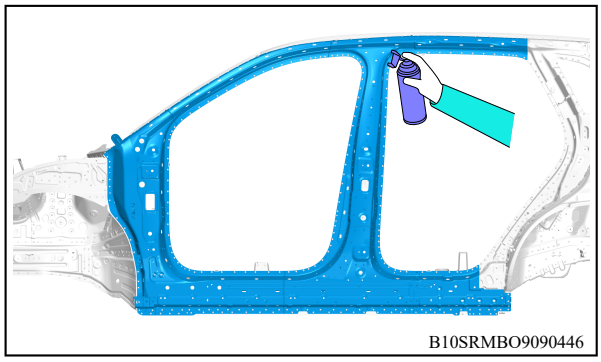


When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. Use a MAG welder to perform plug welding on the left side panel reinforcement assembly, the left A-pillar inner panel assembly, the left B-pillar upper inner panel assembly, and the rear upper section of the left inner sill.



i. Use a MAG welder to perform plug welding on the left side member reinforcement assembly, left side member inner panel sub-assembly, left inner rocker upper section, and left A-pillar inner panel assembly.



j. Use a MAG welder to perform plug welding on the left side panel reinforcement assembly, the lower section of the left inner sill, and the left inner sill front connecting plate assembly.

© 2026, All rights reserved

k. After welding, use a grinder to clean the welding area of the left side panel reinforcement assembly. Do not grind excessively.

l. After grinding the spot welds, the surface of the left side panel reinforcement assembly needs to be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

m. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

5. Install the roof front crossmember sub-assembly.
SeeReplacement of roof front crossmember sub-assembly (page 782)
6. Install the roof assembly.
SeeReplacement of Roof Panel Assembly (with Sunroof) (page 774)
7. Install the front section of the left side outer panel.
SeeReplacement of the front section of the left side outer panel (page 699)

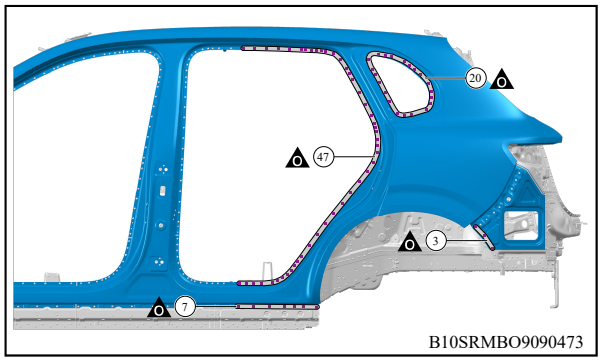
REPLACEMENT OF REAR SECTION OF LEFT SIDE OUTER PANEL

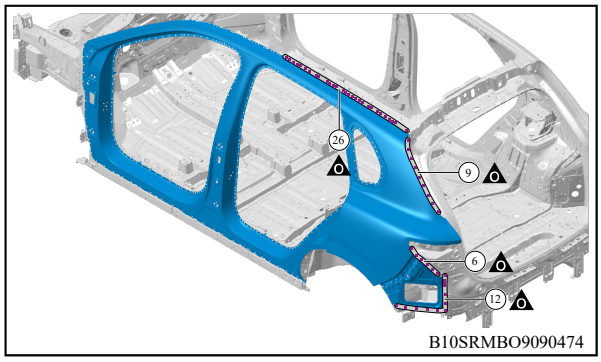
1. Tools



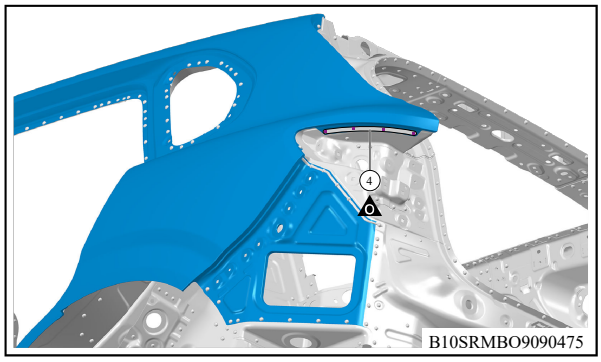
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part

a. Use a cutting tool to cut the rear section of the left side outer panel along the dashed lines a and b.

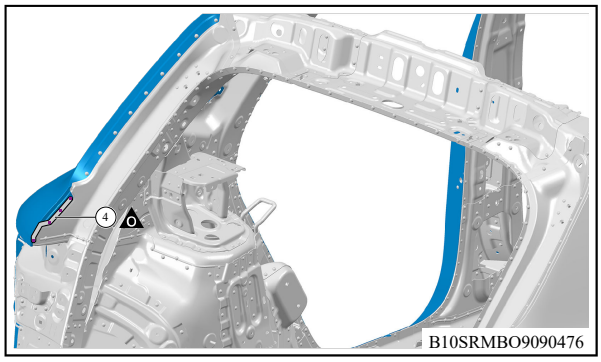


> **CAUTION**
>
> Operators may refer to the cross-sections of key areas to adjust the position and depth of the cut. Do not damage the inner reinforcement panels.

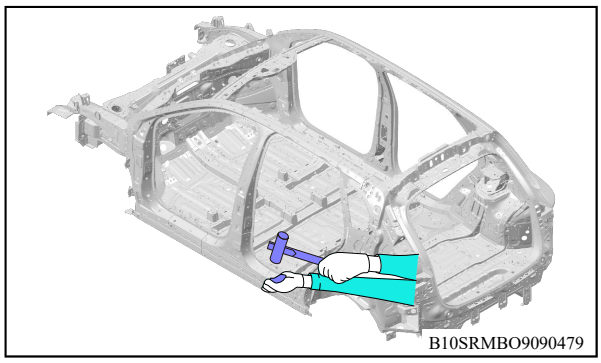


b. Drill out all spot welds to separate the rear section of the left side outer panel from the left C-pillar reinforcement panel assembly and the rear section of the left side inner panel.

> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

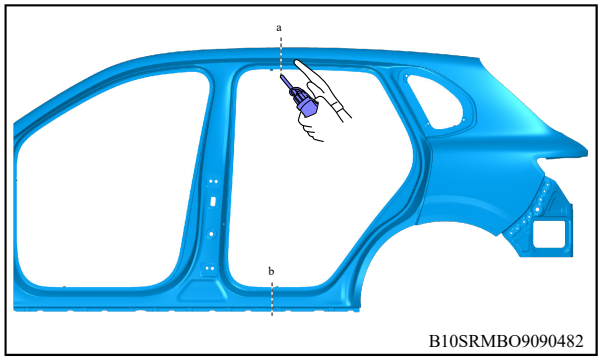


© 2026, All rights reserved

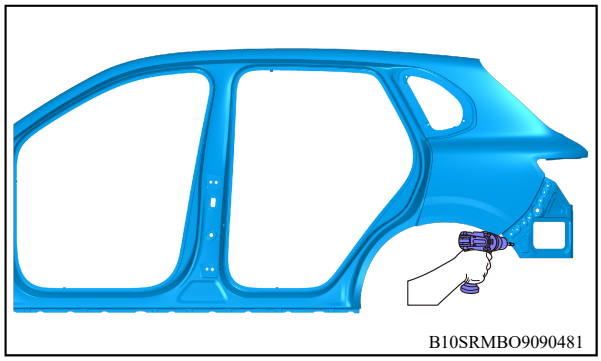


c. Drill out all spot welds to separate the rear section of the left side outer panel from the left D-pillar reinforcement panel assembly and the rear panel assembly.

d. Drill out all spot welds to separate the rear section of the left side outer panel from the left taillight mounting panel sub-assembly.



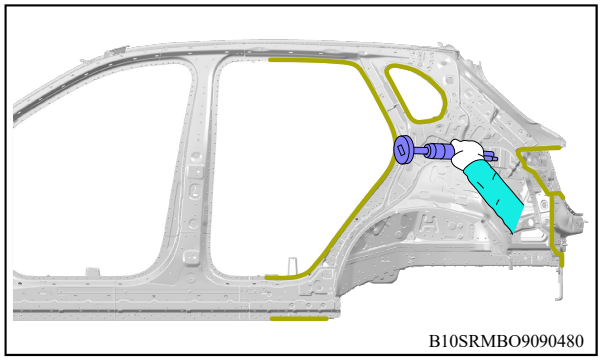
e. Drill out all spot welds to separate the rear section of the left side outer panel from the left taillight mounting plate sub-assembly, and remove the rear section of the left side outer panel.



f. Remove the sound insulation rubber blocks from the body cavity. Use a flat hammer and a dolly to straighten the twisted and deformed hem after removing the weld spots.

3. Prepare new parts

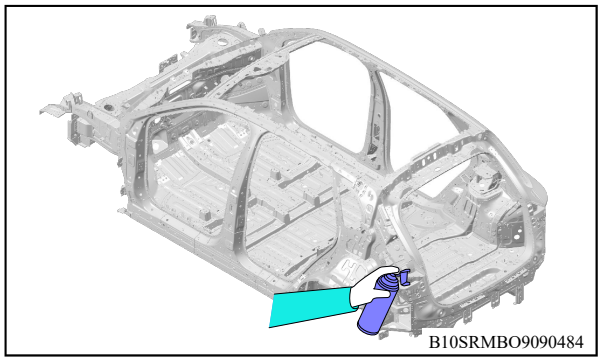
a. Mark the cutting line on the rear section of the new left side outer panel, increase the lap length at the lap joint end, and cut along the marked line.



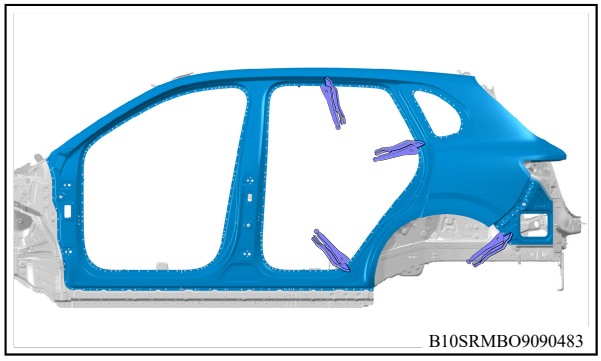
© 2026, All rights reserved

b. Prepare new parts and materials (rear section of the left side outer panel, sealant, cleaner, sound insulation pads).
c. To perform plug welding, first drill holes in the rear section of the left side outer panel, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Rear section of left bodyside outer pa nel
Plug weld hole di ameter (Φ)	8.0mm



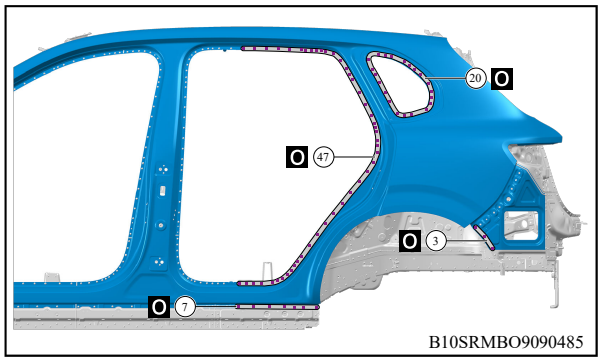
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

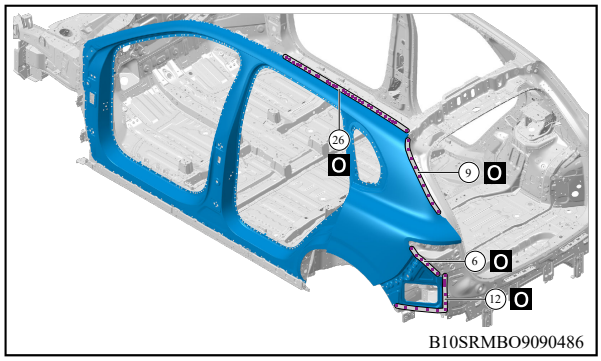
Clean the welding area by wiping, taking care not to damage other panels.



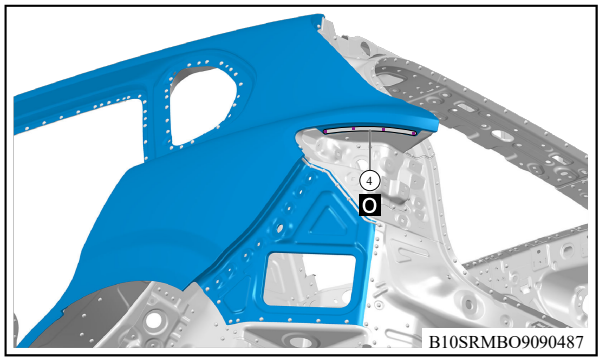
b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the rear section of the left side outer panel in place, align the two surfaces to eliminate any gaps, and clamp the parts to be welded using tools such as locking pliers.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)

© 2026, All rights reserved

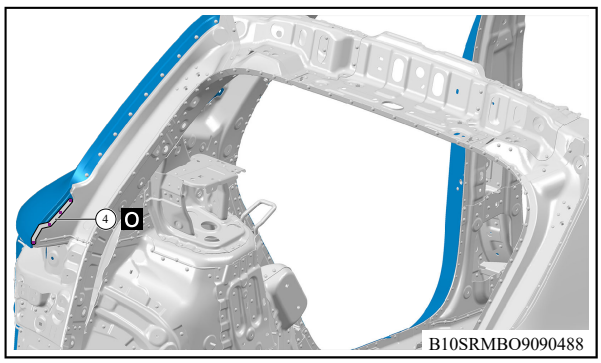


f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



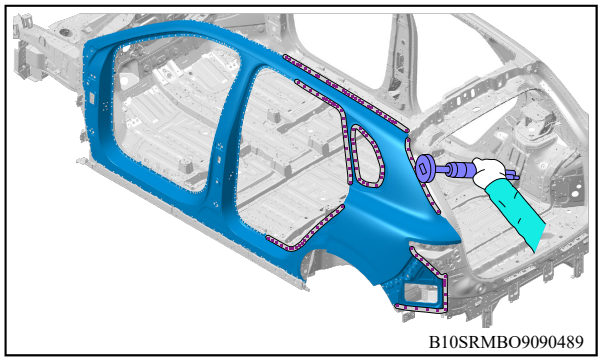
g. Use a MAG welder to perform plug welding on the rear section of the left side outer panel, the left C-pillar reinforcement panel assembly, and the rear section of the left side inner panel.

CAUTION

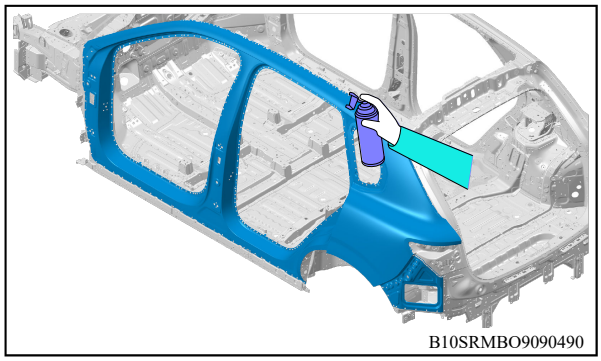


When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. Use a MAG welder to perform plug welding on the rear section of the left side outer panel, the left D-pillar reinforcement panel assembly, and the rear panel assembly.

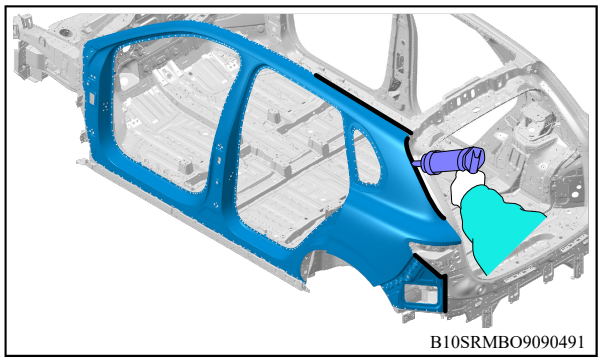


i. Use a MAG welder to plug weld the rear section of the left side outer panel and the left taillight mounting plate subassembly.



j. Use a MAG welder to plug weld the rear section of the left side outer panel and the left taillight mounting plate subassembly.

© 2026, All rights reserved



k. After welding is completed, use a grinder to clean the welding area at the rear section of the left side outer panel. Do not over-grind.

l. After grinding the spot welds, the surface of the rear section of the left side outer panel must be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

m. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

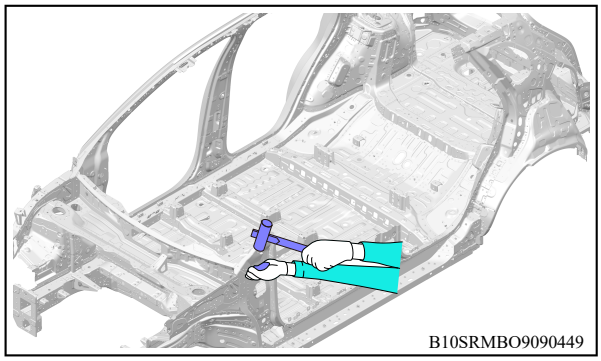
REPLACEMENT OF LEFT SIDE FRAME INNER PANEL SUB-ASSEMBLY

1. Tools

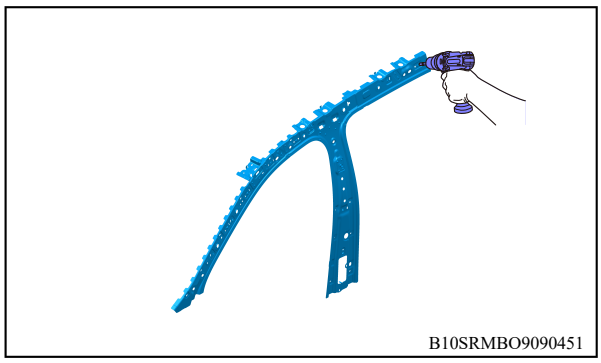
Welding tools	Spot welder, MAG welder
Spot weld removal tool	Spot weld drill
Positioning and Securing Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair tools	Flat hammer, dolly

2. Remove the original part



a. Remove the roof cover assembly.
SeeReplacement of Roof Panel Assembly (with Sunroof) (page 774)
b. Remove the roof front crossmember sub-assembly.
SeeReplacement of roof front crossmember sub-assembly (page 782)
c. Remove the front section of the left side outer panel.
SeeReplacement of the front section of the left side outer panel (page 699)
d. Remove the left side member reinforcement assembly.
SeeReplacement of Left Side Panel Reinforcement Assembly (page 716)
e. Drill out all spot welds to separate the left side inner panel sub-assembly from the upper section of the left A-pillar inner panel, the upper section of the left inner sill, and the front section of the left C-pillar upper side rail reinforcement, and remove the left side inner panel sub-assembly.

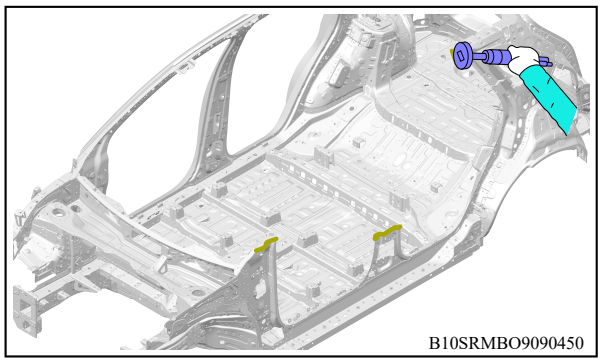
CAUTION



If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

© 2026, All rights reserved

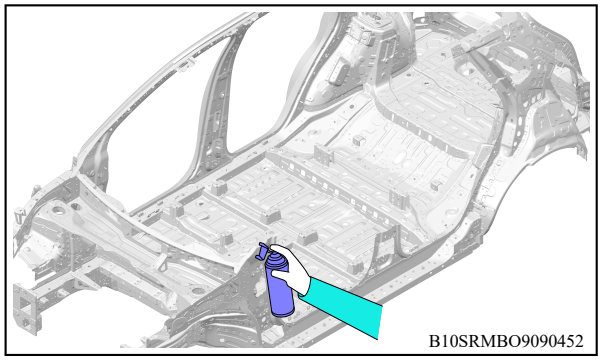
f. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.



3. Prepare new parts

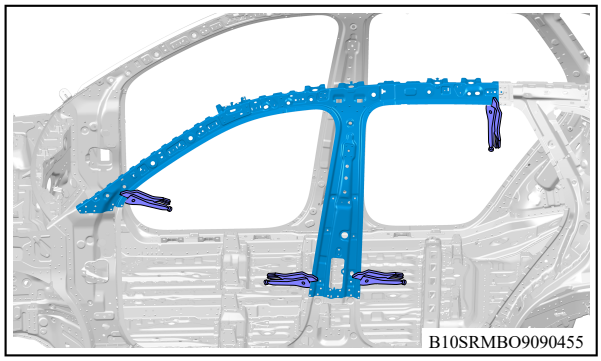
a. Prepare new parts and materials (left side inner panel sub-assembly, sealant, cleaner, sound insulation rubber block).
b. To perform plug welding, first drill holes in the left side inner panel sub-assembly, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Left side frame inner panel sub-assembly
Plug weld hole diameter (Φ)	8.0mm



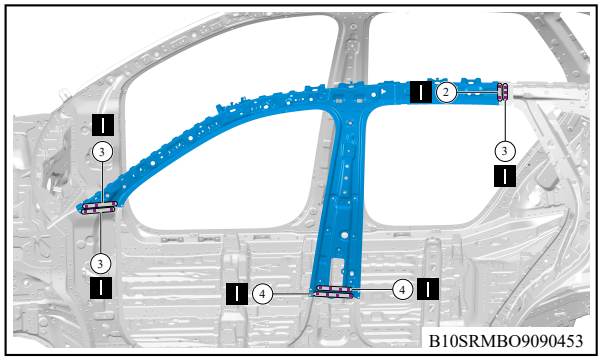
4. Welding

a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).



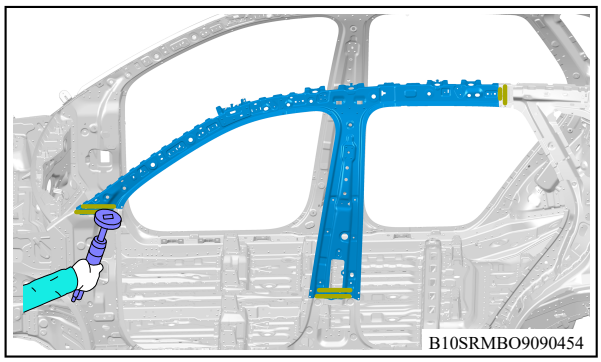
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.

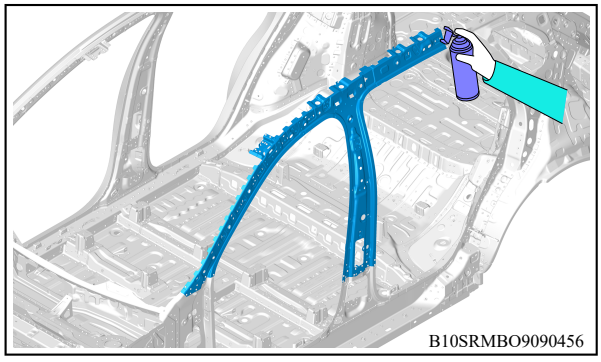


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



c. Install the left side inner panel sub-assembly in place, align the two surfaces to eliminate the gap, and clamp the parts to be welded using vise clamps or similar tools.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding between the left side inner panel sub-assembly and the upper section of the left A-pillar inner panel, the upper section of the left inner sill, and the front section of the left C-pillar upper side rail reinforcement plate.

CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. After welding is completed, use a grinder to clean the welding area of the left side inner panel sub-assembly. Avoid excessive grinding.

i. After grinding the spot welds, spray or brush epoxy primer onto the surface of the left side

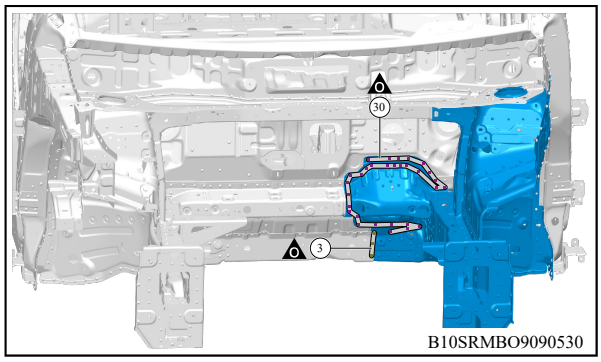
REPLACEMENT OF THE FRONT LEFT LONGITUDINAL RAIL WHEELHOUSE ASSEMBLY

1. Tools

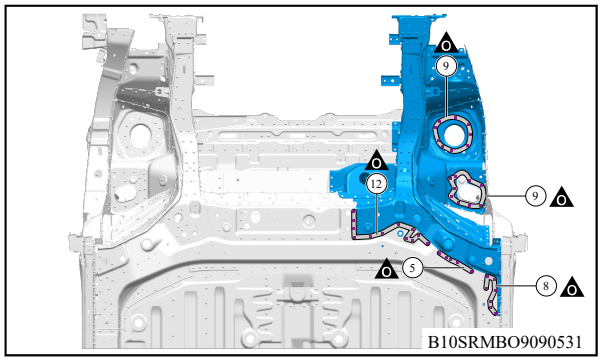
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



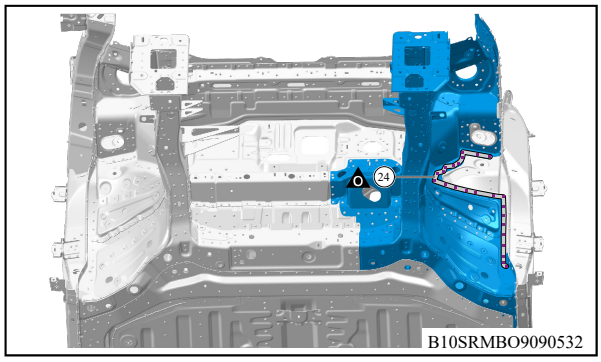
a. Remove the front connecting plate assembly of the left side panel.
SeeReplacement of the Left Side Front Connecting Plate Assembly (page 747)

b. Drill out all spot welds to separate the left front longitudinal rail wheelhouse assembly from the left A-pillar inner panel and the left A-pillar front extension inner panel.

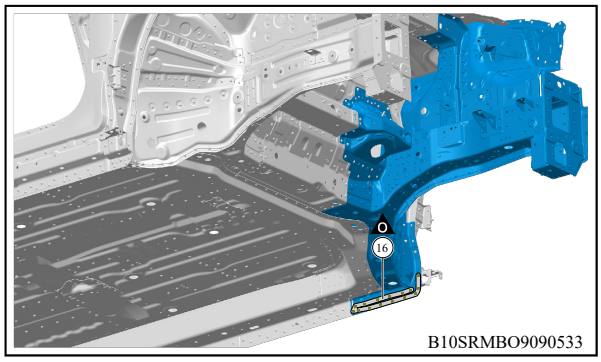


CAUTION

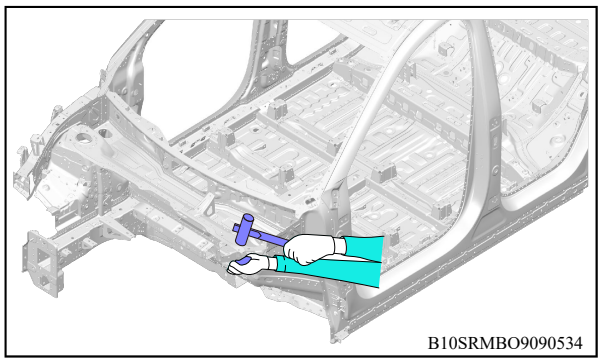
If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



c. Drill out all spot welds to separate the left front longitudinal rail wheelhouse assembly from the dash panel assembly and the dash crossmember.

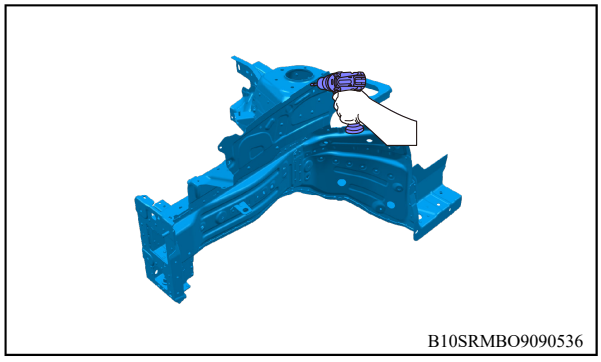


© 2026, All rights reserved



a. Drill out all spot welds to separate the left front longitudinal rail wheel housing assembly from the lower dash panel and the water trough.

a. Drill out all spot welds to separate the left front longitudinal rail wheelhouse assembly from the upper dash panel and the left A-pillar inner panel.

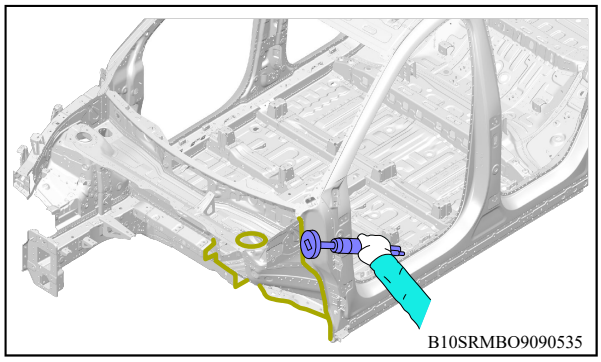


a. Drill out all spot welds to separate the left front longitudinal beam wheel housing assembly from the lower section of the left side door ring, and remove the left front longitudinal beam wheel housing assembly.

g. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

3. Prepare new parts

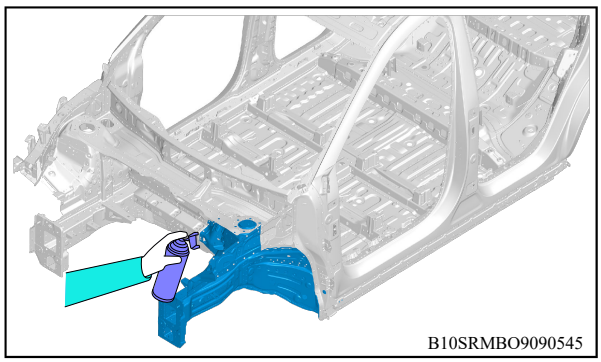
a. Prepare new parts and materials (front left longitudinal rail wheelhouse assembly, sealant, cleaner).



b. To perform plug welding, first drill holes in the left front longitudinal rail wheelhouse assembly, and select the appropriate hole diameter based on the metal thickness.

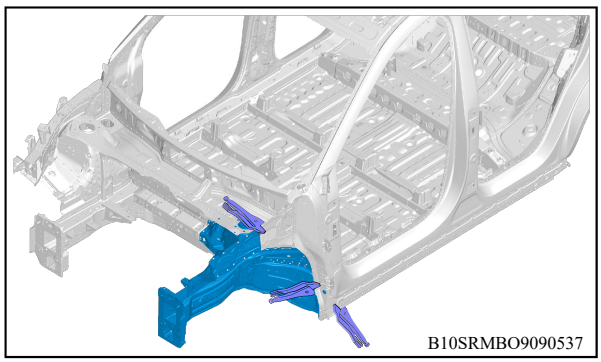
Plug hole diameter

© 2026, All rights reserved



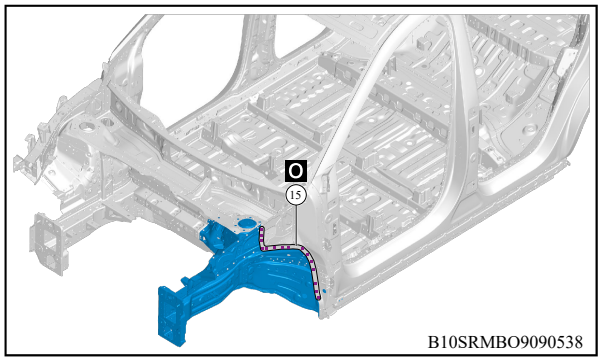
Name	Left front longitudinal rail wheel housing assembly
Plug weld hole diameter (Φ)	8.0mm

4. Welding



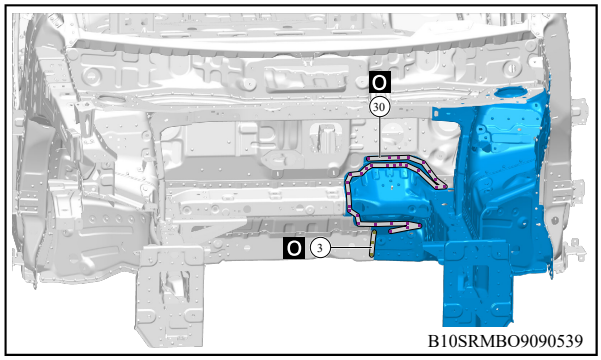
a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

> **CAUTION**
>
> Clean the welding area by wiping, taking care not to damage other panels.

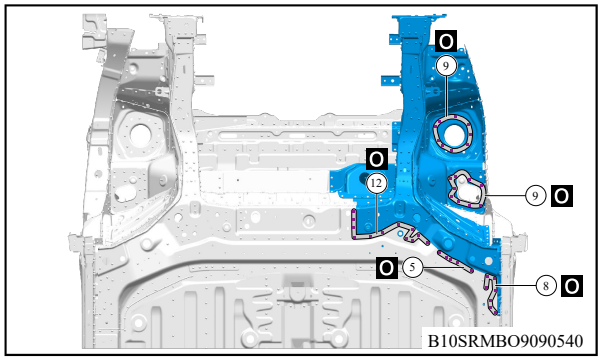


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the left front longitudinal rail wheelhouse assembly in position, align the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as locking pliers or welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)

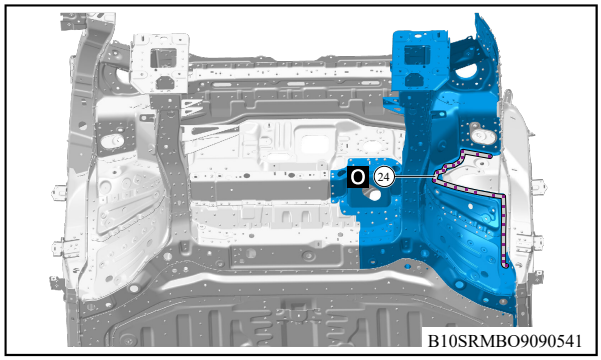


© 2026, All rights reserved



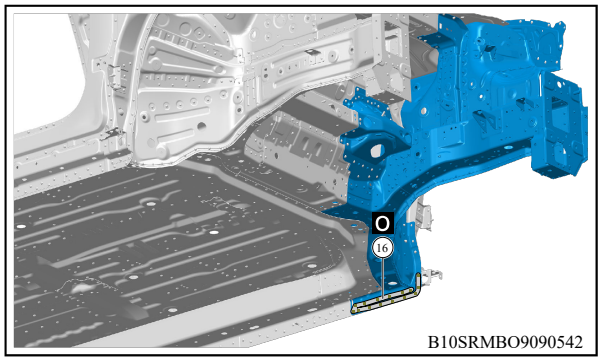
g. Use a MAG welder to perform plug welding on the left front longitudinal beam wheelhouse assembly, the left A-pillar inner panel, and the left A-pillar front extension inner panel.

CAUTION

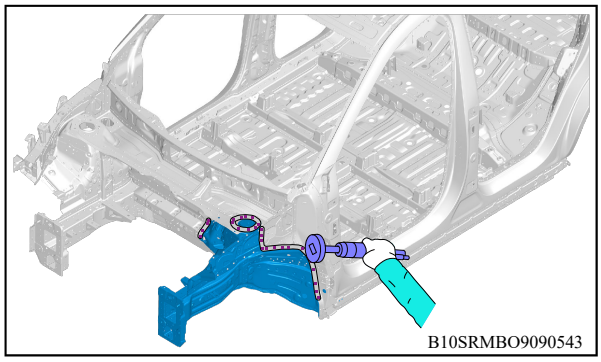


When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

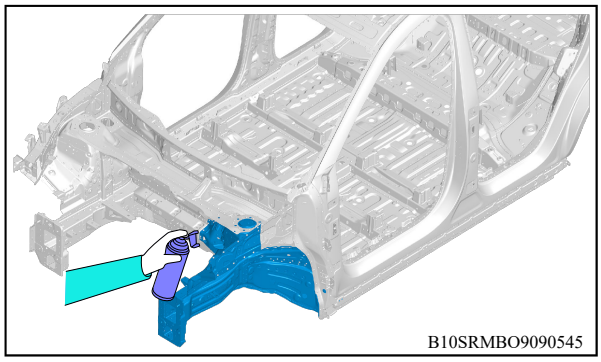
h. Use a MAG welder to plug weld the left front longitudinal rail wheelhouse assembly, the dash panel assembly, and the dash panel crossmember.



i. Use a MAG welder to perform plug welding on the left front longitudinal rail wheel housing assembly, the lower cowl panel, and the rain gutter.

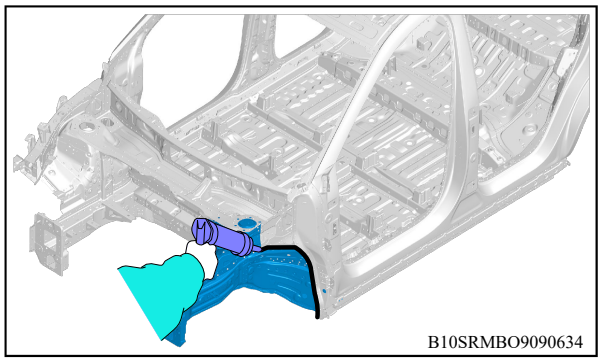


j. Use a MAG welder to plug weld the left front longitudinal rail wheel housing assembly, the dash panel upper, and the left A-pillar inner panel.



© 2026, All rights reserved

k. Use a MAG welder to perform plug welding on the left front longitudinal rail wheel house assembly and the lower section of the left side door ring.



l. After welding, use a grinder to clean the welding area of the left front longitudinal rail wheelhouse assembly. Do not over-grind.

m. After grinding the weld spots, the surface of the left front longitudinal rail wheelhouse assembly must be sprayed or brushed with an epoxy primer for anti-corrosion treatment.

CAUTION

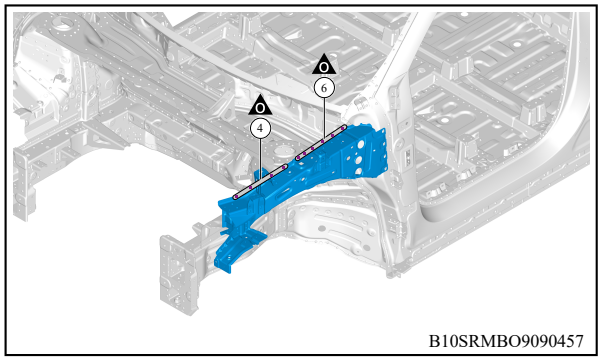
The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

n. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

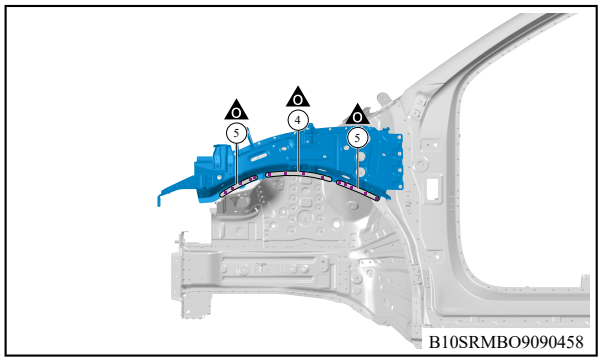
5. Install the left side panel front connecting plate assembly.
SeeReplacement of the Left Side Front Connecting Plate Assembly (page 747)



© 2026, All rights reserved

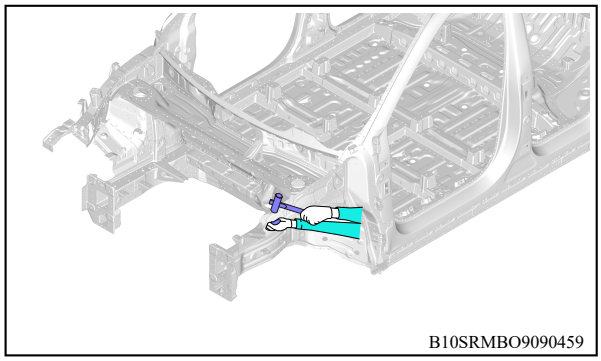
REPLACEMENT OF THE LEFT SIDE FRONT CONNECTING PLATE ASSEMBLY

1. Tools



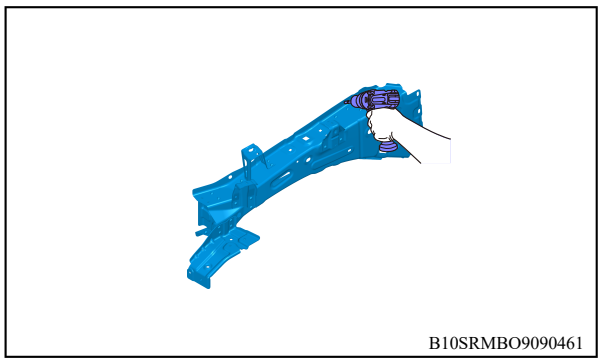
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



a. Drill out all spot welds to separate the left side panel front connecting plate assembly from the upper section of the left A-pillar upper rail inner panel.

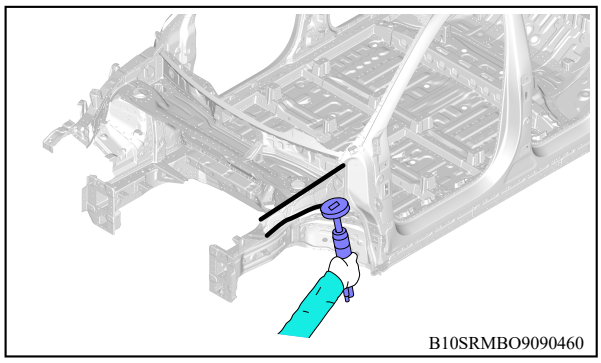
> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



b. Drill out all spot welds to separate the left side panel front connecting plate assembly from the lower section of the left A-pillar upper side rail inner panel, and remove the left side panel front connecting plate assembly.

© 2026, All rights reserved

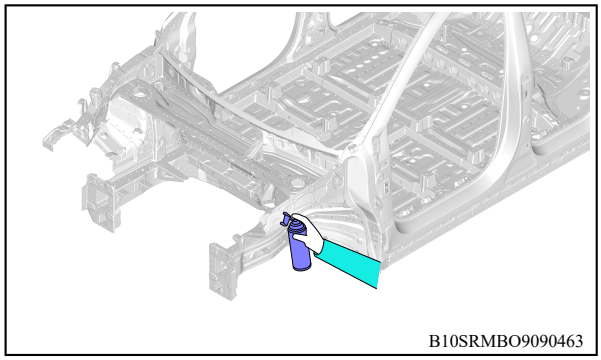
c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.



3. Prepare new parts

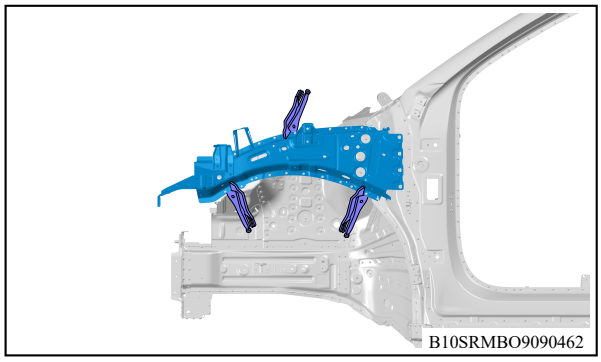
a. Prepare new parts and materials (left side member front connecting plate assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the left side body front connecting plate assembly, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Left side frame front connecting plate assembly
Plug weld hole diameter (Φ)	8.0mm



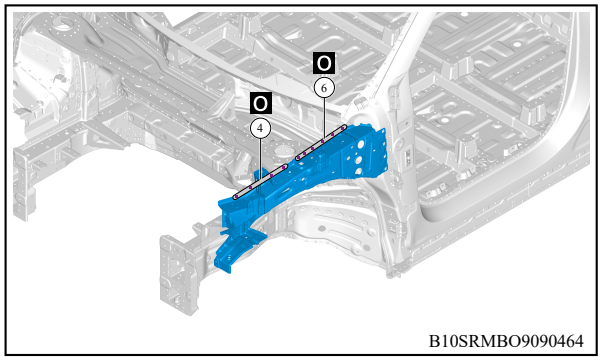
4. Welding

a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).



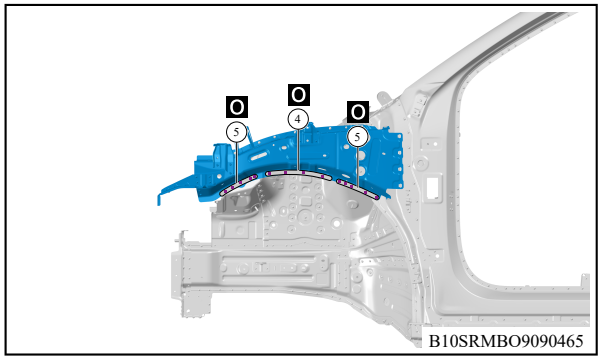
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.

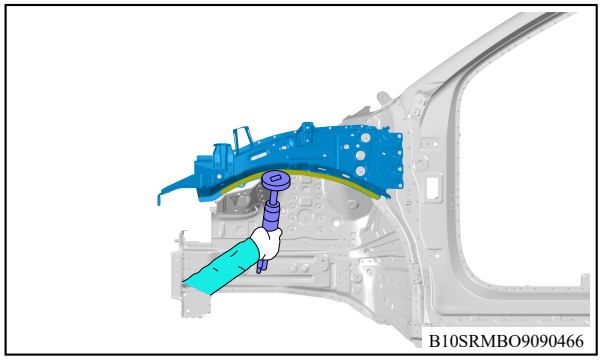


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



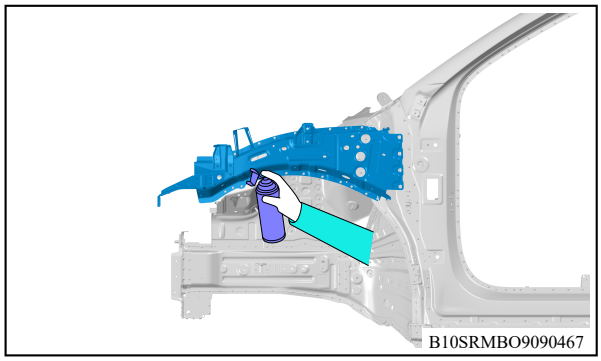
c. Install the left side member front connecting panel assembly in position, align the two surfaces to eliminate any gaps, and clamp the parts to be welded using vise grips or similar tools.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding on the left side front connecting plate assembly and the upper section of the left A-pillar upper side rail inner panel.

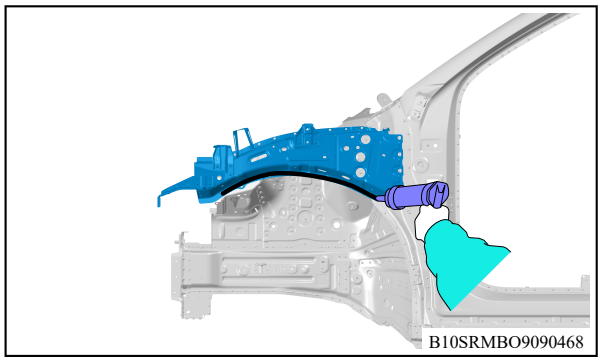
CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



h. Use a MAG welder to perform plug welding on the left side front connecting plate assembly and the lower section of the inner panel of the left A-pillar upper side rail.

i. After welding, use a grinder to clean the welding area of the left side panel front connecting plate assembly, and do not overgrind.



© 2026, All rights reserved

j. After grinding the spot welds, the surface of the left side panel front connecting plate assembly shall be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

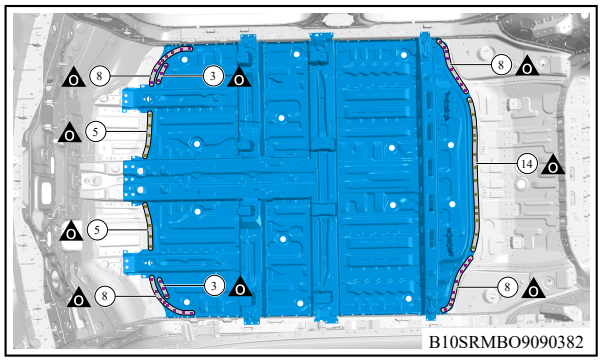
FLOOR

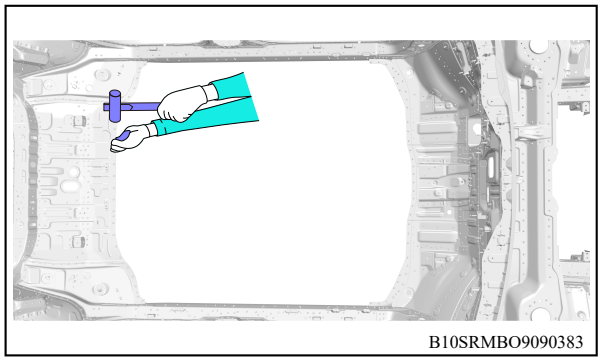
REPLACEMENT OF FRONT FLOOR STUD ASSEMBLY

1. Tools



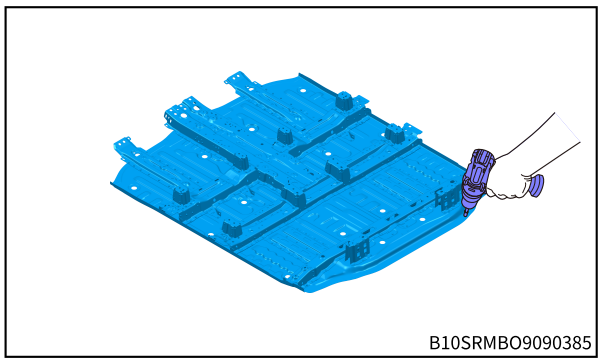
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



a. Drill out all spot welds to separate the front floor panel stud assembly from the left and right inner rocker panels.

> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

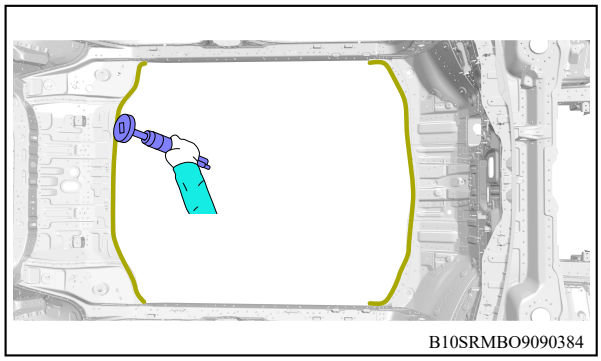


b. Drill out all spot welds to separate the front floor rail stud assembly from the lower cowl panel and rear floor panel, and remove the front floor rail stud assembly.

© 2026, All rights reserved

B10SRMBO9090383

c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

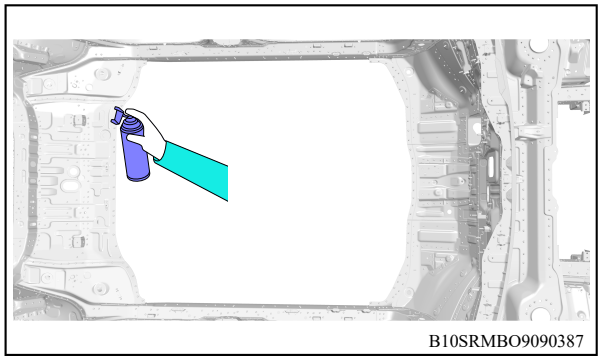


3. Prepare new parts

B10SRMBO9090385

a. Prepare new parts and materials (front floor stud assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the front floor stud assembly, and select the appropriate hole diameter according to the metal thickness.

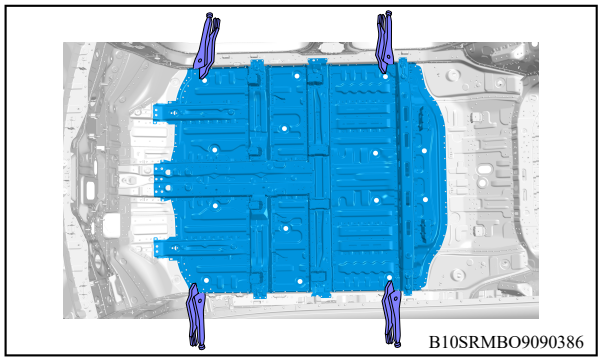
Plug hole diameter	
Name	Front floor with stud assembly
Plug weld hole diameter (Φ)	8.0mm



4. Welding

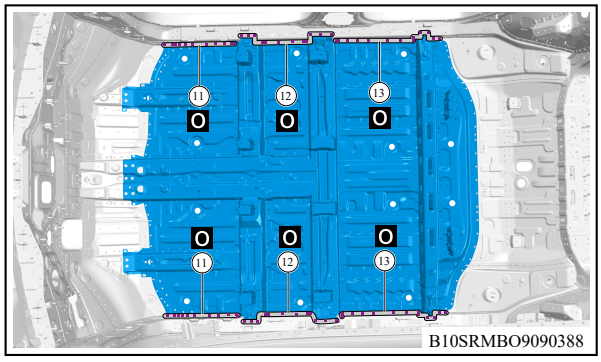
B10SRMBO9090384

a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).



