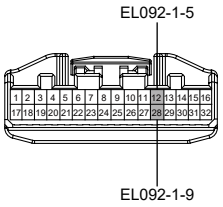
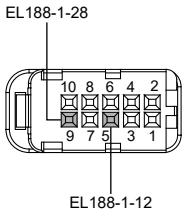
DTC: B130A1C-TBOXMCU

Fault code	Description
B130A1C	Abnormal E-CALL button voltage





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the overhead switch assembly and the telematics host.	
EL188-1 Telematics Main Unit  B10DMTBOX1227045 EL092-1 Overhead Switch Assembly  B10DMTBOX1227046	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector EL092-1 from the overhead console switch assembly. D Using a multimeter set to the resistance range, measure the resistance between terminal 5 of harness connector EL092-1 for the overhead console switch assembly and terminal 12 of harness connector EL188-1 for the telematics control unit to check if the resistance is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 9 of the wire harness connector EL092-1 of the overhead switch assembly and terminal 28 of the wire harness connector EL188-1 of the telematics host to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》

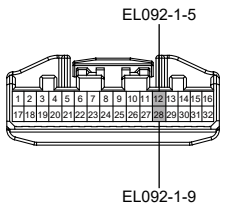
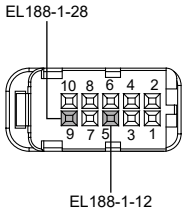
DTC: B130A71-TBOXMCU

Fault code	Description
B130A71	E-CALL button stuck





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the E-CALL button.	
	A Check whether the E-CALL button is damaged or jammed by foreign objects.
Yes》》》 Replace the overhead switch assembly or remove foreign objects, and recheck.	
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the overhead switch assembly and the telematics host.	
EL188-1 Telematics Main Unit  B10DMTBOX1227045 EL092-1 Overhead Switch Assembly  B10DMTBOX1227046	A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes. B Disconnect the wiring harness connector EL188-1 of the telematics main unit. C Disconnect the wiring harness connector EL092-1 from the overhead console switch assembly. D Using a multimeter set to the resistance range, measure the resistance between terminal 5 of harness connector EL092-1 for the overhead console switch assembly and terminal 12 of harness connector EL188-1 for the telematics control unit to check if the resistance is normal. E Use a multimeter set to the resistance range to measure the resistance between terminal 9 of the wire harness connector EL092-1 of the overhead switch assembly and terminal 28 of the wire harness connector EL188-1 of the telematics host to check whether it is normal. Resistance standard value: Less than 1 Ω F Use a multimeter set to the resistance range to check whether the resistance between terminals 12 and 28 of the wiring harness connector EL188-1 of the telematics host and the vehicle body ground is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value. H. Connect the negative terminal of the battery, and power on the vehicle. I Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 12 and 28 of the wiring harness connector EL188-1 of the telematics host and the body ground is normal. Voltage standard value: 0V

© 2026, All rights reserved

	J Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

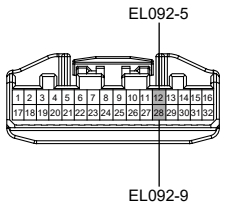
DTC: B130A11-TBOXMCU

Fault code	Description
B130A11	E-CALL button short to ground

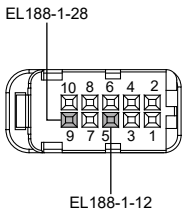
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the overhead switch assembly and the telematics host.

EL188-1 Telematics Main Unit

B10DMTBOX1227039

EL092 Overhead Switch Assembly

B10DMTBOX1227040

A Power off the vehicle, disconnect the negative battery ter minal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the t elematics main unit.
C Disconnect the wiring harness connector EL092 of the ov erhead switch assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the wire harness con nector EL092 of the overhead console switch assembly and terminal 12 of the wire harness connector EL188-1 of the te lematics host to check whether the resistance value is norm al.
E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 9 of the harness connector EL092 of the overhead switch assembly and term inal 28 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter set to the resistance range to check whe ther the resistance between terminals 12 and 28 of the wiri ng harness connector EL188-1 of the telematics host and th e vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the overhead console switch assembly.

A Replace the overhead console switch assembly.
B After replacing the overhead switch assembly, is the fault cleared?

Yes》》》 System normal.
No》》》 Go to step 4.
Step 4 Replace the telematics host.

© 2026, All rights reserved

	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

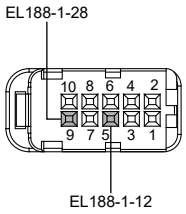
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the overhead switch assembly and the telematics host.

EL188-1 Telematics Main Unit

B10DMTBOX1227039

EL092 Overhead Switch Assembly

B10DMTBOX1227040

A Power off the vehicle, disconnect the negative battery terminal, and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL188-1 of the telematics main unit.
C Disconnect the wiring harness connector EL092 of the overhead switch assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the wire harness connector EL092 of the overhead console switch assembly and terminal 12 of the wire harness connector EL188-1 of the telematics host to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 9 of the harness connector EL092 of the overhead switch assembly and terminal 28 of the harness connector EL188-1 of the telematics host is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 12 and 28 of the wiring harness connector EL188-1 of the telematics host and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the overhead console switch assembly.

A Replace the overhead console switch assembly.
B After replacing the overhead switch assembly, is the fault cleared?

Yes》》》 System normal.

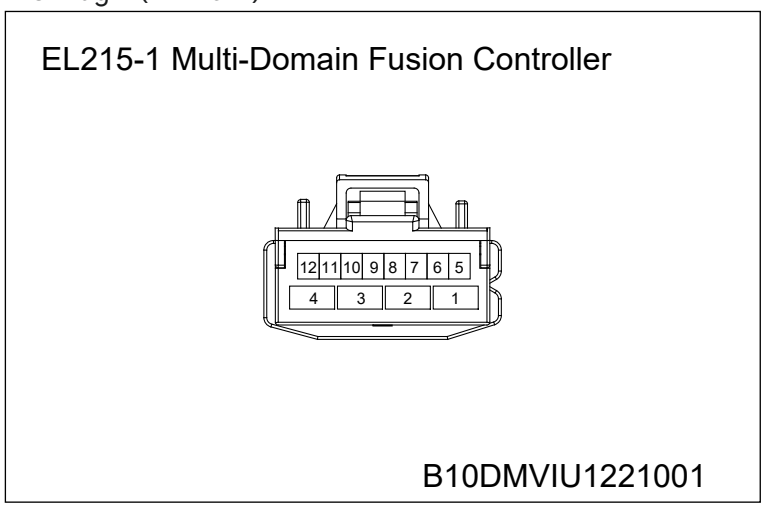
DIAGNOSTIC INSTRUCTIONS-VIU

Fault codes can be read via the vehicle's OBD diagnostic connector using a diagnostic tool. By utilizing the VIU data list and reading the data list displayed on the diagnostic tool, switch and sensor values can be read without disassembling any components. Reading the data list is the first step in troubleshooting and one of the ways to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-VIU

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DIAGNOSTIC TROUBLE CODE LIST-VIU

DTC	DTC Definition	Description of possible fault causes	Repair Recommendations
B120043	External storage electronic device specific area fault	HPC internal component damage	Replace the BCM
B120119	ON1-A current exceeds threshold	ON1-A Control Circuit (Wiring Harness and Connectors) Fault	Check the ON1-A control circuit (wiring harness and connectors)