CAUTION

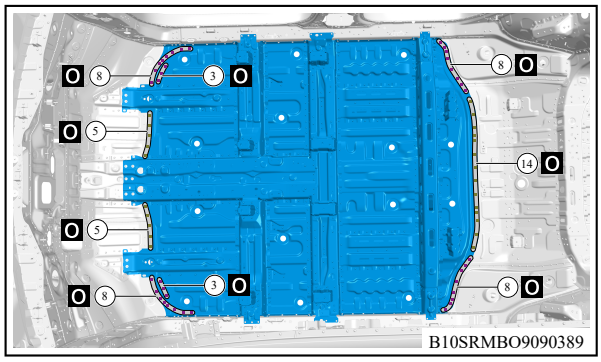
Clean the welding area by wiping, taking care not to damage other panels.



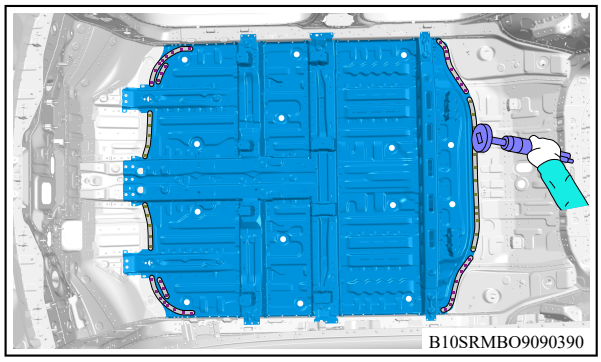
B10SRMBO9090387

b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



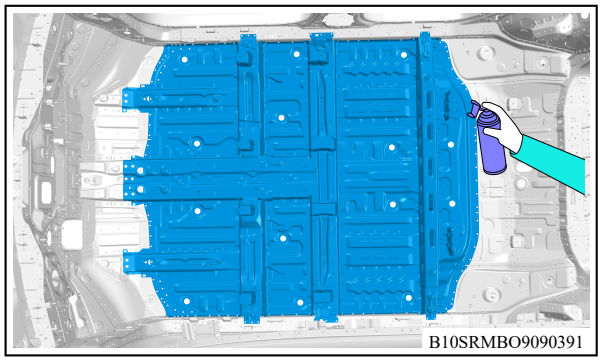
c. Install the front floor rail stud assembly in position, align the two surfaces to eliminate any gap, and clamp the parts to be welded using tools such as locking pliers.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to plug weld the front floor stud assembly and the left and right inner rocker panels.

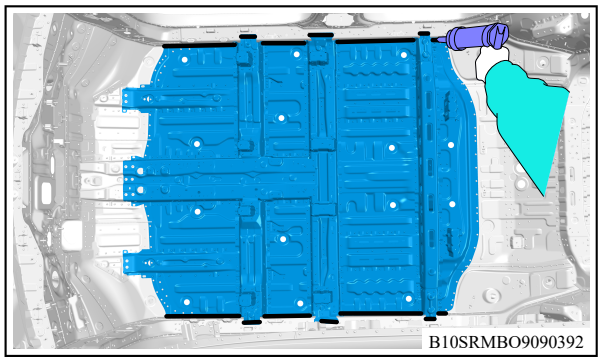
CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



h. Use a MAG welding machine to plug weld the front floor stud assembly, the lower dash panel, and the rear floor panel.

i. After welding, use a grinder to clean the weld area of the front floor panel with stud assembly. Avoid excessive grinding.



© 2026, All rights reserved

j. After grinding the spot welds, spray or brush epoxy primer onto the surface of the front floor panel with studs assembly for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

NOTE

Apply the paint coating only after the sealant has dried.

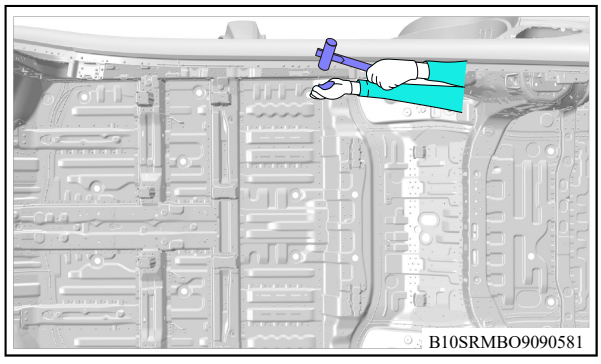
REPLACEMENT OF KICK PANEL ASSEMBLY

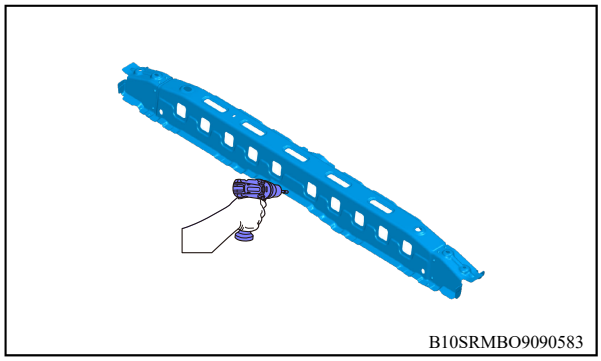
1. Tools



Welding tools	Spot welder, MAG welder
Spot weld removal tool	Spot weld drill
Positioning and Securing Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair tools	Flat hammer, dolly

2. Remove the original part

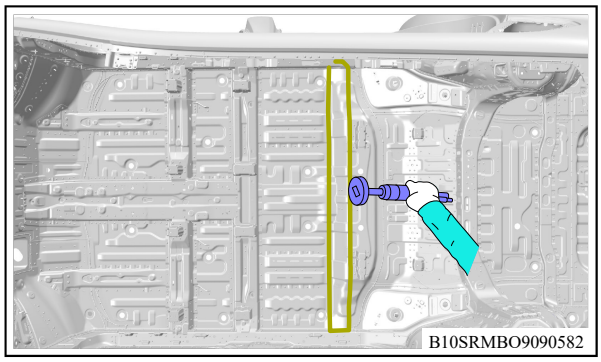
a. Drill out all spot welds to separate the kick panel assembly from the front floor assembly and the left and right inner rocker panels, and remove the kick panel assembly.



> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

b. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

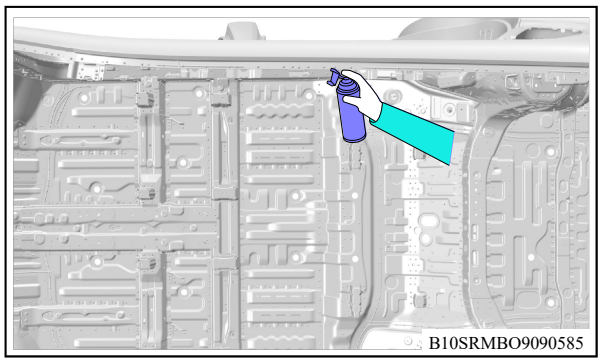
3. Prepare new parts



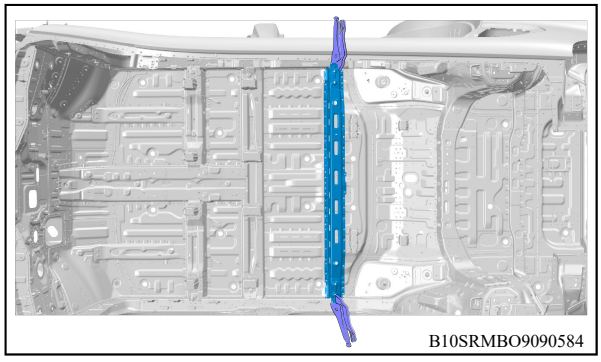
© 2026, All rights reserved

a. Prepare new parts and materials (heel plate assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the heel plate assembly, selecting the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Scuff plate assembly
Plug weld hole diameter (Φ)	8.0mm



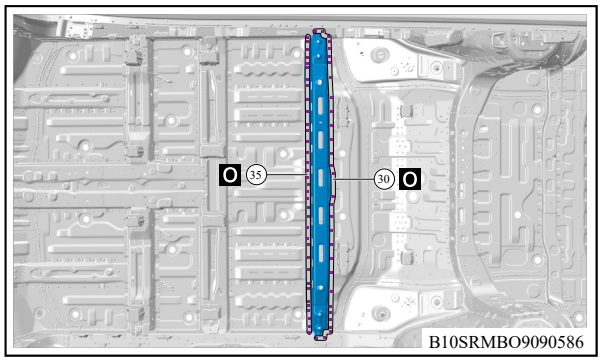
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

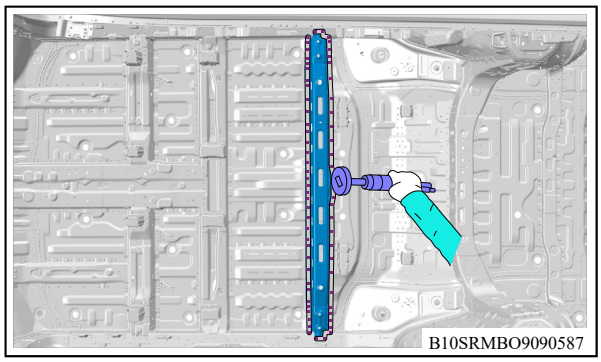
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.



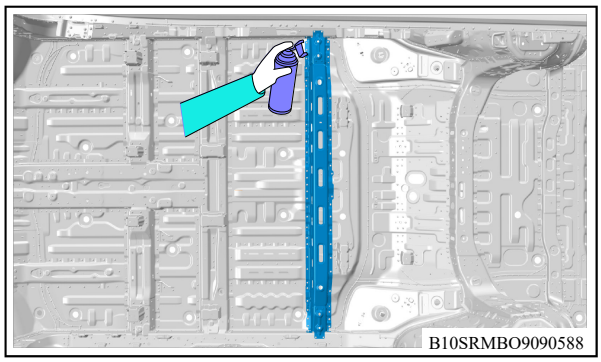
b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the kick panel assembly in position, flatten the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as vise-grip welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.



© 2026, All rights reserved

SeeExterior body clearance (page 577)



g. Use a MAG welder to plug weld the heel plate assembly to the front floor assembly and the left and right inner rocker panels.

> **CAUTION**
>
> When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. After welding is completed, use a grinder to clean the weld area of the heel plate assembly, and do not over-grind.

i. After grinding the spot welds, the surface of the seat cross member assembly must be sprayed or brushed with epoxy primer for anti-corrosion treatment.

> **CAUTION**
>
> The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

j. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

> **NOTE**
>
> Apply the paint coating only after the sealant has dried.

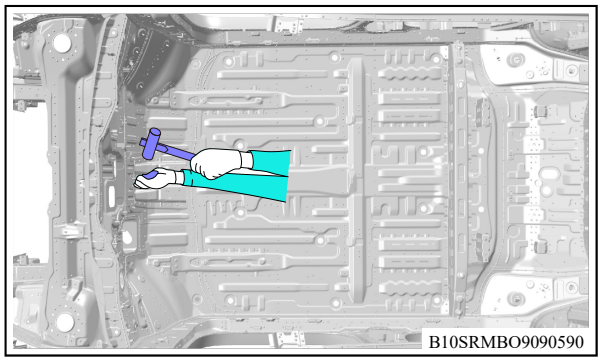
REPLACEMENT OF SEAT CROSS MEMBER ASSEMBLY

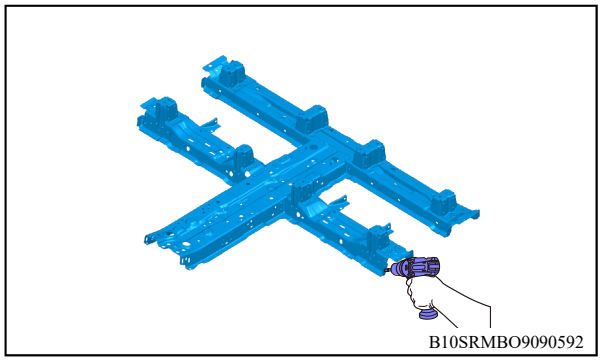
1. Tools



Welding tools	Spot welder, MAG welder
Spot weld removal tool	Spot weld drill
Positioning and Securing Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair tools	Flat hammer, dolly

2. Remove the original part

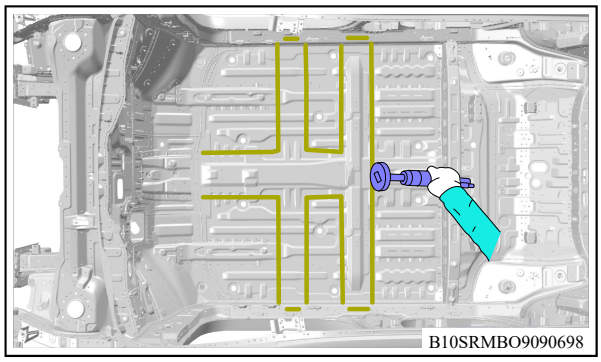
a. Drill out all spot welds, separate the seat cross member assembly from the front floor assembly and the left and right inner rocker panels, and remove the seat cross member assembly.



> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

b. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

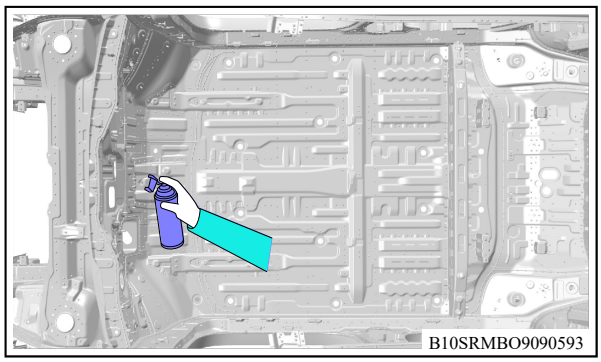
3. Prepare new parts



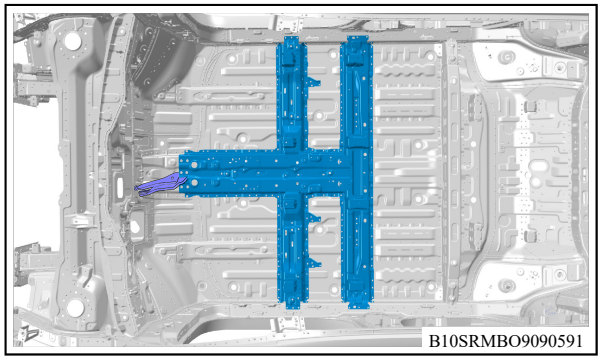
© 2026, All rights reserved

a. Prepare new parts and materials (seat crossmember assembly, sealant, cleaner).
b. To perform plug welding, first drill a hole in the seat crossmember assembly, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Seat crossmembe r assembly
Plug weld hole dia meter (Φ)	8.0mm



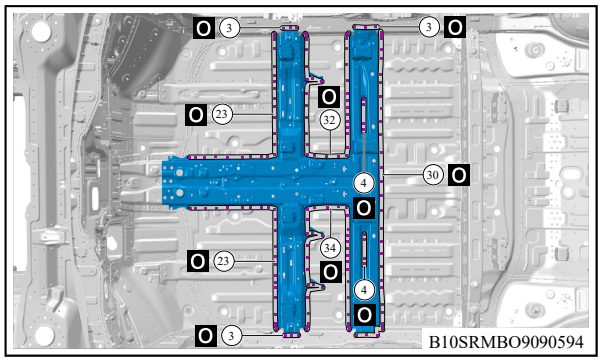
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

Clean the welding area by wiping, taking care not to damage other panels.



b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the seat crossmember assembly in place, smooth the two surfaces to eliminate any gaps, and clamp the parts to be welded using tools such as vise-grip welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.

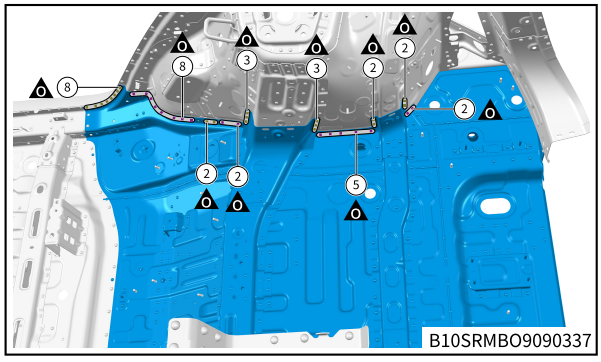
REPLACEMENT OF REAR FLOOR STUD ASSEMBLY

1. Tools

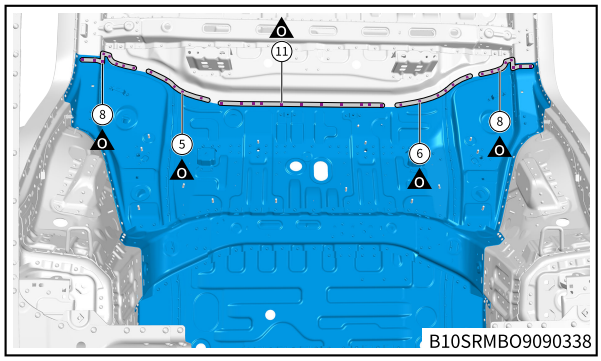
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



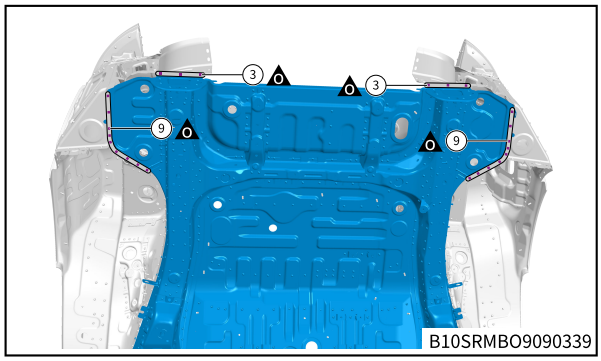
a. Remove the rear body assembly. SeeRear Panel Assembly Replacement (page 794)

b. Drill out all spot welds to separate the rear floor rail stud assembly from the left rear wheelhouse inner panel assembly.

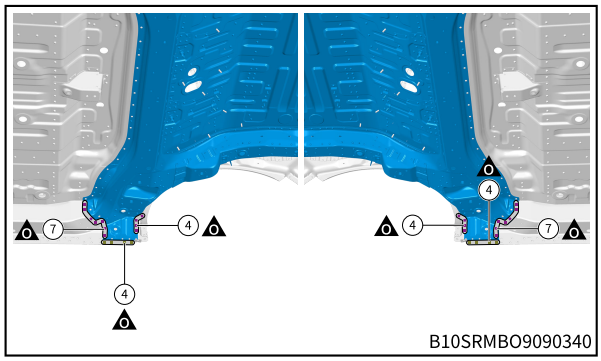


CAUTION

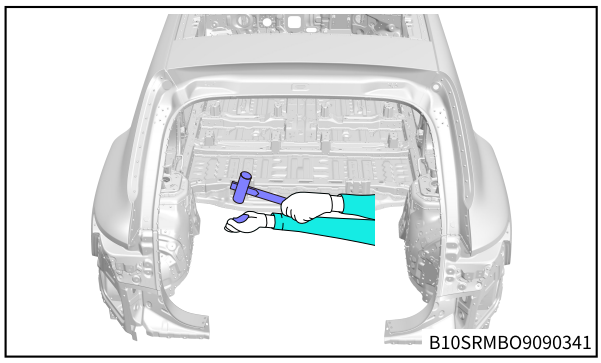
If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



c. Drill out all spot welds to separate the rear floor rail stud assembly from the right rear wheelhouse inner panel assembly.

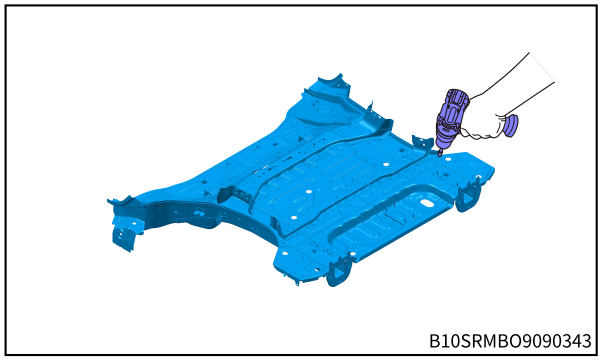


© 2026, All rights reserved



d. Drill out all spot welds to separate the rear floor rail stud assembly from the front floor assembly.

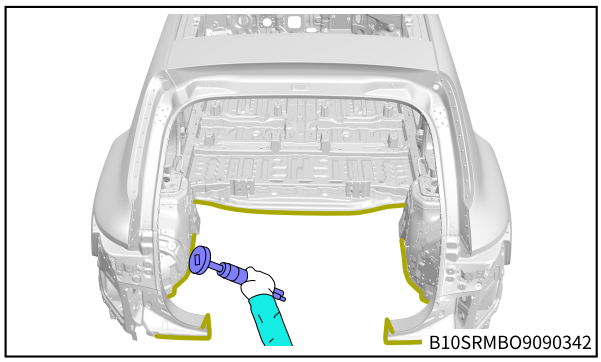
e. Drill out all spot welds to separate the rear floor pan stud assembly from the left and right side outer panel assemblies.



f. Drill out all spot welds to separate the rear floor rail stud assembly from the left and right side panel assemblies, and remove the rear floor rail stud assembly.

g. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

3. Prepare new parts

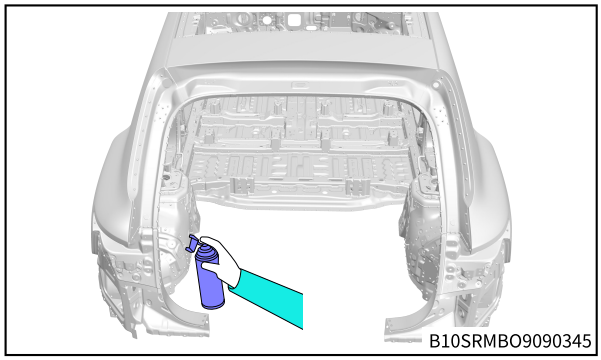


a. Prepare new parts and materials (rear floor panel with stud assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the rear floor rail stud assembly, and select the appropriate hole diameter according to the metal thickness.

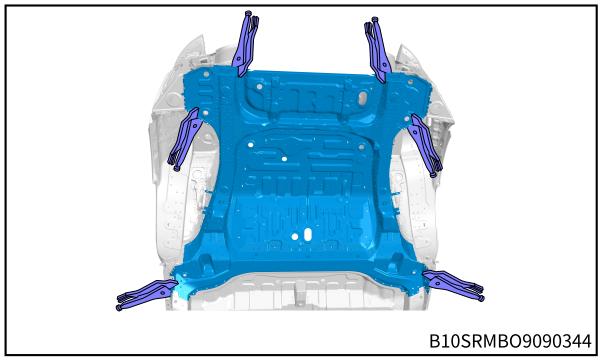
Plug hole diameter

© 2026, All rights reserved

Name	Rear Floor Stud As sembly
Plug weld hole di ameter (Φ)	8.0mm



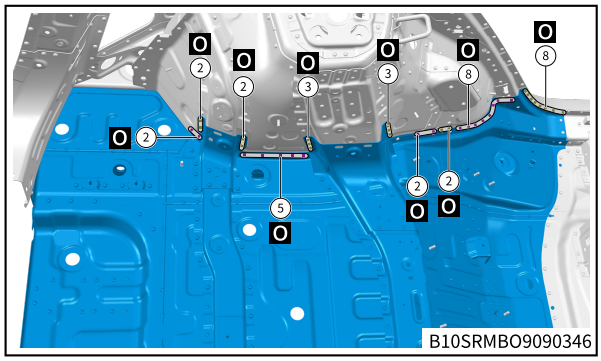
4. Welding



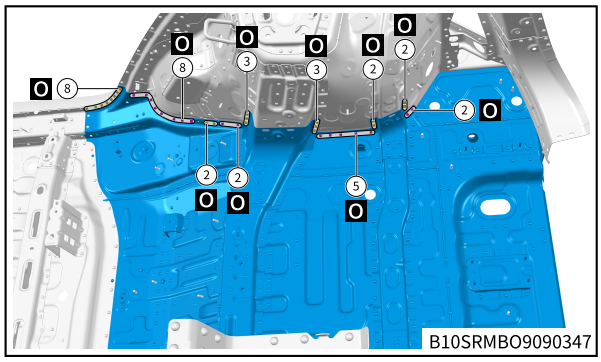
a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

Clean the welding area by wiping, taking care not to damage other panels.



b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.



c. Install the rear floor rail stud assembly in position, align the two surfaces to eliminate the gap, and clamp the parts to be welded using tools such as locking pliers.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.

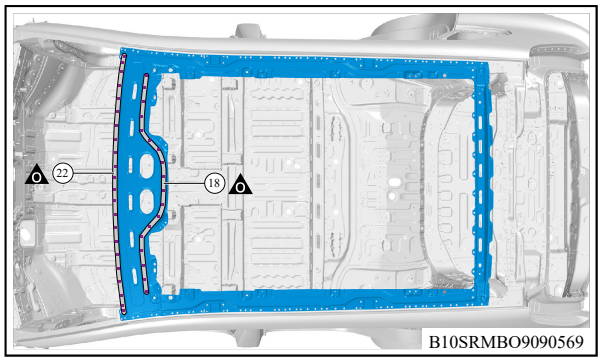
ROOF COVER

REPLACEMENT OF SUNROOF REINFORCEMENT PANEL ASSEMBLY

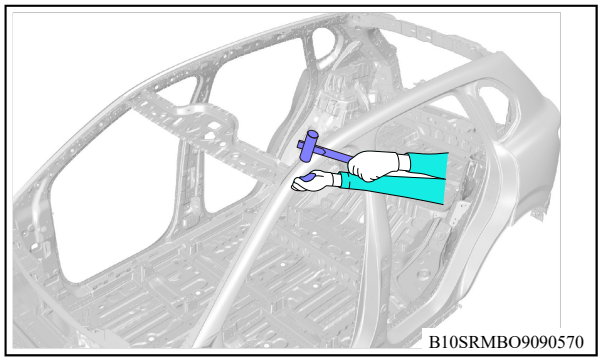
1. Tools

Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly



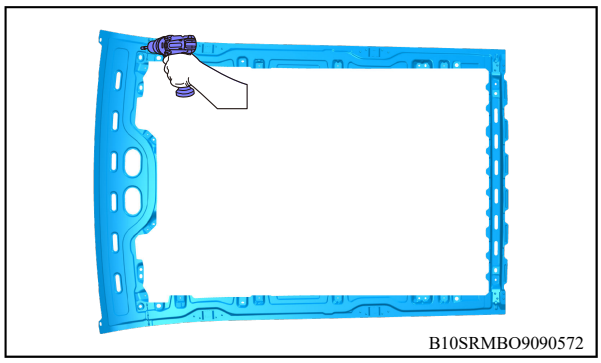
2. Remove the original part

a. Remove the roof outer panel (panoramic roof).
SeeReplacement of Roof Outer Panel (Panoramic Roof) (page 770)



b. Drill out all spot welds to separate the sunroof reinforcement panel assembly from the left side panel assembly and the right side panel assembly.

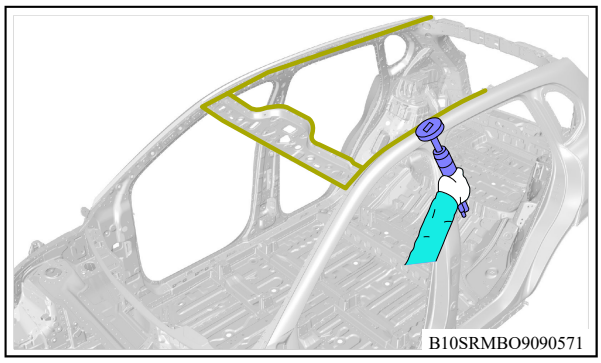
> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



c. Drill out all spot welds to separate the sunroof reinforcement panel assembly from the front roof crossmember, and remove the sunroof reinforcement panel assembly.

© 2026, All rights reserved

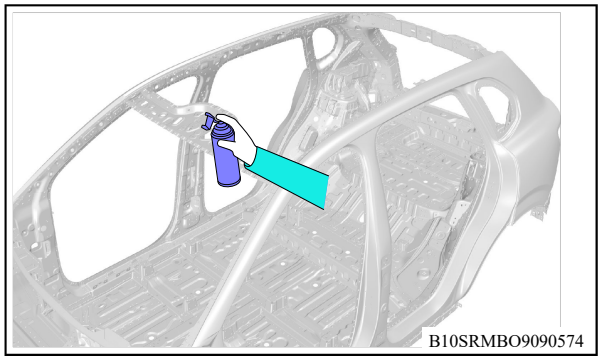
d. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.



3. Prepare new parts

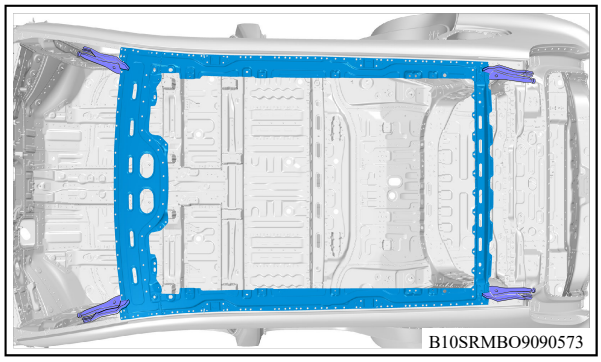
a. Prepare new parts and materials (sunroof reinforcement panel assembly, sealant, cleaner).
b. To perform plug welding, first drill a hole in the sunroof reinforcement panel assembly, and select the appropriate hole diameter based on the metal thickness.

Plug hole diameter	
Name	Sunroof reinforcement plate assembly
Plug weld hole diameter (Φ)	8.0mm



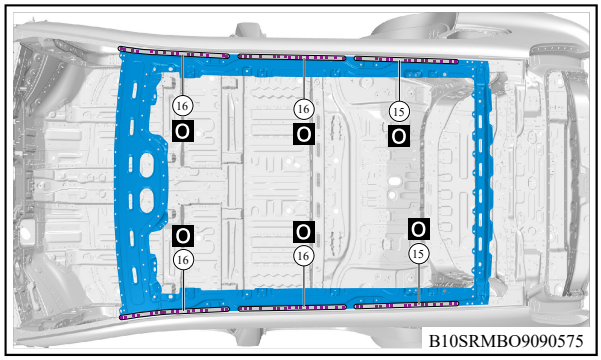
4. Welding

a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).



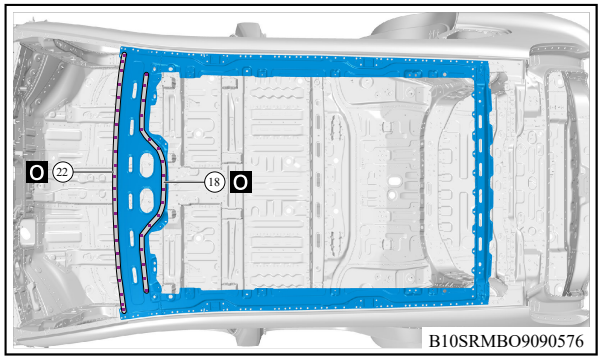
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.

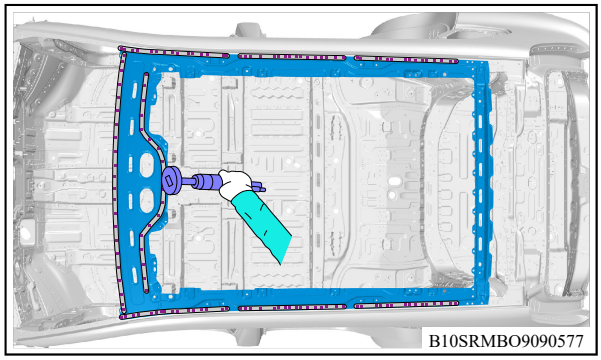


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



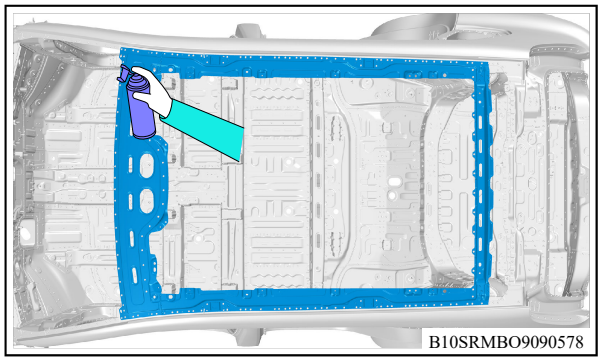
c. Install the sunroof reinforcement panel assembly in position, align the two surfaces to eliminate gaps, and clamp the parts to be welded using tools such as vise-grip welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding on the sunroof reinforcement panel assembly, the left side panel assembly, and the right side panel assembly.

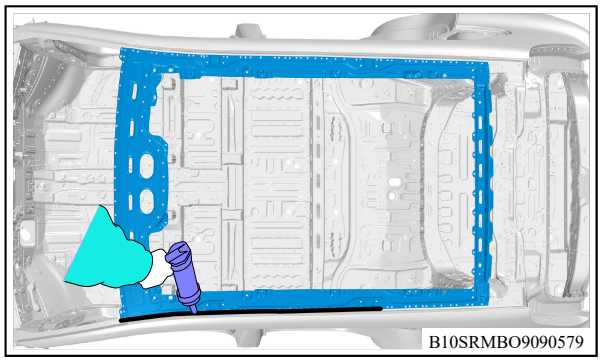
CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



h. Use a MAG welder to perform plug welding on the sunroof reinforcement panel assembly and the roof front cross member.

i. After welding is completed, use a grinder to clean the welding area of the sunroof reinforcement panel assembly, and do not over-grind.



© 2026, All rights reserved

j. After grinding the spot welds, the surface of the sunroof reinforcement panel assembly must be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

CAUTION

Apply the paint coating only after the sealant has dried.

5. Install the roof outer panel (panoramic roof).
SeeReplacement of Roof Outer Panel (Panoramic Roof) (page 770)

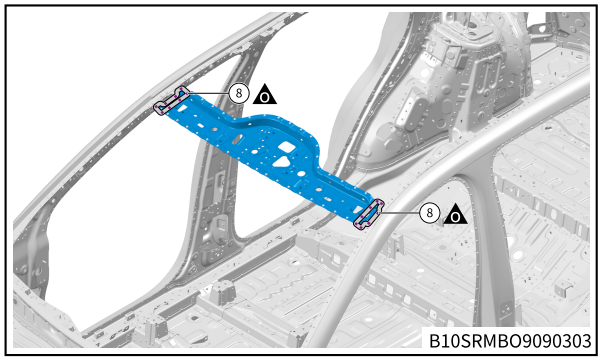
j. After grinding the spot welds, the surface of the lower panel of the roof rear cross member must be sprayed or brushed with an epoxy primer for anti-corrosion treatment.

> **CAUTION**
>
> The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

> **CAUTION**
>
> Apply the paint coating only after the sealant has dried.

5. Install the roof outer panel (panoramic roof).
SeeReplacement of Roof Outer Panel (Panoramic Roof) (page 770)



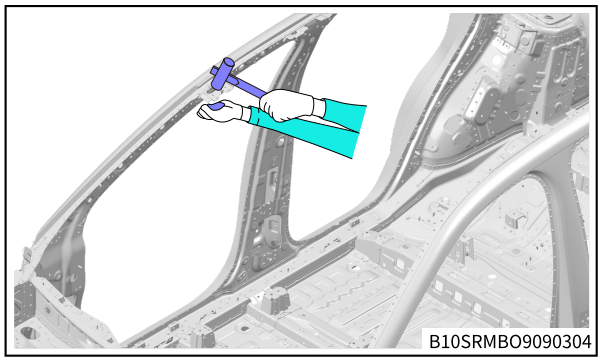
© 2026, All rights reserved

REPLACEMENT OF ROOF FRONT CROSSMEMBER SUB-ASSEMBLY

1. Tools

Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

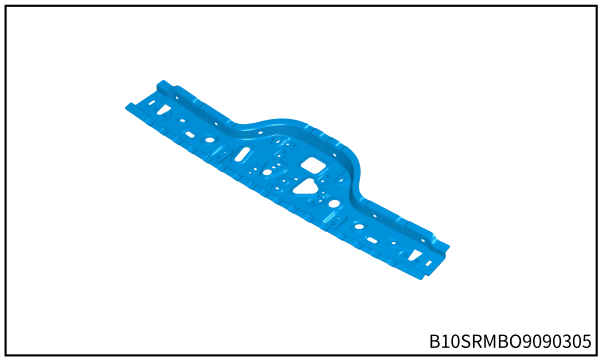
2. Remove the original part



a. Remove the roof panel assembly (with sunroof).
SeeReplacement of Roof Panel Assembly (with Sunroof) (page 774)

b. Drill out all spot welds to separate the roof front cross member sub-assembly from the left roof front cross member connecting plate and the right roof front cross member connecting plate.

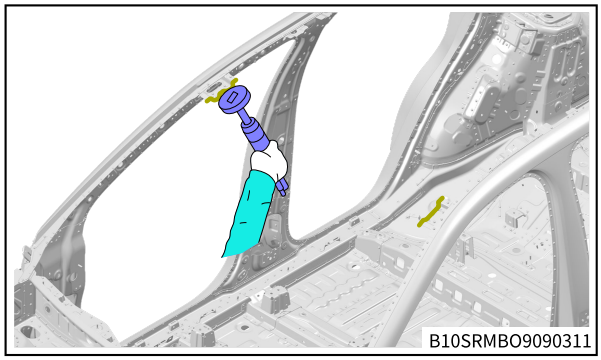
CAUTION



If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.

c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

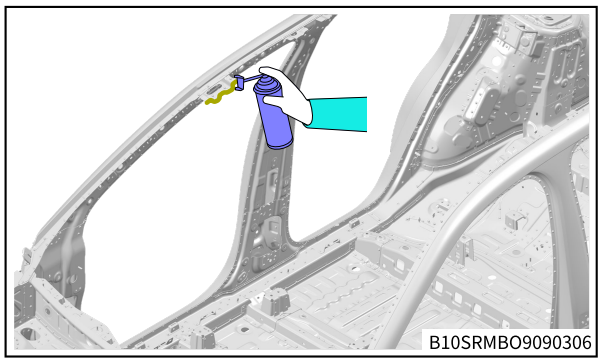
3. Prepare new parts



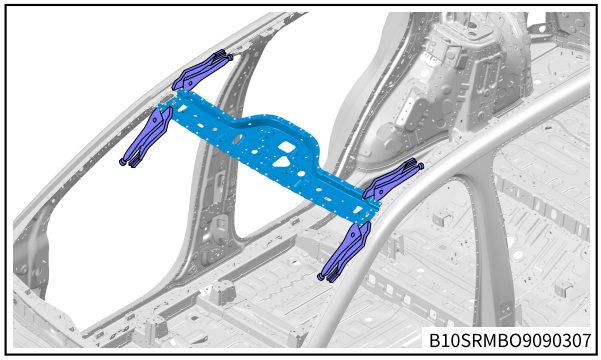
© 2026, All rights reserved

a. Prepare new parts and materials (front roof crossmember sub-assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the roof front crossmember sub-assembly, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Roof Front Cross member Sub-asse mbly
Plug weld hole dia meter (Φ)	8.0mm



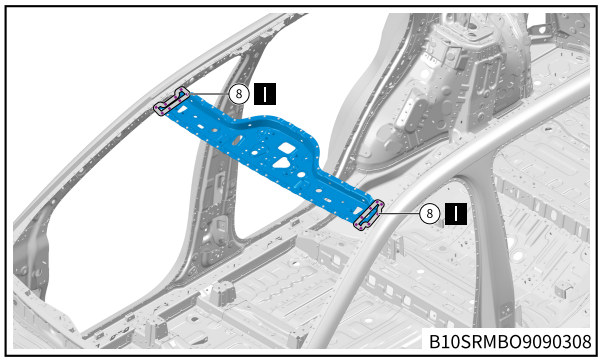
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

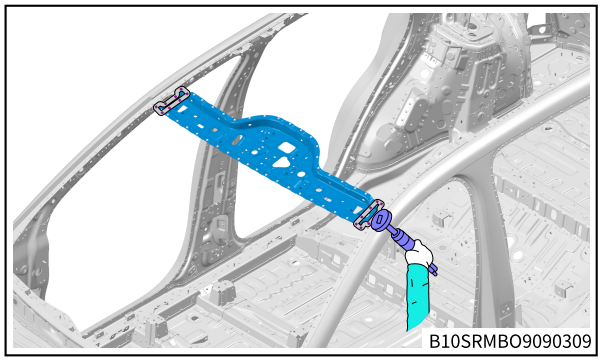
Clean the welding area by wiping, taking care not to damage other panels.



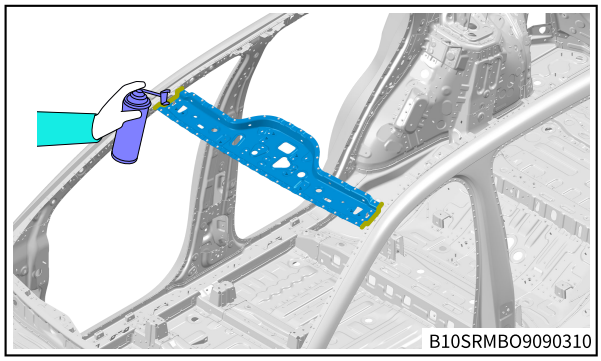
b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the roof front crossmember sub-assembly in place, align the two surfaces to eliminate any gap, and clamp the parts to be welded using tools such as vise-grip welding clamps.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)

© 2026, All rights reserved



f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding on the front roof crossmember sub-assembly, the left front roof crossmember connecting plate, and the right front roof crossmember connecting plate.

CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. After welding is completed, use a grinder to clean the welding area of the roof front crossmember sub-assembly, and do not grind excessively.

i. After grinding the spot welds, the surface of the roof front cross member sub-assembly needs to be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

j. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

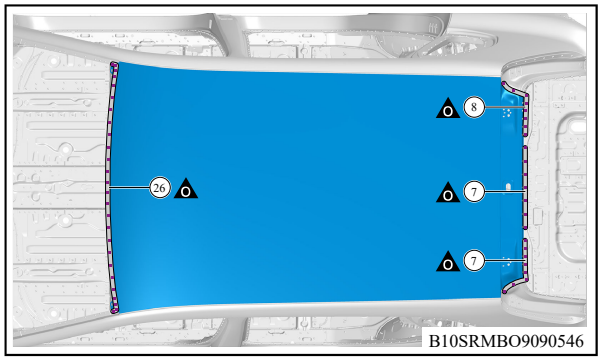
CAUTION

Apply the paint coating only after the sealant has dried.

5. Install the roof panel assembly (with sunroof).

© 2026, All rights reserved

SeeReplacement of Roof Panel Assembly (with Sunroof) (page 774)

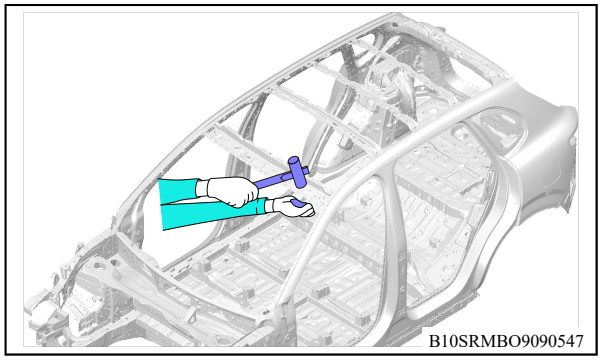


© 2026, All rights reserved

REPLACEMENT OF ROOF PANEL ASSEMBLY (METAL ROOF)

1. Tools

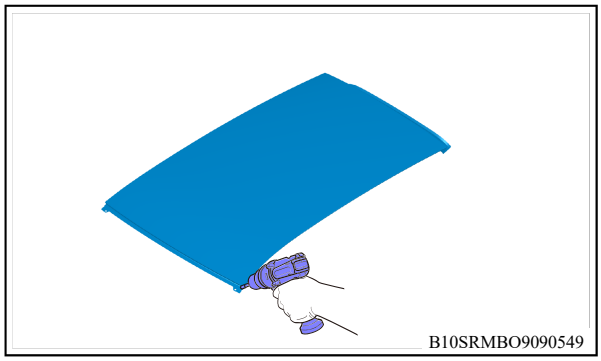
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly



2. Remove the original part

a. Drill out all spot welds to separate the metal roof panel assembly from the left side panel assembly and the right side panel assembly.

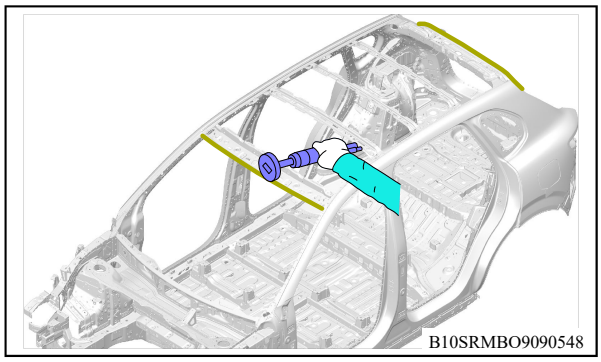
> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



b. Drill out all spot welds to separate the metal roof assembly from the front roof crossmember and the rear roof crossmember, and remove the metal roof assembly.

c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

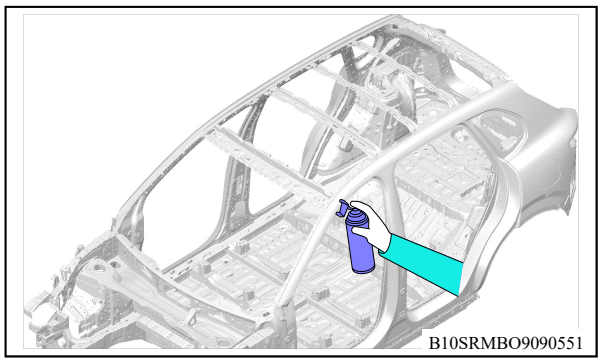
3. Prepare new parts



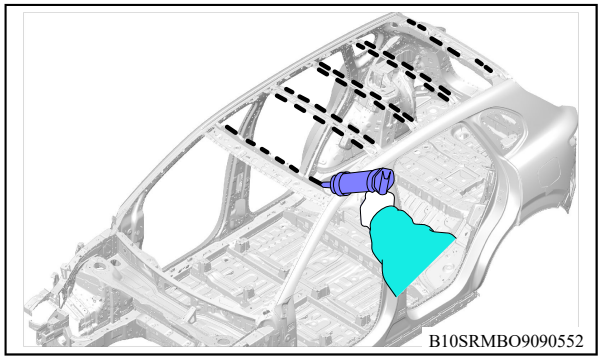
© 2026, All rights reserved

a. Prepare new parts and materials (metal roof cover assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the metal roof panel assembly, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Metal top cover a ssembly
Plug weld hole dia meter (Φ)	8.0mm



4. Welding

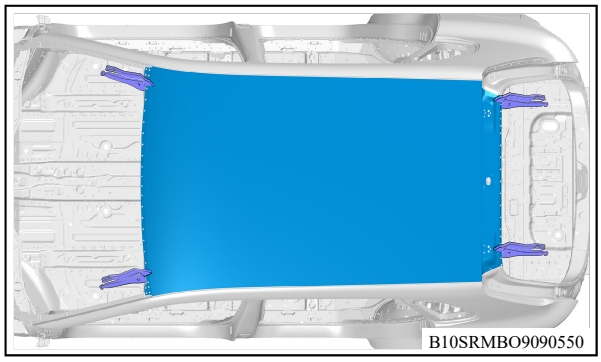


a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

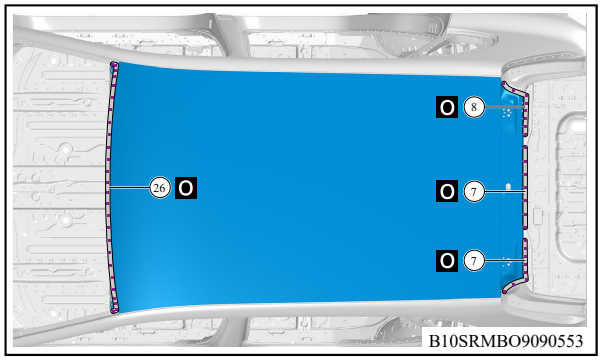
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.

b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.



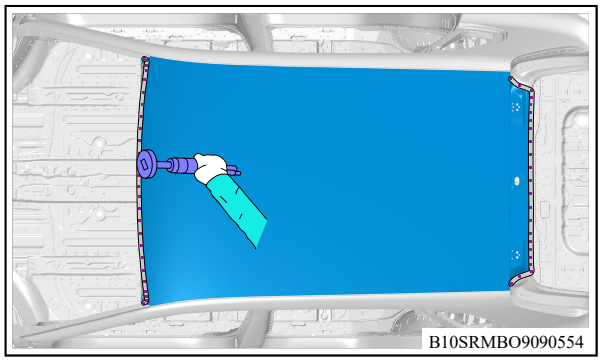
c. Before welding, spray sealant (TEROSONPV 3558) onto the roof cross member, applying it to the groove of the rear roof cross member.



CAUTION

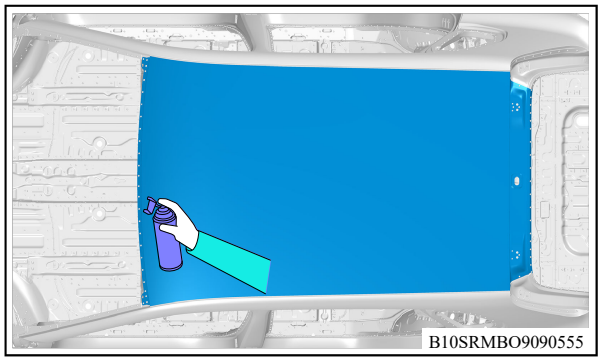
The sealant (TEROSONPV 3558) is applied for bonding and sealing at the roof cover. Using the sealant can reduce the transmission of driving noise into the vehicle interior.

© 2026, All rights reserved



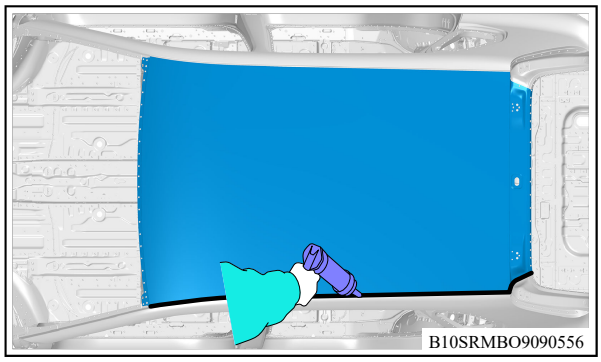
d. Install the metal roof panel assembly in position, align the two surfaces flush to eliminate any gaps, and clamp the parts to be welded using tools such as vise-grip welding clamps.
e. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
f. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
g. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)

h. Use a MAG welder to perform plug welding on the metal roof panel assembly, the left side panel assembly, and the right side panel assembly.



> **CAUTION**
>
> When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

i. Use a MAG welder to plug weld the all-metal roof assembly to the front roof crossmember and the rear roof crossmember.



j. After welding is completed, use a grinder to clean the weld area of the metal roof panel assembly, and avoid over-grinding.

© 2026, All rights reserved

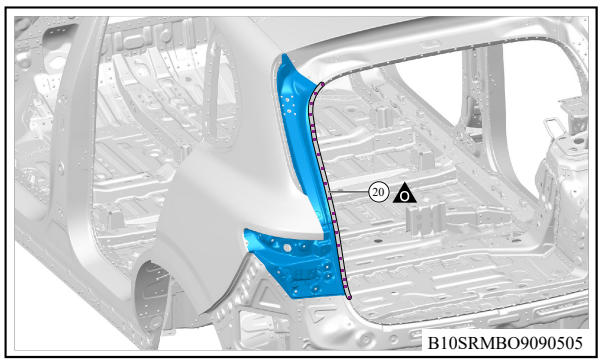
k. After grinding the weld spots, spray or brush an epoxy primer onto the surface of the metal roof panel assembly for anti-corrosion treatment.

> **CAUTION**
>
> The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

l. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

> **CAUTION**
>
> Apply the paint coating only after the sealant has dried.

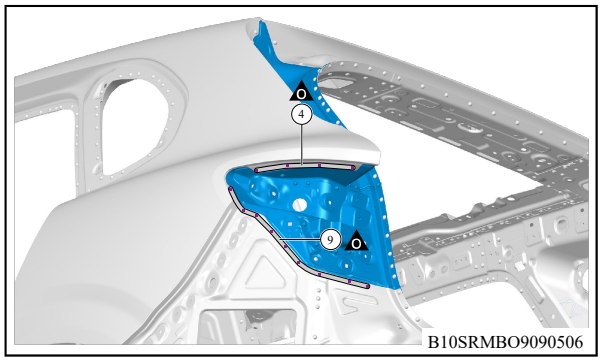
© 2026, All rights reserved



REAR PANEL

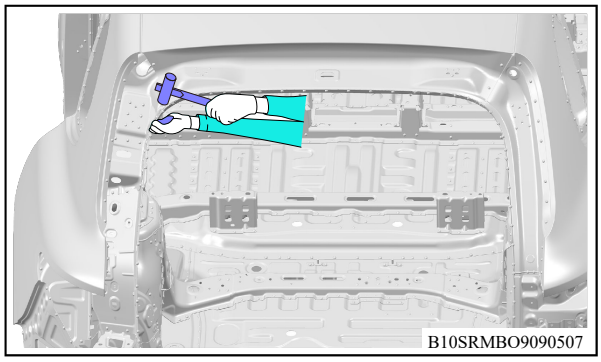
REPLACEMENT OF REAR LEFT WATER DRAIN CHANNEL ASSEMBLY

1. Tools



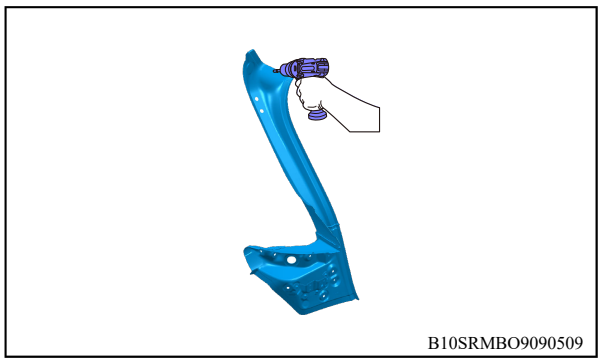
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



a. Drill out all spot welds to separate the left rear drip rail assembly from the left D-pillar inner panel.

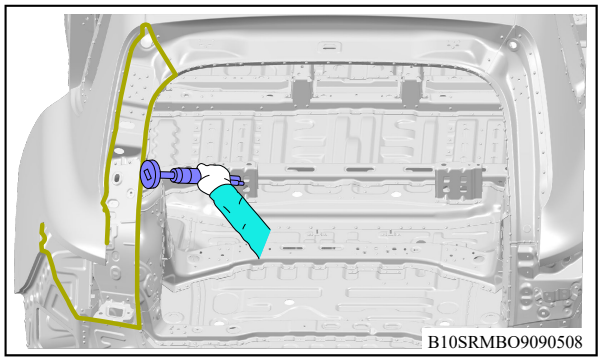
> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



b. Drill out all spot welds to separate the left rear water trough assembly from the rear panel outer and the rear section of the left side panel assembly, and remove the left rear water trough assembly.

© 2026, All rights reserved

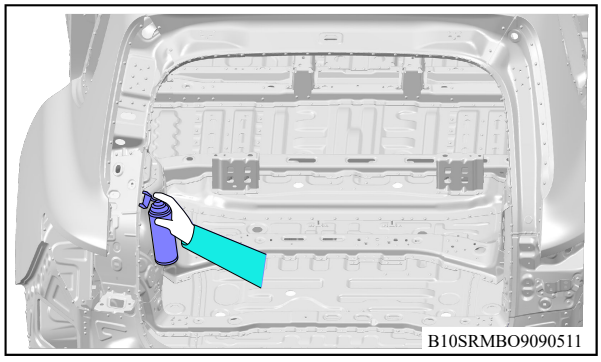
c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.



3. Prepare new parts

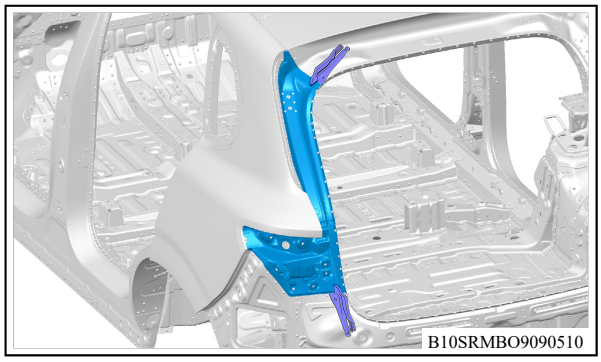
a. Prepare new parts and materials (left rear water channel assembly, sealant, cleaner).
b. To perform plug welding, first drill a hole in the left rear drip rail assembly, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Rear left water channel assembly
Plug weld hole diameter (Φ)	8.0mm



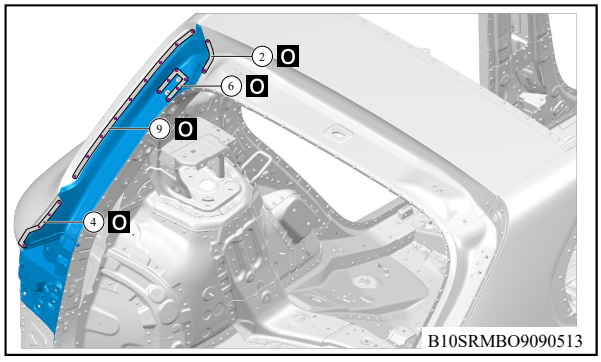
4. Welding

a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).



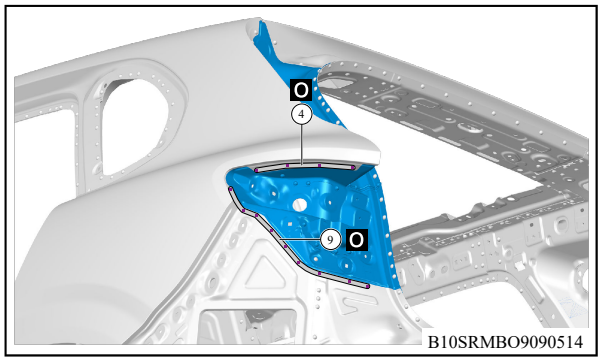
CAUTION

Clean the welding area by wiping, taking care not to damage other panels.

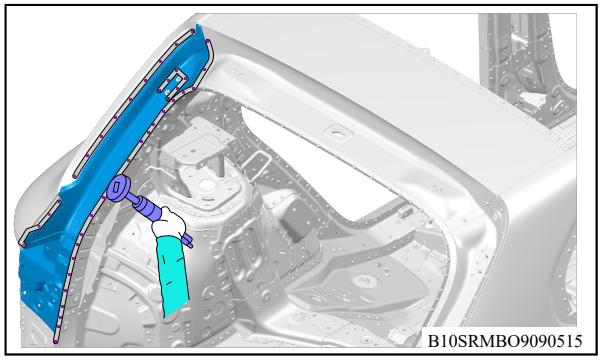


b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

© 2026, All rights reserved



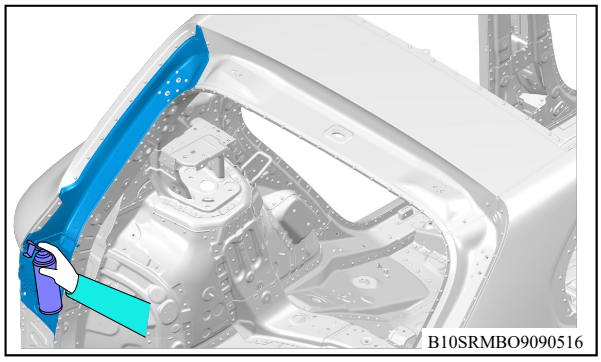
c. Install the left rear water drain trough assembly in position, level the two surfaces to eliminate the gap, and clamp the parts to be welded with tools such as vise grips.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.
SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding on the left rear drip rail assembly, the left D-pillar inner panel, and the rear section of the left side outer panel assembly.

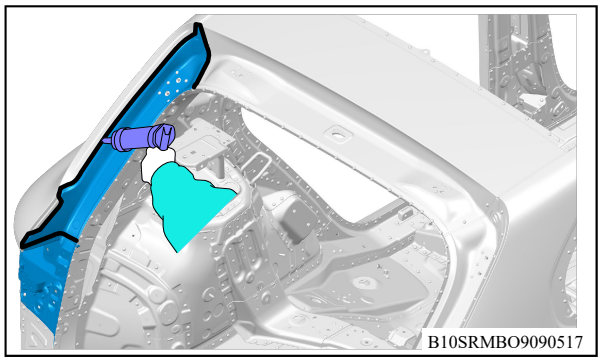
CAUTION

When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.



h. Use a MAG welder to plug weld the left rear water channel assembly, the rear outer panel, and the rear section of the left side member assembly.

i. After welding, use a grinder to clean the weld area of the left rear water channel assembly, and do not grind excessively.



© 2026, All rights reserved

j. After grinding the weld spots, the surface of the left rear water channel assembly needs to be sprayed or brushed with an epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

NOTE

Apply the paint coating only after the sealant has dried.

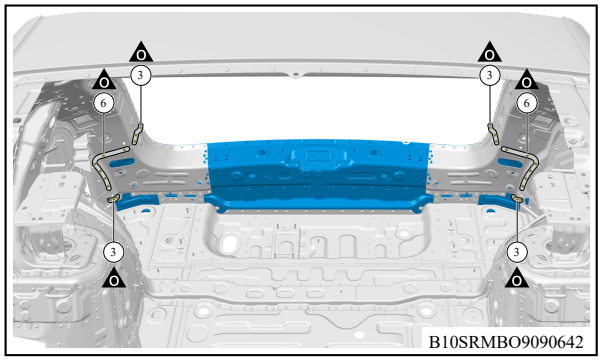
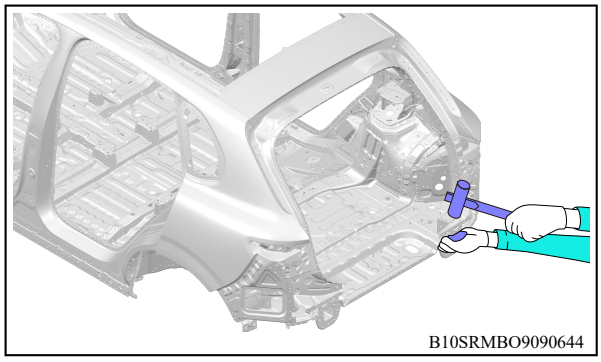
REAR PANEL ASSEMBLY REPLACEMENT

1. Tools



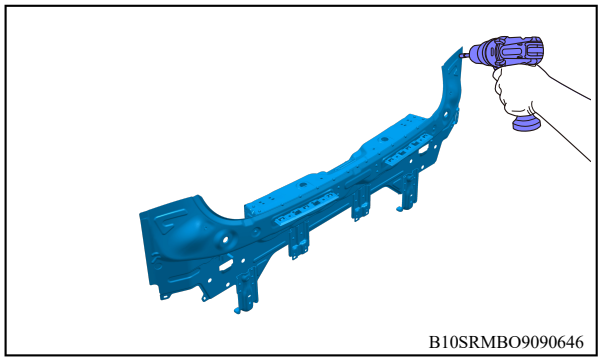
Welding tools	Spot welder, MAG welder
Spot weld removal t ool	Spot weld drill
Positioning and Sec uring Tools	Vise clamp
Grinding tool	Grinder
Sheet metal repair t ools	Flat hammer, dolly

2. Remove the original part



a. Drill out all spot welds to separate the rear panel assembly from the rear floor assembly.

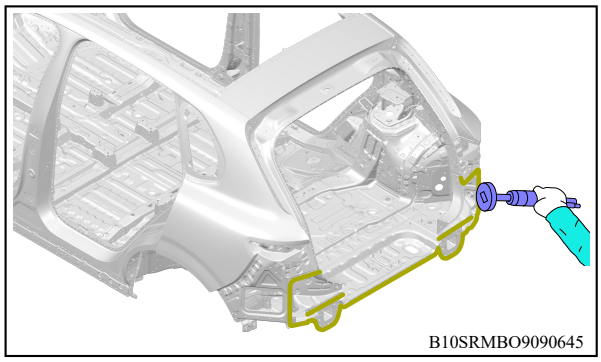
> **CAUTION**
>
> If the spot welds are not clearly visible, a rotary wire brush can be used to remove the paint layer.



b. Drill out all spot welds to separate the rear body assembly from the left side body assembly and the right side body assembly, and remove the rear body assembly.

c. Use a body hammer and dolly to straighten the twisted and deformed hem after removing the spot welds.

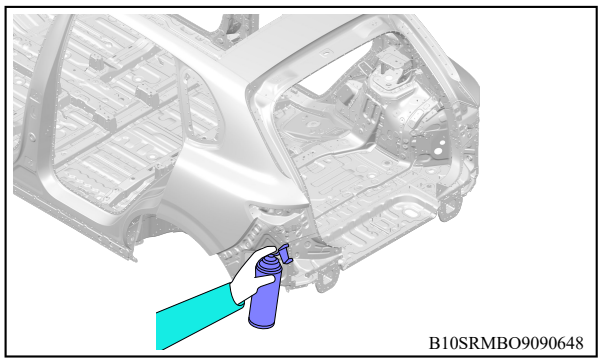
3. Prepare new parts



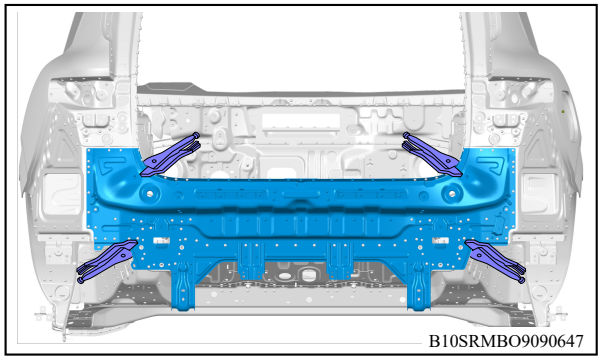
© 2026, All rights reserved

a. Prepare new parts and materials (rear panel assembly, sealant, cleaner).
b. To perform plug welding, first drill holes in the rear body assembly, and select the appropriate hole diameter according to the metal thickness.

Plug hole diameter	
Name	Rear panel assembly
Plug weld hole diameter (Φ)	8.0mm



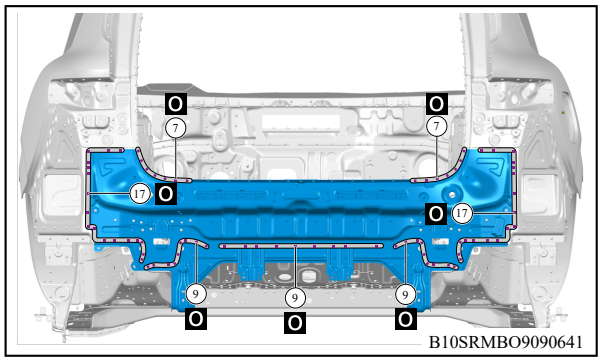
4. Welding



a. Use a grinder or similar tool to grind away the welding marks left on the vehicle body surface and smooth the surface (removing foreign matter, paint film, and rust).

CAUTION

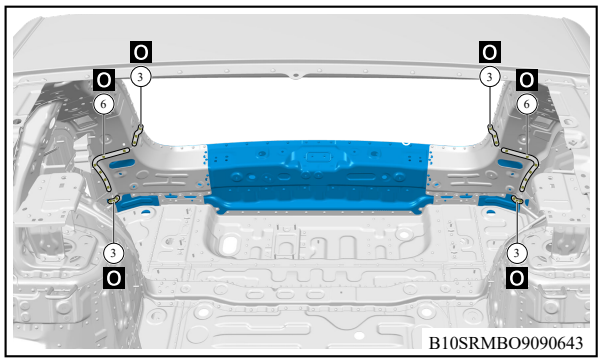
Clean the welding area by wiping, taking care not to damage other panels.



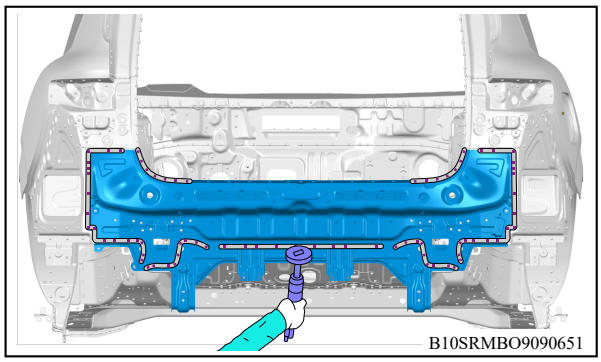
b. Before welding, apply a zinc powder spray to the mating surfaces of the body for corrosion protection.

c. Install the rear body assembly in position, flatten both surfaces to eliminate any gaps, and clamp the parts to be welded using tools such as vise grips.
d. Before installing the new component, match its mounting position on the vehicle body for initial positioning.
e. Measure body dimensions, adjust the mounting position, and make positioning marks, detailed dimension data.
SeeVehicle Dimensions (page 675)
f. Check and adjust the gaps around the vehicle body to ensure they are normal.

© 2026, All rights reserved

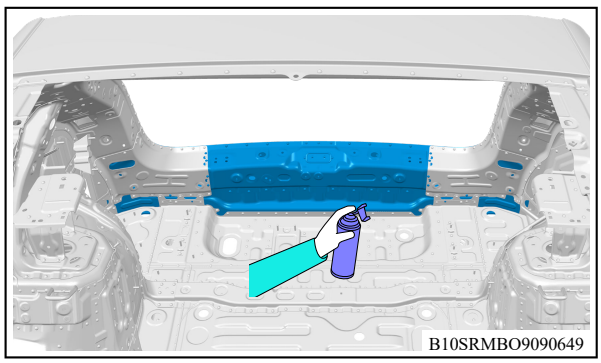


SeeExterior body clearance (page 577)



g. Use a MAG welder to perform plug welding on the rear body assembly and the rear floor assembly.

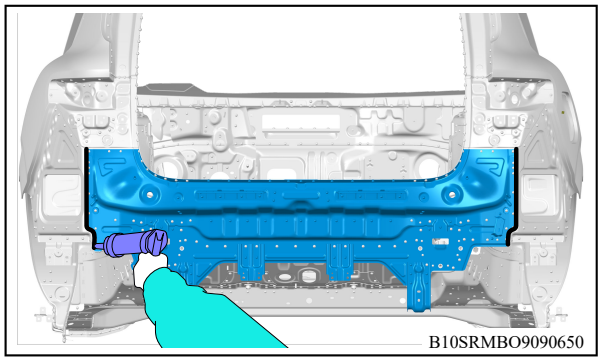
CAUTION



When performing spot welding operations, the number of spot welds shall be 1.3 times the number of OEM spot welds.

h. Use a MAG welder to perform plug welding on the rear body assembly, the left side body assembly, and the right side body assembly.

i. After welding, use a grinder to clean the weld area of the rear panel assembly. Do not grind excessively.



j. After grinding the spot welds, the surface of the rear body assembly needs to be sprayed or brushed with epoxy primer for anti-corrosion treatment.

CAUTION

The body seam sealant (TEROSONPV 3558) can only be applied after the epoxy primer has dried.

© 2026, All rights reserved

k. Apply a suitable sheet metal sealant (TEROSONPV 3558) at all seams to complete the repair.
SeeBody PVC sealant sealing area (page 323)

NOTE

Apply the paint coating only after the sealant has dried.

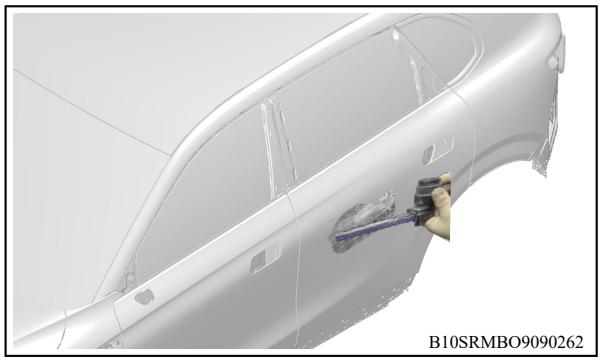
2.2.9 BODY PANEL REPAIR

REPAIR OF FOUR DOORS, HOOD, LIFTGATE, AND FENDERS

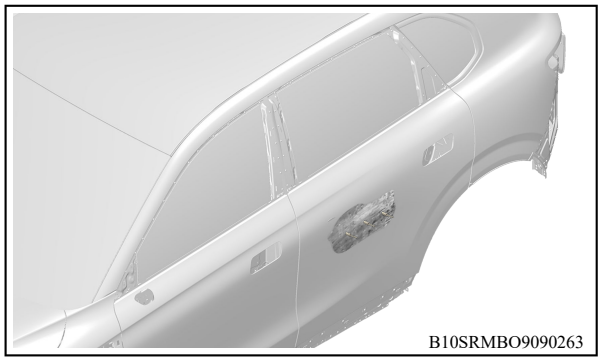
REPAIR LEFT REAR DOOR ASSEMBLY



1. Assembly Overview

Before repair, a damage diagnosis should be performed to assess the extent of deformation in the damaged area and confirm whether the damage is repairable.

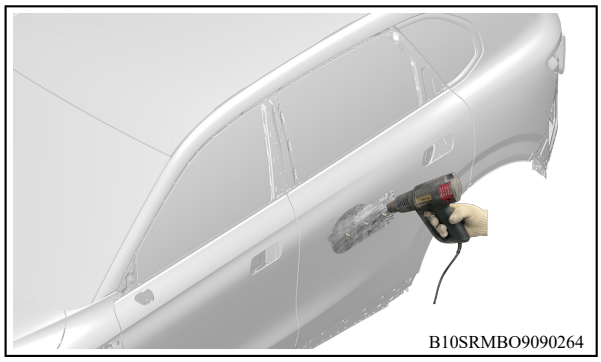
Repair tools	
1	Sheet metal repair machine
2	Thermometer
3	Grinder
4	Single-arm straightening frame
5	Heat gun
6	Diagonal pliers



2. Repair of the left rear door assembly

a. As shown in the figure, use a grinder to grind the paint layer in the deformed area until the metal surface is completely exposed.

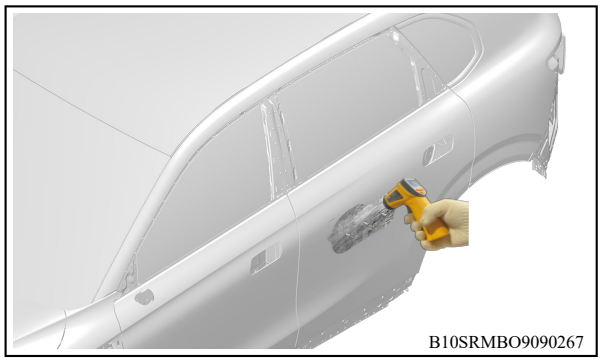
> NOTE
>
> Grind off the oxide film on the sheet metal parts; otherwise, due to the heat resistance of the oxide film, it will be difficult to weld the disposable welding studs using the sheet metal repair machine.
> After grinding, welding operations must be performed immediately to prevent secondary oxidation.



© 2026, All rights reserved

b. As shown in the figure, use a body repair machine to weld disposable studs in the dented area of the damaged sheet metal.

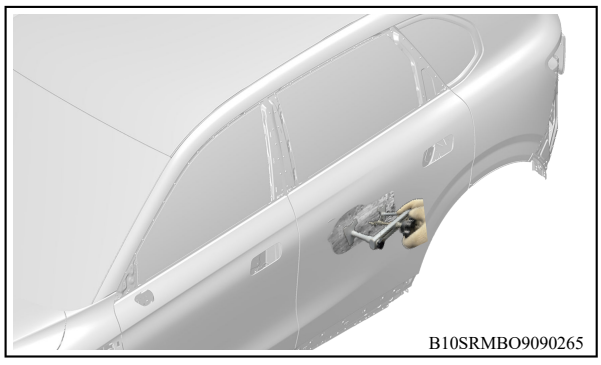
NOTE



The number and location of single-use weld studs used will vary depending on the extent of damage to the sheet metal parts.

c. As shown in the illustration, use a heat gun to heat the damaged sheet metal area.

NOTE

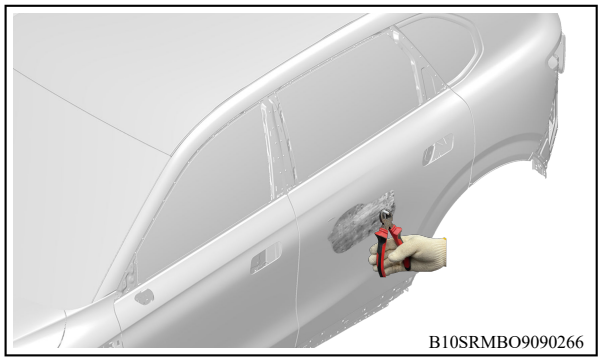


Do not let high temperatures damage other panels.

d. As shown in the illustration, use a temperature measuring instrument to inspect the damaged sheet metal area.

NOTE

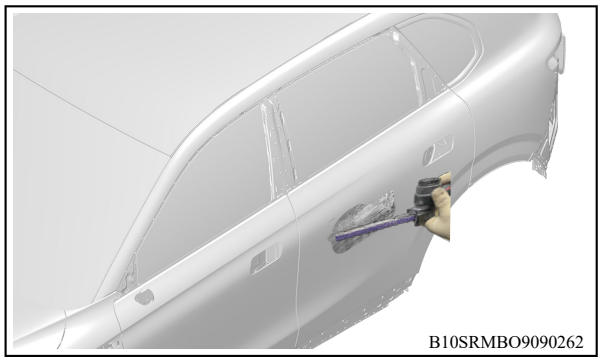
Use a thermometer to monitor the temperature of the heating area, and maintain the temperature between 100℃ and 200℃ during heating.



e. As shown in the illustration, use a single-arm straightening frame to pull out the dent.

NOTE

During stretching, the temperature of the aluminum alloy panel area must be maintained between 100℃ and 200℃.



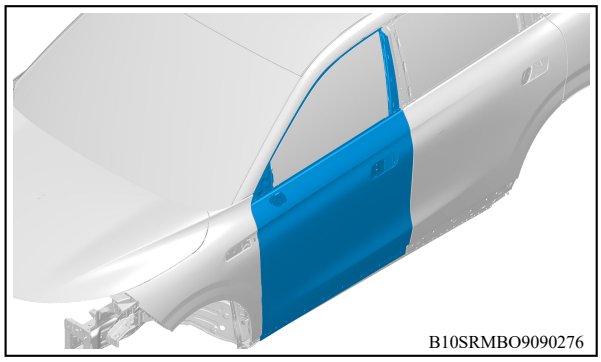
© 2026, All rights reserved

f. As shown in the illustration, use diagonal cutters to remove the disposable weld studs on the surface of the sheet metal area.

NOTE

During stretching, the temperature in the sheet metal area must be maintained between 100 and 200 degrees Celsius.

g. As shown in the illustration, use a grinder to remove residues from the surface of sheet metal parts (grind off welding marks, foreign objects, paint film, and rust that may remain on the vehicle body surface).

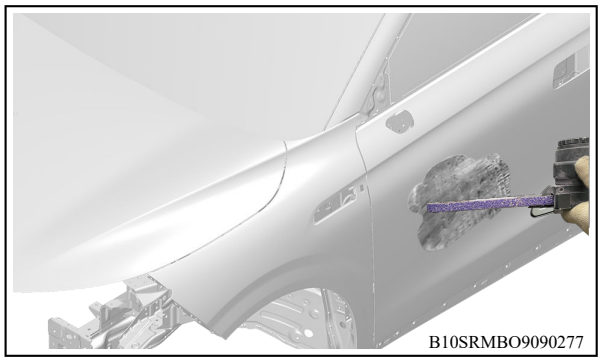


NOTE

Do not damage other panels.
Use a cleaner to clean the sanded area, ensuring the entire area is clean, dry, and free of contaminants.

© 2026, All rights reserved

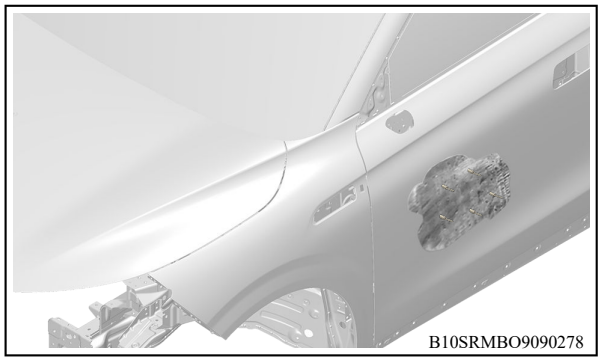
REPAIR FRONT LEFT DOOR ASSEMBLY



1. Assembly Overview

Before repair, a damage diagnosis should be performed to assess the extent of deformation in the damaged area and confirm whether the damage is repairable.

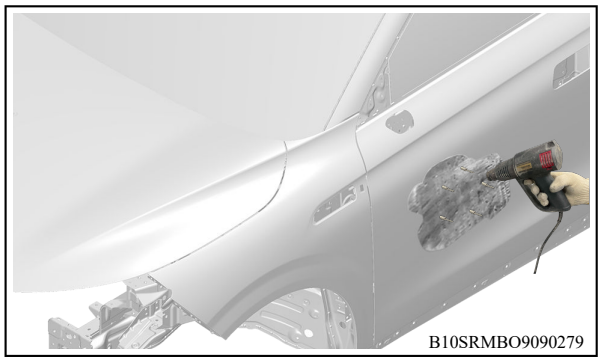
Repair tools	
1	Sheet metal repair machine
2	Thermometer
3	Grinder
4	Single-arm straightening frame
5	Heat gun
6	Diagonal pliers



2. Repair of Front Left Door Assembly

a. As shown in the figure, use a grinder to grind the paint layer in the deformed area until the metal surface is completely exposed.

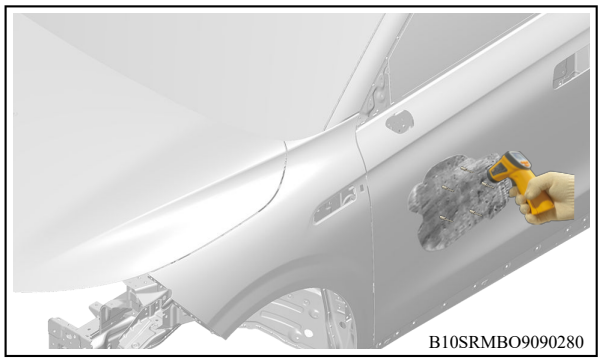
> **NOTE**
>
> Grind off the oxide film on the sheet metal parts; otherwise, due to the heat resistance of the oxide film, it will be difficult to weld the disposable welding studs using the sheet metal repair machine.
> After grinding, welding operations must be performed immediately to prevent secondary oxidation.



© 2026, All rights reserved

b. As shown in the figure, use a body repair machine to weld disposable studs in the dented area of the damaged sheet metal.

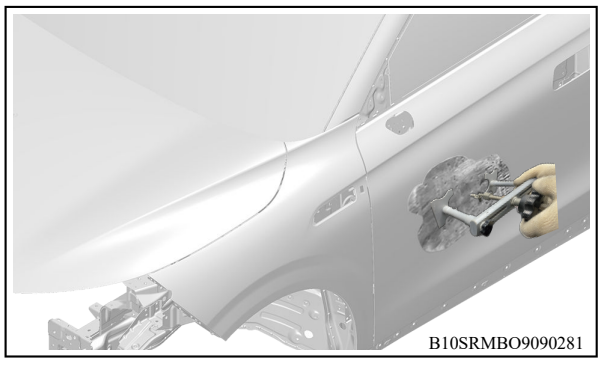
NOTE



The number and location of single-use weld studs used will vary depending on the extent of damage to the sheet metal parts.

c. As shown in the illustration, use a heat gun to heat the damaged sheet metal area.

NOTE

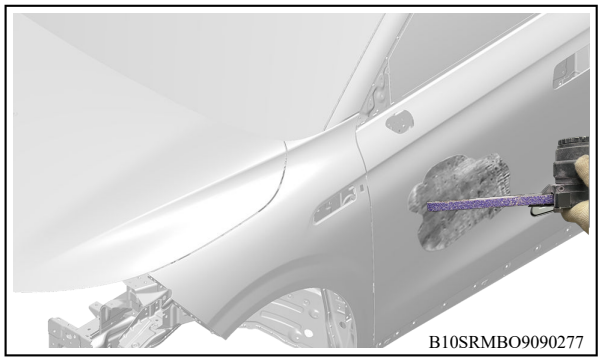


Do not let high temperatures damage other panels.

d. As shown in the illustration, use a thermometer to inspect the damaged panel area.

NOTE

Use a thermometer to monitor the temperature of the heating area, and maintain the temperature between 100℃ and 200℃ during heating.



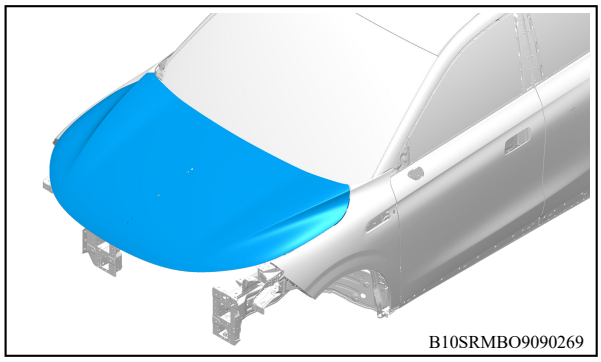
e. As shown in the illustration, use a single-arm straightening frame to pull out the dent.

NOTE

During stretching, the temperature in the sheet metal area must be maintained between 100 and 200 degrees Celsius.

© 2026, All rights reserved

f. As shown in the illustration, use a grinder to remove residues from the surface of sheet metal parts (grind off welding marks, foreign objects, paint film, and rust that may remain on the vehicle body surface).

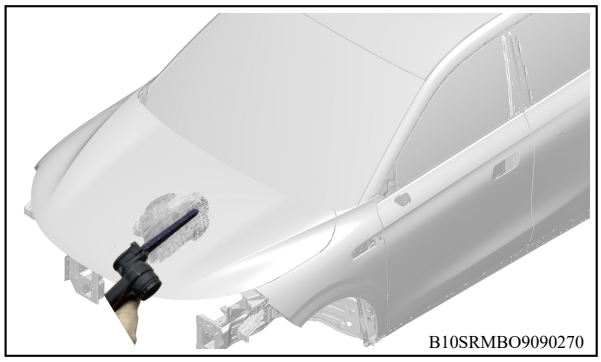


NOTE

Do not damage other panels.
Use a cleaner to clean the sanded area, ensuring the entire area is clean, dry, and free of contaminants.

© 2026, All rights reserved

REPAIR FRONT COVER ASSEMBLY

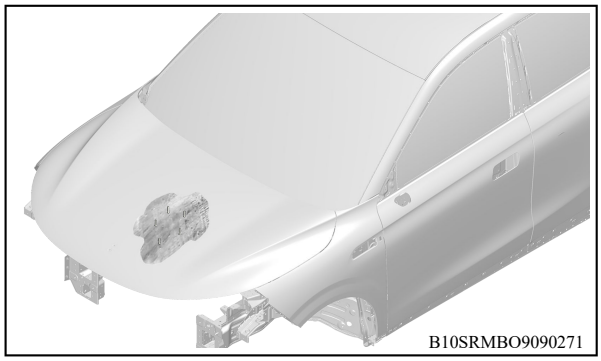


1. Assembly Overview

Before repair, a damage diagnosis should be performed to assess the extent of deformation in the damaged area and confirm whether the damage is repairable.

Repair tools	
1	Sheet metal repair machine
2	Thermometer
3	Grinder
4	Single-arm straightening frame
5	Heat gun
6	Diagonal pliers

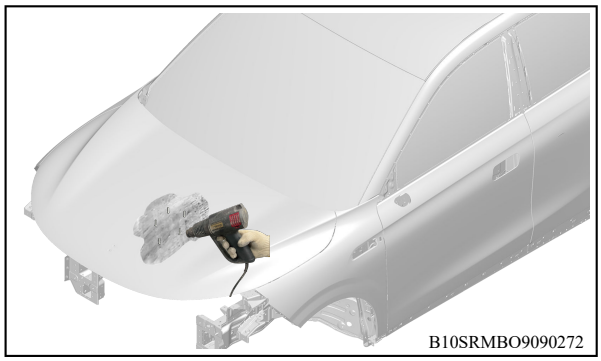
2. Tailgate Assembly Repair



a. As shown in the figure, use a grinder to grind the paint layer in the deformed area until the metal surface is completely exposed.

NOTE

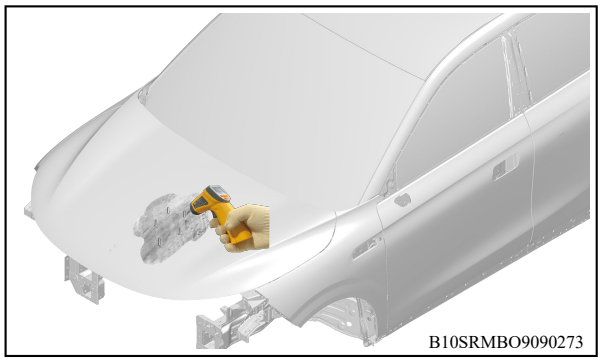
Grind off the oxide film on the sheet metal parts; otherwise, due to the heat resistance of the oxide film, it will be difficult to weld the disposable welding studs using the sheet metal repair machine.
After grinding, welding operations must be performed immediately to prevent secondary oxidation.



© 2026, All rights reserved

b. As shown in the figure, use a body repair machine to weld disposable studs in the dented area of the damaged sheet metal.

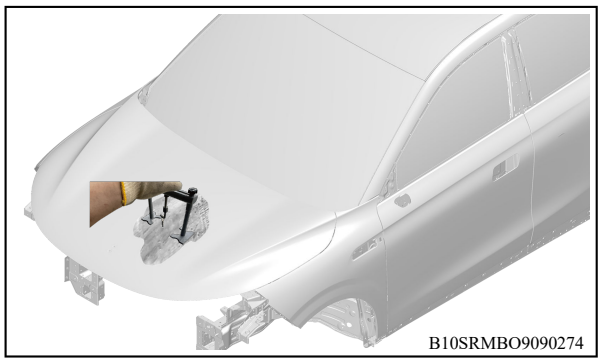
NOTE



The number and location of single-use weld studs used will vary depending on the extent of damage to the sheet metal parts.

c. As shown in the illustration, use a heat gun to heat the damaged sheet metal area.

NOTE

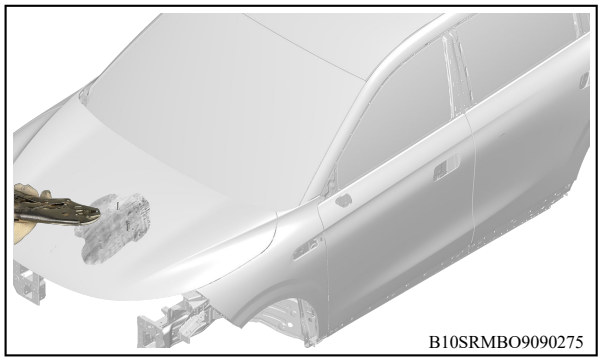


Do not let high temperatures damage other panels.

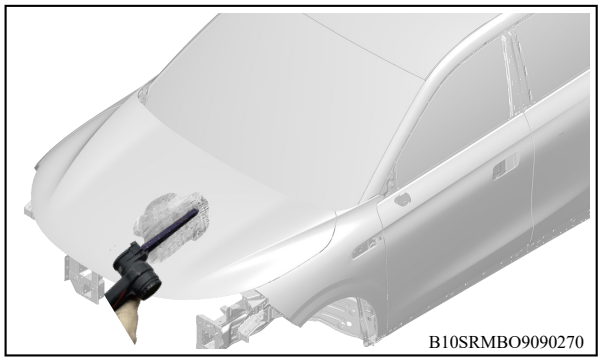
d. As shown in the illustration, use a temperature measuring instrument to inspect the damaged sheet metal area.

NOTE

Use a thermometer to monitor the temperature of the heating area, and maintain the temperature between 100℃ and 200℃ during heating.



e. As shown in the illustration, use a single-arm straightening frame to pull out the dent.



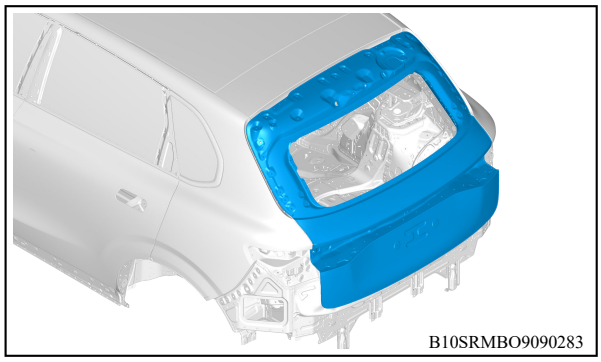
NOTE

During stretching, the temperature in the aluminum alloy panel area must be maintained between 100℃ and 200℃.

© 2026, All rights reserved

f. As shown in the illustration, use diagonal cutters to remove the disposable weld studs on the surface of the sheet metal area.

g. As shown in the illustration, use a grinder to remove residues from the surface of sheet metal parts (grind off welding marks, foreign objects, paint film, and rust that may remain on the vehicle body surface).

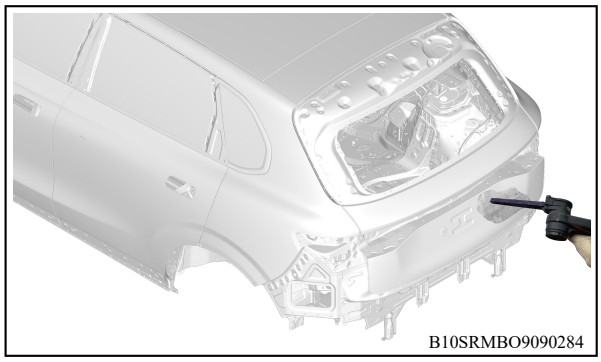


NOTE

Do not damage other panels.
Use a cleaner to clean the sanded area, ensuring the entire area is clean, dry, and free of contaminants.

© 2026, All rights reserved

REPAIR THE TAILGATE ASSEMBLY

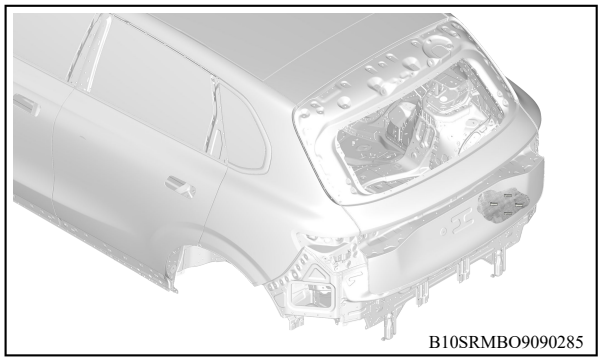


1. Assembly Overview

Before repair, a damage diagnosis should be performed to assess the extent of deformation in the damaged area and confirm whether the damage is repairable.

Repair tools	
1	Sheet metal repair machine
2	Thermometer
3	Grinder
4	Single-arm straightening frame
5	Heat gun
6	Diagonal pliers

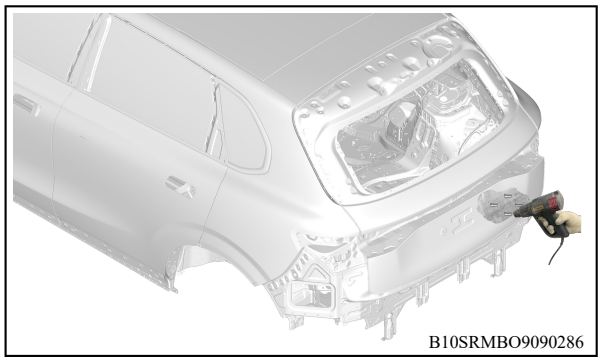
2. Tailgate Assembly Repair



a. As shown in the figure, use a grinder to grind the paint layer in the deformed area until the metal surface is completely exposed.

NOTE

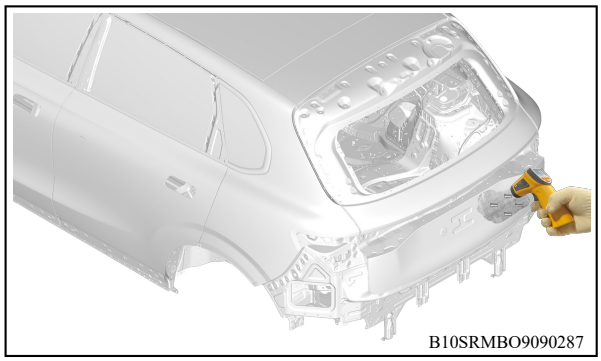
Grind off the oxide film on the sheet metal parts, otherwise, due to the heat resistance of the oxide film, it will be difficult to weld the disposable weld studs using the sheet metal repair machine.
After grinding, welding operations must be performed immediately to prevent secondary oxidation.



© 2026, All rights reserved

b. As shown in the figure, use a body repair machine to weld disposable studs in the dented area of the damaged sheet metal.

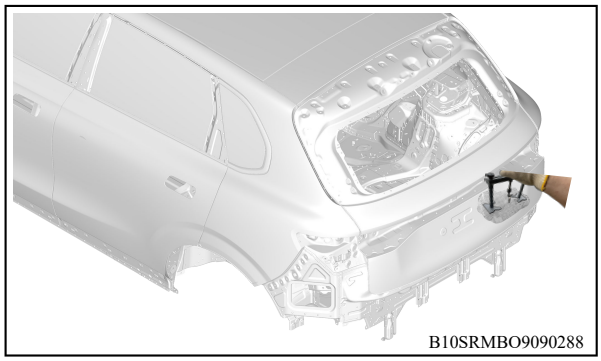
NOTE



The number and location of single-use weld studs used will vary depending on the extent of damage to the sheet metal parts.

c. As shown in the illustration, use a heat gun to heat the damaged sheet metal area.

NOTE

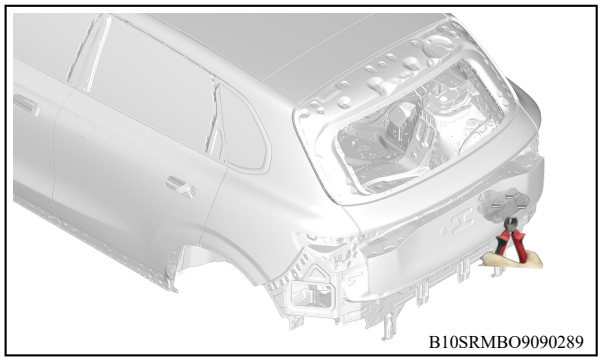


Do not let high temperatures damage other panels.

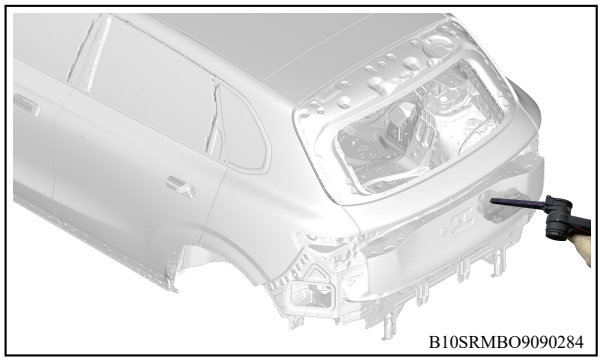
d. As shown in the illustration, use a temperature measuring instrument to inspect the damaged sheet metal area.

NOTE

Use a thermometer to monitor the temperature of the heating area, and maintain the temperature between 100 and 200 degrees Celsius during heating..



e. As shown in the illustration, use a single-arm straightening frame to pull out the dent.



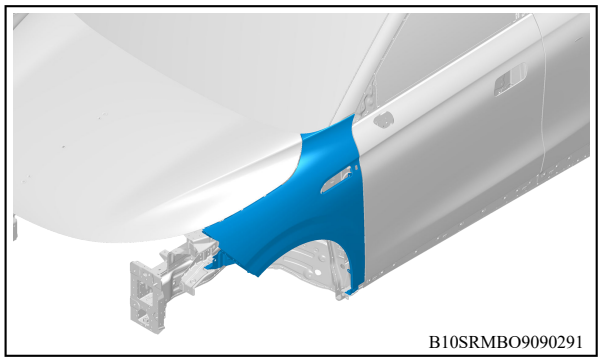
NOTE

During stretching, the temperature in the aluminum alloy panel area must be maintained between 100°C and 200°C.

© 2026, All rights reserved

f. As shown in the illustration, use diagonal cutters to remove the disposable weld studs on the surface of the sheet metal area.

g. As shown in the illustration, use a grinder to remove residues from the surface of sheet metal parts (grind off welding marks, foreign objects, paint film, and rust that may remain on the vehicle body surface).

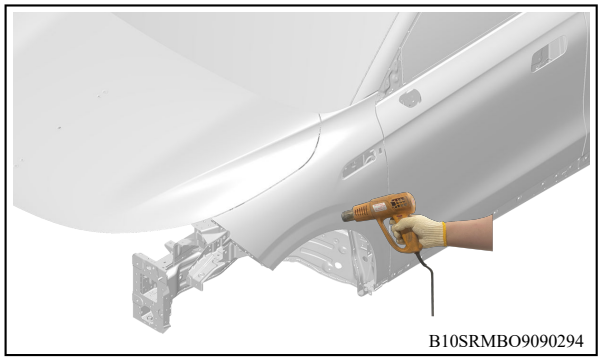


NOTE

Do not damage other panels.
Use a cleaner to clean the sanded area, ensuring the entire area is clean, dry, and free of contaminants.

© 2026, All rights reserved

REPAIR LEFT FENDER ASSEMBLY

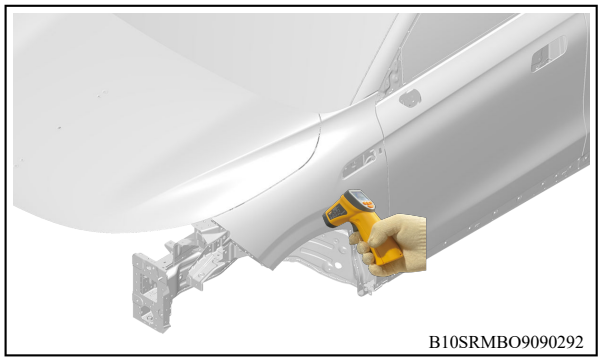


1. Assembly Overview

Before repair, a damage diagnosis should be performed to assess the extent of deformation in the damaged area and confirm whether the damage is repairable.

Repair tools	
1	Wooden mallet/Rubber mallet
2	Roof crossbar
3	Thermometer
4	Heat gun

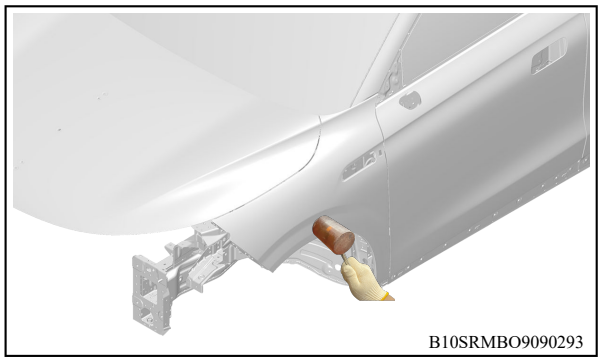
2. Repair of the Left Fender Assembly



a. Use a heat gun to heat the damaged sheet metal area.

NOTE

Observe safety instructions. The high-voltage system must be disconnected before performing bodywork.
During repair work, ensure that the tools are free of iron powder or other metallic compounds before use.
If the damaged area is close to other intact components, they must be removed in advance to prevent accidental damage caused by heating, hammering, etc. during the repair process.
Do not let high temperatures damage other panels.

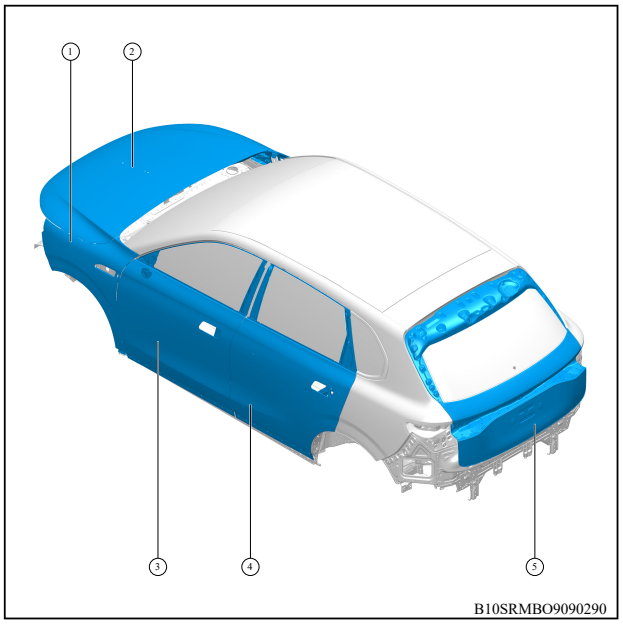


© 2026, All rights reserved

b. As shown in the figure, use a thermometer to measure the temperature of the heated area.

NOTE

Use a thermometer to monitor the temperature of the heating area, and maintain the temperature between 100℃ and 200℃ during heating.



c. As illustrated, in the dented area of the damaged sheet metal panel, use a wooden mallet or rubber mallet in conjunction with a dolly to perform off-dolly or on-dolly hammering on the damaged area.

NOTE

During the repair process, off-dolly tapping should be prioritized to minimize material stretching.
If it is necessary to tap squarely, tap lightly several times; otherwise, it will exacerbate the damage to the material.
When knocking, the temperature of the sheet metal area must be maintained between 100 and 200 degrees Celsius.

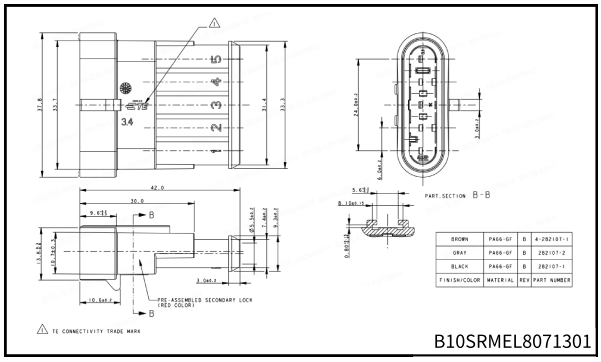
2.3 VEHICLE ACCESSORIES

2.3.1 ALCOLOCK INTERLOCK DEVICE - INSTALLATION GUIDE

NOTE

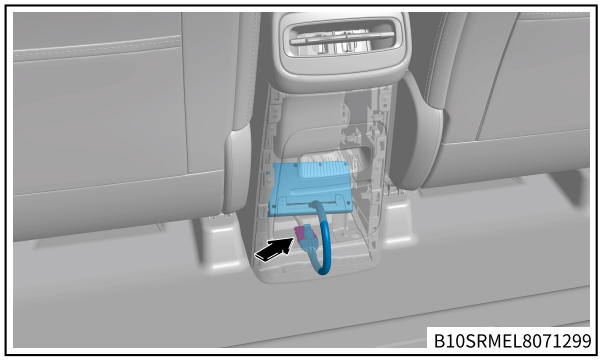


Announcement: Alcolock - Installation Guide.

NOTE

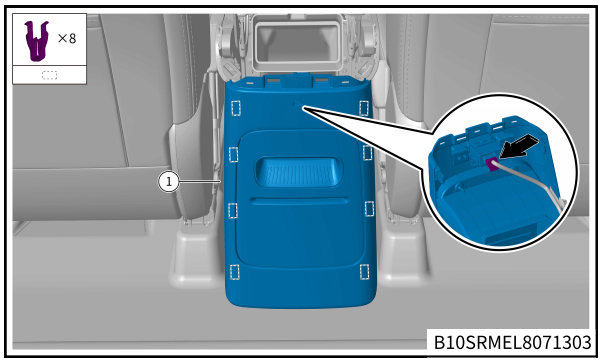
Keywords: Alcolock, Modification/Alteration, Wiring Harness/Wiring/Circuit.

1. Purpose: To comply with European regulatory requirements, the OEM shall issue this guide manual, which aims to guide customers on how to install the alcolock device.
2. Target vehicle: G117.
3. Symptom: None.
4. Operation procedure:
   Overview
   a. Leapmotor can be equipped with an alcolock interlock device (AI). This is optional equipment that can be installed by the after-sales service.
   b. This function is implemented based on EN50436-4(2022) (the European standard for alcolocks).
   c. The device communicates with the Vehicle Intelligent Unit (VIU) via hardwired signals, and the VIU is integrated into the multi-domain fusion controller (ICHS).
   d. If the coding parameter "Alcolock" in the VIU coding data string is set to "Enabled" (DID 0xF1A8), the function is activated. When the vehicle is ready to start, the driver must undergo a breath test via AI to start the vehicle. The alcolock device sends high and low level signals to the VIU to determine the lock/unlock command. If the signal input to the VIU is at a low level, the alcolock is considered locked; if it is at a high level, the alcolock is considered unlocked, and the VIU feeds back the alcolock status to the CAN network.
   e. Once the breath test is passed, the lock will be released.
   Components
   Perform the function of the following ICHS part number:
   a. ICHS Assembly Number: 8011037-AH01.
   b. The following device shall be connected: an alcolock device based on EN50436-7(2022).
   c. Coding parameters and description: Based on the coding parameter "Alcolock device" in the VIU coding data string (UDS) 0xF1A8, the alcolock function can be disabled (0x00 "None") or enabled (0x01 "Yes") via the OBD interface.
   Connector Pin Definition:



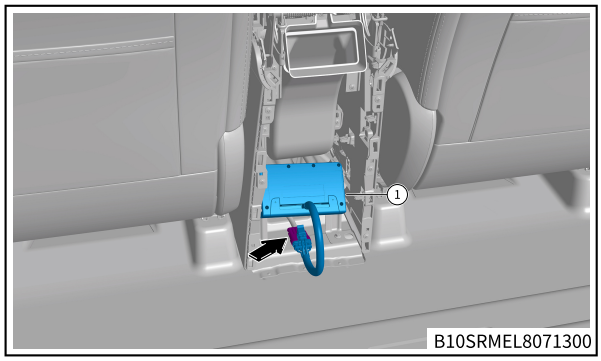
© 2026, All rights reserved

	Function	Cable or pin	Connection Position
1	Battery power supply: 12V	Red wire, Pin 5, 0.5 mm^2	Pin 5 of the connector, located in the sub-instrument
2	Grounding	Black wire, pin 4, 0.5 mm^2	Pin 4 in the connector, located in the sub-instrument
3	Input/Output a. When the alcolock signal is grounded or at a high level, vehicle starting/movement shall be prohibited. b. After the alcolock signal, the vehicle should be allowed to start/move, with the signal at a high level or grounded.	Gray cable, Pin 2, 0.5 mm^2	Pin 2 in the connector, the connector is located in the sub-instrument
4	Vehicle Ready a. High level: For a nominal 12V, the alcolock is ready for use.	Brown cable, Pin 1, 0.5 mm^2	Pin 1 in the connector, which is located in the sub-instrument.



© 2026, All rights reserved

	Function	Cable or pin	Connection Position
	b. Low level: May not be usable for a nominally grounded alcolock.		
5	Wake up a. High level: The alcolock is in the awake state. b. Low level: The alcolock is in sleep mode.	Blue cable, Pin 3, 0.5mm²	Pin 3 in the connector, which is located in the sub-instrument

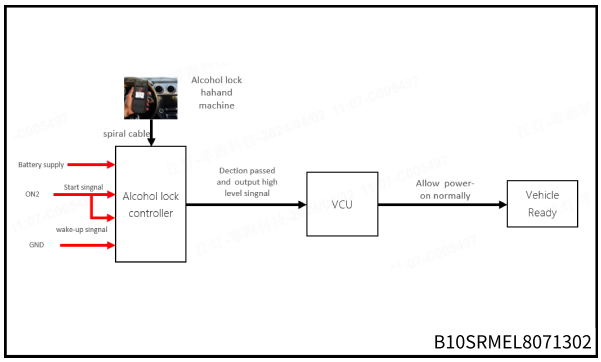


a. The alcolock device connector is located as shown in the figure - arrow -.

Installation steps:

a. Remove the passenger side air outlet assembly.
See:Passenger instrument panel air outlet assembly (page 5479)
b. Release the 8 double-sided clips of the center console rear panel assembly, and disconnect the 1 connector for the rear USB charging from the instrument wiring harness -arrow-.
Recommended tool: Interior trim removal tool
c. Remove the center console rear panel assembly ①.

© 2026, All rights reserved



d. Connect the connector -arrow- of alcolock device ① to the floor wiring harness assembly.

> **ATTENTION**
>
> - For specific details on alcolock device installation, refer to the alcolock device instructions.

e. The remaining installation steps are performed in reverse order, while noting the following:

f. The VIU must be coded accordingly: UDS (0xF1A8) coding parameter Alcohol Interlock = 0x01 "Yes" (instead of 0x00 "No").

Function Description:

- If the vehicle is powered on and started, the alcohol interlock program will be activated, and it will initiate a breath test.
- Once the breath test is passed, the vehicle can be started, and relevant information will be displayed on the ignition interlock.

Mode:

- Off: The vehicle is off;
- Conduction: Request and pass the breath test, the ignition interlock unlocks, allowing the vehicle to start;
- Disconnected: No test requested or test failed, the alcohol interlock is in the off state, and vehicle starting is not permitted;

When the vehicle is powered on, it will transition from the OFF state to the DISCONNECTED state. At this point, the vehicle is in the alcohol interlock state. When the alcohol interlock test is passed, it will enter the START state;

When the vehicle is disabled (ACC off), the alcohol interlock is powered on only, the detection function operates normally, but the detection results have no effect on vehicle starting.

5. Note: For technical support, please contact the regional technical support engineer.

3 POWER BATTERY SYSTEM

3.1 BATTERY PACK SYSTEM

3.1.1 PRECAUTIONS

PRECAUTIONS

1. Do not dispose of batteries in the garbage.
2. It is strictly forbidden to disassemble, squeeze, puncture or burn.
3. Avoid severe vibration during loading, unloading, and transportation.
4. It is strictly forbidden to expose the battery to temperatures above 55℃.
5. Do not wear loose clothing. Do not wear jewelry when working.
6. Do not connect batteries of different types in series or parallel.
7. Strictly prohibited when charging without a charging protection circuit or using devices not approved by the battery manufacturer.
8. When connecting and disconnecting system cables, please disconnect all high-voltage and low-voltage switches.
9. Always remember that there is high voltage inside the system. Even if the system is not running, after disconnecting the service switch, use a multimeter to confirm that there is no voltage at the high-voltage terminal before proceeding to the next step.
10. The working environment of the battery pack shall be free from corrosive, explosive, and insulation-destructive gases and conductive dust, and away from heat sources.
11. During maintenance, please use insulated tools and wear insulated gloves and insulated shoes. Insulated tools used during maintenance (hex keys, screwdrivers, etc.) must be wrapped with insulating tape to minimize the exposed area.
12. Fire extinguishing method: Use a CO2 or dry powder fire extinguisher to extinguish the fire, or cover it with sand or soil.
13. Operator equipment: guidance documents, multimeter, fire extinguisher, safety helmet, protective goggles, cotton work clothes, cotton work gloves, high-voltage glove tools, high-voltage insulating shoes, etc.
14. The orange wiring harnesses in the engine compartment are high-voltage wiring harnesses. Do not touch them if they have not been discharged and you are not wearing insulated work clothes.
15. In all maintenance operations involving vehicle electrical appliances and high-voltage wiring harness areas, the high-voltage cable connectors connected to the power battery pack must be disconnected, and the high-voltage cables and electrical appliances must be discharged.
16. After completing maintenance work, please promptly clean up tools and materials, and do not place metal objects inside or on top of the equipment.
17. Wrap the connector interfaces of the removed and disconnected high-voltage electrical components with insulating tape to prevent debris from entering.
18. The harness connector should be kept dry. If coolant or oil is accidentally splashed into the high-voltage harness or electrical components, it should be cleaned and dried with compressed air. And use a megohmmeter to measure the insulation resistance of the high-voltage electrical components or harness. Installation can only be performed if it meets the standard.
19. Do not expose battery cells, modules or systems to heat sources or flames.

3.1.2 OVERVIEW AND INTRODUCTION TO PRINCIPLES

INTRODUCTION TO THE STRUCTURE AND PRINCIPLES OF THE POWER BATTERY SYSTEM

The main functions of the power battery system are as follows:

1. Provides electrical power for the entire vehicle, enabling it to operate according to the driver's intent, while simultaneously supporting the normal operation of the high-voltage accessory system.
2. Receive the electrical energy recovered from regenerative braking of the drive motor.
3. Under the control of the battery management system, the on-board charger supports charging via household power and AC charging piles (slow charging 3.3~6.6kW).
4. Supports charging the battery using DC charging piles. The charging control process and communication protocol comply with overseas standards (fast charging), meeting the competitive power supply requirements for 12V lead-acid and 12V fast charging.
5. Provides a device for connecting and disconnecting the high-voltage circuit.
6. It features high-voltage electrical safety management functions, including collision power-off, high-voltage system circuit insulation, and high-voltage interlock detection and handling.
7. Each high-voltage circuit is equipped with a corresponding device to protect against faults such as overcurrent.
8. Provides real-time monitoring functions for the battery system status (temperature monitoring, voltage monitoring, current monitoring, SOC estimation, SOH estimation, etc.).
9. Provides system diagnostic functions: features fault diagnosis, fault storage management, and other functions. The diagnostic protocol is UDS.
10. Scheduled charging function.
11. Provides the VCU with the battery system's charge and discharge capability.
12. Supports the OTA upgrade function.
13. Detection of short to ground, short to power, and open circuit in the contactor control signal controlled by the Battery Management System.
14. The contactor control signal feedback check function only detects the open/closed status of the contacts of the main positive, main negative, and PTC contactors.

AC charging procedure:

- When the vehicle is switched to the ON2 ignition state or the charging connector is plugged in, the EVCC is awakened. The EVCC detects the duty cycle for AC charging, outputting the CP signal to the OBC via a hardwired connection. The EVCC determines the OBC S2 status by sampling the CPOUT voltage to control the EVCC S2 switch. The BMS and OBC exchange messages to initiate slow charging. At the end of charging, the EVCC detects the OBC S2 disconnected status and requests to disconnect S2. Upon detection, the charging pile stops outputting the CP signal, the BMS enters sleep mode, and the EVCC waits for the next CP signal input.

DC charging procedure:

- When the vehicle is powered on to the ON2 state or the charging plug is connected, the EVCC is woken up. The EVCC detects the duty cycle to identify DC charging, outputs the A+ and CC2 signals via hardwire to wake up the BMS and HPC, and pulls the CPOUT duty cycle to 0. The EVCC and the charging pile start PLC communication and enter the fast charging mode. The EVCC enters the GB/T 27930 charging process. The EVCC controls S2 according to the process. Upon completion of charging, the EVCC sends a message to notify the BMS that charging has ended, and after the charging plug is disconnected, the EVCC enters sleep mode.

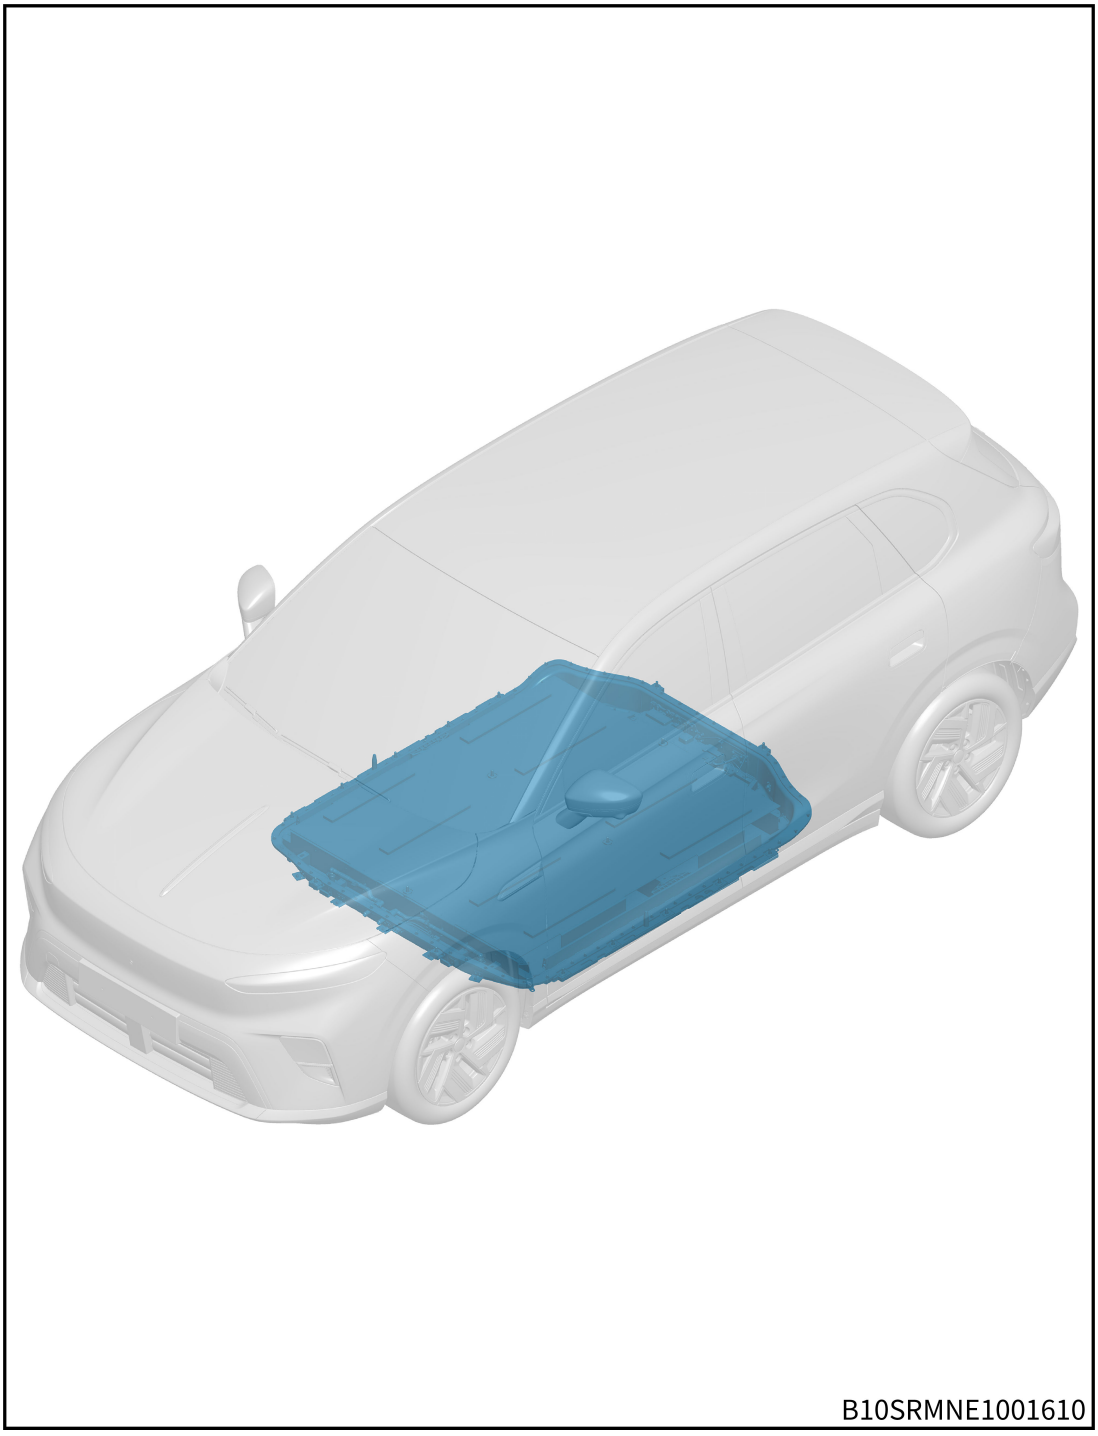
High Voltage Interlock System Overview

1. The High Voltage Interlock Loop (HVIL) system refers to a safety design method that uses low-voltage signals to monitor the integrity of the high-voltage circuit. By using low-voltage signals to check the components connected to the high-voltage harness in the electric vehicle, it verifies the integrity and continuity of the electrical connections in each high-voltage system circuit. It has three main functions:
   - Detect loose connections in the high-voltage circuit and provide alarm information to relevant vehicle controllers before high-voltage power disconnection, allowing time for system response and taking measures.
   - Before the vehicle is powered on, if an incomplete circuit is detected, system power-on is prevented to avoid safety hazards caused by open circuits or poor connections.
   - Prevent safety accidents caused by human error. During the operation of the high-voltage system, without the high-voltage interlock design, manually disconnecting or maintaining high-voltage connection points will cause the full high voltage to remain applied to the connection points at the moment of disconnection. This will result in arcing between the connection points, causing damage to personnel or equipment.

High voltage interlock working principle:

- This vehicle model is equipped with the following High Voltage Interlock Loops:
  a. Rear motor controller interlock circuit 1.
  b. DC fast charging interlock circuit 2.
  c. Two-in-one and power interlock 3 circuits.
  d. Electric compressor interlock circuit 4.



- Each high-voltage interlock circuit is independently controlled. When an abnormality occurs in any high-voltage interlock signal, the Battery Management System will perform corresponding fault handling based on the specific abnormal circuit. In severe cases, it will trigger high-voltage power-down or prohibit high-voltage power-up.

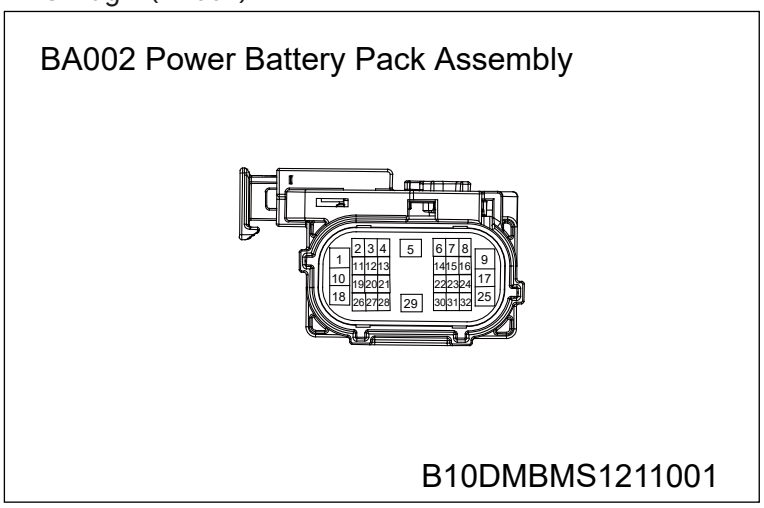
3.1.5 FAULT DIAGNOSIS

DIAGNOSTIC INSTRUCTIONS-BMS

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic port. By utilizing the BMS data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and an effective way to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION - BMS

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST - BMS

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
U007388	PCAN BusOff Fault	1. Physical faults: Thes e include: CAN_H open circuit, CAN_L open cir cuit, CAN_H short to C AN_L, CAN_L short to VBAT, CAN_H short to VBAT, CAN_H short to GND, CAN_L short to G ND, termination resisto r open circuit, etc. 2. Caused by compone nt failures such as the CAN controller or trans ceiver; or incorrect tra nsmission and receptio n of CAN signals due t o CAN bus signal interf erence.	1. Check the PCAN bus cha nnels of the entire vehicle, c onfirm the resistance betw een CAN lines, the CAN-to -ground resistance, and th e voltage to ground in the low-voltage operating stat e. 2. By elimination, sequenti ally disconnect the controll ers in the PCAN until the fa ult is cleared. 3. Replace the suspected f aulty controller
U007387	PCAN communication lost	1. Physical faults: Thes e include: CAN_H open circuit, CAN_L open cir cuit, CAN_H short to C AN_L, CAN_L short to VBAT, CAN_H short to VBAT, CAN_H short to GND, CAN_L short to G ND, termination resisto r open circuit, etc. 2. Caused by compone nt failures such as the CAN controller or trans ceiver; or incorrect tra nsmission and receptio n of CAN signals due t o CAN bus signal interf erence.	1. Check the PCAN bus cha nnels of the entire vehicle, c onfirm the resistance betw een CAN lines, the CAN-to -ground resistance, and th e voltage to ground in the low-voltage operating stat e. 2. By elimination, sequenti ally disconnect the controll ers in the PCAN until the fa ult is cleared. 3. Replace the suspected f aulty controller
U007488	Internal CAN Bus-Off Faul t	1. Physical faults: Thes e include: CAN_H open circuit, CAN_L open cir cuit, CAN_H short to C	1. Check the PCAN bus cha nnels of the entire vehicle, c onfirm the resistance betw een CAN lines, the CAN-to

		AN_L, CAN_L short to VBAT, CAN_H short to VBAT, CAN_H short to GND, CAN_L short to GND, termination resistor open circuit, etc. 2. Caused by component failures such as the CAN controller or transceiver; or incorrect transmission and reception of CAN signals due to CAN bus signal interference.	-ground resistance, and the voltage to ground in the low-voltage operating state. 2. By elimination, sequentially disconnect the controllers in the PCAN until the fault is cleared. 3. Replace the suspected faulty controller
U007487	Loss of internal CAN communication	1. Physical faults: These include: CAN_H open circuit, CAN_L open circuit, CAN_H short to CAN_L, CAN_L short to VBAT, CAN_H short to VBAT, CAN_H short to GND, CAN_L short to GND, termination resistor open circuit, etc. 2. Caused by component failures such as the CAN controller or transceiver; or incorrect transmission and reception of CAN signals due to CAN bus signal interference.	1. Check the PCAN bus channels of the entire vehicle, confirm the resistance between CAN lines, the CAN-to-ground resistance, and the voltage to ground in the low-voltage operating state. 2. By elimination, sequentially disconnect the controllers in the PCAN until the fault is cleared. 3. Replace the suspected faulty controller
U007688	Fast Charging CAN Bus Off Fault	1. Physical faults: These include: CAN_H open circuit, CAN_L open circuit, CAN_H short to CAN_L, CAN_L short to VBAT, CAN_H short to VBAT, CAN_H short to GND, CAN_L short to GND, termination resistor open circuit, etc. 2. Caused by component failures such as the	1. Check the PCAN bus channels of the entire vehicle, confirm the resistance between CAN lines, the CAN-to-ground resistance, and the voltage to ground in the low-voltage operating state. 2. By elimination, sequentially disconnect the controllers in the PCAN until the fault is cleared.

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
		4.False Detection of BMS Internal Fault	
P122817	Relay Independent Power Supply Low Voltage Fault	1.Prolonged inactivity and non-use, resulting in battery depletion 2.DCDC power supply abnormality, abnormal battery charging 3.Vehicle low-voltage system abnormality, continuous power consumption 4.False Detection of BMS Internal Fault	1. Check the low-voltage battery voltage 2. Check the operating condition of the DCDC 3.Check BMS hardware status 4. Check the power supply harness circuit
P122900	DC charging fault (charging equipment fault)	1. Fast charging pile failure resulting in inability to charge 2.Abnormal output of the fast charging pile causes charging failure. 3. Vehicle Malfunction Causing Charging Failure 4.Unable to detect due to BMS internal fault	1. Check the charging pile interface and record the fault information reported by the charging pile control screen or mobile app, and confirm the results with the charging pile manufacturer. 2.Check vehicle fault information 3. Check BMS fault information
P124200	VCU stops charging (VCU does not allow charging)	Charging stopped due to vehicle reasons	1. Check vehicle fault information 2. Check BMS fault information
P122A00	AC Charging Fault	Charging stopped due to vehicle reasons	1.Check OBC fault information 2. Check BMS fault information
P12BC00	BMS abnormal charging stop High internal fault level of charging BMS (High internal fault level of charging BMS)	Charging stopped due to BMS	Check BMS fault information

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
P122B00	DC Charger and BMS Power Mismatch Fault	1. Fast charging pile failure resulting in inability to charge 2.Abnormal output of the fast charging pile causes charging failure. 3. Vehicle Malfunction Causing Charging Failure 4.Unable to detect due to BMS internal fault	1. Check the charging pile interface and record the fault information reported by the charging pile control screen or mobile app, and confirm the results with the charging pile manufacturer. 2.Check vehicle fault information 3. Check BMS fault information
P122C00	VCU Fault Response Timeout	Charging stopped due to vehicle reasons	1. Check vehicle fault information 2. Check BMS fault information
P122D29	Complete Failure of DC Charging Socket Temperature Monitoring	1. Fast charging temperature sensing harness open circuit 2.Temperature sensor signal short to ground, short to power 3. Temperature sensor probe damaged 4.HPC hardware acquisition circuit fault	1.Check the temperature acquisition harness, measure the sensor resistance. 2.Replace the DC fast charging socket 3.Replace the HPC socket temperature acquisition hardware
P122F17	DC charging socket over-temperature Level 1	1. Unreliable connection of the charging socket leads to excessively high charging temperature. 2. Overcurrent during charging, causing overheating 3. High ambient temperature, charging in a high-temperature environment, high temperature 4.Temperature sensor signal short to ground, short to power	1.Check the connection of the DC fast charging port 2.Check the fast charging temperature harness, check the temperature acquisition harness, and measure the sensor resistance. 3. Replace the DC fast charging socket 4. Replace HPC socket temperature acquisition hardware

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
		3.BMS hardware interface failure	3. Try replacing the BMS hardware.
P126213	High Voltage Interlock 2 Open Fault	1. Loose high-voltage connector 2. Open circuit or short circuit in the high-voltage interlock low-voltage detection harness 3.BMS hardware interface failure	1.Check the interlock circuit connector 2. Check the continuity of the wiring harness inside the battery pack 3. Try replacing the BMS hardware.
P126312	High Voltage Interlock 3 Short to Power Fault	1. Loose high-voltage connector 2. Open circuit or short circuit in the high-voltage interlock low-voltage detection harness 3.BMS hardware interface failure	1.Check the interlock circuit connector 2. Check the continuity of the wiring harness inside the battery pack 3. Try replacing the BMS hardware.
P126411	High Voltage Interlock 3 Short to Ground Fault	1. Loose high-voltage connector 2. Open circuit or short circuit in the high-voltage interlock low-voltage detection harness 3.BMS hardware interface failure	1.Check the interlock circuit connector 2. Check the continuity of the wiring harness inside the battery pack 3. Try replacing the BMS hardware.
P126513	High Voltage Interlock 3 Open Fault	1. Loose high-voltage connector 2. Open circuit or short circuit in the high-voltage interlock low-voltage detection harness 3.BMS hardware interface failure	1.Check the interlock circuit connector 2. Check the continuity of the wiring harness inside the battery pack 3. Try replacing the BMS hardware.
P12CC00	SOC too high	Software false alarm	Try to power on the vehicle again after it enters sleep mode
P12CB00	SOC too low	Battery pack remaining capacity is too low	It is recommended to fully charge the vehicle.

© 2026, All rights reserved

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
P12CD00	SOC Jump	After the battery remai ns stationary for an ext ended period, a signifi cant discrepancy betw een the actual battery charge and the SOC va lue may cause a sudde n jump in automatic S OC calibration	It is recommended to fully charge the vehicle to recali brate the SOC.
P126900	SOH Too Low Level 1	1. Battery pack state o f health is too low 2.Software false alarm	Reported fault issues will b e handled uniformly by the After-Sales Service.
P126A00	SOH Too Low Level 2	1. Battery pack state o f health is too low 2.Software false alarm	Reported fault issues will b e handled uniformly by the After-Sales Service.
U109300	Collision fault (from CAN s ignal)	1. The vehicle is involv ed in a collision 2. Collision sensor false alarm 3.False detection of B MS crash module fault	1. Vehicle BMS and wiring harness inspection and ma intenance 2. Replace the collision sen sor
P125600	Collision fault (from hard wired PWM signal)	Vehicle collision	1.Vehicle Repair 2. Replace the collision sen sor
P121111	Crash signal short to grou nd fault (from hardwired PWM signal)	1. The vehicle is involv ed in a collision 2.False trigger alarm 3.False detection of B MS crash module fault 4. Check hardwire harn ess issues	1. Vehicle BMS and wiring harness inspection and ma intenance 2. Replace the collision sen sor
P121115	Crash signal shorted to po wer or open	1. The vehicle is involv ed in a collision 2.False trigger alarm 3.False detection of B MS crash module fault 4. Check hardwire harn ess issues	1. Vehicle BMS and wiring harness inspection and ma intenance 2. Replace the collision sen sor

DTC: P110200-BMS

Fault code	Description
P110200	Main negative relay coil LSD drive abnormal fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114000-BMS

Fault code	Description
P114000	Cell overvoltage Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P110D13-BMS

Fault code	Description
P110D13	Pre-charge relay coil open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P110800-BMS

Fault code	Description
P110800	Pre-charge relay coil LSD drive fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114B00-BMS

Fault code	Description
P114B00	Level 1 High Battery Temperature Alarm

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P112500-BMS

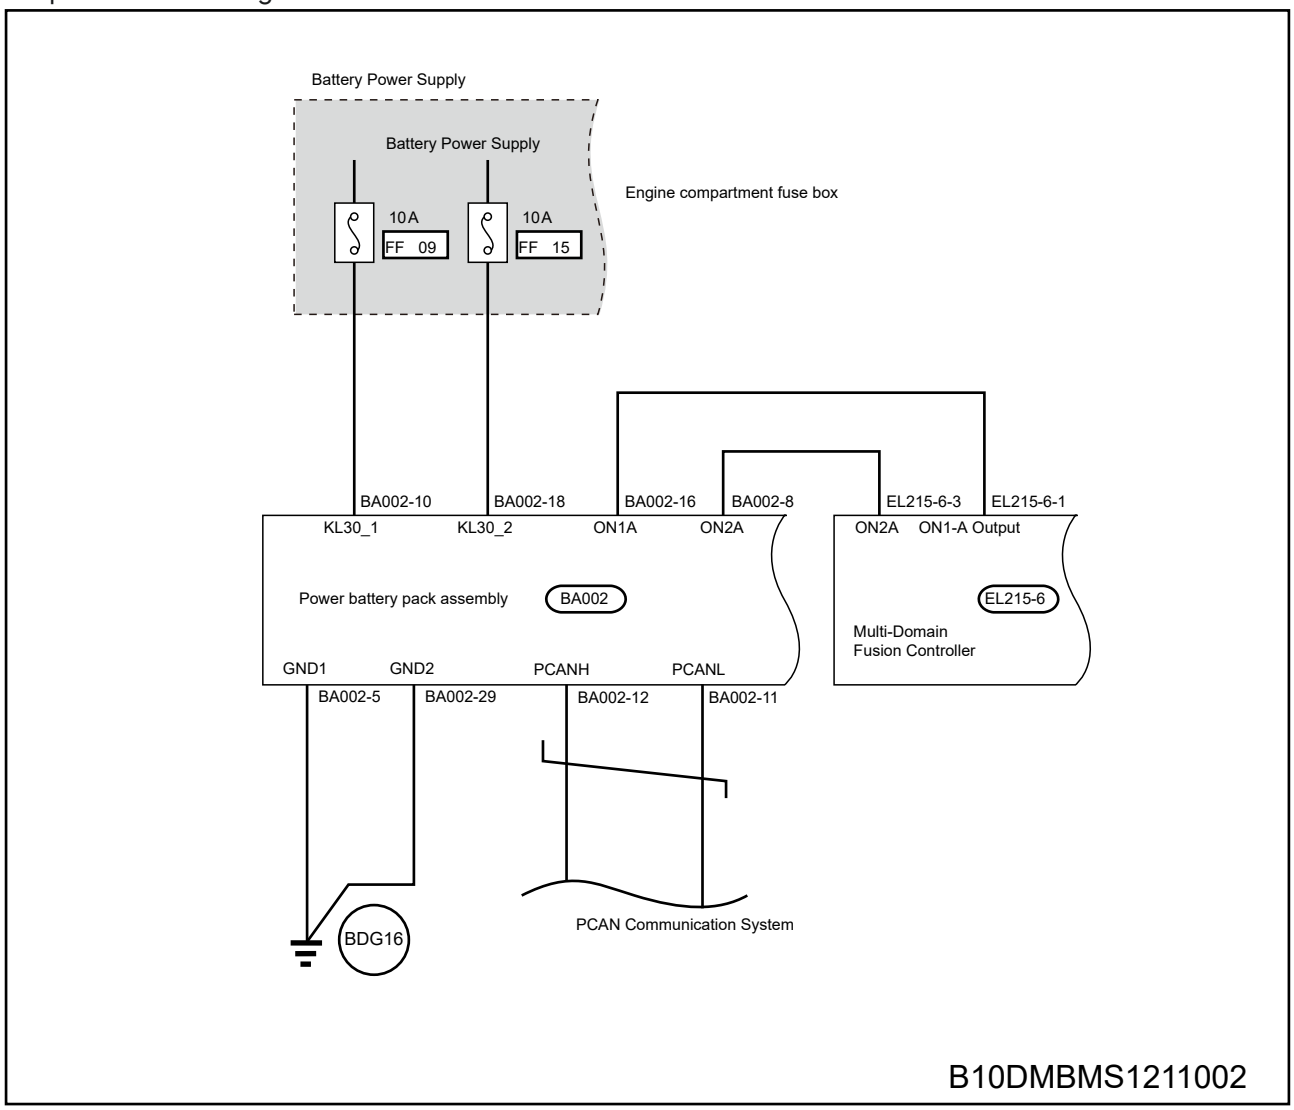
Fault code	Description
P112500	Charging Overcurrent Level 3

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 4.	
Step 4 Diagnosis complete.

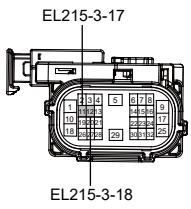
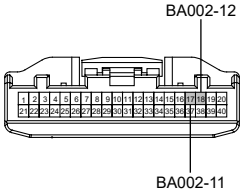
DTC: B1FD361-BMS

Fault code	Description
B1FD361	VIU and BMS Authentication Failure or Timeout Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the multi-domain fusion controller key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the key of the multi-domain fu sion controller, and check whether it is written correctly.
No》》》 Rewrite the multi-domain fusion controller key.	
Yes》》》 Go to step 3.	
Step 3 Restart the vehicle.	
	A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211024 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211025	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	

© 2026, All rights reserved

	Yes》》》 Go to step 5.
Step 5 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Do main Fusion Controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

DTC: P114800-BMS

Fault code	Description
P114800	Module voltage out of range fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P115100-BMS

Fault code	Description
P115100	Battery temperature sensor exceeds upper limit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes》》》 Stop charging or discharging; wait for a period of time and recheck.	
No》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes》》》 Inspect and repair the faulty part; add coolant.	
No》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No》》》 Troubleshoot the electric compressor assembly fault.	
Yes》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P112000-BMS

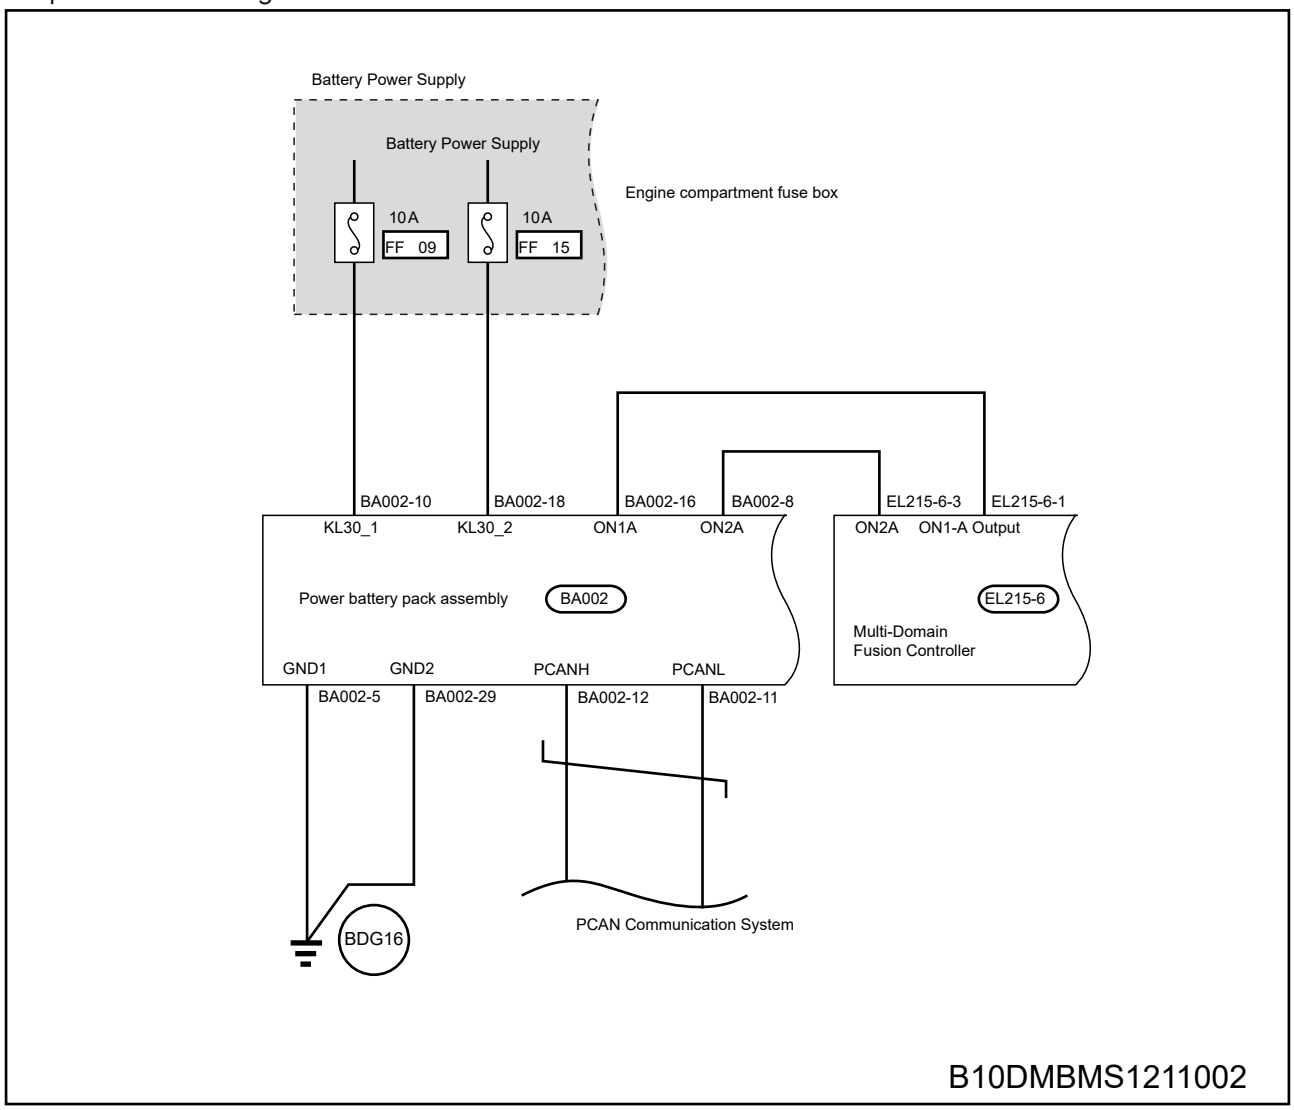
Fault code	Description
P112000	Discharge overcurrent Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P110312-BMS

Fault code	Description
P110312	Main negative relay coil HSD short to power fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P111000-BMS

Fault code	Description
P111000	Abnormal Fault in HSD Drive Circuit of DC Charging Positive Relay Coi l

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P113800-BMS

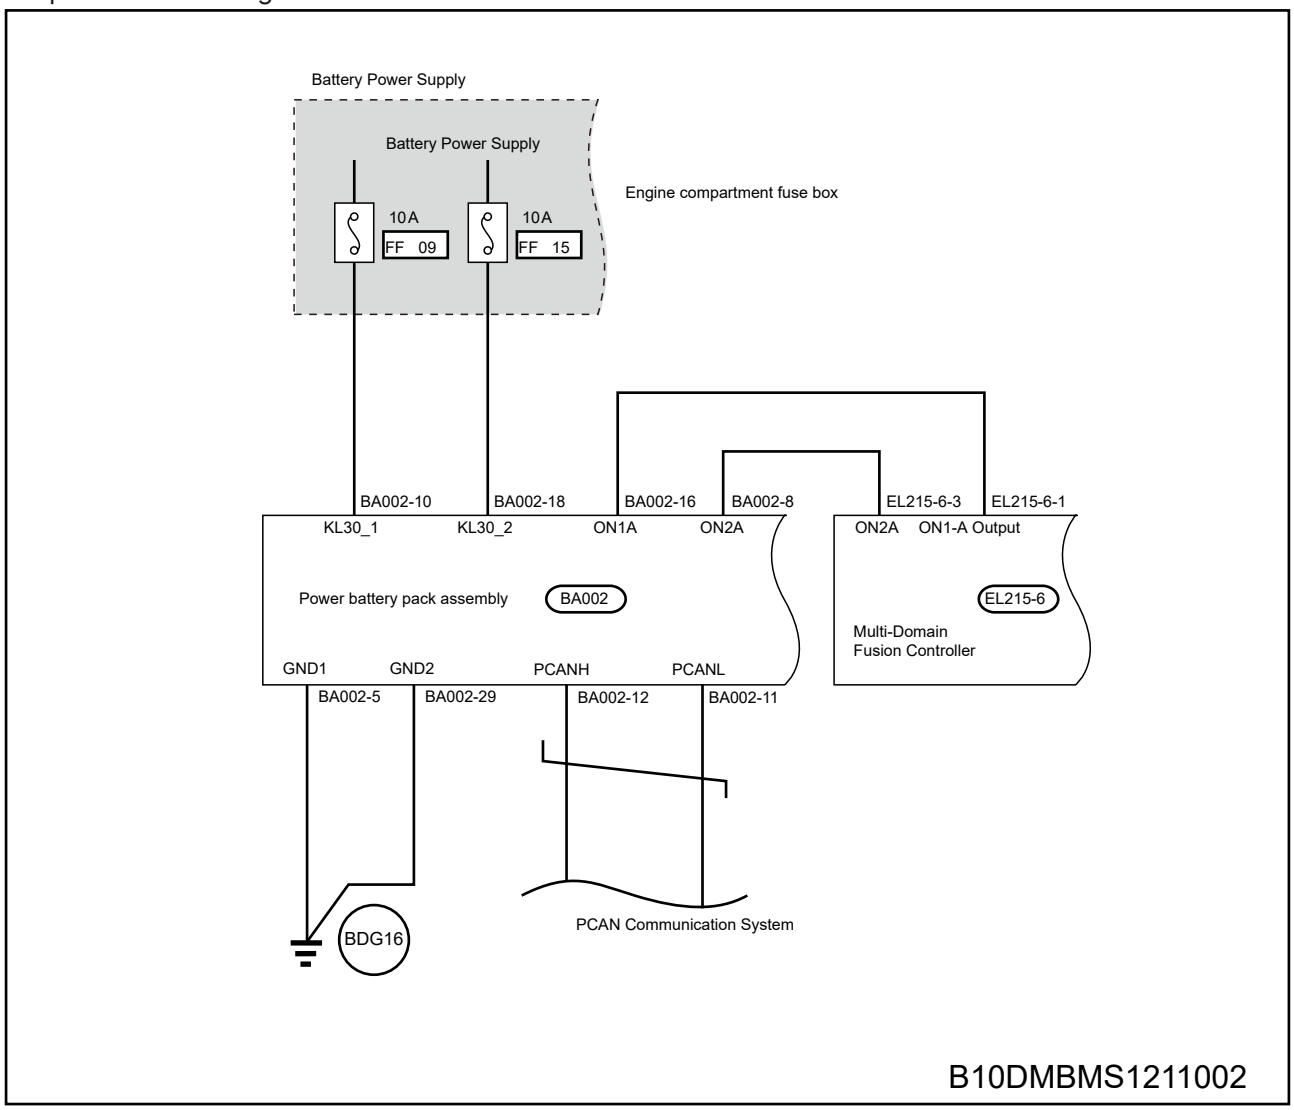
Fault code	Description
P113800	Current sensor shunt overtemperature Level 1 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P114500-BMS

Fault code	Description
P114500	Cell under-voltage Level 2

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Perform an inspection after charging.	
	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114700-BMS

Fault code	Description
P114700	Cell Voltage Plausibility Check

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P115011-BMS

Fault code	Description
P115011	Battery temperature sampling short to ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
	Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.
	No 》》》 Go to step 3.
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
	Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.
	No 》》》 Go to step 4.
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
	Yes 》》》 Inspect and repair the faulty part; add coolant.
	No 》》》 Go to step 5.
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 6.
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P110C11-BMS

Fault code	Description
P110C11	Precharge relay LSD short to ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P111411-BMS

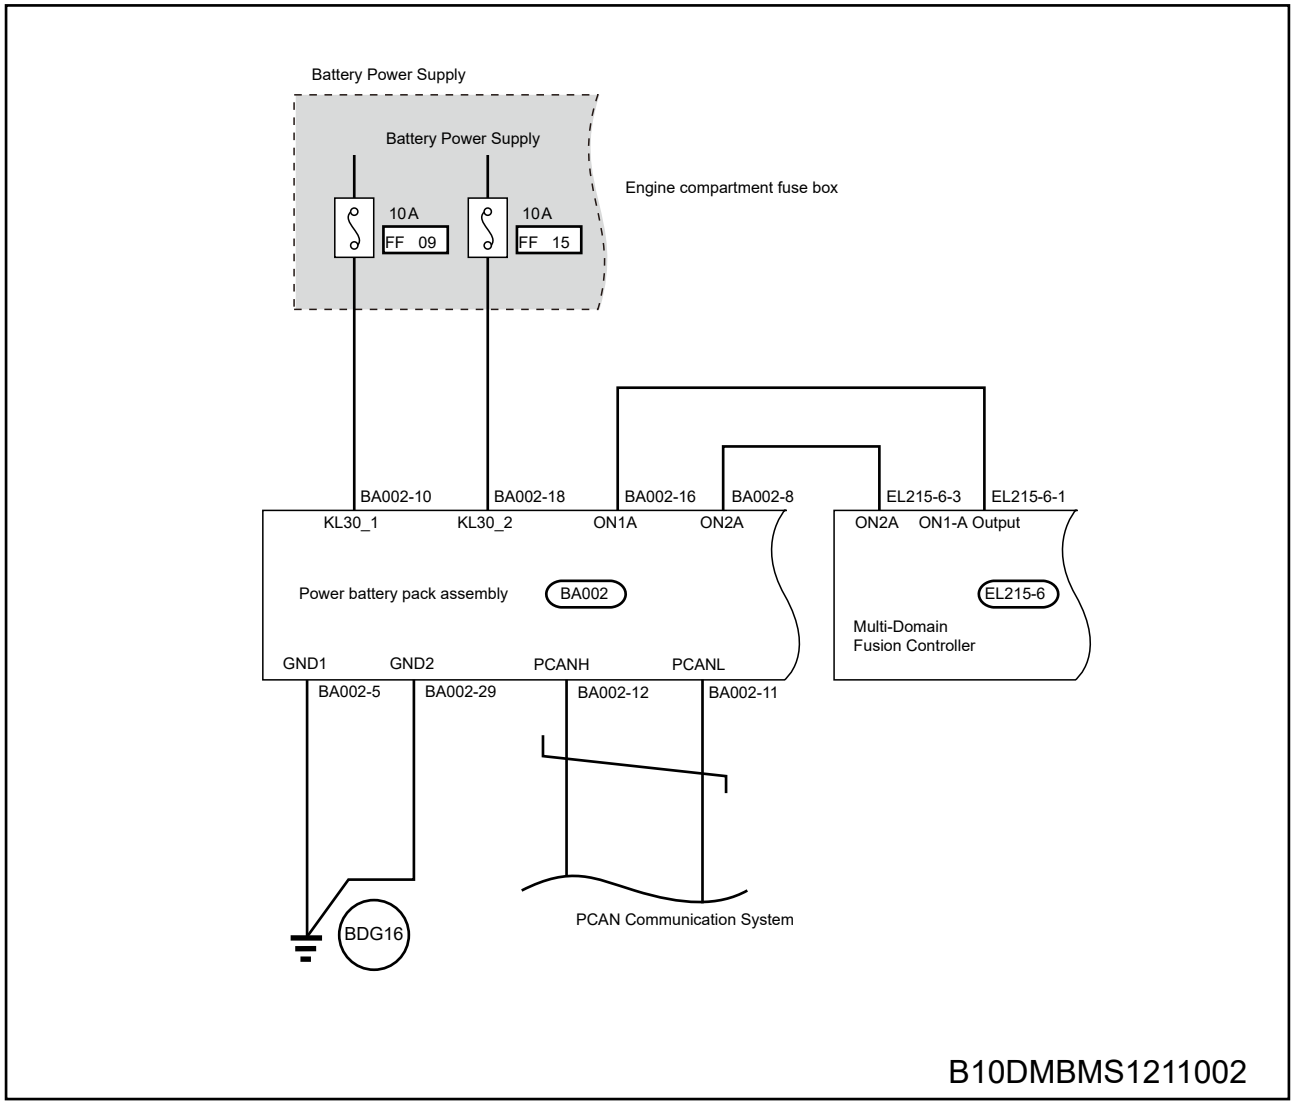
Fault code	Description
P111411	DC Charging Positive Relay Coil HSD Short to Ground Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast charging relay and the BMS control harness (internal harness of the power battery pack assembly).
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 3.	
Step 3 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: P111D13-BMS

Fault code	Description
P111D13	Cell voltage acquisition below lower limit fault (DC charging negative relay coil open circuit fault)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P114200-BMS

Fault code	Description
P114200	Cell overvoltage Level 3

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P115600-BMS

Fault code	Description
P115600	High-voltage connector over-temperature Level 1 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P113200-BMS

Fault code	Description
P113200	First Current Over-Range Fault (Charging)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: B1FD055-BMS

Fault code	Description
B1FD055	IMMO Random Number Injection Failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the IMMO key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and reprogram the IMMO key as pr ompted by the diagnostic tool. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P115300-BMS

Fault code	Description
P115300	Minor Abnormality Fault of Battery Temperature Sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
	Yes》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.
	No》》》 Go to step 3.
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
	Yes》》》 Stop charging or discharging; wait for a period of time and recheck.
	No》》》 Go to step 4.
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
	Yes》》》 Inspect and repair the faulty part; add coolant.
	No》》》 Go to step 5.
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No》》》 Troubleshoot the electric compressor assembly fault.
	Yes》》》 Go to step 6.
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P110B11-BMS

Fault code	Description
P110B11	Pre-charge relay coil HSD short-to-ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P111312-BMS

Fault code	Description
P111312	DC charging positive relay LSD short to power fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P110412-BMS

Fault code	Description
P110412	Main negative relay LSD short to power fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114D00-BMS

Fault code	Description
P114D00	High battery temperature Level 4 warning

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P114300-BMS

Fault code	Description
P114300	Cell extreme overvoltage

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P110A12-BMS

Fault code	Description
P110A12	Precharge relay LSD short to power fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P111212-BMS

Fault code	Description
P111212	DC charging positive relay HSD coil short to power fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P110411-BMS

Fault code	Description
P110411	Main negative relay coil HSD short-to-ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P110613-BMS

Fault code	Description
P110613	Main negative relay coil open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114A00-BMS

Fault code	Description
P114A00	Busbar voltage out-of-limit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P111511-BMS

Fault code	Description
P111511	DC charging positive relay LSD short to ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P111700-BMS

Fault code	Description
P111700	DC charging negative relay coil HSD drive circuit abnormal fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P114400-BMS

Fault code	Description
P114400	Cell Under-voltage Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Perform an inspection after charging.	
	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P115400-BMS

Fault code	Description
P115400	Battery temperature sensor medium fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Perform an inspection after charging.	
	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P113000-BMS

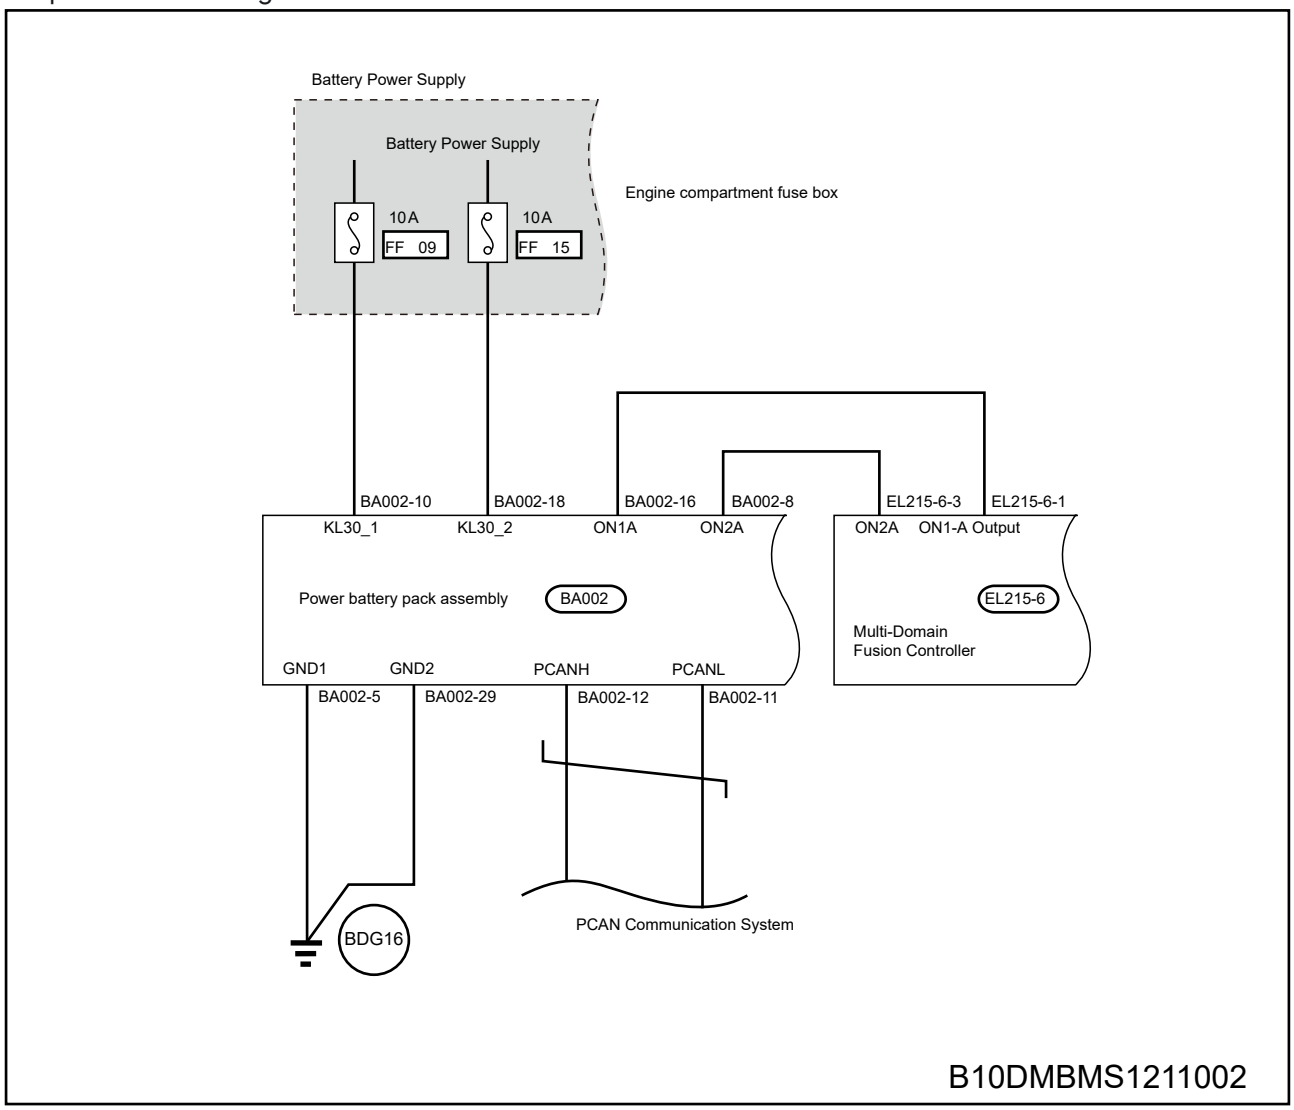
Fault code	Description
P113000	Current acquisition plausibility fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P115200-BMS

Fault code	Description
P115200	Battery temperature sensor below lower limit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
	Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.
	No 》》》 Go to step 3.
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
	Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.
	No 》》》 Go to step 4.
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
	Yes 》》》 Inspect and repair the faulty part; add coolant.
	No 》》》 Go to step 5.
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 6.
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

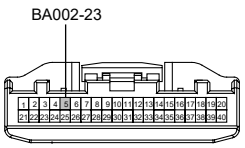
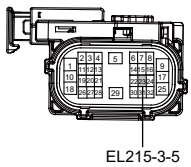
DTC: P119C00-BMS

Fault code	Description
P119C00	V2X Wake-Up Circuit Overcurrent Fault (BJB Chip Hardware Initialization Fault)





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wake-up harness between the multi-domain fusion controller and the power battery pack assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211039 BA002 Power Battery Pack Assembly  B10DMBMS1211040	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the wiring harness connector BA002 of the power battery pack assembly. D Use a multimeter, select the resistance setting, and measure the resistance between terminal 5 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector BA002 of the power battery pack assembly to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of the wiring harness connector BA002 of the traction battery pack assembly and the body ground is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the harness connector BA002 of the power battery pack assembly and the vehicle body ground to check if it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: P117300-BMS

Fault code	Description
P117300	HV_FCH+ Sampling Open Circuit/Short to Ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P119100-BMS

Fault code	Description
P119100	Precharge overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the power b attery pack assembly, and record them. C Check for insulation, interlock, precharge relay, and other related faults.
	Yes 》》》 Prioritize the repair of related faults.
	No 》》》 Go to step 3.
Step 3 Check the high-voltage wiring harness of the entire vehicle.	
	A Check whether the positive and negative poles of the veh icle high-voltage harness are connected incorrectly.
	Yes 》》》 Properly connect the high-voltage wiring harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

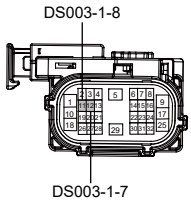
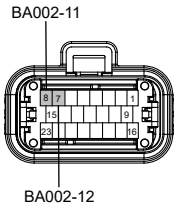
DTC: P119400-BMS

Fault code	Description
P119400	Vehicle Emergency Power-Off Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check controller assembly fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controll er assembly and record them. C Check the controller assembly for faults.
	Yes》》》 Prioritize the repair of faults related to the controller assembly.
	No》》》 Go to step 3.
Step 3 Check the CAN communication harness between the controller assembly and the power battery pac k assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211042 DS003-1 Controller Assembly  B10DMBMS1211043	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector DS003-1 of the c ontroller assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 7 of the wire harness connector DS003-1 on the controller assembly and terminal 12 of the wire harness connector BA002 on the po wer battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 8 of the wire ha rness connector DS003-1 of the controller assembly and te rminal 11 of the wire harness connector BA002 of the powe r battery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: P116900-BMS

Fault code	Description
P116900	HV_Heat+ sampling out of range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P117700-BMS

Fault code	Description
P117700	Balancing Circuit Over-Temperature Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: P116A00-BMS

Fault code	Description
P116A00	HV_FCH+ sampling out of range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P118800-BMS

Fault code	Description
P118800	Fault of Increased Temperature Difference in Temperature Differential Self-Circulation Mode

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the wiring harness of the water temperature sensor at the power battery water outlet.	
	A Check the wire harness of the water temperature sensor a t the water outlet of the power battery (inside the battery p ack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the water temperature sensor at the power battery water inlet and the water temperature s ensor at the power battery water outlet.	
	A Replace the power battery water inlet temperature sensor (inside the power battery pack) and the power battery wate r outlet temperature sensor (inside the power battery pack), and check whether the fault is cleared.
Yes》》》 System normal.	
No》》》 Go to Step 9.	
Step 9 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 10.	
Step 10 Diagnosis complete.

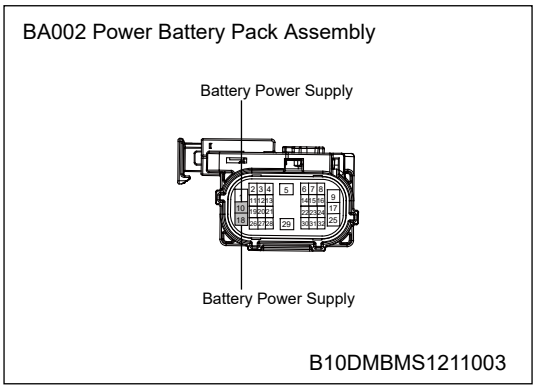
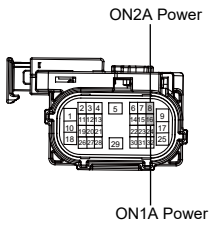
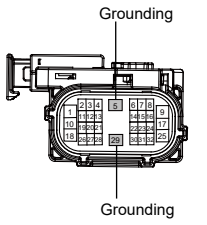
DTC: P11B700-BMS

Fault code	Description
P11B700	BMS Battery Voltage Detection Open Circuit Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: P119600-BMS

Fault code	Description
P119600	AFE reference voltage too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P119700-BMS

Fault code	Description
P119700	Abnormal Cell Voltage Difference Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P116B00-BMS

Fault code	Description
P116B00	HV_FCH-Sampling out of range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

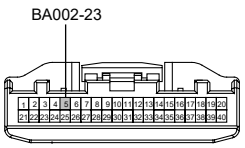
DTC: P119A00-BMS

Fault code	Description
P119A00	VCU/BCM Wake-Up Circuit Short to Power Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

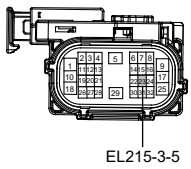
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wake-up harness between the multi-domain fusion controller and the power battery pack assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211039

BA002 Power Battery Pack Assembly

B10DMBMS1211040

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance setting, and measure the resistance between terminal 5 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector BA002 of the power battery pack assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of the wiring harness connector BA002 of the traction battery pack assembly and the body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the harness connector BA002 of the power battery pack assembly and the vehicle body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: P117100-BMS

Fault code	Description
P117100	HV_BAT Sampling Open Circuit / Short to Ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P11B500-BMS

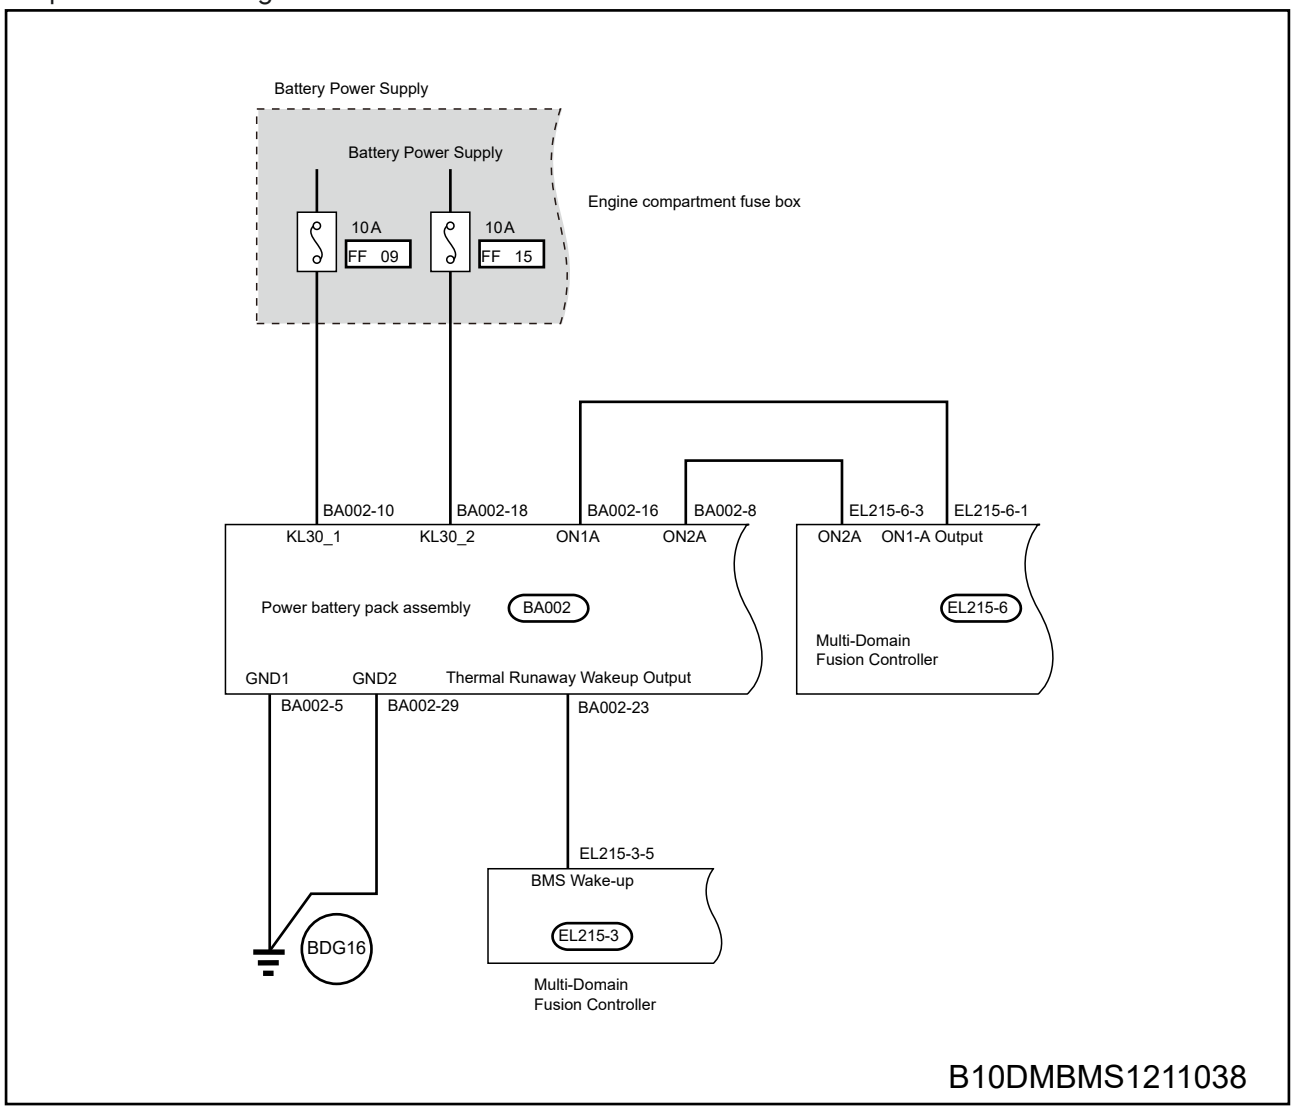
Fault code	Description
P11B500	Unexpected Contactor Disconnection

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the control wiring harnesses for each relay.	
	A Check the control wiring harness between each relay and the BMS (internal wiring harness of the battery pack assembly) for short circuits or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 3.	
Step 3 Replace the relay.	
	A Replace the relays one by one, and check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

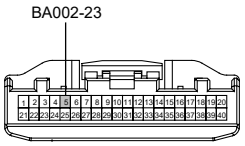
DTC: P119D00-BMS

Fault code	Description
P119D00	MSD/E-service OUT Fault

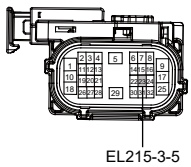
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wake-up harness between the multi-domain fusion controller and the power battery pack assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211039

BA002 Power Battery Pack Assembly

B10DMBMS1211040

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance setting, and measure the resistance between terminal 5 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector BA002 of the power battery pack assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of the wiring harness connector BA002 of the traction battery pack assembly and the body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the harness connector BA002 of the power battery pack assembly and the vehicle body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: P11A400-BMS

Fault code	Description
P11A400	PACK Internal Insulation Level 2 Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P118C00-BMS

Fault code	Description
P118C00	Battery temperature sampling wire open circuit, short to power Level 2 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or battery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (inside the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

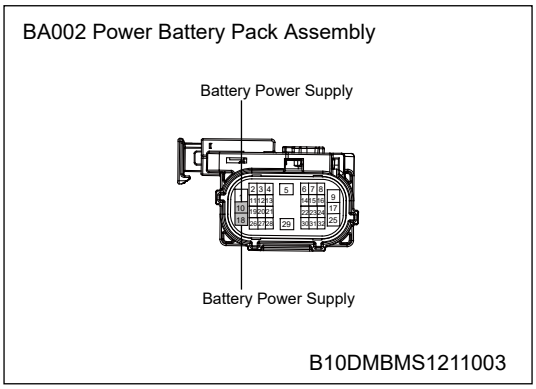
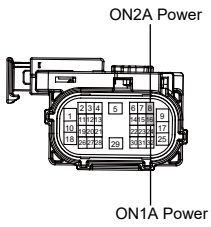
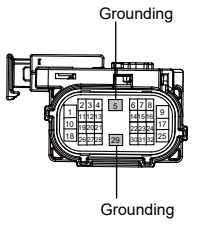
DTC: P11B600-BMS

Fault code	Description
P11B600	BMS Battery Voltage Detection Value Plausibility Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P118900-BMS

Fault code	Description
P118900	AC Charging Heating Under-Temperature Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the wiring harness of the water temperature sensor at the power battery water outlet.	
	A Check the wire harness of the water temperature sensor a t the water outlet of the power battery (inside the battery p ack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the water temperature sensor at the power battery water inlet and the water temperature s ensor at the power battery water outlet.	
	A Replace the power battery water inlet temperature sensor (inside the power battery pack) and the power battery wate r outlet temperature sensor (inside the power battery pack), and check whether the fault is cleared.
Yes》》》 System normal.	
No》》》 Go to Step 9.	
Step 9 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 10.	
Step 10 Diagnosis complete.

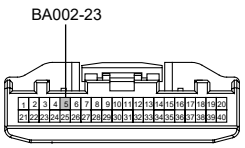
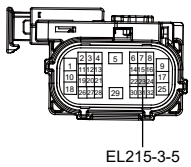
DTC: P119B00-BMS

Fault code	Description
P119B00	VCU/BCM Wake-Up Circuit Short to Ground Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wake-up harness between the multi-domain fusion controller and the power battery pack assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211039 BA002 Power Battery Pack Assembly  B10DMBMS1211040	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the wiring harness connector BA002 of the power battery pack assembly. D Use a multimeter, select the resistance setting, and measure the resistance between terminal 5 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector BA002 of the power battery pack assembly to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of the wiring harness connector BA002 of the traction battery pack assembly and the body ground is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 23 of the harness connector BA002 of the power battery pack assembly and the vehicle body ground to check if it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the multi-domain fusion controller.	
	A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: P115A11-BMS

Fault code	Description
P115A11	High-voltage connector NTC short-to-ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P116000-BMS

Fault code	Description
P116000	Battery pack total voltage too high Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P118712-BMS

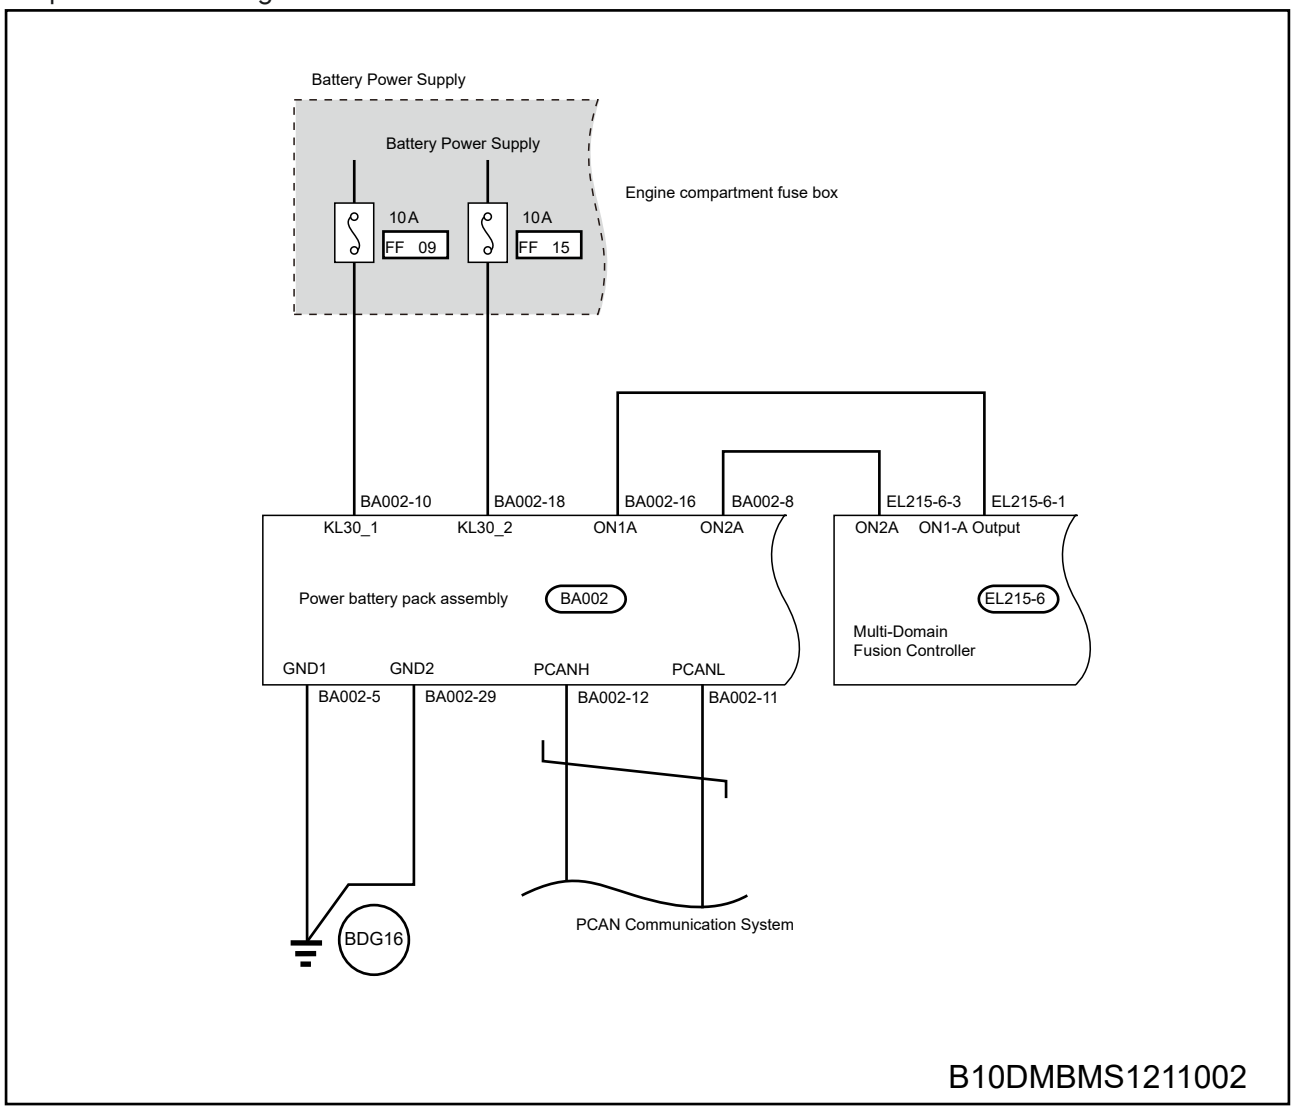
Fault code	Description
P118712	Outlet temperature sensor short to power or open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the wiring harness of the water temperature sensor at the power battery water outlet.	
	A Check the wire harness of the water temperature sensor at the water outlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 3.	
Step 3 Replace the water temperature sensor at the water outlet of the power battery.	
	A Replace the water temperature sensor at the water outlet of the power battery (inside the power battery pack), and check whether the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: P11B400-BMS

Fault code	Description
P11B400	Pyrofuse Power Supply Abnormal Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: P115800-BMS

Fault code	Description
P115800	High-Voltage Connector Overheating Level 3 Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P116100-BMS

Fault code	Description
P116100	Battery pack total voltage too low Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Perform an inspection after charging.	
	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P116800-BMS

Fault code	Description
P116800	HV_BAT+ sampling out of range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P118A00-BMS

Fault code	Description
P118A00	DC charging heating under-temperature fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the wiring harness of the water temperature sensor at the power battery water outlet.	
	A Check the wire harness of the water temperature sensor a t the water outlet of the power battery (inside the battery p ack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the water temperature sensor at the power battery water inlet and the water temperature s ensor at the power battery water outlet.	
	A Replace the power battery water inlet temperature sensor (inside the power battery pack) and the power battery wate r outlet temperature sensor (inside the power battery pack), and check whether the fault is cleared.
Yes》》》 System normal.	
No》》》 Go to Step 9.	
Step 9 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 10.	
Step 10 Diagnosis complete.

DTC: P11A300-BMS

Fault code	Description
P11A300	PACK Internal Insulation Level 1 Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P116500-BMS

Fault code	Description
P116500	HV_FUSE+ Sampling Out of Range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P119500-BMS

Fault code	Description
P119500	AFE reference voltage is too low

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P11A100-BMS

Fault code	Description
P11A100	Pre-charge resistor open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connected to the precharge resistor.	
	A Check the wiring harness connecting the precharge resist or (inside the battery pack) for an open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Replace the precharge resistor.	
	A After replacing the pre-charge resistor, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P119200-BMS

Fault code	Description
P119200	BJB Chip Voltage Sampling Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P128000-BMS

Fault code	Description
P128000	Pre-charge short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the power b attery pack assembly, and record them. C Check for insulation, interlock, precharge relay, and other related faults.
	Yes 》》》 Prioritize the repair of related faults.
	No 》》》 Go to step 3.
Step 3 Check the high-voltage wiring harness of the entire vehicle.	
	A Check whether the positive and negative poles of the veh icle high-voltage harness are connected incorrectly.
	Yes 》》》 Properly connect the high-voltage wiring harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

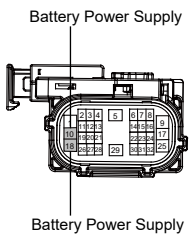
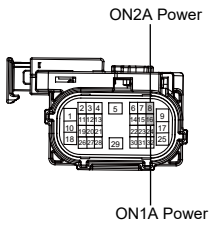
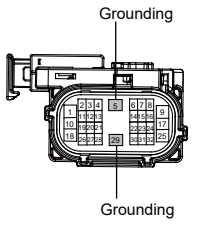
DTC: P121317-BMS

Fault code	Description
P121317	BMS Low-Voltage Power Supply Overvoltage Fault (12V Power Supply Voltage Exceeds Threshold)



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
	No》》》 Check the power supply of ON1A and ON2A.
	Yes》》》 Go to step 6.
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P127649-BMS

Fault code	Description
P127649	Insulation control switch K1/k2 stuck

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.	

© 2026, All rights reserved

DTC: P121A4B-BMS

Fault code	Description
P121A4B	BMU Over-temperature Fault (Excessive BMU Board Temperature)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or battery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (inside the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P126900-BMS

Fault code	Description
P126900	SOH Too Low Level 1

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P127349-BMS

Fault code	Description
P127349	Insulation Detection Circuit Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P121C00-BMS

Fault code	Description
P121C00	Balancing circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: P123811-BMS

Fault code	Description
P123811	AC charging socket temperature 1 short-to-ground fault

1. Simplified Circuit Diagram

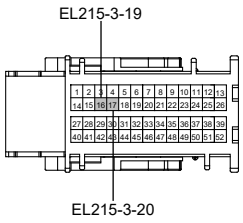
2. Diagnostic Steps

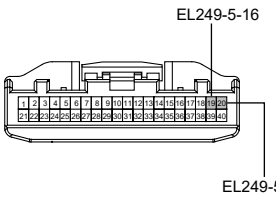
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

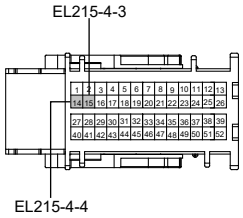
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

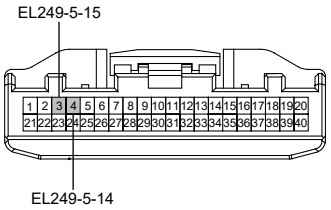
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



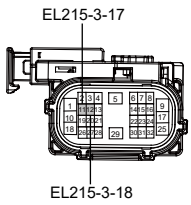
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

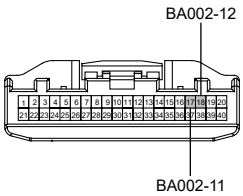
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: P127149-BMS

Fault code	Description
P127149	BJB Power Supply Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
	No 》》》 Replace the fast and slow charging cable assembly.
	Yes 》》》 Go to step 3.
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P122D29-BMS

Fault code	Description
P122D29	Complete Failure of DC Charging Socket Temperature Monitoring

1. Simplified Circuit Diagram

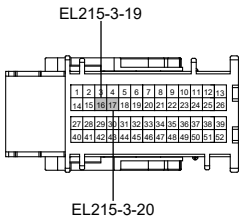
2. Diagnostic Steps

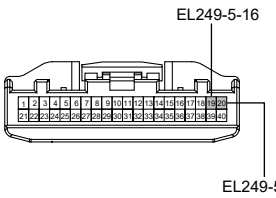
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

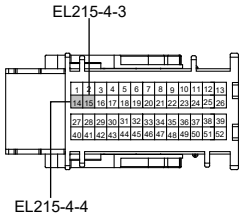
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

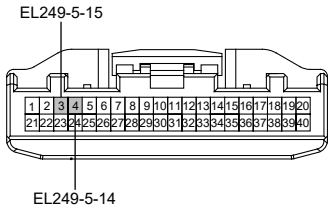
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



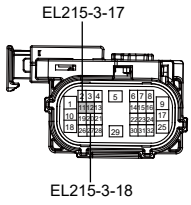
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

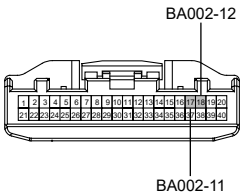
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to Step 9.
Step 9 Diagnosis complete.

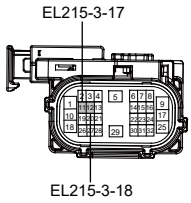
EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

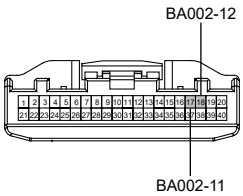
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: P120C00-BMS

Fault code	Description
P120C00	Excessive battery temperature difference fault (Large temperature difference in the power battery pack)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P120E18-BMS

Fault code	Description
P120E18	Overcharge of on-board energy storage device type

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P120717-BMS

Fault code	Description
P120717	Cell voltage acquisition over upper limit fault (Cell voltage of the power battery pack exceeds the threshold)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

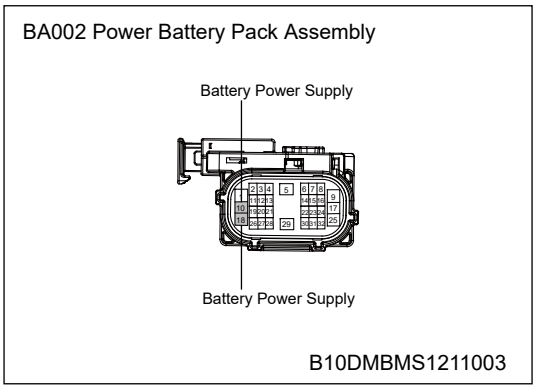
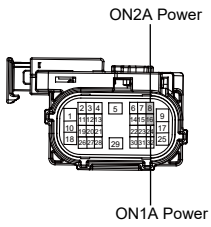
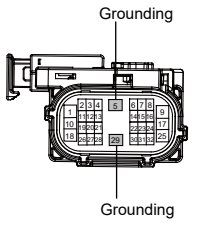
DTC: P122717-BMS

Fault code	Description
P122717	Relay independent power supply overvoltage fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
	No》》》 Check the power supply of ON1A and ON2A.
	Yes》》》 Go to step 6.
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P120513-BMS

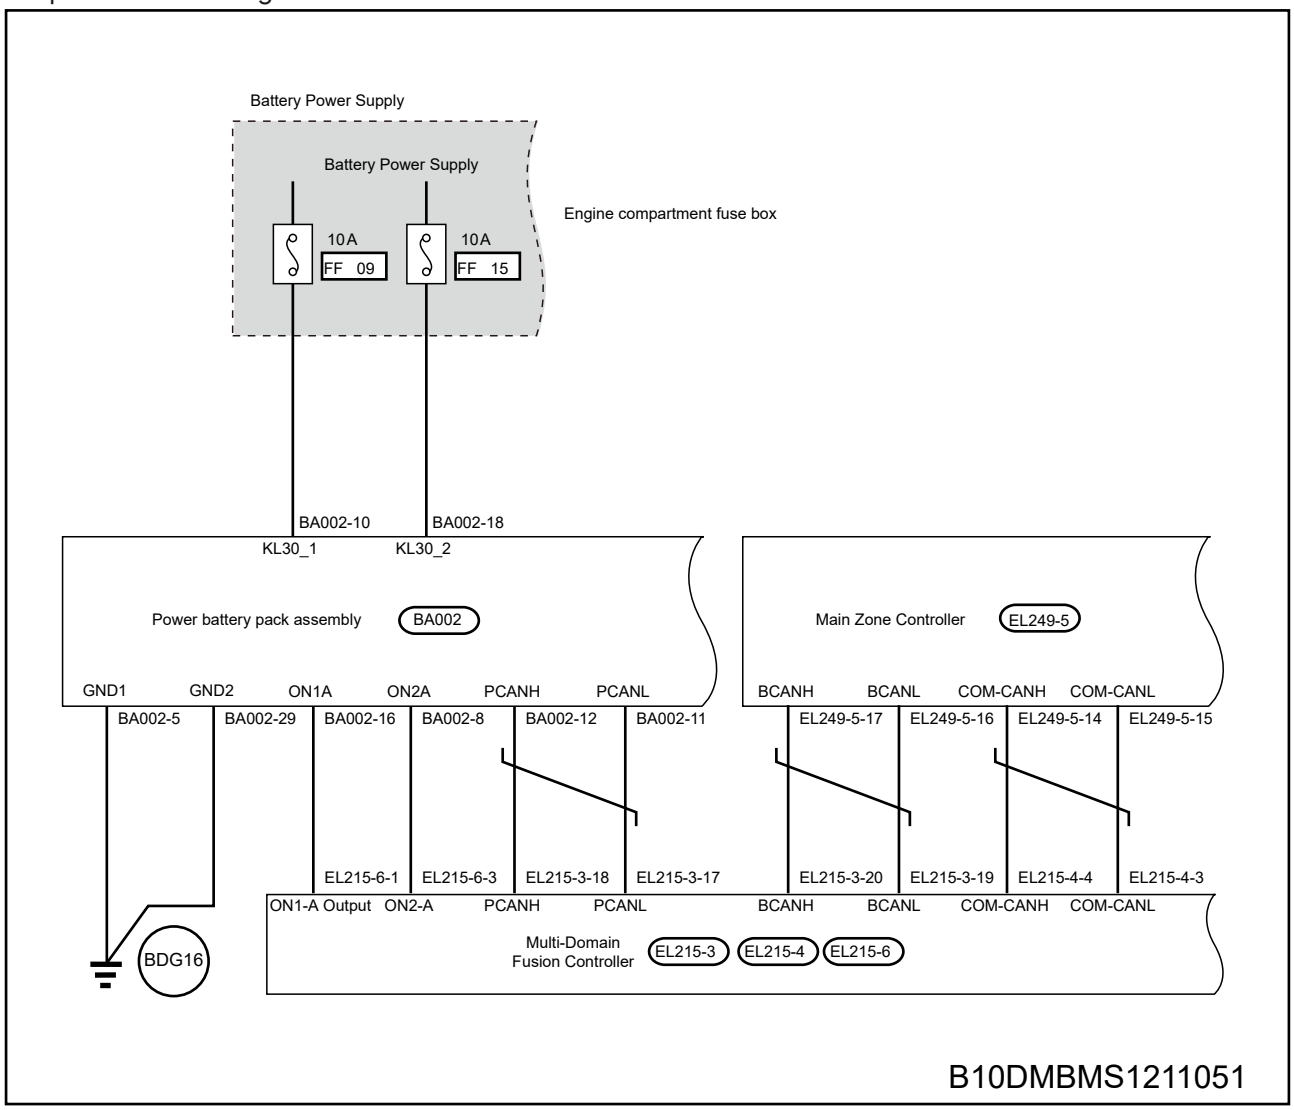
Fault code	Description
P120513	Main positive relay open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the main positive relay control wiring harness.	
	A Check the main positive relay and the BMS control harness (internal harness of the power battery pack assembly) for short circuits or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 3.	
Step 3 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: P123017-BMS

Fault code	Description
P123017	DC Charging Socket Over-temperature Level 2

1. Simplified Circuit Diagram

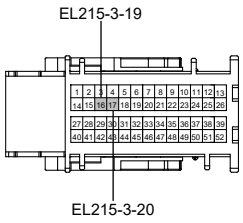
2. Diagnostic Steps

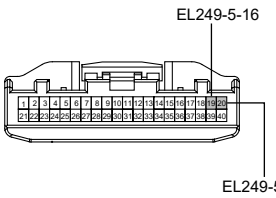
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

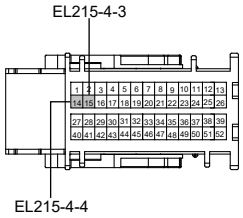
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

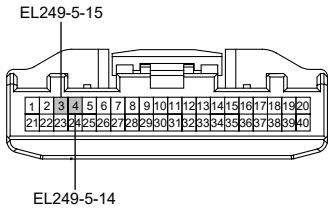
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



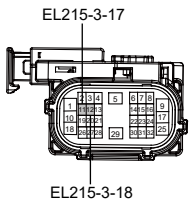
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

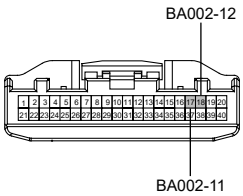
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: P127700-BMS

Fault code	Description
P127700	DC charging insulation Level 1 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
	No 》》》 Replace the fast and slow charging cable assembly.
	Yes 》》》 Go to step 3.
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P123612-BMS

Fault code	Description
P123612	DC charging port positive terminal short to power or open circuit faul t

1. Simplified Circuit Diagram

2. Diagnostic Steps

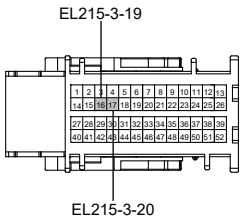
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

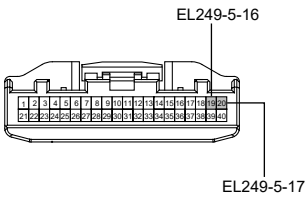
Step 2 Check the fault code of the main zone controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the main zone controller and record them.
C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.



Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

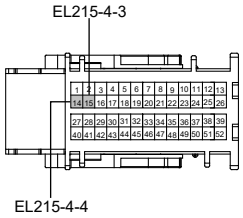
EL249-5 Main Zone Controller

B10DMBMS1211052

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211053

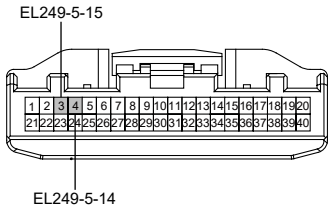
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main zone controller.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



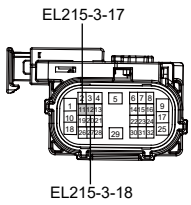
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

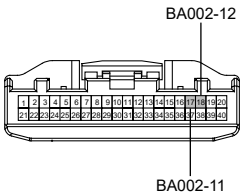
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

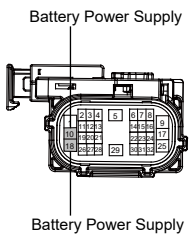
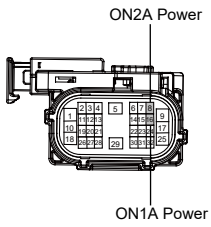
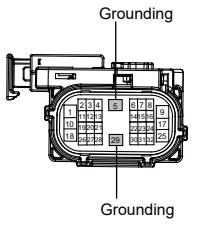
DTC: P122416-BMS

Fault code	Description
P122416	Low battery fault before or during high-voltage power-on



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
	No》》》 Check the power supply of ON1A and ON2A.
	Yes》》》 Go to step 6.
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P122B00-BMS

Fault code	Description
P122B00	DC Charger and BMS Power Mismatch Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Replace the charging equipment and recharge.	
	A Replace the charging equipment and recharge, then chec k whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check vehicle fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the vehicle fault codes, and re cord them. C Check for any other relevant fault codes affecting chargin g.
	Yes》》》 Prioritize the repair of other related faults.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P125252-BMS

Fault code	Description
P125252	Inlet water temperature does not drop in cooling mode

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes 》 》 》 Repair or replace the wiring harness.	
No 》 》 》 Go to step 7.	
Step 7 Replace the water temperature sensor at the water inlet of the power battery.	
	A Replace the water temperature sensor at the water inlet o f the power battery (inside the power battery pack), and ch eck whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.	

© 2026, All rights reserved

DTC: P127B00-BMS

Fault code	Description
P127B00	Built-in barometric pressure sensor BPS wake-up BMS hardwire fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power batt ery pack assembly.	
	A Check the wiring harness between the aerosol sensor (ins ide the battery pack) and the power battery pack assembly for short or open circuits.
	Yes 》》》 Replace the internal wiring harness of the battery pack.
	No 》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P120473-BMS

Fault code	Description
P120473	Main negative relay sticking fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the main negative relay.	
	A Remove the main negative relay and check whether the s witch terminal of the main negative relay is normally closed.
	Yes》》》 Replace the main negative relay.
	No》》》 Go to step 3.
Step 3 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harne ss (internal wiring harness of the power battery pack assem bly) for short circuits or open circuits.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

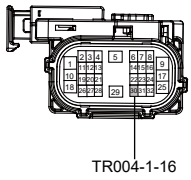
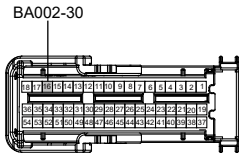
DTC: P126C29-BMS

Fault code	Description
P126C29	Collision hardwire invalid fault (from hardwire PWM signal)





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check whether collision-related fault codes are displayed.
Yes》》》 Prioritize the repair of collision-related faults in the airbag control module assembly.	
No》》》 Go to step 3.	
Step 3 Check the crash signal line between the airbag control module assembly and the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211019 TR004-1 Airbag Control Module Assembly  B10DMBMS1211020	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. D. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 16 of harness c onnector TR004-1 of the airbag control module assembly a nd terminal 30 of harness connector BA002 of the power ba ttery pack assembly is normal. Resistance standard value: Less than 1Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 16 of harness connector T R004-1 of the airbag control module assembly and the vehi cle body ground to check if the voltage is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard va lue.
No》》》 Repair or replace the wiring harness.	
Yes》》》	

© 2026, All rights reserved

	Go to step 4.
Step 4 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: P120613-BMS

Fault code	Description
P120613	Pre-charge relay open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the precharge relay control harness.	
	A Check whether there is a short circuit or open circuit betw een the pre-charge relay and the BMS control harness (inte rnal harness of the power battery pack assembly).
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

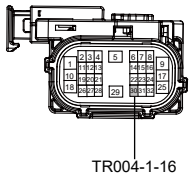
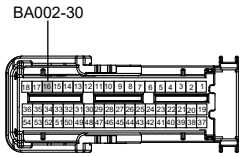
DTC: P121115-BMS

Fault code	Description
P121115	Crash signal shorted to power or open





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check whether collision-related fault codes are displayed.
Yes》》》 Prioritize the repair of collision-related faults in the airbag control module assembly.	
	No》》》 Go to step 3.
Step 3 Check the crash signal line between the airbag control module assembly and the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211019 TR004-1 Airbag Control Module Assembly  B10DMBMS1211020	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. D. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 16 of harness c onnector TR004-1 of the airbag control module assembly a nd terminal 30 of harness connector BA002 of the power ba ttery pack assembly is normal. Resistance standard value: Less than 1Ω E Check whether the resistance value meets the standard v alue. F. Connect the negative terminal of the battery and power o n the vehicle. G Use a multimeter set to the DC voltage range to measure the voltage between terminal 16 of the harness connector T R004-1 of the airbag control module assembly and the bod y ground to check if it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard va lue.
No》》》 Repair or replace the wiring harness.	
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the airbag control module assembly.	

© 2026, All rights reserved

	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: P120B1C-BMS

Fault code	Description
P120B1C	Cell imbalance (large voltage difference among cells in the power battery pack)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Perform an inspection after charging and discharging.	
	A After charging and discharging the power battery, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell voltage sampling circuit.	
	A Check the cell voltage sampling circuit for open circuit or poor contact.
	Yes 》》》 Replaced the voltage sampling circuit during maintenance.
	No 》》》 Go to step 4.
Step 4 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	No 》》》 Replace the power battery pack assembly.
	Yes 》》》 Go to step 5.
Step 5 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: P127D00-BMS

Fault code	Description
P127D00	Built-in barometric pressure sensor communication loss fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power batt ery pack assembly.	
	A Check the wiring harness between the aerosol sensor (ins ide the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P123A11-BMS

Fault code	Description
P123A11	AC charging socket temperature 2 short to ground fault

1. Simplified Circuit Diagram

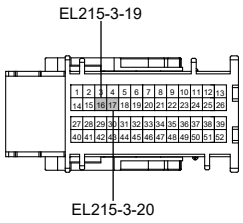
2. Diagnostic Steps

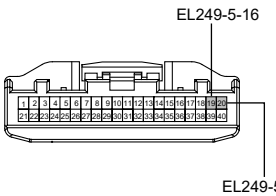
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

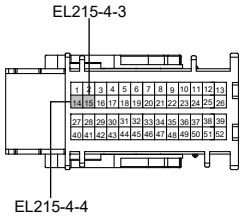
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

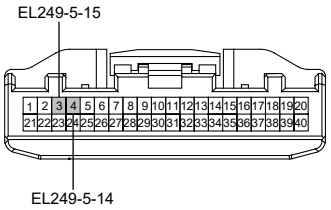
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



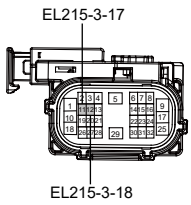
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

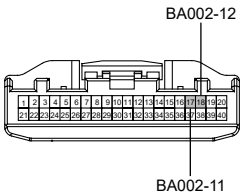
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to Step 9.
Step 9 Diagnosis complete.

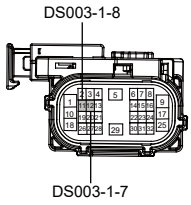
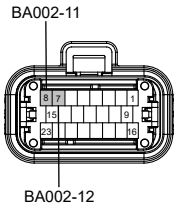
DTC: P124200-BMS

Fault code	Description
P124200	VCU stops charging (VCU does not allow charging)





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check controller assembly fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controll er assembly and record them. C Check the controller assembly for faults.
	Yes》》》 Prioritize the repair of faults related to the controller assembly.
	No》》》 Go to step 3.
Step 3 Check the CAN communication harness between the controller assembly and the power battery pac k assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211042 DS003-1 Controller Assembly  B10DMBMS1211043	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector DS003-1 of the c ontroller assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 7 of the wire harness connector DS003-1 on the controller assembly and terminal 12 of the wire harness connector BA002 on the po wer battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 8 of the wire ha rness connector DS003-1 of the controller assembly and te rminal 11 of the wire harness connector BA002 of the powe r battery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.

© 2026, All rights reserved

	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: P125209-BMS

Fault code	Description
P125209	Cooling mode water inlet temperature too low

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes 》 》 》 Repair or replace the wiring harness.	
No 》 》 》 Go to step 7.	
Step 7 Replace the water temperature sensor at the water inlet of the power battery.	
	A Replace the water temperature sensor at the water inlet o f the power battery (inside the power battery pack), and ch eck whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P120100-BMS

Fault code	Description
P120100	High-voltage relay closed, Level 1 insulation fault (low vehicle insulation resistance)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
	No 》 》 》 Replace the fast and slow charging cable assembly.
	Yes 》 》 》 Go to step 3.
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P120898-BMS

Fault code	Description
P120898	Battery temperature too high level 3 warning (power battery pack te mperature high)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P123217-BMS

Fault code	Description
P123217	AC charging socket over-temperature Level 1

1. Simplified Circuit Diagram

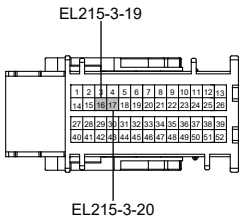
2. Diagnostic Steps

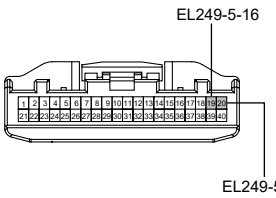
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

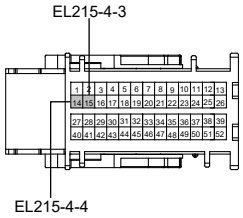
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

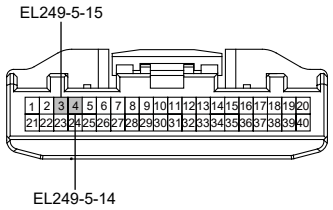
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



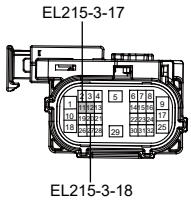
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

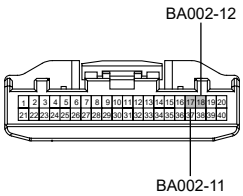
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: P123511-BMS

Fault code	Description
P123511	DC charging socket negative terminal short-to-ground fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

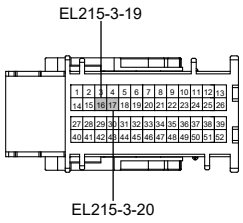
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

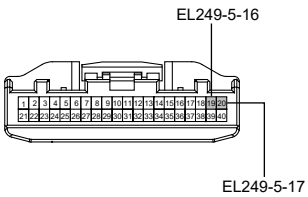
Step 2 Check the fault code of the main zone controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the main zone controller and record them.
C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.



Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

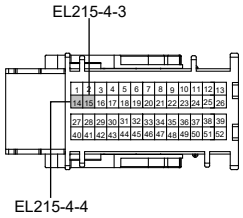
EL249-5 Main Zone Controller

B10DMBMS1211052

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211053

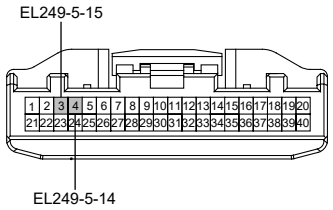
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main zone controller.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



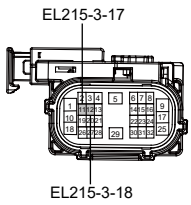
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

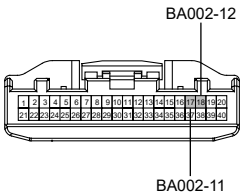
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.

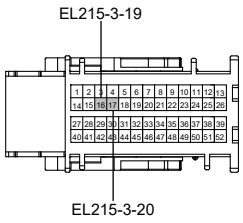
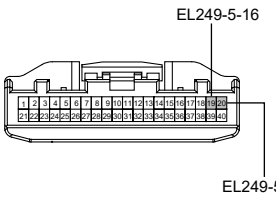
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

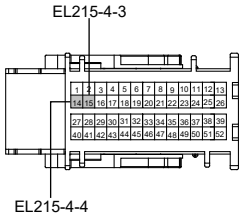
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

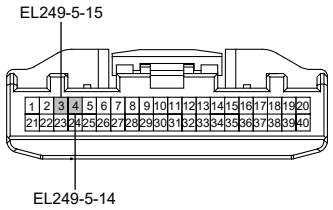
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



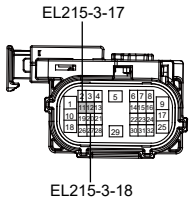
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

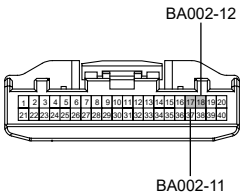
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

DTC: P126A00-BMS

Fault code	Description
P126A00	SOH Too Low Level 2

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P126D29-BMS

Fault code	Description
P126D29	Simultaneous invalid fault of CAN and hardwire (analog or PWM) cras h detection

1. Simplified Circuit Diagram

2. Diagnostic Steps

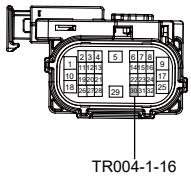
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

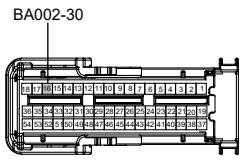
Step 2 Check the airbag control module assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them.
C Check whether collision-related fault codes are displayed.

Yes》》》 Prioritize the repair of collision-related faults in the airbag control module assembly.

No》》》
Go to step 3.



Step 3 Check the crash signal line between the airbag control module assembly and the power battery pack assembly.

BA002 Power Battery Pack Assembly

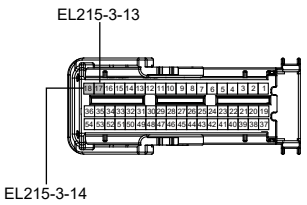
B10DMBMS1211019

TR004-1 Airbag Control Module Assembly

B10DMBMS1211020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 16 of harness c onnector TR004-1 of the airbag control module assembly a nd terminal 30 of harness connector BA002 of the power ba ttery pack assembly is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 16 of harness connector T R004-1 of the airbag control module assembly and the vehi cle body ground to check if the voltage is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard va lue.

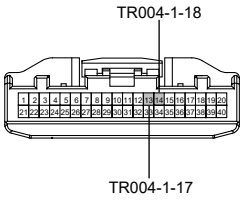
No》》》 Repair or replace the wiring harness.



Yes》》》

© 2026, All rights reserved

Go to step 4.



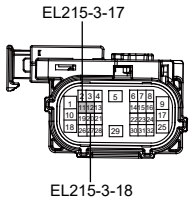
Step 4 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMBMS1211022

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211023

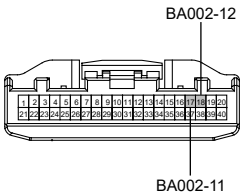


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of harness connector TR004-1 of the airbag control module assembly and terminal 13 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

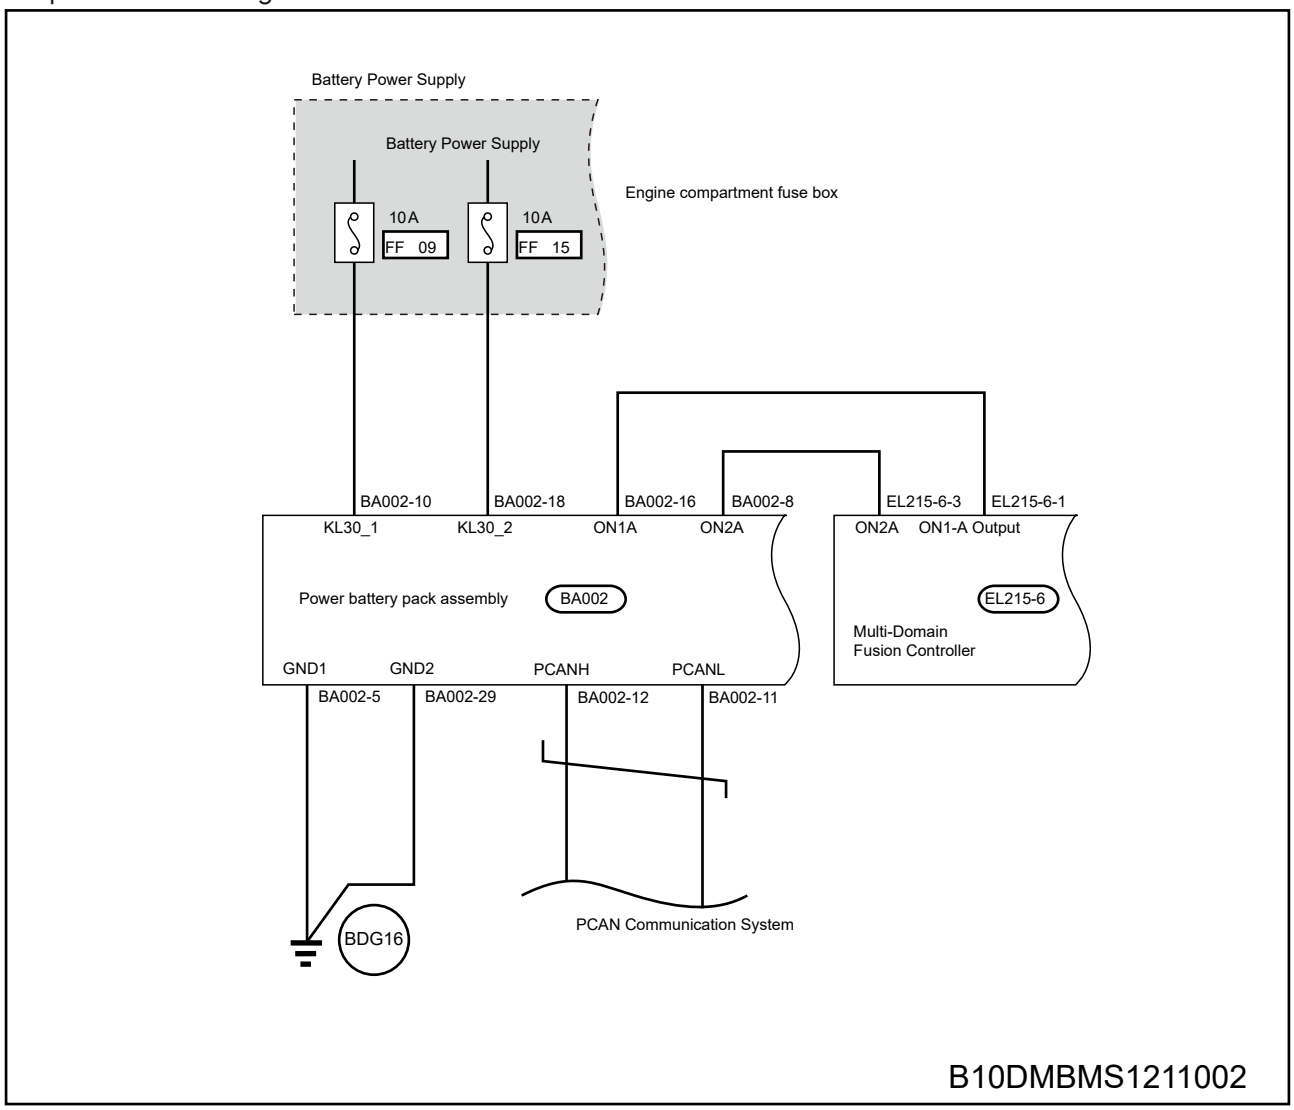


BA002 Power Battery Pack Assembly

B10DMBMS1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211025	Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

DTC: P127800-BMS

Fault code	Description
P127800	DC charging insulation Level 2 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P128317-BMS

Fault code	Description
P128317	Main positive relay over-temperature Level 2 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P120E17-BMS

Fault code	Description
P120E17	Battery pack total voltage too high Level 2

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check whether the vehicle is charging.	
	A Check whether the vehicle is charging.
	Yes》》》 Stop charging.
	No》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes》》》 Repair or replace the battery pack cell sampling harness.
	No》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P127900-BMS

Fault code	Description
P127900	Built-in barometric pressure sensor malfunction

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power battery pack assembly.	
	A Check the wiring harness between the aerosol sensor (inside the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P125600-BMS

Fault code	Description
P125600	Collision fault (from hardwired PWM signal)

1. Simplified Circuit Diagram

2. Diagnostic Steps

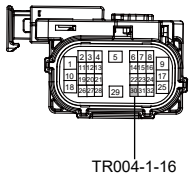
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

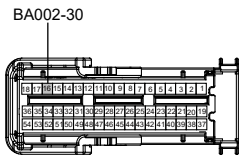
Step 2 Check the airbag control module assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them.
C Check whether collision-related fault codes are displayed.

Yes》》》 Prioritize the repair of collision-related faults in the airbag control module assembly.

No》》》
Go to step 3.



Step 3 Check the crash signal line between the airbag control module assembly and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211019

TR004-1 Airbag Control Module Assembly

B10DMBMS1211020

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 16 of harness c onnector TR004-1 of the airbag control module assembly a nd terminal 30 of harness connector BA002 of the power ba ttery pack assembly is normal.
Resistance standard value: Less than 1Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of the harness connec tor TR004-1 of the airbag control module assembly and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 16 of harness connector T R004-1 of the airbag control module assembly and the vehi cle body ground to check if the voltage is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard va lue.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag co ntrol module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

DTC: P123912-BMS

Fault code	Description
P123912	AC charging port temperature 1 short to power or open circuit fault

1. Simplified Circuit Diagram

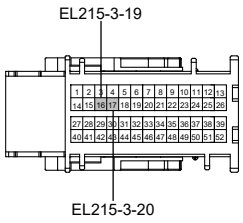
2. Diagnostic Steps

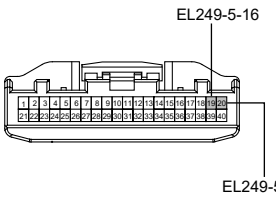
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault code of the main zone controller.

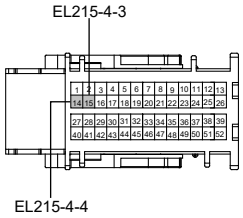
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.

Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

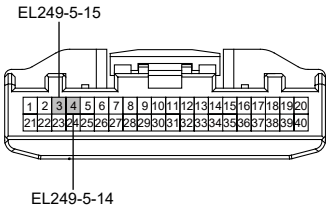
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



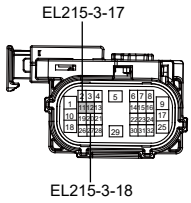
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

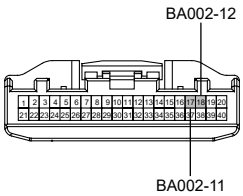
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

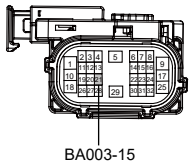
Yes》》》
Go to step 2.

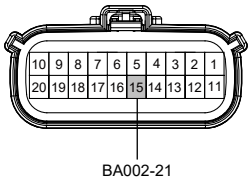
Step 2 Check the fault codes of the charging protocol converter.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the chargin g protocol converter, and record them.
C Check for faults.

Yes》》》 Prioritize repairing faults related to the charging protocol converter.

No》》》
Go to step 3.



Step 3 Check the CC2 connection harness between the charging protocol converter and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211036

BA003 Charging Protocol Converter

B10DMBMS1211037

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA003 of the ch arging protocol converter.
C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of harness connector BA003 of the charging protocol converter and terminal 21 of harness connector BA002 of the power battery pack ass embly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 15 of the harness connec tor BA003 of the charging protocol converter and the vehic le body ground to check whether the voltage value is norm al.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

DTC: P120200-BMS

Fault code	Description
P120200	High-voltage relay closed, Level 2 insulation fault (extremely low vehi cle insulation resistance)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the fast and slow charging cable assembly.	
Yes 》》》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P125398-BMS

Fault code	Description
P125398	Water inlet temperature too high in heating mode

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes 》 》 》 Repair or replace the wiring harness.	
No 》 》 》 Go to step 7.	
Step 7 Replace the water temperature sensor at the water inlet of the power battery.	
	A Replace the water temperature sensor at the water inlet o f the power battery (inside the power battery pack), and ch eck whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.	

© 2026, All rights reserved

DTC: P126F00-BMS

Fault code	Description
P126F00	Low Bilateral Insulation Resistance Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the fast and slow charging cable assembly.	
Yes 》》》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

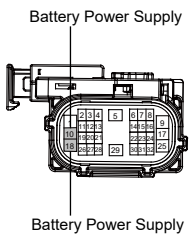
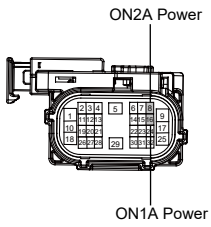
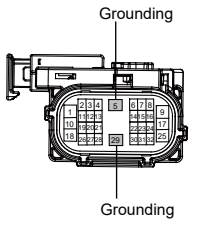
DTC: P122100-BMS

Fault code	Description
P122100	Unexpected BMS Reset



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211003	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

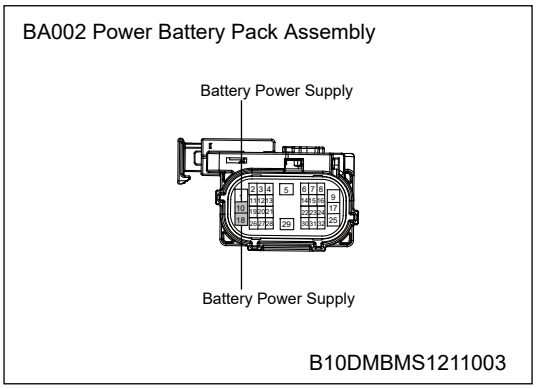
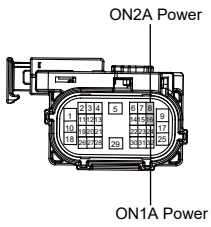
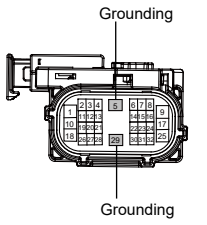
DTC: P12231C-BMS

Fault code	Description
P12231C	BMS Battery Voltage Detection Value Out-of-Range Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: P128217-BMS

Fault code	Description
P128217	Main Positive Relay Over-Temperature Level 1 Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P127C00-BMS

Fault code	Description
P127C00	Built-in BMS thermal runaway calibration failure fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power battery pack assembly.	
	A Check the wiring harness between the aerosol sensor (inside the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

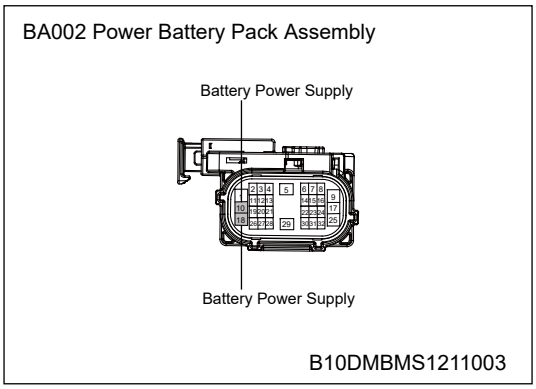
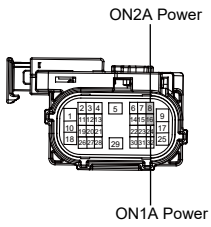
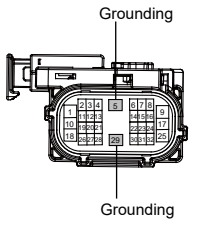
DTC: P11B800-BMS

Fault code	Description
P11B800	Relay Independent Power Supply Open Circuit Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P127261-BMS

Fault code	Description
P127261	Insulation resistance monitoring failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
	No 》》》 Replace the fast and slow charging cable assembly.
	Yes 》》》 Go to step 3.
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.	

© 2026, All rights reserved

DTC: P122A00-BMS

Fault code	Description
P122A00	AC Charging Fault

1. Simplified Circuit Diagram

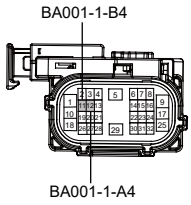
2. Diagnostic Steps

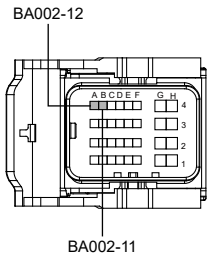
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.





Step 2 Check the fault codes of the 2-in-1 power supply assembly.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the 2-in-1 p ower assembly and record them. C. Check if the 2-in-1 power assembly has a fault.

Yes》》》 Prioritize the repair of faults related to the two-in-one power assembly.

No》》》
Go to step 3.

Step 3 Check the CAN communication wiring harness between the 2-in-1 power supply assembly and the p ower battery pack assembly.

BA002 Power Battery Pack Assembly  B10DMBMS1211011 BA001-1 2-in-1 Power Supply Assembly  B10DMBMS1211012	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA001-1 of the 2-in-1 power supply assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power supply ass embly and terminal 12 of the wiring harness connector BA0 02 of the power battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal B4 of harness c onnector BA001-1 of the 2-in-1 power supply assembly an d terminal 11 of harness connector BA002 of the power bat tery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 po wer assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the 2-in-1 power supply assembly.	
	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

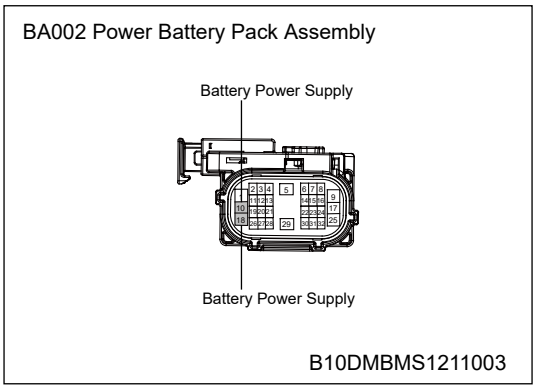
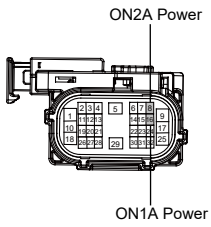
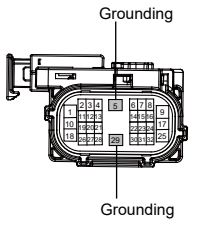
DTC: P122817-BMS

Fault code	Description
P122817	Relay Independent Power Supply Low Voltage Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: P122900-BMS

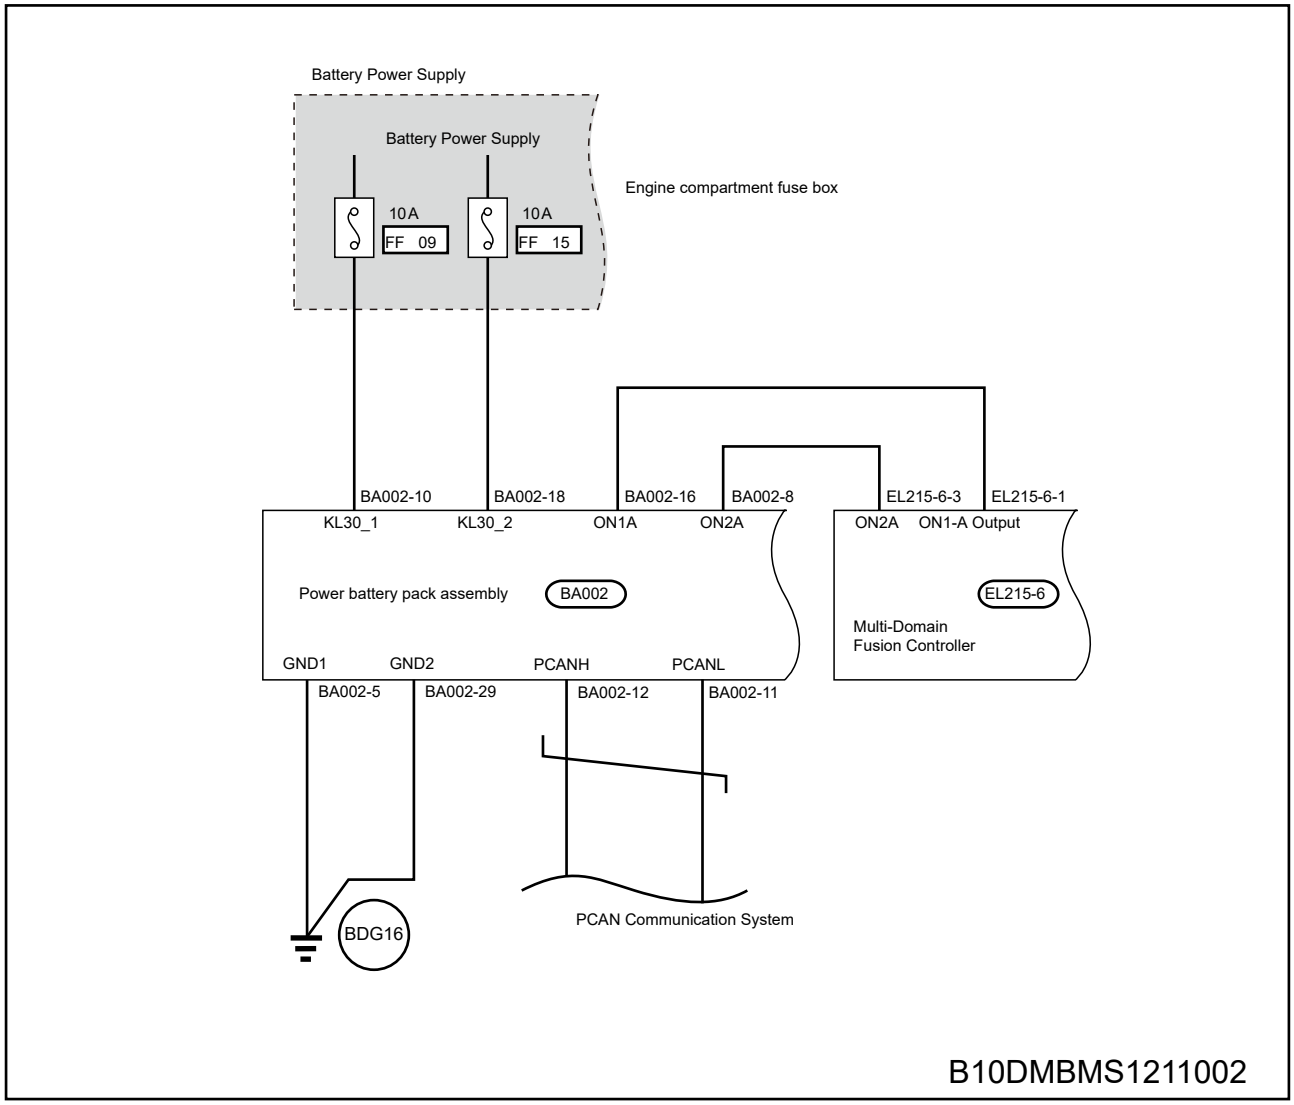
Fault code	Description
P122900	DC charging fault (charging equipment fault)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Replace the charging pile and recharge.	
	A Replace the charging pile and recharge, and check wheth er the fault is cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 3.	
Step 3 Check vehicle fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read all fault codes, and record the m. C Check whether any fault codes related to fast charging ar e displayed.
Yes 》》》 Prioritize the repair of related faults.	
No 》》》 Go to step 4.	
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

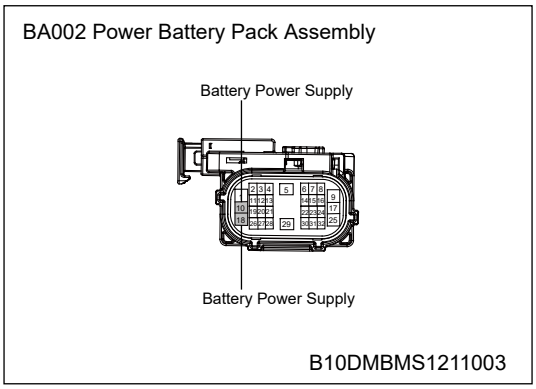
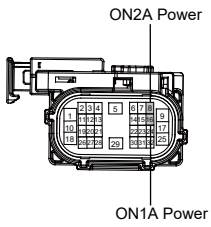
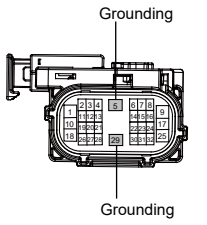
DTC: P121316-BMS

Fault code	Description
P121316	BMS low voltage power supply undervoltage fault (12V power supply voltage below threshold)



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

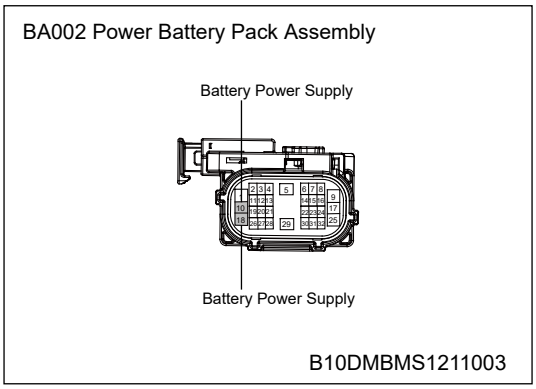
© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

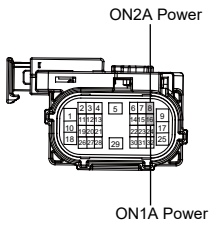
© 2026, All rights reserved

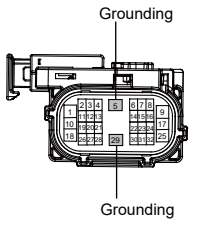
DTC: P122516-BMS

Fault code	Description
P122516	Relay independent power supply voltage severe undervoltage fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
No》》》 Check the power supply of ON1A and ON2A.	
Yes》》》 Go to step 6.	
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

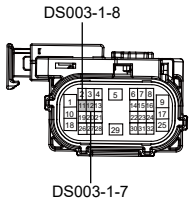
© 2026, All rights reserved

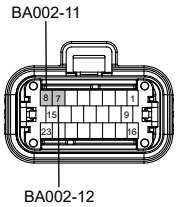
	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P122C00-BMS

Fault code	Description
P122C00	VCU Fault Response Timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check controller assembly fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controll er assembly and record them. C Check the controller assembly for faults.
	Yes》》》 Prioritize the repair of faults related to the controller assembly.
	No》》》 Go to step 3.
Step 3 Check the CAN communication harness between the controller assembly and the power battery pac k assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211042 DS003-1 Controller Assembly  B10DMBMS1211043	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector DS003-1 of the c ontroller assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 7 of the wire harness connector DS003-1 on the controller assembly and terminal 12 of the wire harness connector BA002 on the po wer battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 8 of the wire ha rness connector DS003-1 of the controller assembly and te rminal 11 of the wire harness connector BA002 of the powe r battery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: P127549-BMS

Fault code	Description
P127549	Insulation switch Q2 control circuit open

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P120800-BMS

Fault code	Description
P120800	Low Battery Temperature Fault (Low Power Battery Pack Temperatur e)

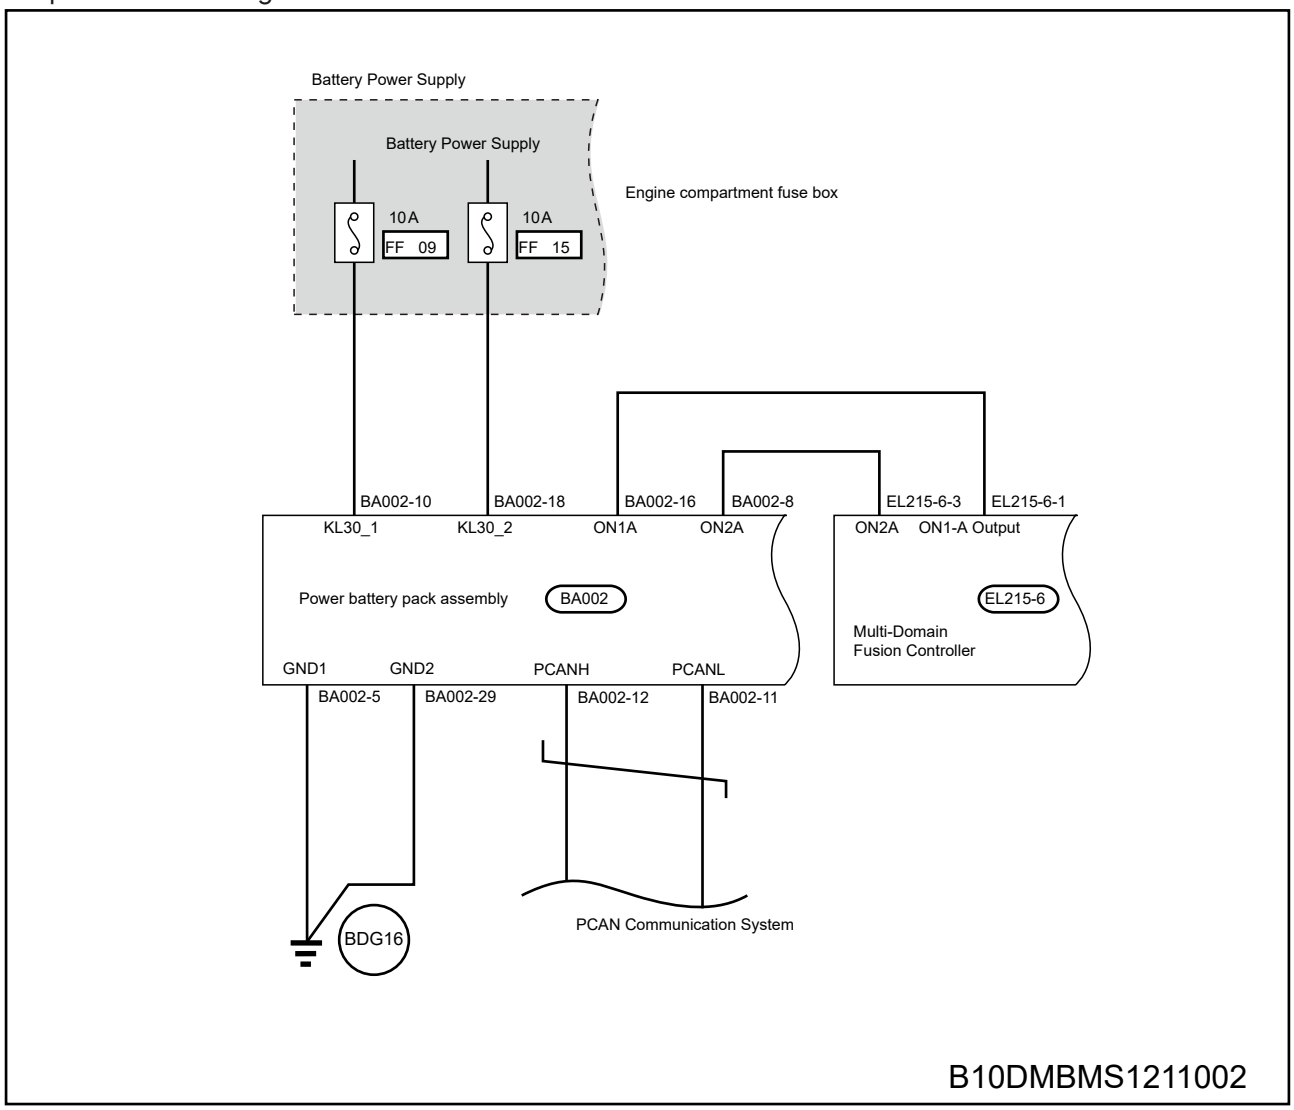
1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the ambient temperature around the vehicle.	
	A Check whether the ambient temperature around the vehicle is extremely low.
Yes》》》 Move the vehicle to a location with a slightly higher ambient temperature, wait for a period of time, and then retest.	
No》》》 Go to step 3.	
Step 3 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevant diagnostic trouble codes.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 4.	
Step 4 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (inside the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.



© 2026, All rights reserved

DTC: P125352-BMS

Fault code	Description
P125352	Water inlet temperature does not rise in heating mode

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the battery pack thermal management system lines.	
	A Check whether the coolant level is too low or whether the re are bubbles in the coolant. B Check the battery pack cooling lines for leaks or blockage s.
	Yes 》》》 Repair the cooling pipeline or replace the coolant.
	No 》》》 Go to step 3.
Step 3 Check the battery water pump.	
	A Check whether the battery coolant pump is working prop erly.
	No 》》》 Troubleshoot the battery coolant pump fault.
	Yes 》》》 Go to step 4.
Step 4 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
	No 》》》 Troubleshoot the electric compressor assembly fault.
	Yes 》》》 Go to step 5.
Step 5 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
	Yes 》》》 Prioritize repairing faults related to the thermal management controller.
	No 》》》 Go to step 6.
Step 6 Check the wiring harness of the water temperature sensor at the water inlet of the power battery.	

© 2026, All rights reserved

	A Check the wiring harness of the water temperature senso r at the water inlet of the power battery (inside the battery pack) for short circuit or open circuit.
Yes 》 》 》 Repair or replace the wiring harness.	
No 》 》 》 Go to step 7.	
Step 7 Replace the water temperature sensor at the water inlet of the power battery.	
	A Replace the water temperature sensor at the water inlet o f the power battery (inside the power battery pack), and ch eck whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P120716-BMS

Fault code	Description
P120716	Cell undervoltage level 3 (the cell voltage of the power battery pack i s below the threshold)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Perform an inspection after charging.	
	A After charging the power battery, perform an inspection t o check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cell voltage values of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell voltage data of the tra ction battery pack assembly, and record the data. Cell rated voltage: 3.16V C Check whether the cell voltage values of the power batter y pack assembly are normal.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P123412-BMS

Fault code	Description
P123412	DC charging socket negative terminal short to power or open circuit f ault

1. Simplified Circuit Diagram

2. Diagnostic Steps

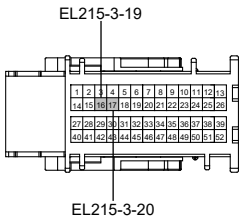
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

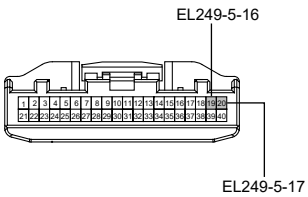
Step 2 Check the fault code of the main zone controller.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the main zone controller and record them.
C Check whether any fault codes related to the charging port temperature are displayed.

Yes》》》 Prioritize repairing faults related to the main zone controller.

No》》》
Go to step 3.



Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.

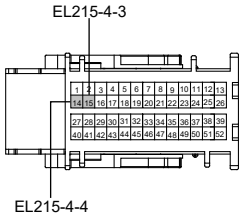
EL249-5 Main Zone Controller

B10DMBMS1211052

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211053

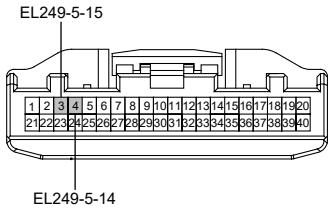
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main zone controller.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.



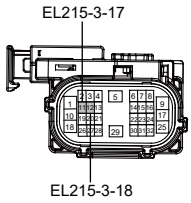
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

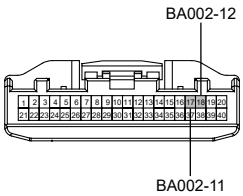
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: P121B13-BMS

Fault code	Description
P121B13	Cell voltage sampling wire disconnected (cell sampling harness open)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle and check whether the fault is cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the cell sampling circuit of the power battery (inside the battery pack).	
	A Check whether the cell sampling circuit (inside the battery pack) is short-circuited or open-circuited?
	Yes 》》》 Repair or replace the battery pack cell sampling harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

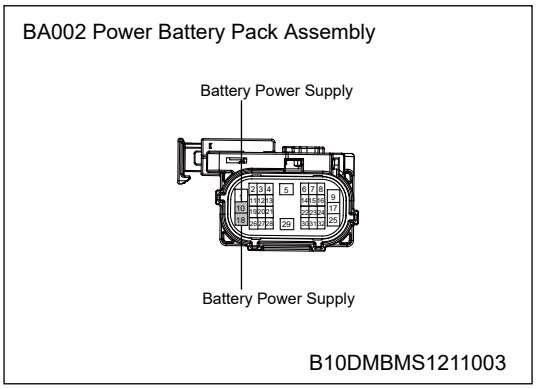
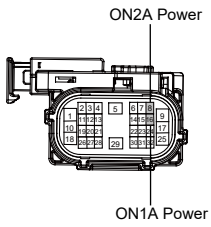
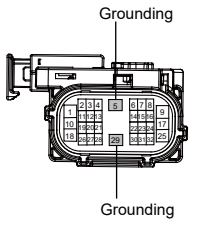
DTC: P12221C-BMS

Fault code	Description
P12221C	BMS Battery Voltage Detection Value Too Low Fault



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes》》》 Go to step 3.	
Step 3 Check the power supply fuse of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the fuses FF09 and FF15 of the power battery pack assembly. Fuse specification: FF09 10A, FF15 10A C. Confirm whether the fuse is blown.
Yes》》》 Replace the fuse with one of the same rating.	
No》》》 Go to step 4.	
Step 4 Check the battery power supply harness of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 10 and 18 of wiring harn ess connector BA002 of the power battery pack assembly a nd the vehicle body ground to check if the voltage is norma l. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the ON1A and ON2A power supply wiring harnesses of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211004	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminals 8 and 16 of the wire harne ss connector BA002 of the power battery pack assembly an d the vehicle body ground to check whether the voltage val ue is normal. Standard voltage: 11~14V E Confirm whether the voltage meets the standard value.
	No》》》 Check the power supply of ON1A and ON2A.
	Yes》》》 Go to step 6.
Step 6 Check the grounding wire harness of the power battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211005	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 5 and 29 of the wiring harness connector BA002 of the power battery pack assem bly and the body ground to check if it is normal. Resistance standard value: Less than 1Ω D. Confirm whether the resistance meets the standard value .
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: P120413-BMS

Fault code	Description
P120413	Main negative relay open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: P12F100-BMS

Fault code	Description
P12F100	DC charging positive relay sticking fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the fast charging relay.	
	A Remove the fast charging relay, and check whether the s witch terminal of the fast charging relay is normally closed.
	Yes》》》 Replace the fast charging relay.
	No》》》 Go to step 3.
Step 3 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12BD00-BMS

Fault code	Description
P12BD00	Pre-heating charging thermal management not requested

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the cell temperature of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell temperature of the po wer battery pack assembly, and record it. Temperature sampling range：-40~85℃ C Check whether the cell temperature of the power battery pack assembly is normal.
No 》 》 》 Check the sampling harness of each module.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
Yes 》 》 》 Prioritize repairing faults related to the thermal management controller.	
No 》 》 》 Go to step 4.	
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》

DTC: P12C201-BMS

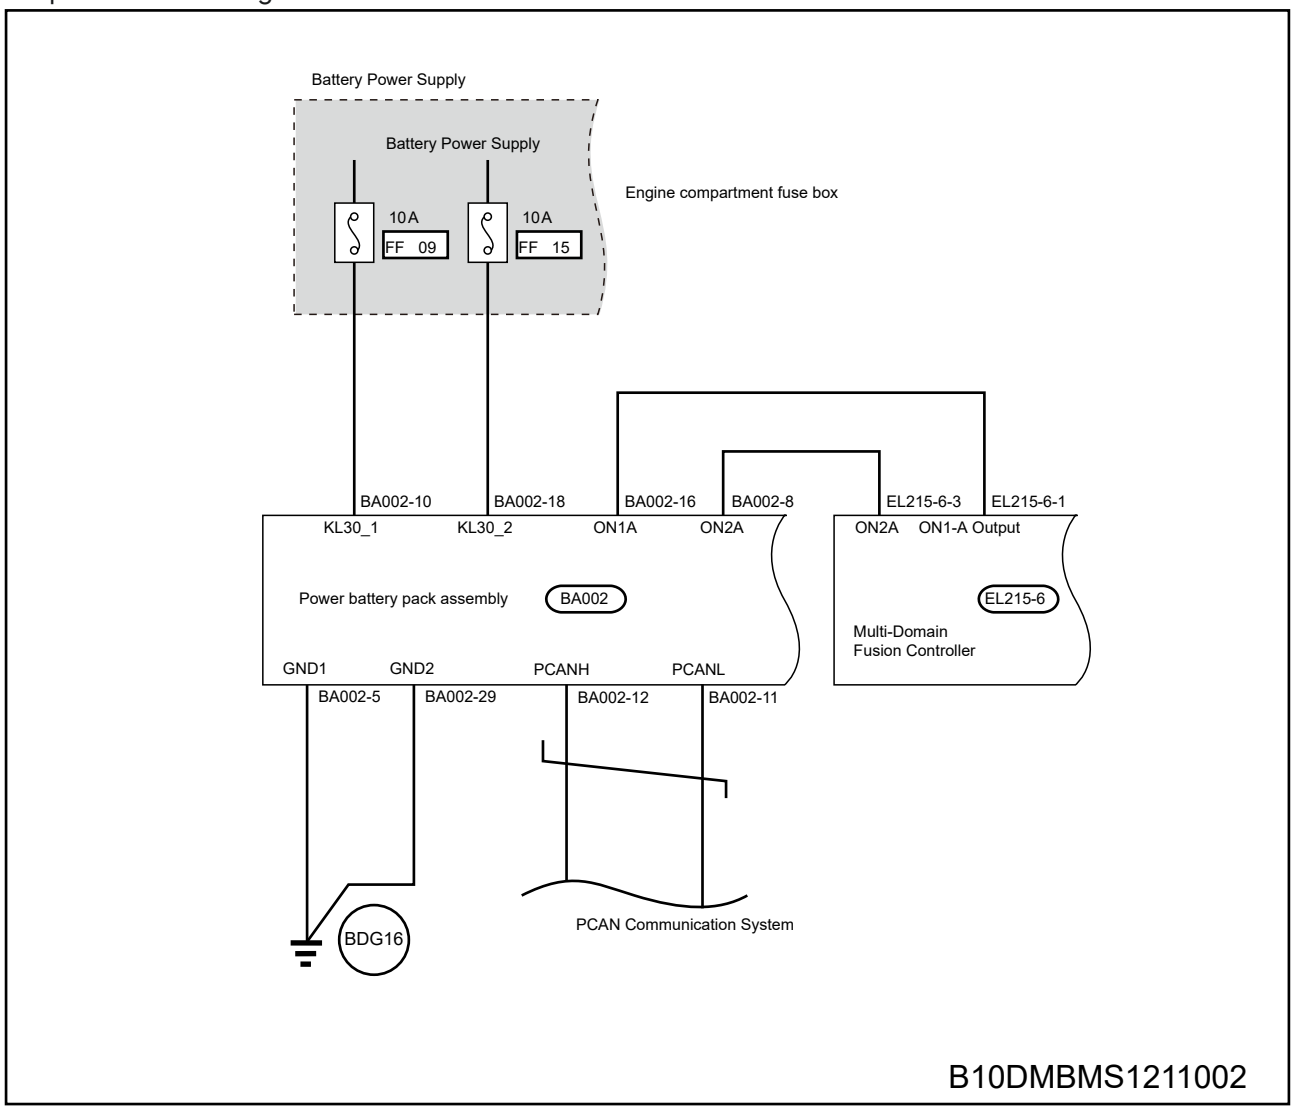
Fault code	Description
P12C201	Fuse open circuit fault (Power battery fuse blown)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the internal fuse of the power battery.	
	A Check whether the internal fuse of the power battery is bl own.
Yes 》》》 Check for short circuit faults inside the battery pack; replace the fuse.	
No 》》》 Go to step 3.	
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

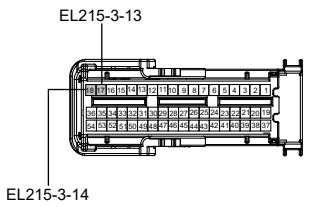
DTC: U130E87-BMS

Fault code	Description
U130E87	ACU Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

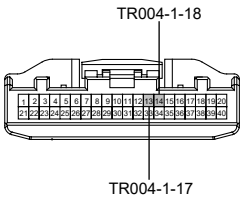
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



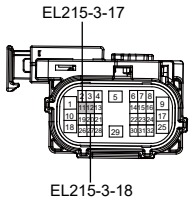
Step 2 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMBMS1211022

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211023

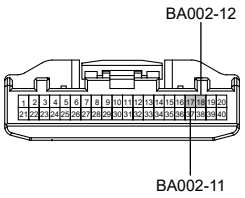


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of harness connector TR004-1 of the airbag control module assembly and terminal 13 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

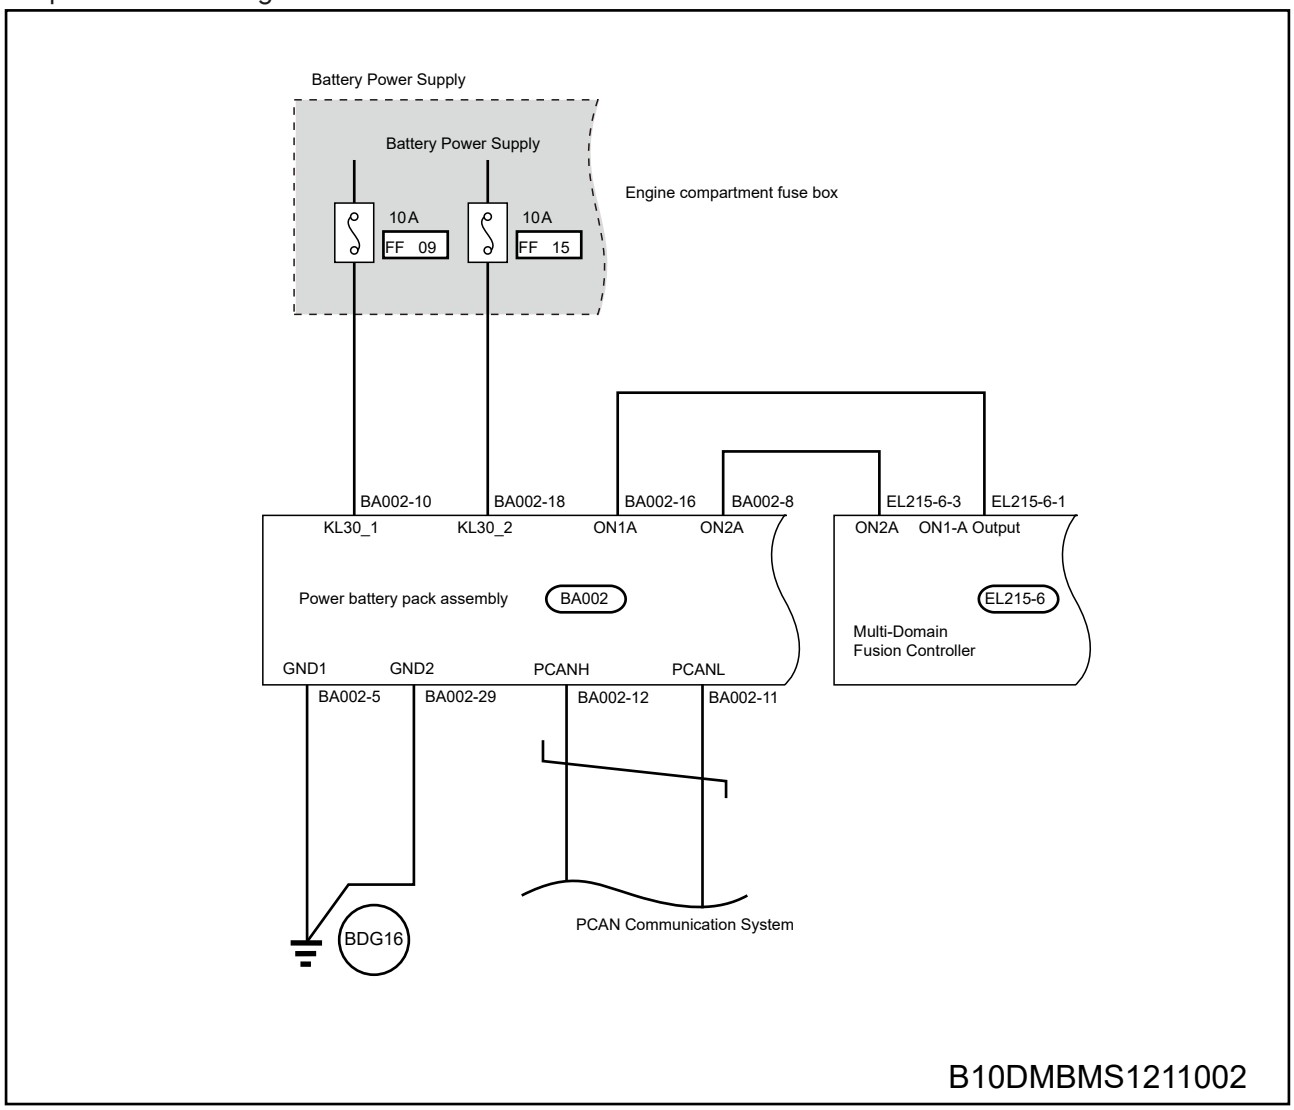


BA002 Power Battery Pack Assembly

B10DMBMS1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211025	EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: P128C17-BMS

Fault code	Description
P128C17	Charge negative relay over-temperature Level 2 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main negative relay.	
	A Check the connecting copper busbar of the main negativ e relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: P12AB1C-BMS

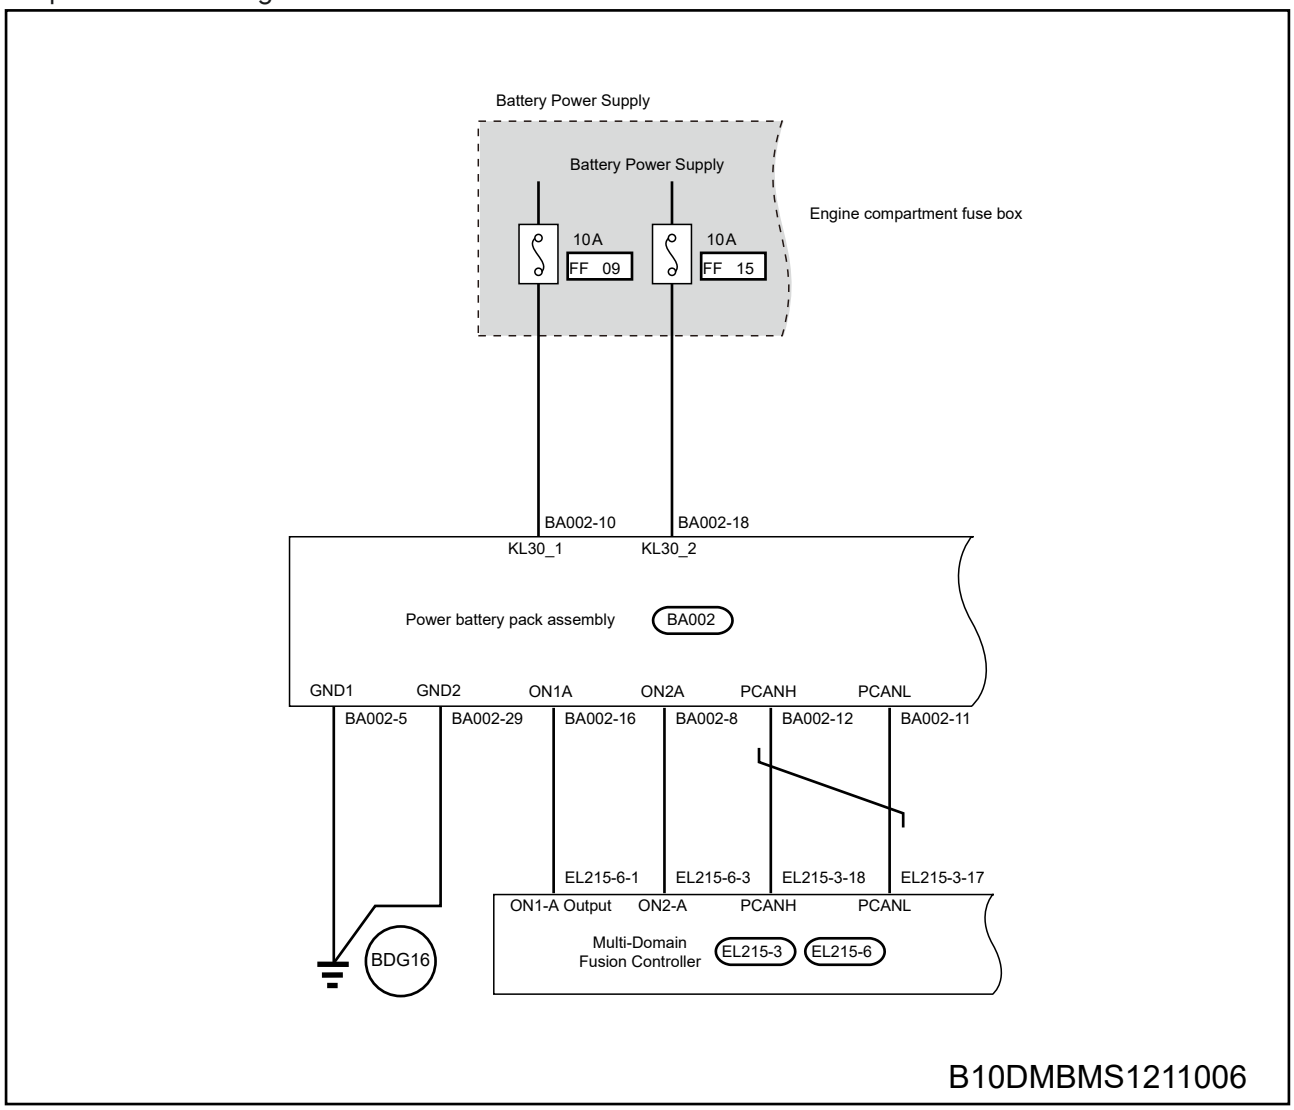
Fault code	Description
P12AB1C	Thermal runaway sensor driver overload or underload

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power batt ery pack assembly.	
	A Check the wiring harness between the aerosol sensor (ins ide the battery pack) and the power battery pack assembly for short or open circuits.
Yes 》》》 Replace the internal wiring harness of the battery pack.	
No 》》》 Go to step 3.	
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

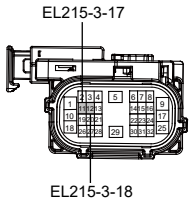
DTC: U130082-BMS

Fault code	Description
U130082	HPC-E2E Verification Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

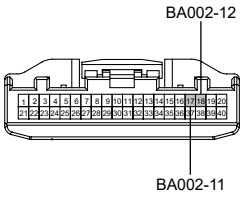
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P128817-BMS

Fault code	Description
P128817	Level 1 fault: Charge positive relay over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

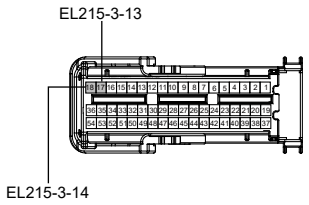
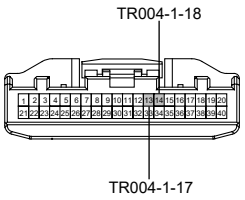
DTC: U109300-BMS

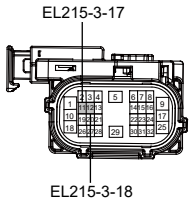
Fault code	Description
U109300	Collision fault (from CAN signal)





1. Simplified Circuit Diagram

2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check whether collision-related fault codes are displayed.
Yes》》》 Prioritize the repair of collision-related faults in the airbag control module assembly.	
No》》》 Go to step 3.	
Step 3 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.	
TR004-1 Airbag Control Module Assembly  B10DMBMS1211022 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211023	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 14 of harness connector EL215-3 of the multi-domain f usion controller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of harness connecto r TR004-1 of the airbag control module assembly and termi nal 13 of harness connector EL215-3 of the multi-domain f usion controller to check if it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the power ground circuit of the airbag control module assembly.

A Check whether the power ground circuit of the airbag control module assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Replacement of airbag control module assembly

A Replacement of airbag control module assembly.
B After replacing the airbag control module assembly, is the fault eliminated?

Yes 》》》 System normal.

No 》》》
Go to step 7.

Step 7 Replace the power battery pack assembly.

A Replace the power battery pack assembly.

© 2026, All rights reserved

	B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: P12D000-BMS

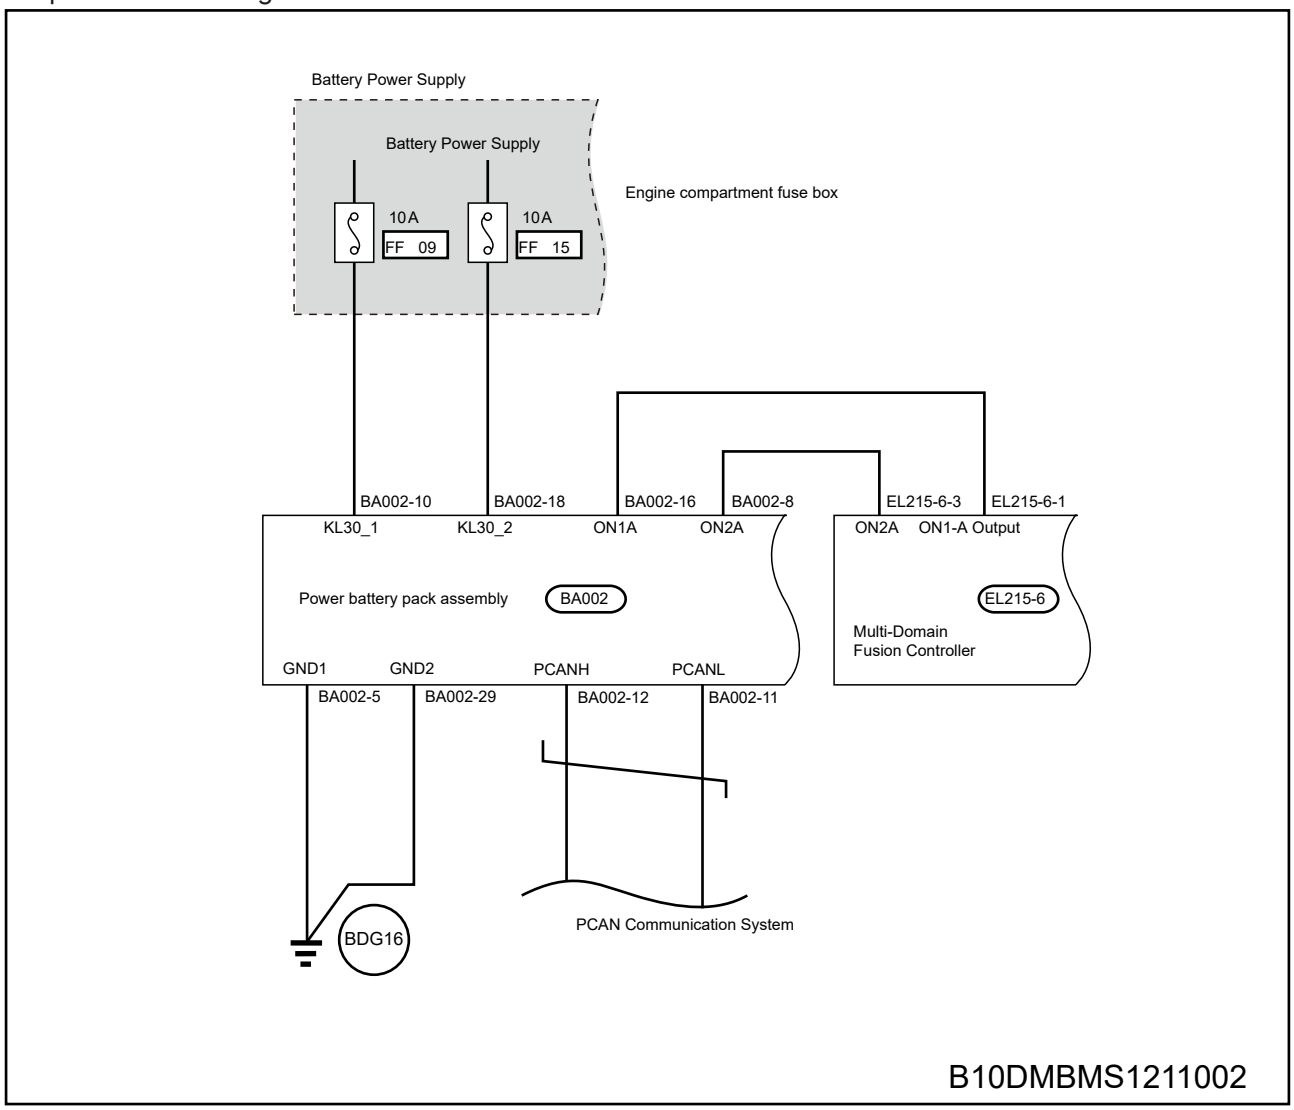
Fault code	Description
P12D000	Main Positive Relay Life Level 1 Alarm Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.	

© 2026, All rights reserved

DTC: P12D900-BMS

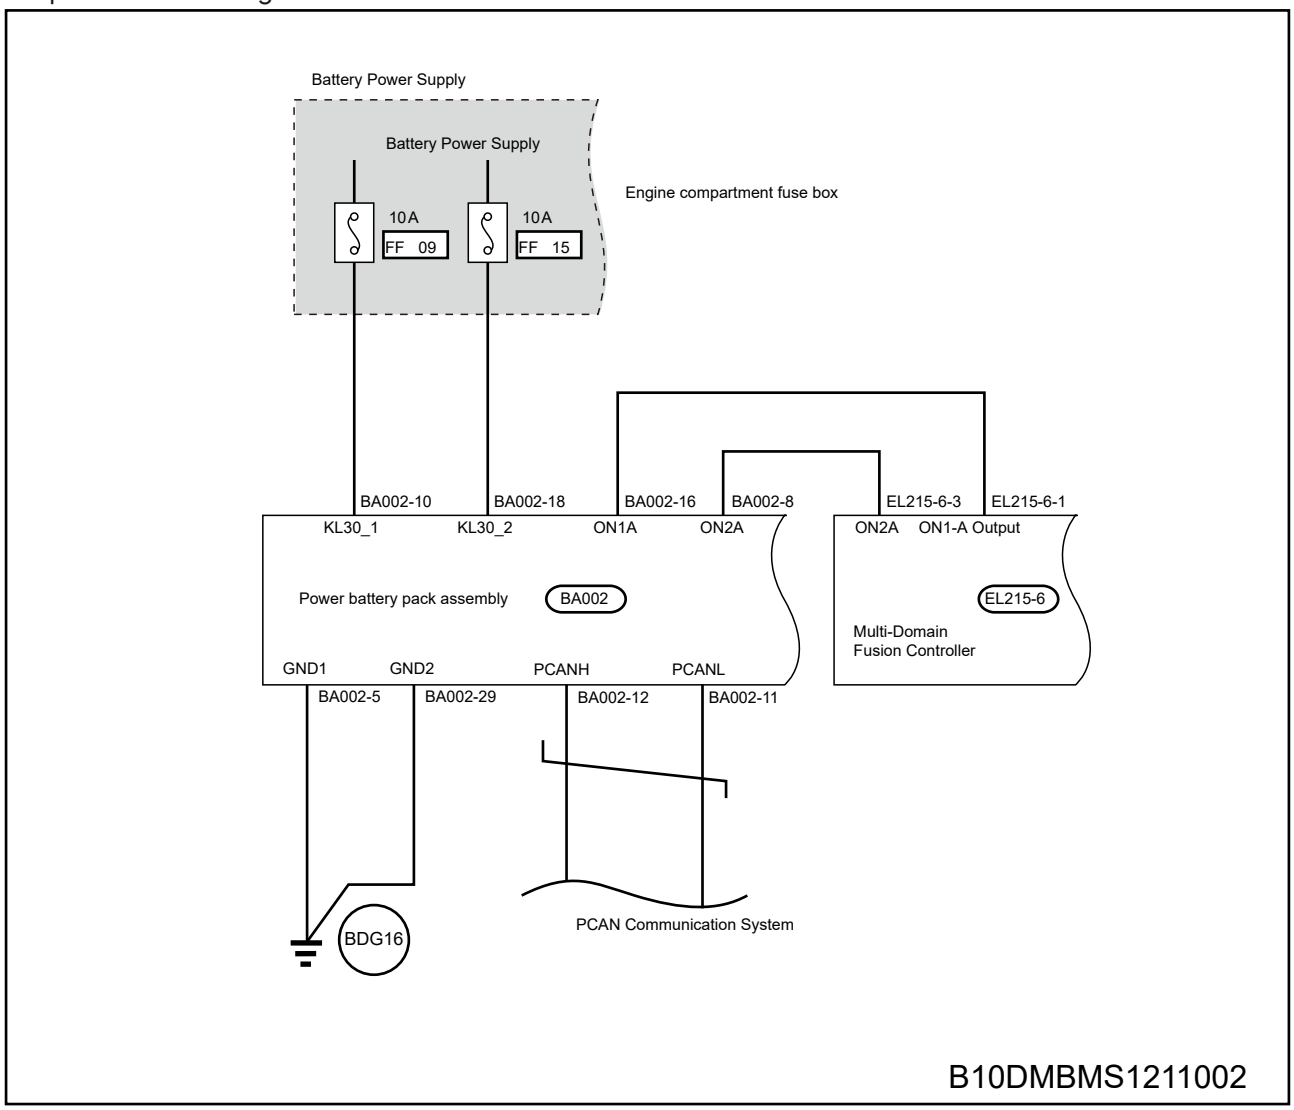
Fault code	Description
P12D900	DC Charging Positive Relay Life Level 1 Alarm Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P12B300-BMS

Fault code	Description
P12B300	Battery Pack External Insulation Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the insulation value of the high-voltage harness for DC charging.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation of the DC charging high-voltage harness for damage, and check the high-voltage connections for looseness or water ingress. C Disconnect the high-voltage harness connector between the DC charging port and the power battery pack assembly. D Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage harness connector of the DC charging port. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage harness connector of the DC charging port and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No 》 》 》 Replace the fast and slow charging cable assembly.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the insulation value of the AC charging high-voltage harness.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the AC charging high-voltage wiring harness for damage, and check whether the high-voltage connections are loose or have water ingress. C. Disconnect the high-voltage harness connector from the AC charging port to the 2-in-1 power assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal and the N terminal of the AC charging socket. Insulation resistance standard value: ≥100MΩ E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the L terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the N terminal of the AC charging socket and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 4.	
Step 4 Check the insulation value of the high-voltage wiring harness of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the 2-in-1 power assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage wiring harness connector from the 2-in-1 power supply assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the 2-in-1 power assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the 2-in-1 power assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the negative

© 2026, All rights reserved

	pole of the high-voltage harness connector from the 2-in-1 power assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the OBC cable assembly.	
Yes 》》》 Go to step 5.	
Step 5 Check the insulation value of the high-voltage wiring harness of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the insulation layer of the high-voltage wiring harness of the controller assembly for damage, and check the high-voltage connection lines for looseness or water ingress. C Disconnect the high-voltage harness connector from the controller assembly to the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the controller assembly. E Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the positive and negative terminals of the high-voltage wiring harness connector from the controller assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the inner shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ G. Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the negative pole of the high-voltage wiring harness connector from the controller assembly to the power battery pack and the contact piece of the internal shielding layer inside the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No 》》》 Replace the rear MCU cable assembly.	
Yes 》》》 Go to step 6.	

© 2026, All rights reserved

Step 6 Check the insulation value of the high-voltage wiring harness for the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check whether the insulation layer of the high-voltage wiring harness of the electric compressor assembly is damaged, and whether the high-voltage connection lines are loose or have water ingress. C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Disconnect the high-voltage harness connector from the power battery pack to the electric compressor assembly. E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive and negative poles of the high-voltage wiring harness connector from the electric compressor assembly to the power battery pack. Insulation resistance standard value: ≥100MΩ F Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the positive terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ G Use an insulation tester, select the DC1000V range, and measure the insulation resistance between the negative terminal of the high-voltage harness connector from the electric compressor assembly to the power battery pack and the contact piece of the internal shielding layer of the plug. Insulation resistance standard value: ≥100MΩ H Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 7.	
Step 7 Check the insulation value of the controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage harness connector of the controller assembly. C Disconnect the DC bus high-voltage wiring harness connector of the controller assembly.

© 2026, All rights reserved

	D Use an insulation tester, select the DC 1000V range, connect the black test lead to the housing, and use the red test lead to test the positive and negative busbar interfaces respectively. Press the "Test" button, wait for about 10s until the reading stabilizes, and record the corresponding resistance value. Insulation resistance standard value: ≥ 550MΩ E Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the controller assembly.	
Yes》》》 Go to step 8.	
Step 8 Check the insulation value of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the electric compressor assembly C Disconnect the high-voltage wiring harness connector between the electric compressor assembly and the power battery pack. D Use an insulation tester, select the DC1000V range, and measure the insulation resistance value between the high-voltage positive terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ E Use an insulation tester, select the DC 1000V range, and measure the insulation resistance value between the high-voltage negative terminal of the electric compressor assembly and the housing. Standard insulation resistance value: ≥ 20MΩ F Confirm whether the insulation resistance meets the standard value.
No》》》 Replace the electric compressor assembly.	
Yes》》》 Go to Step 9.	
Step 9 Check the insulation value of the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of the 2-in-1 power supply assembly.

© 2026, All rights reserved

	C Disconnect the high-voltage wiring harness connector fro m the 2-in-1 power supply assembly to the power battery p ack. D. Disconnect the high-voltage harness connector from the 2-in-1 power assembly to the AC charging socket. E Use an insulation tester, select the DC1000V range, conne ct the black test lead to the housing, and use the red test le ad to measure the insulation resistance between the DC hig h-voltage positive/negative terminals and the housing, and between the AC L/N interface and the housing, respectively . Insulation resistance standard value: ≥100MΩ F Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the 2-in-1 power supply assembly.	
Yes》》》 Go to step 10.	
Step 10 Check the insulation value of the power battery pack assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the low-voltage wiring harness connector of t he power battery pack. C Disconnect the high-voltage wiring harness connectors fr om the power battery pack to each high-voltage componen t. D Use an insulation tester, select the DC1000V range, and m easure the insulation resistance value between each high-v oltage terminal of the power battery pack assembly and the housing. Insulation resistance standard value: ≥10MΩ E Confirm whether the insulation resistance meets the stan dard value.
No》》》 Replace the power battery pack assembly.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P12D600-BMS

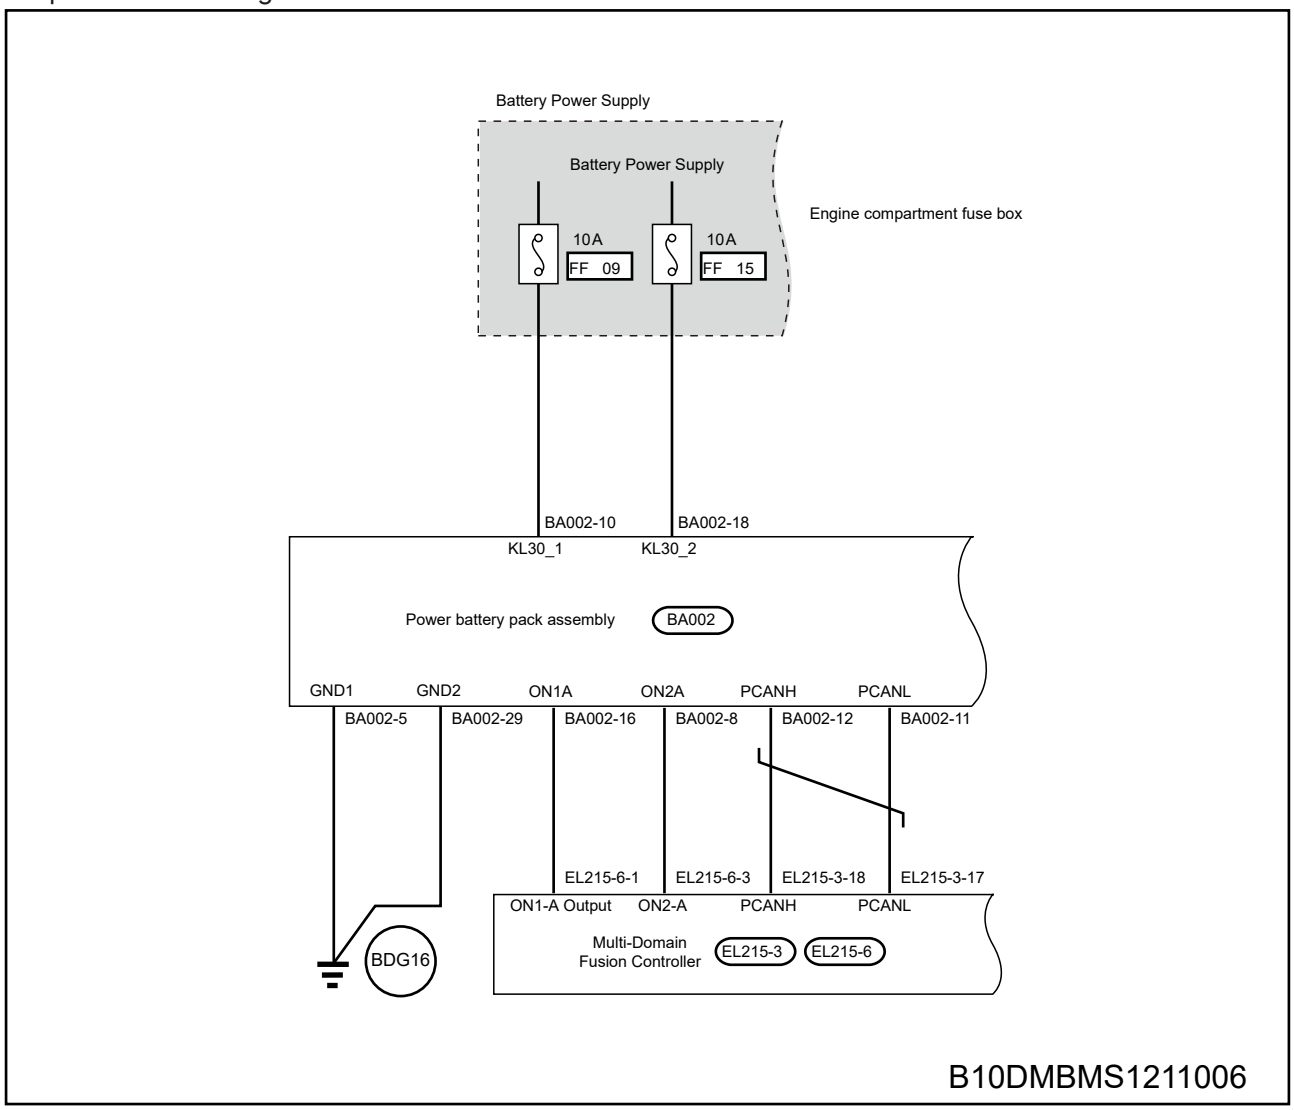
Fault code	Description
P12D600	Precharge Relay Life Level 1 Warning Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.	

© 2026, All rights reserved

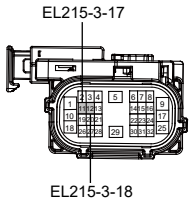
DTC: U130087-BMS

Fault code	Description
U130087	HPC Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

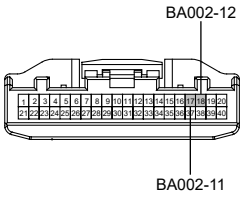
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12F700-BMS

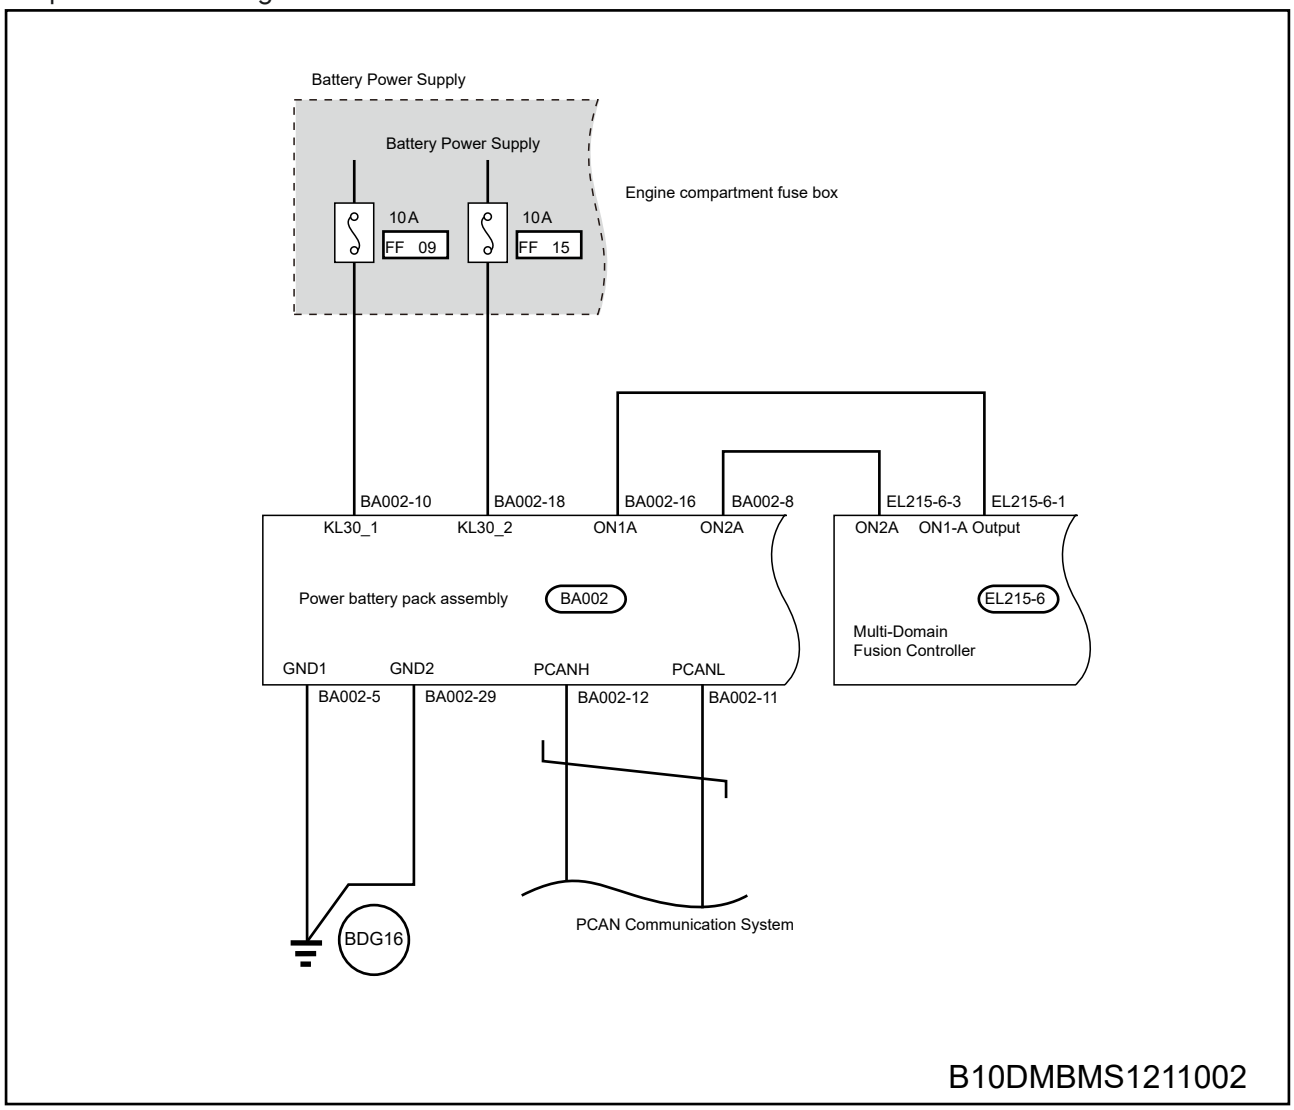
Fault code	Description
P12F700	Main positive relay coil LSD drive abnormality fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the main positive relay control wiring harness.	
	A Check the main positive relay and the BMS control harness (internal harness of the power battery pack assembly) for short circuits or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 3.	
Step 3 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: P128917-BMS

Fault code	Description
P128917	Level 2 Fault: Charging Positive Relay Overheating

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

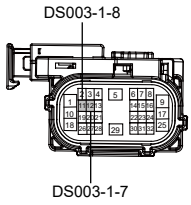
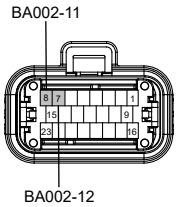
DTC: P12BE00-BMS

Fault code	Description
P12BE00	Preheating Charge High-Voltage Disconnect Response Timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check controller assembly fault codes.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the controll er assembly and record them. C Check the controller assembly for faults.
	Yes》》》 Prioritize the repair of faults related to the controller assembly.
	No》》》 Go to step 3.
Step 3 Check the CAN communication harness between the controller assembly and the power battery pac k assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211042 DS003-1 Controller Assembly  B10DMBMS1211043	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector DS003-1 of the c ontroller assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 7 of the wire harness connector DS003-1 on the controller assembly and terminal 12 of the wire harness connector BA002 on the po wer battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 8 of the wire ha rness connector DS003-1 of the controller assembly and te rminal 11 of the wire harness connector BA002 of the powe r battery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.

© 2026, All rights reserved

	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

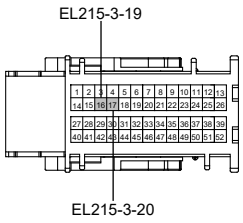
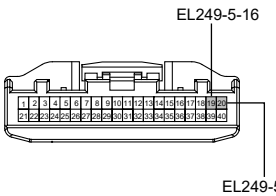
DTC: P12B698-BMS

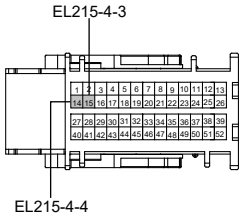
Fault code	Description
P12B698	AC charging socket over-temperature Level 2 (slow charging port te mperature too high)





1. Simplified Circuit Diagram

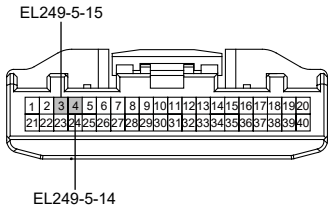
2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the fault code of the main zone controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.
Yes》》》 Prioritize repairing faults related to the main zone controller.	
No》》》 Go to step 3.	
Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.	
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.	



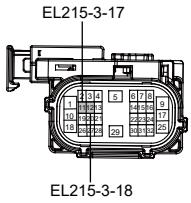
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

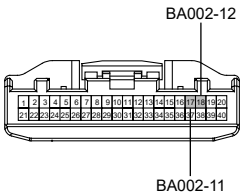
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: U108587-BMS

Fault code	Description
U108587	BAS/BPS Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power batt ery pack assembly.	
	A Check the wiring harness between the aerosol sensor (ins ide the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P128617-BMS

Fault code	Description
P128617	Main negative relay over-temperature level 2 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main negative relay.	
	A Check the connecting copper busbar of the main negativ e relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

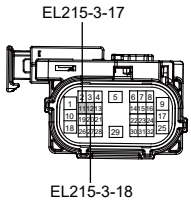
DTC: U131382-BMS

Fault code	Description
U131382	IVI Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

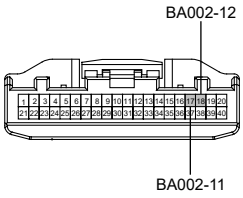
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12F413-BMS

Fault code	Description
P12F413	DC Charging Negative Relay Open Circuit Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harness (internal wiring harness of the power battery pack assembly) for short circuits or open circuits.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: U108487-BMS

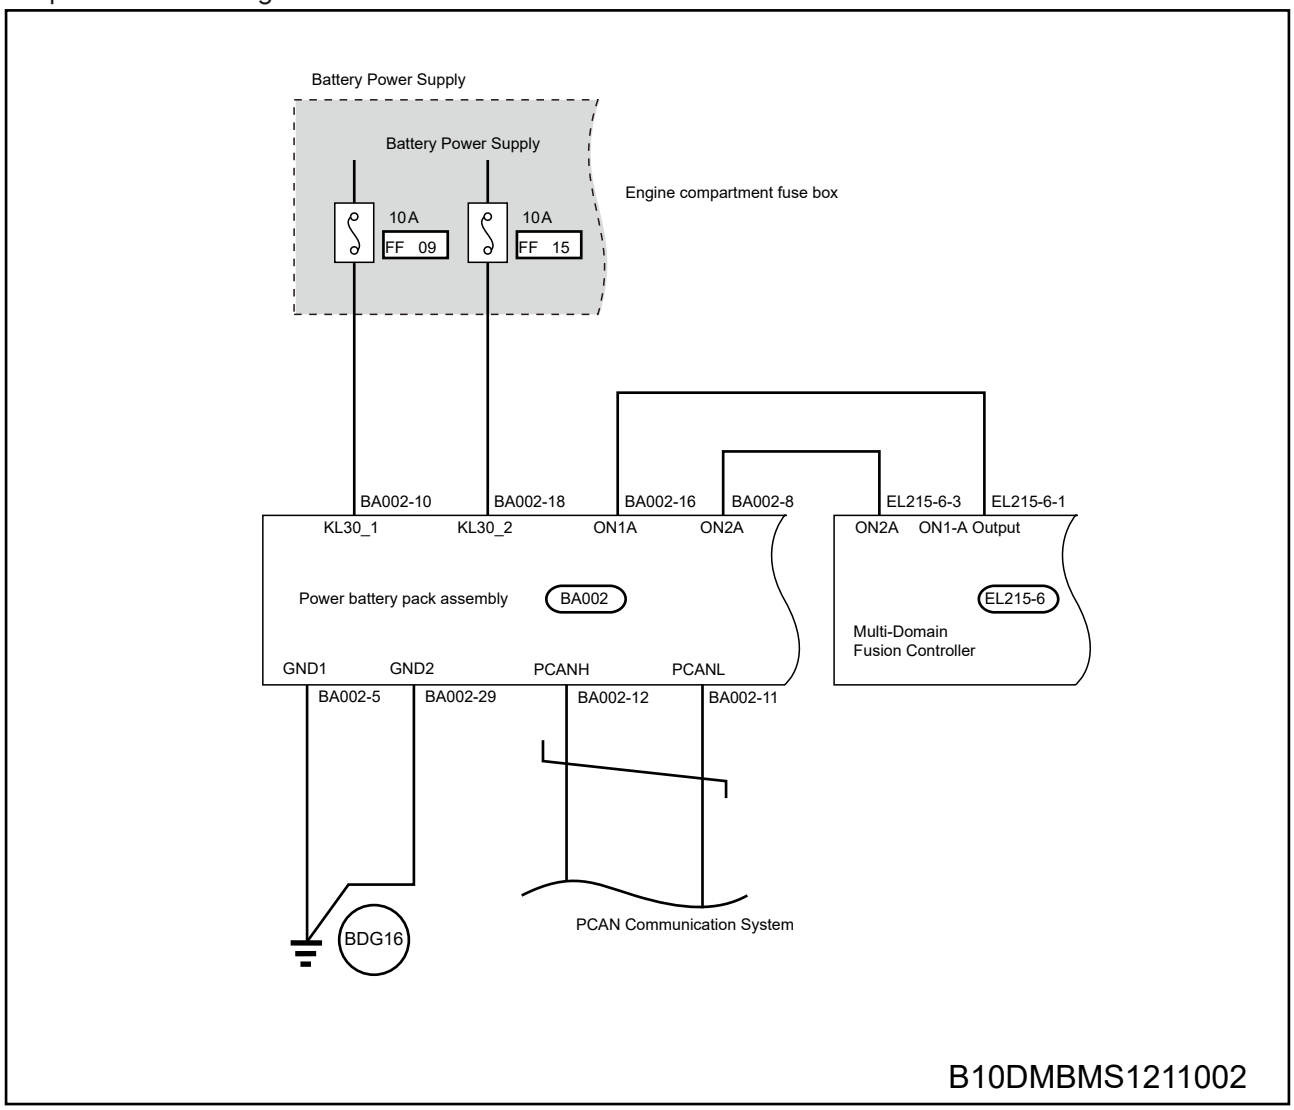
Fault code	Description
U108487	Daisy chain communication fault (Analog Front End communication ti meout)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the daisy chain wiring harness.	
	A Check the daisy chain harness (inside the power battery pack) for open or short circuits.
Yes 》》》 Replace the daisy chain wiring harness.	
No 》》》 Go to step 3.	
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

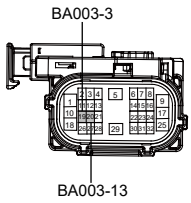
DTC: U007688-BMS

Fault code	Description
U007688	Fast Charging CAN Bus Off Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

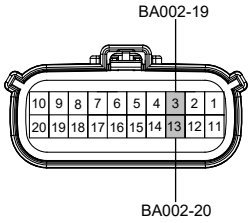
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN communication harness between the charging protocol converter and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211046

BA003 Charging Protocol Converter

B10DMBMS1211047

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA003 of the charging protocol converter.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the wire harness connector BA003 of the charging protocol converter and terminal 20 of the wire harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector BA003 of the charging protocol converter and terminal 19 of harness connector BA002 of the power battery pack assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply ground of the power battery pack assembly.

A Check whether the power supply ground of the power battery pack assembly is normal.

No》》》 Repair or replace the wiring harness.

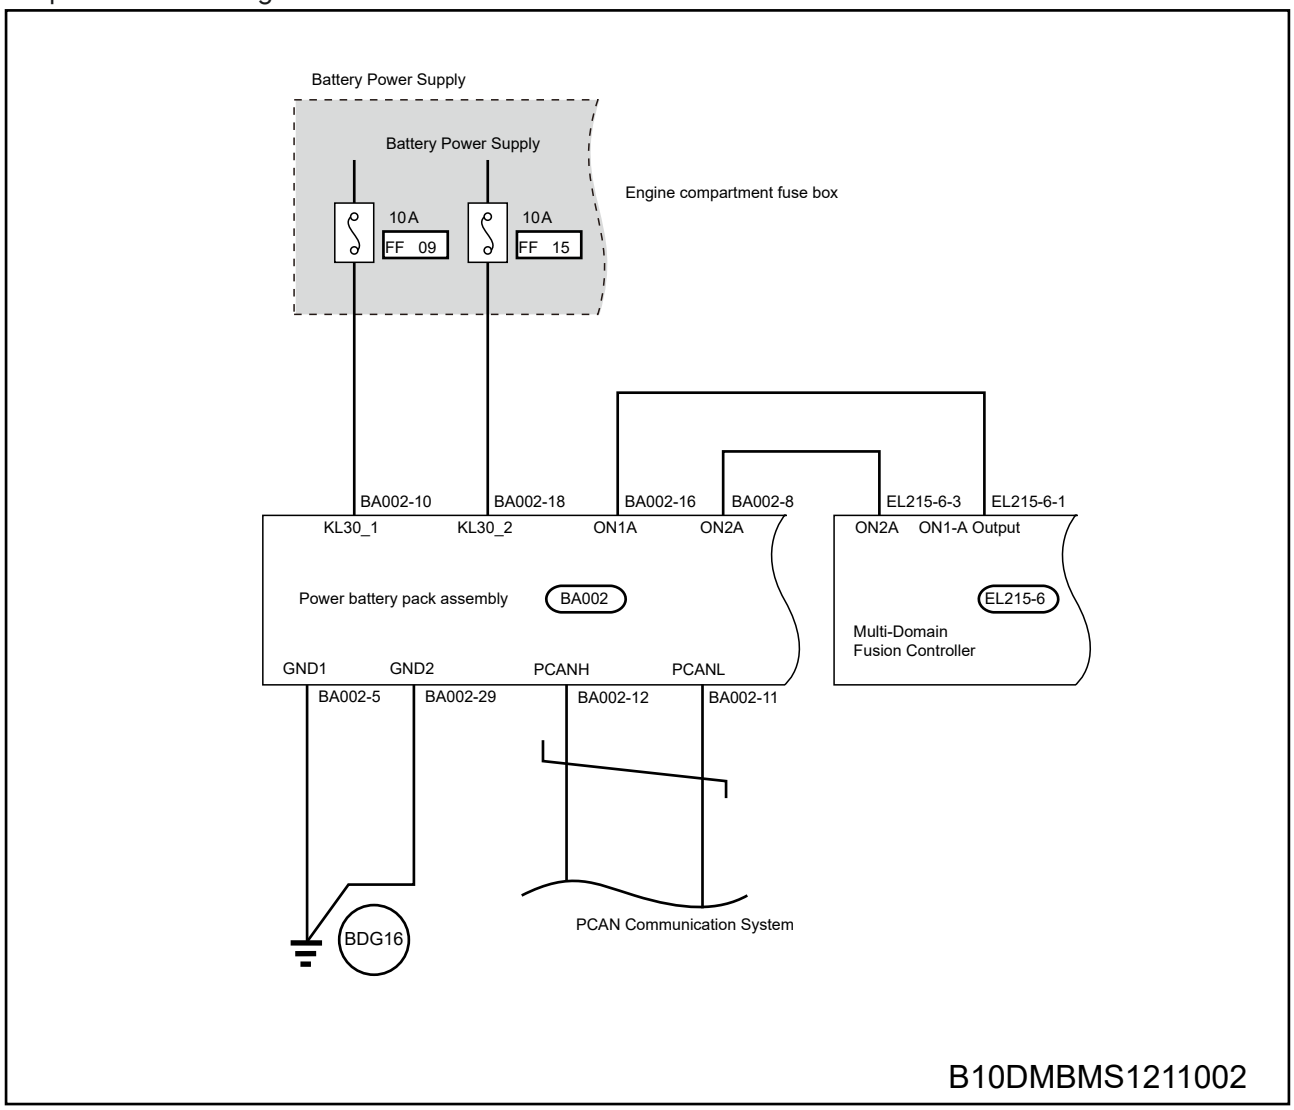
Yes》》》
Go to step 4.

Step 4 Replace the power battery pack assembly.

A Replace the power battery pack assembly.
B After replacing the power battery pack assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved



Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

© 2026, All rights reserved

DTC: P12B000-BMS

Fault code	Description
P12B000	Thermal runaway fault

1. Simplified Circuit Diagram

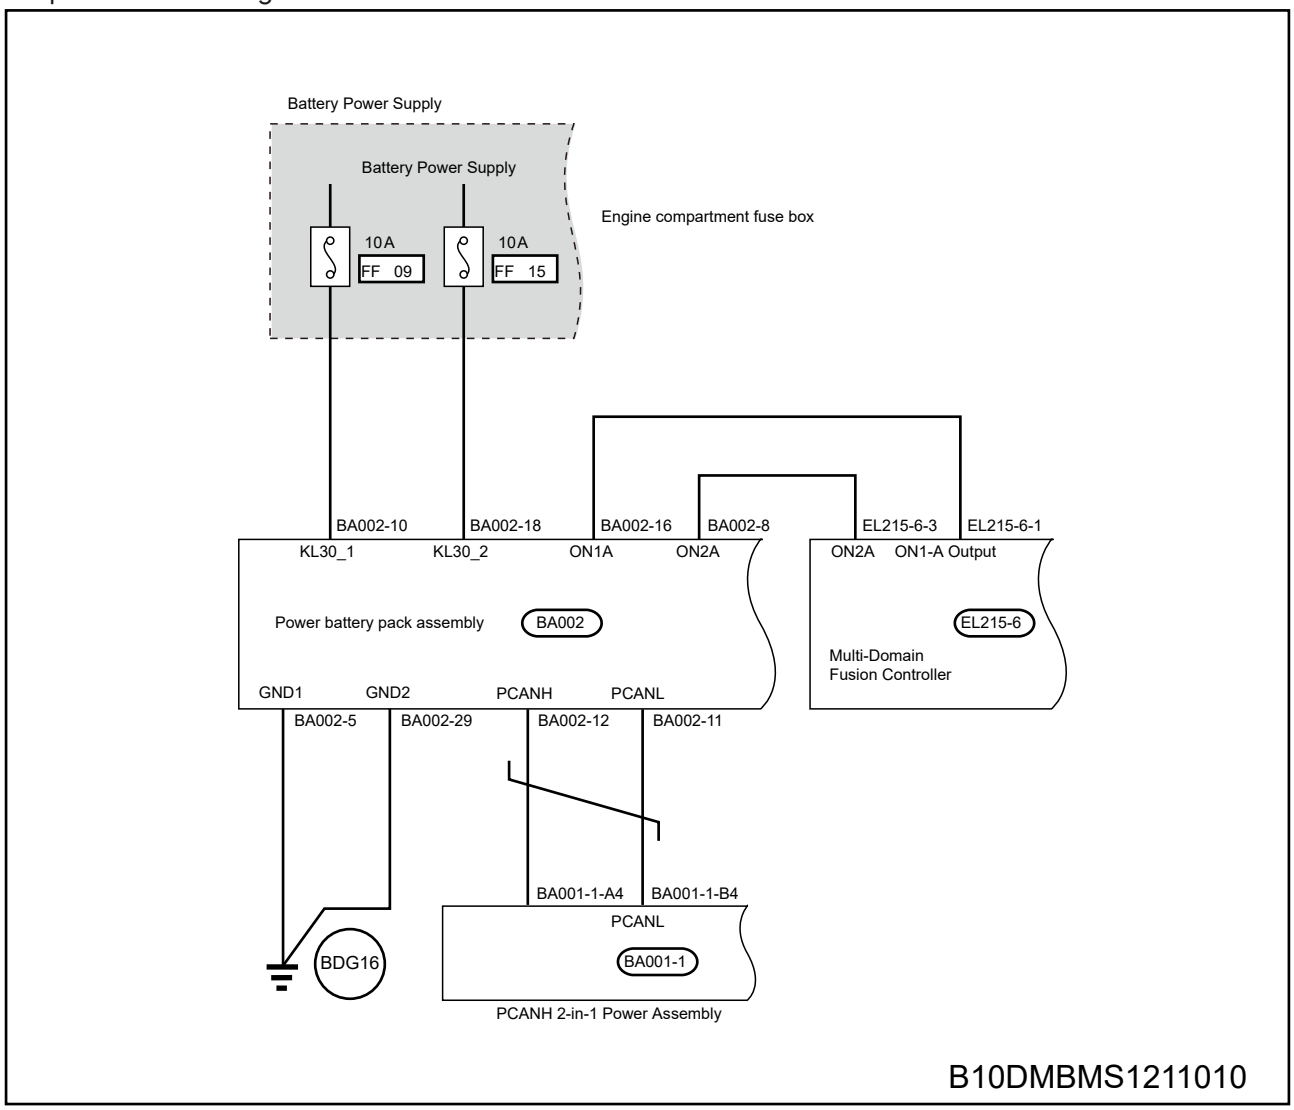
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power battery pack.	
	A Check the power battery pack for severe deformation.
	Yes》》》 Replace the power battery pack assembly.
	No》》》 Go to step 3.
Step 3 Check the insulation value of the power battery pack module.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Remove the power battery pack assembly. C. Wear insulated gloves, use an insulation tester, select the DC 1000V range, connect the black test lead to the power b attery housing, and use the red test lead to measure the tot al positive and total negative terminals of the power battery module respectively. Press the test button, with the voltage rise time ≤ 2s and the test time ≥ 10s, and observe the value displayed on the insulation tester. Insulation standard value: ≥10MΩ D Check whether the insulation value meets the standard v alue.
	No》》》 Replace the power battery pack module.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?

© 2026, All rights reserved

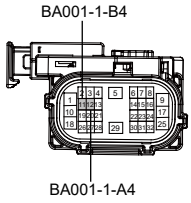


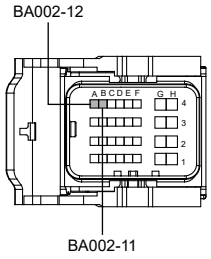
Yes 》 》 》 System normal.
Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

© 2026, All rights reserved

DTC: U130482-BMS

Fault code	Description
U130482	OBC-E2E Verification Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the CAN communication wiring harness between the 2-in-1 power supply assembly and the p ower battery pack assembly.	
BA002 Power Battery Pack Assembly  B10DMBMS1211011 BA001-1 2-in-1 Power Supply Assembly  B10DMBMS1211012	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA001-1 of the 2-in-1 power supply assembly. C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly. D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power supply ass embly and terminal 12 of the wiring harness connector BA0 02 of the power battery pack assembly is normal. E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal B4 of harness c onnector BA001-1 of the 2-in-1 power supply assembly an d terminal 11 of harness connector BA002 of the power bat tery pack assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.	
	A Check whether the power ground circuit of the 2-in-1 po wer assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.	
	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the f ault cleared?
	Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

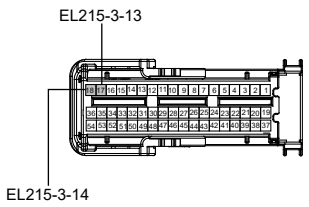
DTC: U130E82-BMS

Fault code	Description
U130E82	ACU-E2E Verification Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

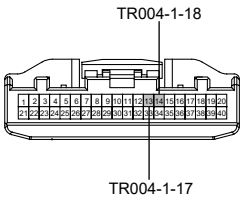
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



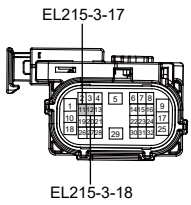
Step 2 Check the CCAN harness between the airbag control module assembly and the multi-domain fusion controller.

TR004-1 Airbag Control Module Assembly

B10DMBMS1211022

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211023

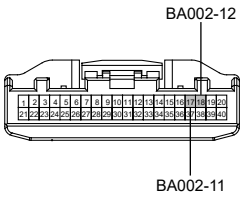


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR004-1 of the airbag control module assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of harness connector TR004-1 of the airbag control module assembly and terminal 14 of harness connector EL215-3 of the multi-domain fusion controller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of harness connector TR004-1 of the airbag control module assembly and terminal 13 of harness connector EL215-3 of the multi-domain fusion controller to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

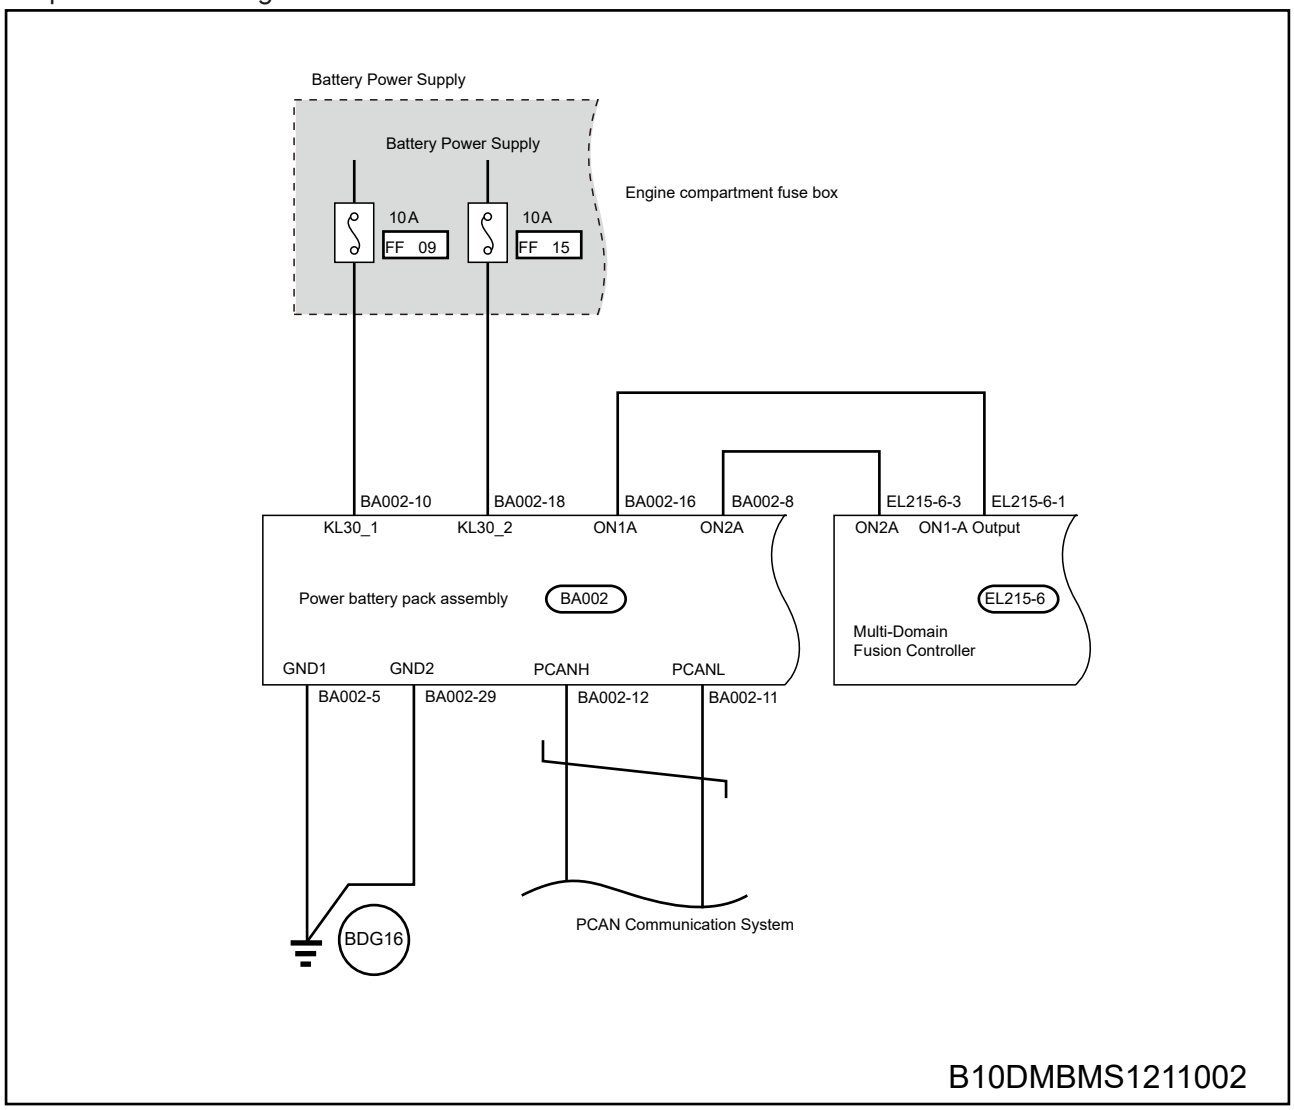


BA002 Power Battery Pack Assembly

B10DMBMS1211024

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector

© 2026, All rights reserved



EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211025	EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

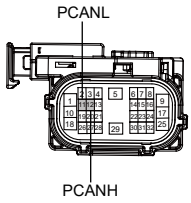
DTC: U007388-BMS

Fault code	Description
U007388	PCAN BusOff Fault



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes 》 》 》 Go to step 3.	
Step 3 Check whether the PCAN harness of the power battery pack assembly is normal.	
BA002 Power Battery Pack Assembly  B10DMBMS1211044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the power battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 11 and the vehicle body ground, and between terminal 12 and the vehicle body ground, at the harness connector BA002 of the power battery pack assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》

DTC: P12BF00-BMS

Fault code	Description
P12BF00	Preheating Zero Current Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the cell temperature of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the cell temperature of the po wer battery pack assembly, and record it. Temperature sampling range：-40~85℃ C Check whether the cell temperature of the power battery pack assembly is normal.
No 》 》 》 Check the sampling harness of each module.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them. C Check the thermal management controller for any relevan t diagnostic trouble codes.
Yes 》 》 》 Prioritize repairing faults related to the thermal management controller.	
No 》 》 》 Go to step 4.	
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》 》 》 System normal.	
Next 》 》 》

DTC: P12A573-BMS

Fault code	Description
P12A573	Main positive or pre-charge relay stuck

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main positive and pre-charge relays.	
	A Remove the main positive relay and the precharge relay, and check whether the switch terminals of the main positive relay and the precharge relay are normally closed.
	Yes 》》》 Replace the main positive relay or pre-charge relay.
	No 》》》 Go to step 3.
Step 3 Check the main positive relay and pre-charge relay control wiring harness.	
	A Check the main positive relay, pre-charge relay, and BMS control harness (internal harness of the power battery pack assembly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 4.
Step 4 Replace the main positive relay and precharge relay.	
	A Replace the main positive relay and pre-charge relay. B After replacing the main positive relay and pre-charge rel ay, check whether the fault is cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12AB15-BMS

Fault code	Description
P12AB15	Thermal runaway sensor driver short to power or open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power batt ery pack assembly.	
	A Check the wiring harness between the aerosol sensor (ins ide the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P12BC00-BMS

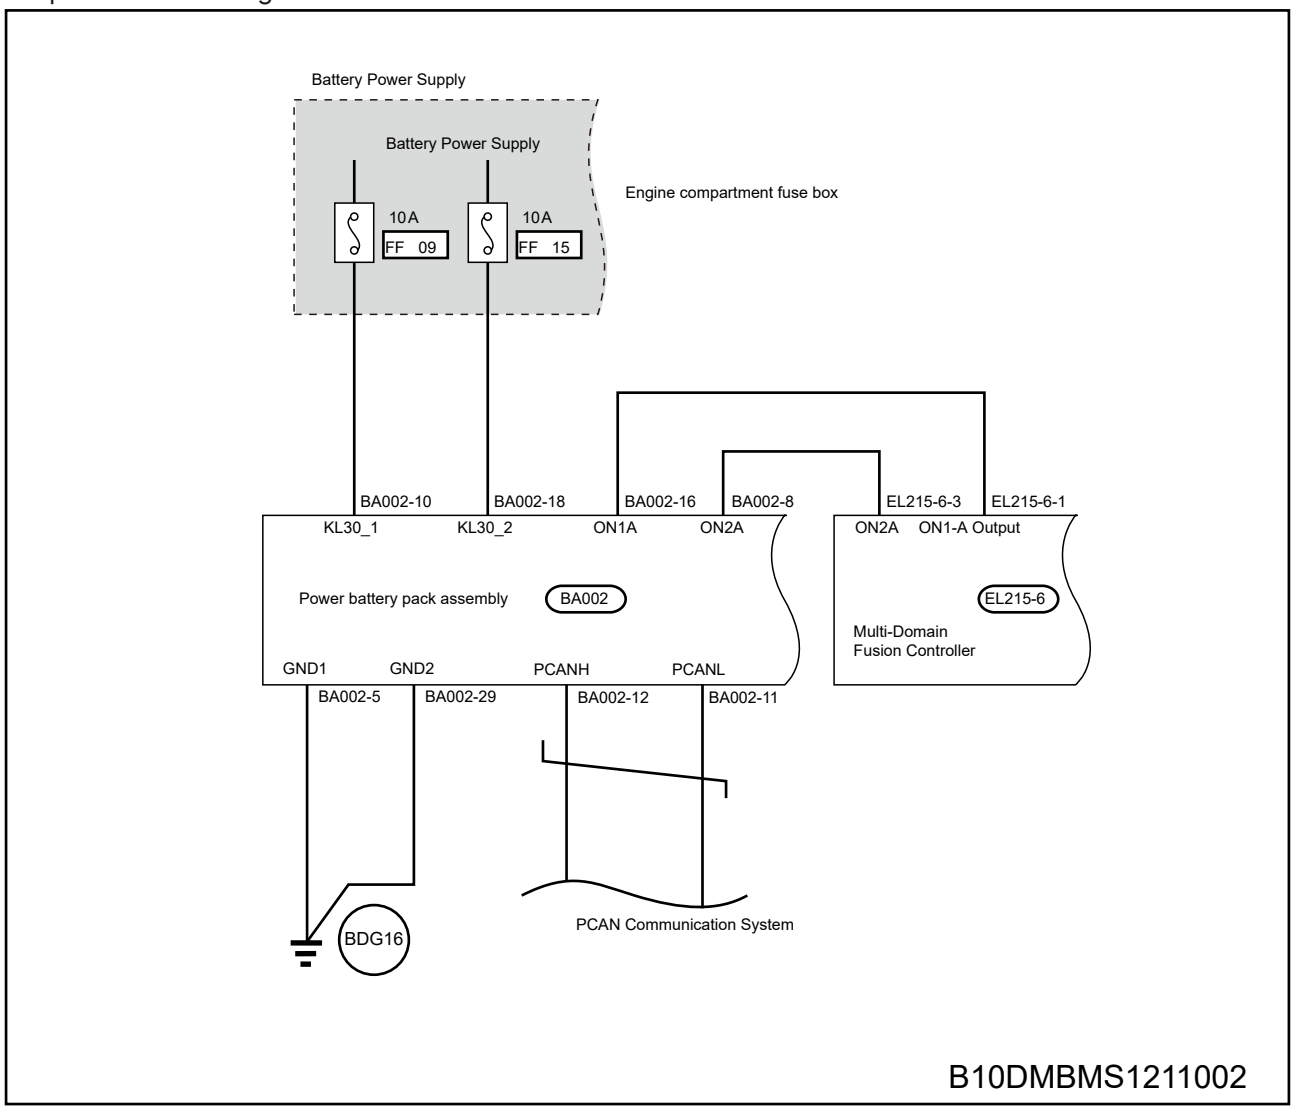
Fault code	Description
P12BC00	BMS abnormal charging stop High internal fault level of charging BM S (High internal fault level of charging BMS)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the diagnostic trouble codes of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the power b attery pack assembly, and record them. C Check for any other fault codes.
Yes 》》》 Prioritize the repair of other related faults.	
No 》》》 Go to step 3.	
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: P12FC13-BMS

Fault code	Description
P12FC13	Main positive relay coil open circuit fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main positive relay control wiring harness.	
	A Check the main positive relay and the BMS control harnes s (internal harness of the power battery pack assembly) for s hort circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 3.
Step 3 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P128A17-BMS

Fault code	Description
P128A17	Charging relay over-temperature Level 3 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main positive relay.	
	A Check the copper busbar connection of the main positive relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main positive relay.	
	A Replace the main positive relay. B After replacing the main positive relay, check whether the fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

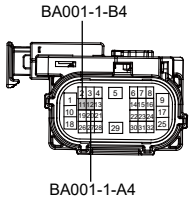
DTC: U130487-BMS

Fault code	Description
U130487	OBC Communication Timeout (Communication Lost with OBC)

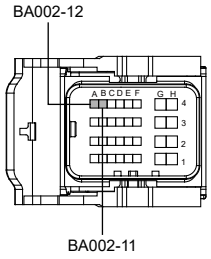
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN communication wiring harness between the 2-in-1 power supply assembly and the p ower battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211011

BA001-1 2-in-1 Power Supply Assembly

B10DMBMS1211012

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA001-1 of the 2-in-1 power supply assembly.
C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power supply ass embly and terminal 12 of the wiring harness connector BA0 02 of the power battery pack assembly is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal B4 of harness c onnector BA001-1 of the 2-in-1 power supply assembly an d terminal 11 of harness connector BA002 of the power bat tery pack assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.
A Check whether the power ground circuit of the 2-in-1 po wer assembly is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.
A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the f ault cleared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12AC96-BMS

Fault code	Description
P12AC96	Thermal Runaway Sensor Malfunction

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness connecting the aerosol sensor (inside the battery pack) and the power battery pack assembly.	
	A Check the wiring harness between the aerosol sensor (inside the battery pack) and the power battery pack assembly for short or open circuits.
	Yes》》》 Replace the internal wiring harness of the battery pack.
	No》》》 Go to step 3.
Step 3 Replace the aerosol sensor.	
	A Replace the aerosol sensor. B After replacing the aerosol sensor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P128D17-BMS

Fault code	Description
P128D17	Level 3 fault: Charging negative relay over-temperature

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main negative relay.	
	A Check the connecting copper busbar of the main negativ e relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

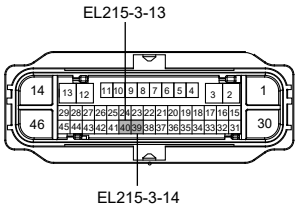
DTC: U131187-BMS

Fault code	Description
U131187	IBC Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

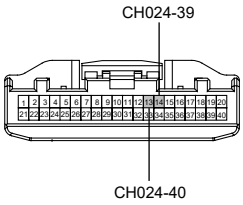
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



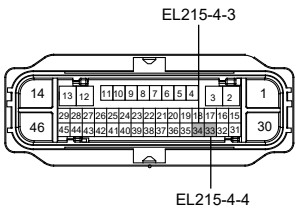
Step 2 Check the CCAN harness between the Intelligent Integrated Braking System Assembly and the Multi-Domain Fusion Controller.

CH024 Intelligent Integrated Brake System Assembly

B10DMBMS1211027

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211028



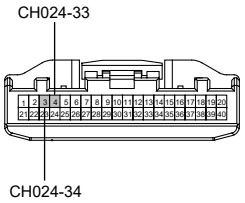
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 on the Intelligent Integrated Brake System assembly and terminal 14 of wiring harness connector EL215-3 on the Multi-Domain Fusion Controller to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 40 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 13 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the COM-CAN wiring harness between the Intelligent Integrated Brake System assembly and the Multi-Domain Fusion Controller.

CH024 Intelligent Integrated Brake System Assembly



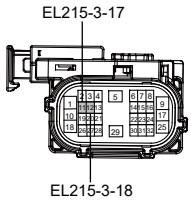
B10DMBMS1211029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of the harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 4 of the harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal.

© 2026, All rights reserved

EL215-4 Multi-Domain Fusion Controller

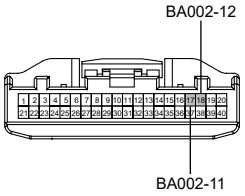
B10DMBMS1211030



E Use a multimeter, set to the resistance range, and measure the resistance between terminal 34 of wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 3 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.



Step 4 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the power ground circuit of the intelligent integrated brake system assembly.

A Check whether the power ground circuit of the intelligent integrated brake system assembly is normal.

No 》》》 Repair or replace the wiring harness.

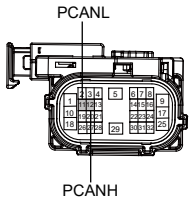
© 2026, All rights reserved

	Yes》》》 Go to step 6.
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: U007387-BMS

Fault code	Description
U007387	PCAN communication lost



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage value: 11~14 V C. Check whether the voltage meets the standard value.
No 》 》 》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.	
Yes 》 》 》 Go to step 3.	
Step 3 Check whether the PCAN harness of the power battery pack assembly is normal.	
BA002 Power Battery Pack Assembly  B10DMBMS1211044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector BA002 of the po wer battery pack assembly. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 11 and the vehicle body gr ound, and between terminal 12 and the vehicle body groun d, at the harness connector BA002 of the power battery pa ck assembly. Voltage standard value: approximately 5V in total. E Confirm whether the voltage meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》	

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Check the ambient temperature.	
	A Check whether the vehicle is exposed to direct sunlight or whether the ambient temperature is too high.
Yes 》》》 Move the vehicle to a shaded area, wait for a while, and then recheck.	
No 》》》 Go to step 3.	
Step 3 Check whether the vehicle is charging or discharging.	
	A Check whether the vehicle is charging or discharging to e xternal devices.
Yes 》》》 Stop charging or discharging; wait for a period of time and recheck.	
No 》》》 Go to step 4.	
Step 4 Check the battery cooling system.	
	A Check the battery cooling system for leaks or low coolant level. B Check whether the cooling fan is malfunctioning. C Check the radiator for excessive dirt or blockage.
Yes 》》》 Inspect and repair the faulty part; add coolant.	
No 》》》 Go to step 5.	
Step 5 Check the electric compressor assembly.	
	A Check whether the electric compressor assembly is worki ng properly.
No 》》》 Troubleshoot the electric compressor assembly fault.	
Yes 》》》 Go to step 6.	
Step 6 Check the fault codes of the thermal management controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the thermal management controller, and record them.

© 2026, All rights reserved

	C Check for any related fault codes for the chiller valve or b attery water pump.
Yes》》》 Prioritize repairing faults related to the thermal management controller.	
No》》》 Go to step 7.	
Step 7 Check the power battery temperature sampling wire (inside the power battery pack).	
	A Check the power battery temperature sampling wire (insi de the power battery pack) for short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 8.	
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes》》》 System normal.	
Next》》》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: P12D500-BMS

Fault code	Description
P12D500	Main Negative Relay Life Level 3 Alarm Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: P12D800-BMS

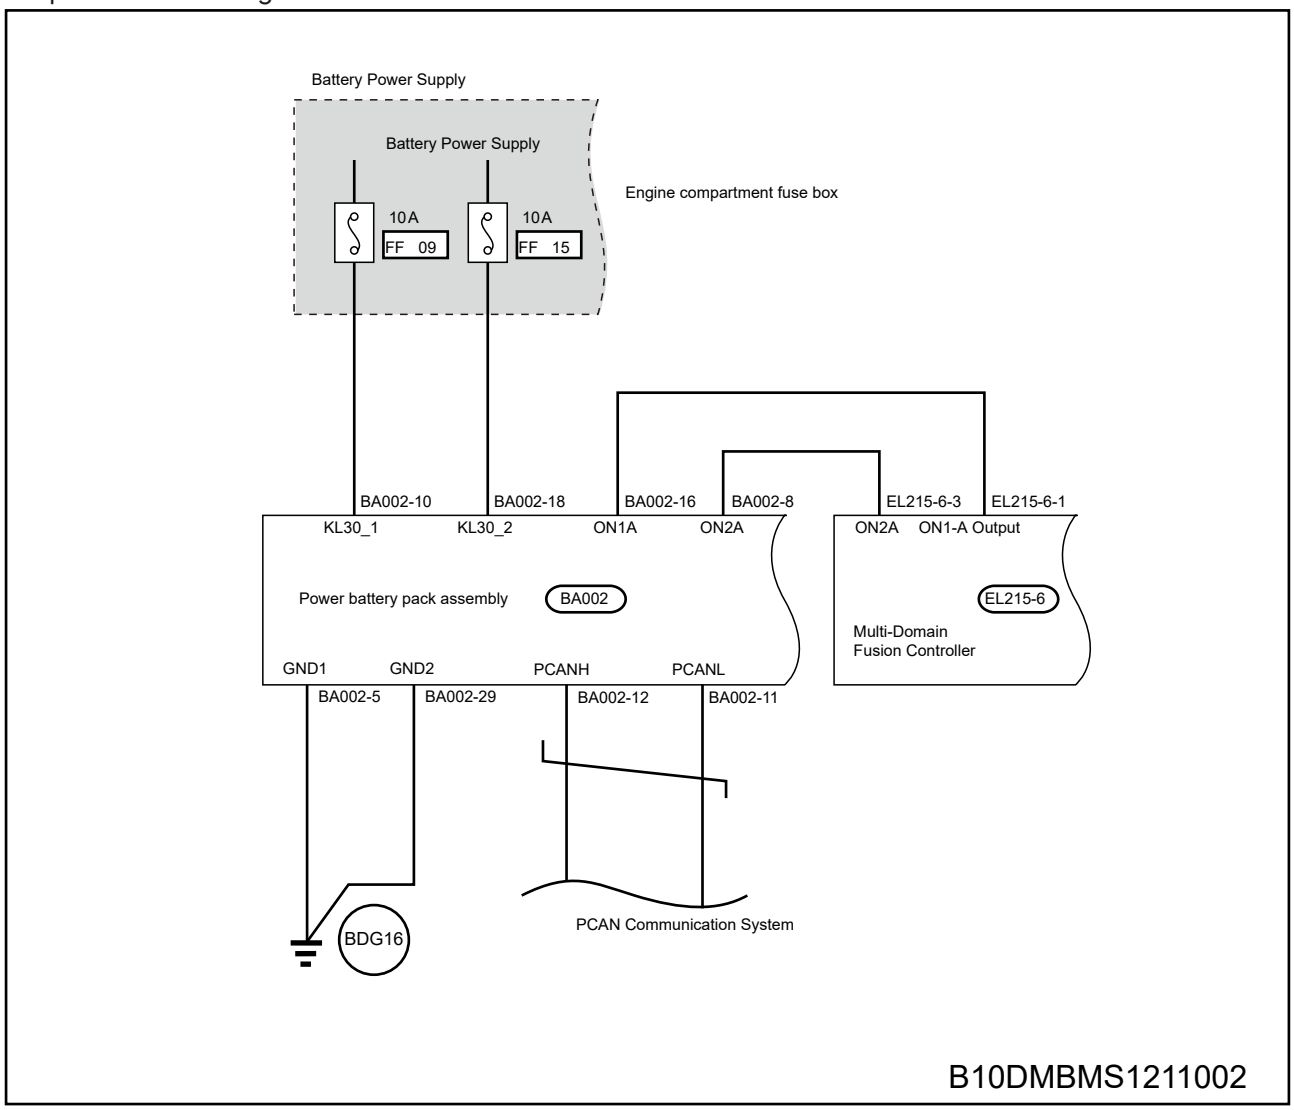
Fault code	Description
P12D800	Pre-charge Relay Life Level 3 Alarm Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved



No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》》》 Go to step 2.	
Step 2 Replace the pre-charge relay.	
	A Replace the pre-charge relay. B After replacing the pre-charge relay, check whether the f ault has been cleared.
Yes 》》》 System normal.	
No 》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 4.	
Step 4 Diagnosis complete.

DTC: P12CC00-BMS

Fault code	Description
P12CC00	SOC too high

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P12B800-BMS

Fault code	Description
P12B800	Pre-charge timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the power battery pack assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the power b attery pack assembly, and record them. C Check for insulation, interlock, precharge relay, and other related faults.
	Yes 》》》 Prioritize the repair of related faults.
	No 》》》 Go to step 3.
Step 3 Check the high-voltage wiring harness of the entire vehicle.	
	A Check whether the positive and negative poles of the veh icle high-voltage harness are connected incorrectly.
	Yes 》》》 Properly connect the high-voltage wiring harness.
	No 》》》 Go to step 4.
Step 4 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12F300-BMS

Fault code	Description
P12F300	DC Charging Negative Relay Welding Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the main negative relay.	
	A Remove the main negative relay and check whether the s witch terminal of the main negative relay is normally closed.
	Yes 》》》 Replace the main negative relay.
	No 》》》 Go to step 3.
Step 3 Check the main negative relay control harness.	
	A Check the main negative relay and the BMS control harne ss (internal wiring harness of the power battery pack assem bly) for short circuits or open circuits.
	Yes 》》》 Repair or replace the wiring harness.
	No 》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

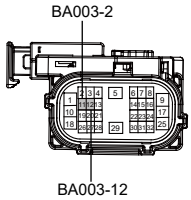
DTC: U137B87-BMS

Fault code	Description
U137B87	EVCC Communication Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

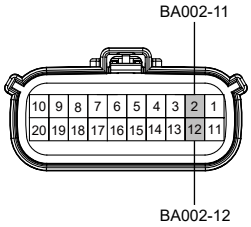
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Inspect the PCAN harness between the charging protocol converter and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211049

BA003 Charging Protocol Converter

B10DMBMS1211050

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector BA003 of the charging protocol converter.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between Terminal 12 of wire harness connector BA003 of the charging protocol converter and Terminal 12 of wire harness connector BA002 of the power battery pack assembly to check if the resistance is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 2 of the charging protocol converter wire harness connector BA003 and terminal 11 of the power battery pack assembly wire harness connector BA002 is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the charging protocol converter.

A Check whether the power ground circuit of the charging protocol converter is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the charging protocol converter.

A Replace the charging protocol converter.
B After replacing the charging protocol converter, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P12AF96-BMS

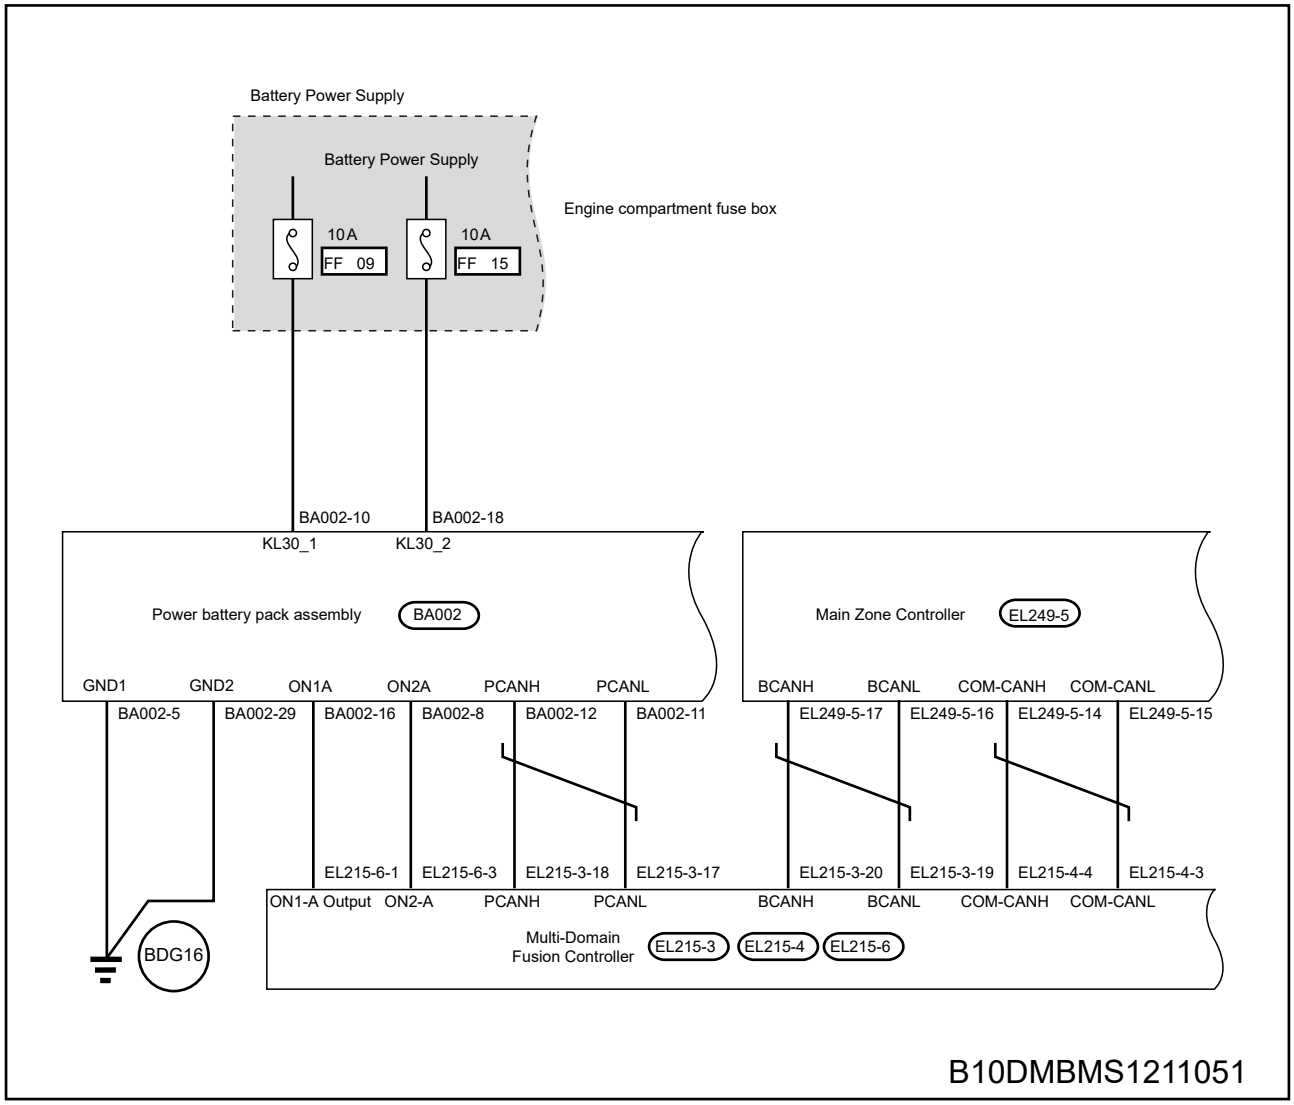
Fault code	Description
P12AF96	Sampling chip fault (AFE hardware fault)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

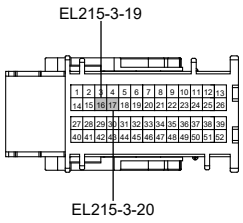


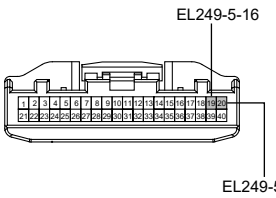
No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power battery pack assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 4.	
Step 4 Diagnosis complete.	

© 2026, All rights reserved

DTC: P12B798-BMS

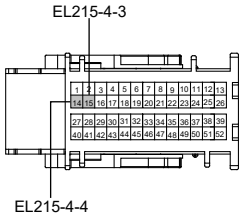
Fault code	Description
P12B798	DC charging socket over-temperature Level 3 (fast charging port tem perature too high)





1. Simplified Circuit Diagram

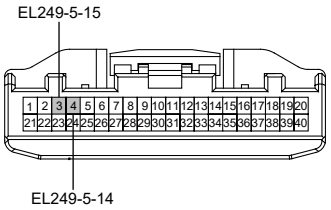
2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the fault code of the main zone controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the main zone controller and record them. C Check whether any fault codes related to the charging port temperature are displayed.
	Yes 》 》 》 Prioritize repairing faults related to the main zone controller.
	No 》 》 》 Go to step 3.
Step 3 Check the BCAN harness between the main zone controller and the multi-domain fusion controller.	
EL249-5 Main Zone Controller  B10DMBMS1211052 EL215-3 Multi-Domain Fusion Controller  B10DMBMS1211053	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main zone controller. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the main zone controller harness connector EL249-5 and terminal 20 of the multi-domain fusion controller harness connector EL215-3 to check whether the resistance value is normal E Use a multimeter set to the resistance range to measure whether the resistance between terminal 16 of harness connector EL249-5 of the main zone controller and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the COM-CAN harness between the main zone controller and the multi-domain fusion controller.	



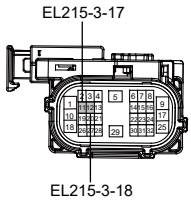
© 2026, All rights reserved

EL249-5 Main Zone Controller

B10DMBMS1211054

EL215-4 Multi-Domain Fusion Controller

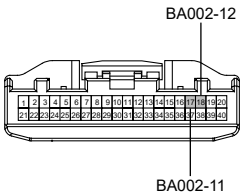
B10DMBMS1211055



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D. Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of harness con nector EL249-5 of the main zone controller and terminal 4 of harness connector EL215-4 of the multi-domain fusion c ontroller is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 15 of harness connecto r EL249-5 of the main zone controller and terminal 3 of har ness connector EL215-4 of the multi-domain fusion controll er to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.



Step 5 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack a ssembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack a ssembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack a ssembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	No 》》》 Go to step 8.
Step 8 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to Step 9.
Step 9 Diagnosis complete.

DTC: P12CB00-BMS

Fault code	Description
P12CB00	SOC too low

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the power supply ground of the power battery pack assembly.	
	A Check whether the power supply ground of the power ba ttery pack assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: P128B17-BMS

Fault code	Description
P128B17	Charging negative relay over-temperature Level 1 fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the copper busbar connection of the main negative relay.	
	A Check the connecting copper busbar of the main negativ e relay for looseness or poor contact.
	Yes》》》 Retighten the copper busbar.
	No》》》 Go to step 3.
Step 3 Check the temperature sampling wiring harness.	
	A Check the temperature sampling harness for short circuit or open circuit.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

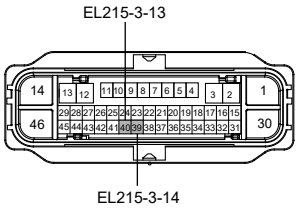
DTC: U131182-BMS

Fault code	Description
U131182	IBC-E2E Verification Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

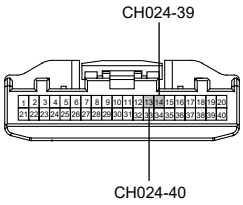
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



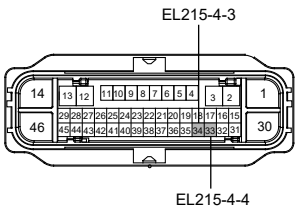
Step 2 Check the CCAN harness between the Intelligent Integrated Braking System Assembly and the Multi-Domain Fusion Controller.

CH024 Intelligent Integrated Brake System Assembly

B10DMBMS1211027

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211028



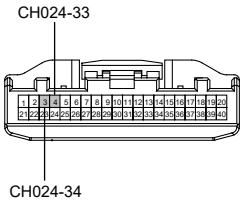
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 39 of wiring harness connector CH024 on the Intelligent Integrated Brake System assembly and terminal 14 of wiring harness connector EL215-3 on the Multi-Domain Fusion Controller to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 40 of the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly and terminal 13 of the wiring harness connector EL215-3 of the Multi-Domain Fusion Controller is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the COM-CAN wiring harness between the Intelligent Integrated Brake System assembly and the Multi-Domain Fusion Controller.

CH024 Intelligent Integrated Brake System Assembly



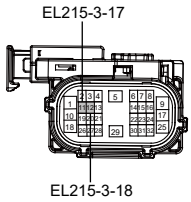
B10DMBMS1211029

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector CH024 of the Intelligent Integrated Brake System assembly.
C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 33 of the harness connector CH024 of the Intelligent Integrated Braking System assembly and terminal 4 of the harness connector EL215-4 of the Multi-Domain Fusion Controller to check if it is normal.

© 2026, All rights reserved

EL215-4 Multi-Domain Fusion Controller

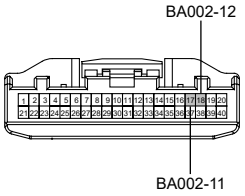
B10DMBMS1211030



E Use a multimeter, set to the resistance range, and measure the resistance between terminal 34 of wiring harness connector CH024 of the Smart Integrated Brake System assembly and terminal 3 of wiring harness connector EL215-4 of the Multi-Domain Fusion Controller to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.



Step 4 Inspect the PCAN harness between the multi-domain fusion controller and the power battery pack assembly.

BA002 Power Battery Pack Assembly

B10DMBMS1211024

EL215-3 Multi-Domain Fusion Controller

B10DMBMS1211025

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 5.

Step 5 Check the power ground circuit of the intelligent integrated brake system assembly.

A Check whether the power ground circuit of the intelligent integrated brake system assembly is normal.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 6.
Step 6 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

DTC: P12D300-BMS

Fault code	Description
P12D300	Main Negative Relay Life Level 1 Alarm Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No 》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Replace the main negative relay.	
	A Replace the main negative relay. B After replacing the main negative relay, check whether th e fault has been cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: P12F500-BMS

Fault code	Description
P12F500	DC Charging Positive and Negative Dual Welding Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.

© 2026, All rights reserved

	No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the fast charging relay.	
	A Remove the fast charging relay, and check whether the s witch terminal of the fast charging relay is normally closed.
	Yes》》》 Replace the fast charging relay.
	No》》》 Go to step 3.
Step 3 Check the fast charging relay control wiring harness.	
	A Check for short or open circuits between the fast chargin g relay and the BMS control harness (internal harness of th e power battery pack assembly).
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 4.
Step 4 Replace the fast charging relay.	
	A Replace the fast charging relay. B After replacing the fast charging relay, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: P11B900-BMS

Fault code	Description
P11B900	High Voltage Interlock 4 Short to Power Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

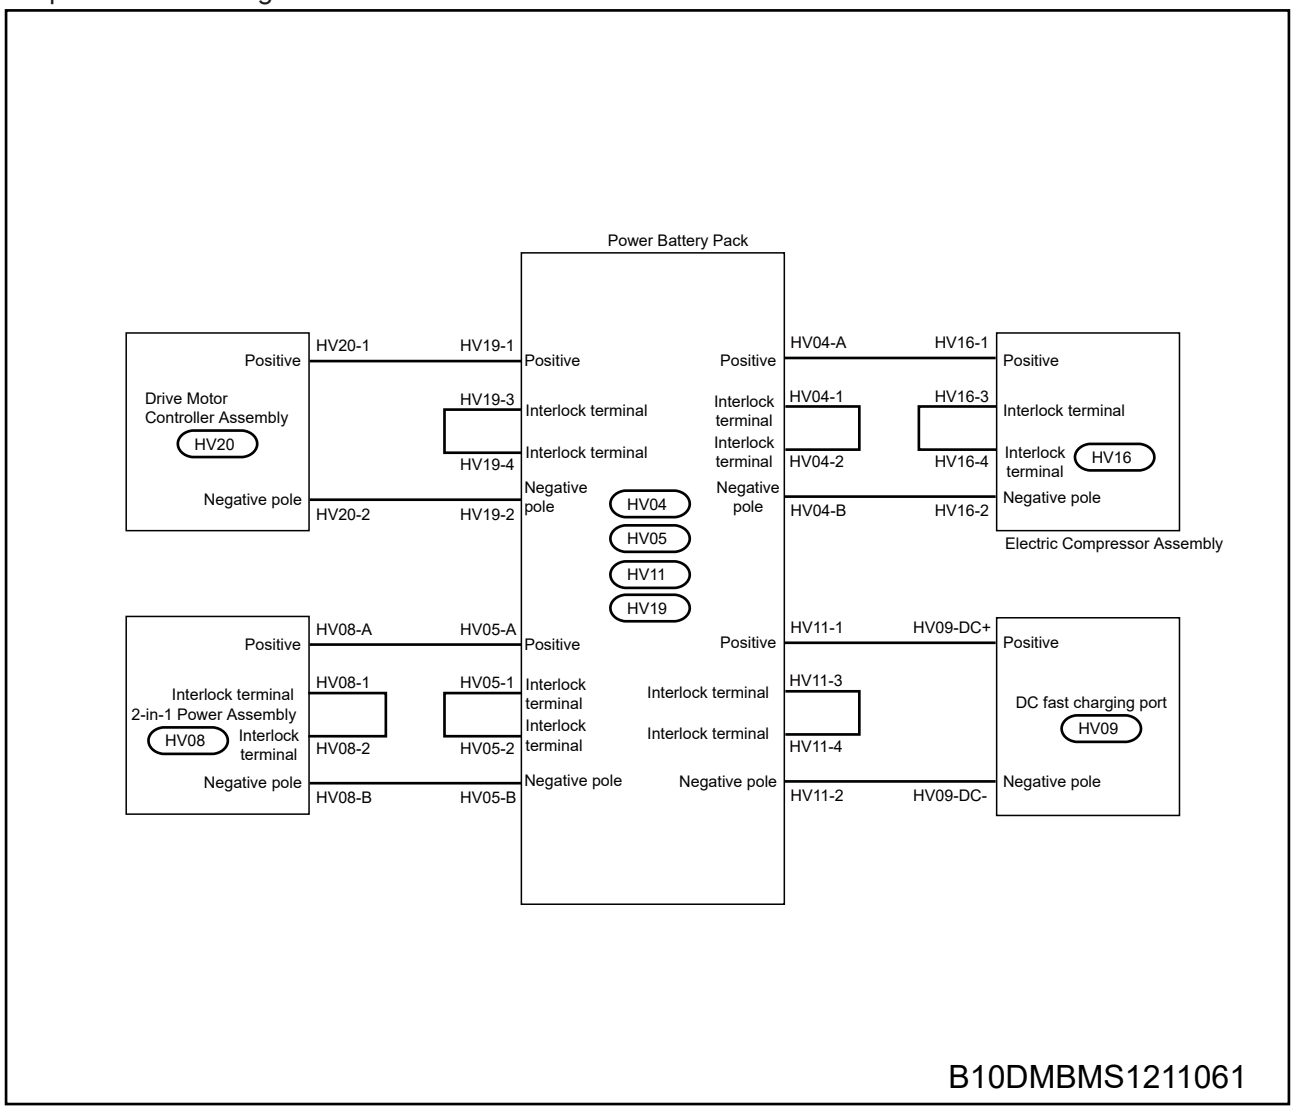
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

© 2026, All rights reserved

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.	

© 2026, All rights reserved



Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P11C100-BMS

Fault code	Description
P11C100	High Voltage Interlock 4 Open Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

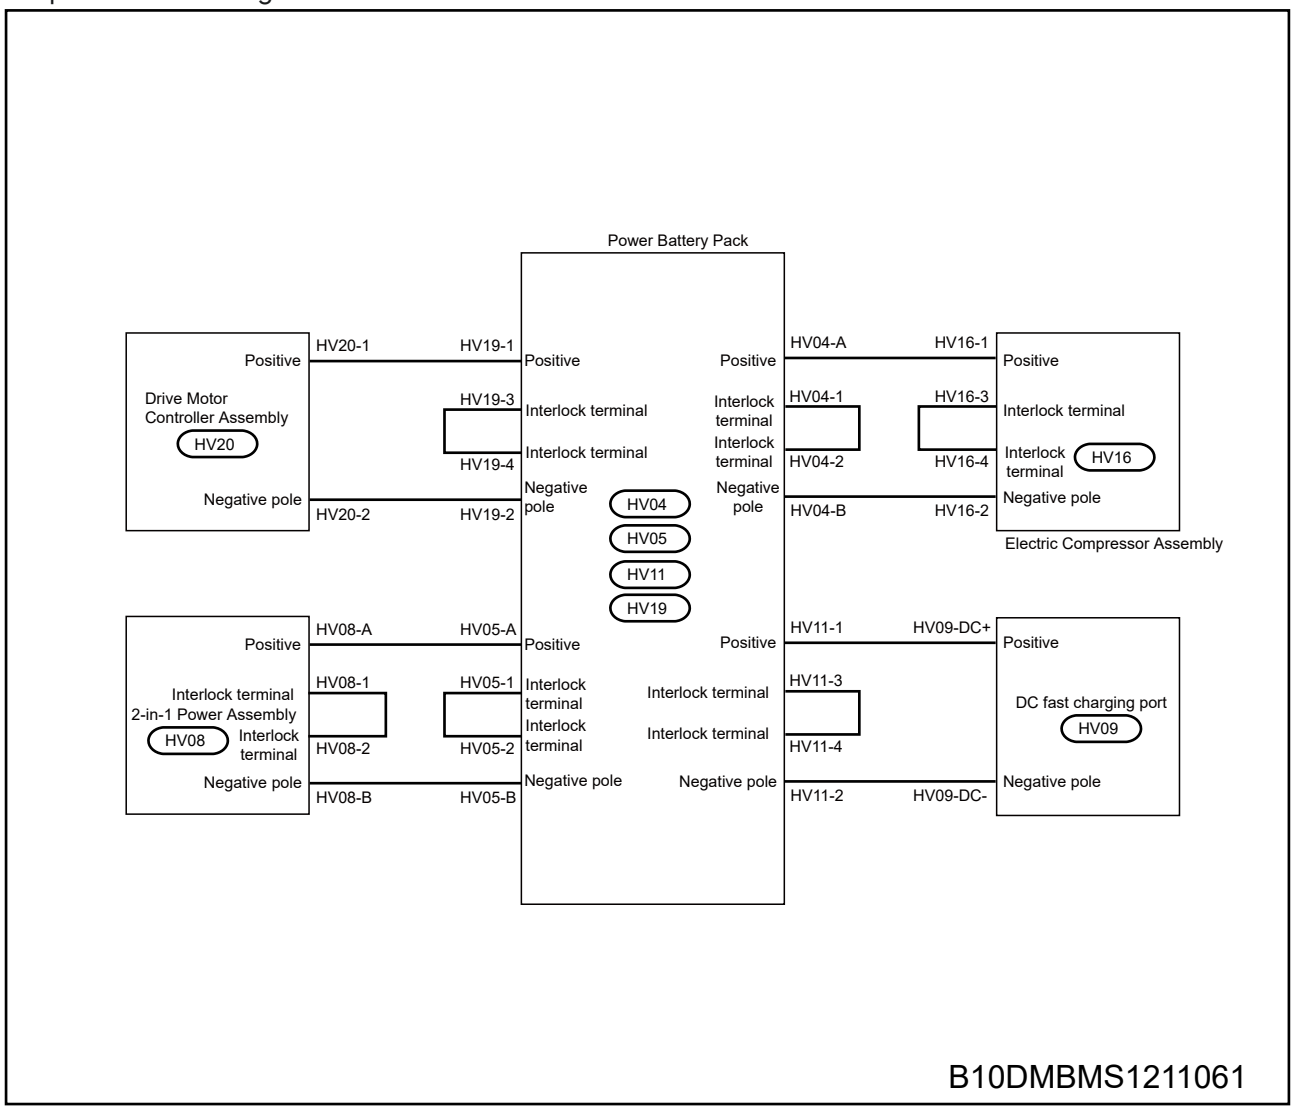
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

© 2026, All rights reserved

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.	

© 2026, All rights reserved



Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

© 2026, All rights reserved

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.

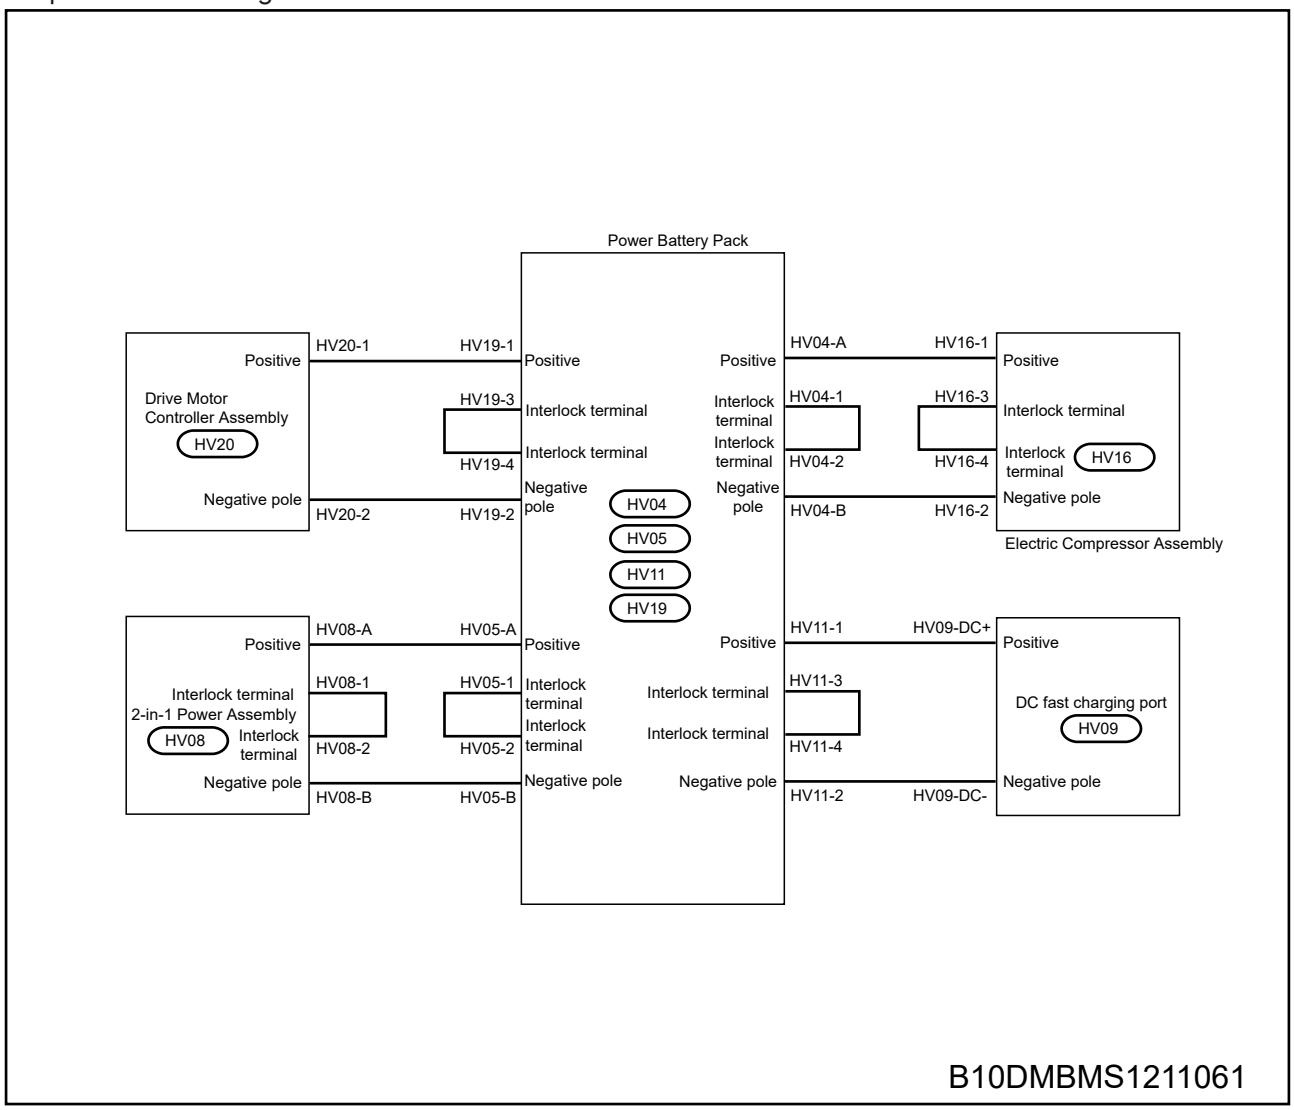
	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

© 2026, All rights reserved

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.	

© 2026, All rights reserved



Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P11C300-BMS

Fault code	Description
P11C300	High Voltage Interlock 5 Short to Ground Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

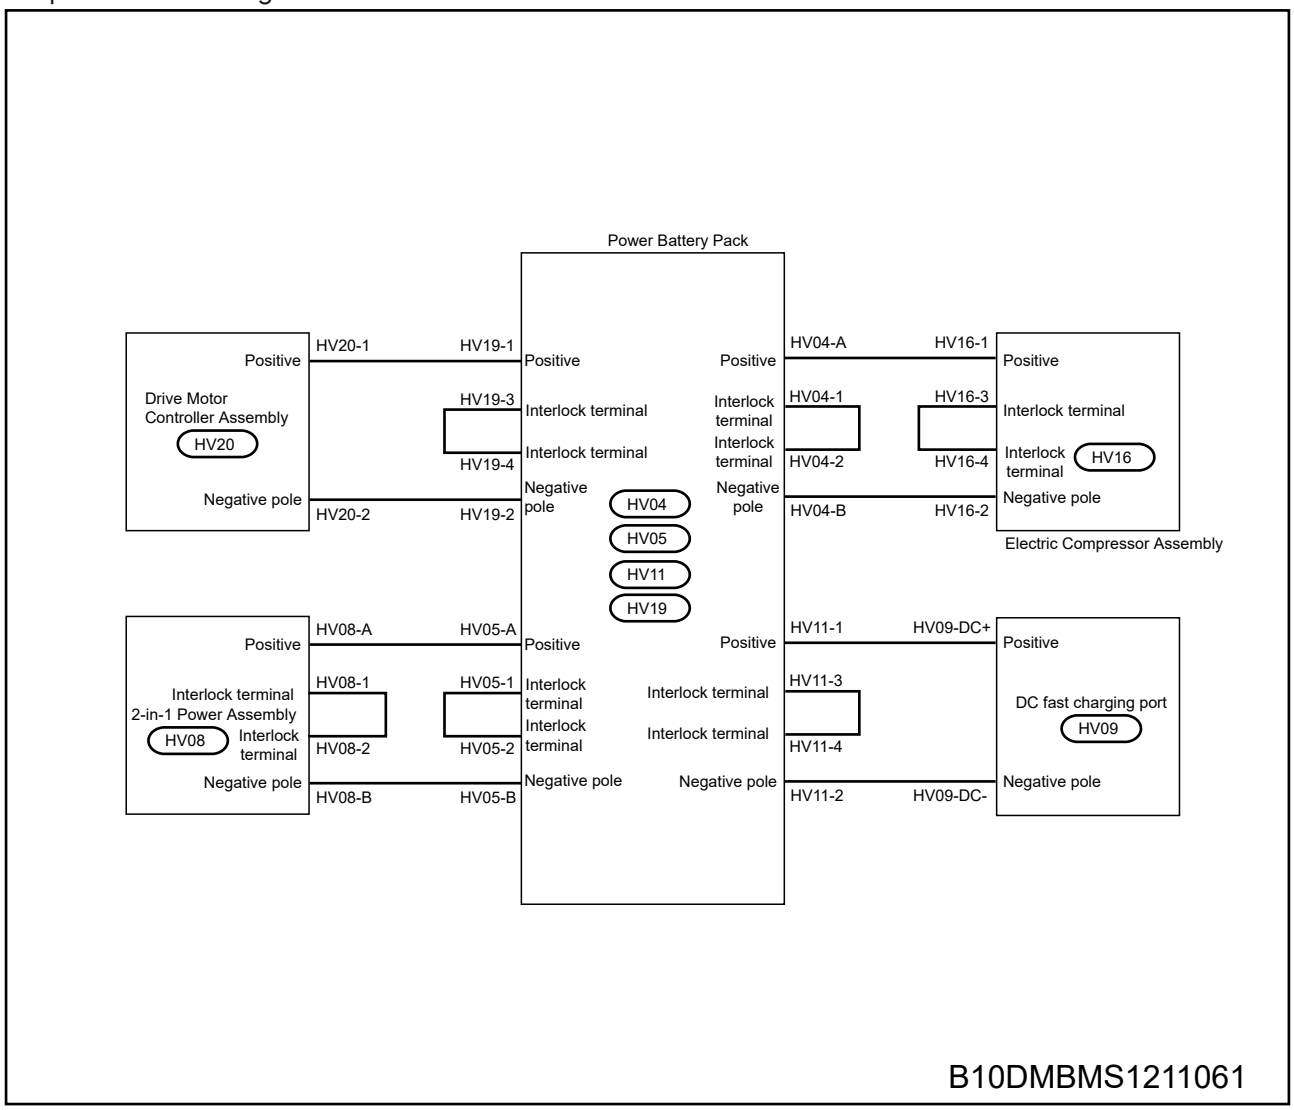
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

© 2026, All rights reserved

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.	

© 2026, All rights reserved



Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.

Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

DTC: P126012-BMS

Fault code	Description
P126012	High Voltage Interlock 2 Short to Power Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the high-voltage harness connectors of the drive motor controller assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connectors between the drive motor controller assembly and the power battery pack for looseness, backed-out pins, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 3.
Step 3 Check the high-voltage interlock of the DC bus in the drive motor controller assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug between the drive motor controller assembly and the power battery pack. C. Using a multimeter, select the continuity test mode and check whether there is continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the drive motor controller assembly.
	No》》》 Replace the rear MCU cable assembly.
	Yes》》》 Go to step 4.
Step 4 Check the HV harness connector between the 2-in-1 power assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the 2-in-1 power assembly and the power battery pack for looseness, terminal back-out, corrosion, or poor contact.
	Yes》》》 Repair or replace the wiring harness.
	No》》》 Go to step 5.
Step 5 Check the high-voltage interlock of the DC bus in the 2-in-1 power assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug from the 2-in-1 power assembly to the power battery pack.

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.

Step 8 Check the HV harness connector between the DC fast charging socket and the power battery pack.	
	A Check the HV wiring harness connector between the DC fast charging port and the power battery pack for looseness, pushed-out terminals, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to Step 9.	
Step 9 Check the high-voltage interlock of the DC bus at the DC fast charging port.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the power battery pack to the DC fast charging port. C Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the DC fast charging port.
No》》》 Replace the fast and slow charging cable assembly.	
Yes》》》 Go to step 10.	
Step 10 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.	
Next》》》 Go to step 11.	
Step 11 Diagnosis complete.

	C. Disconnect the high-voltage DC bus plug from the power battery pack to the 2-in-1 power supply assembly. D Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the 2-in-1 power assembly to the power battery pack. E. Use a multimeter, select the continuity mode, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the power battery pack to the 2-in-1 power assembly.
No》》》 Replace the OBC cable assembly.	
Yes》》》 Go to step 6.	
Step 6 Check the HV harness connector between the electric compressor assembly and the power battery pack.	
	A Check the HV high-voltage wiring harness connector between the electric compressor assembly and the power battery pack for looseness, terminal push-out, corrosion, or poor contact.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 7.	
Step 7 Check the DC bus high-voltage interlock of the electric compressor assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the high-voltage DC bus plug connecting the electric compressor assembly to the power battery pack. C. Disconnect the high-voltage DC bus plug from the power battery pack to the electric compressor assembly. D Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus connector from the electric compressor assembly to the power battery pack. E Use a multimeter, select the continuity setting, and check for continuity between the interlock terminals of the high-voltage DC bus plug from the power battery pack to the electric compressor assembly.
No》》》 Replace the compressor cable assembly.	
Yes》》》 Go to step 8.
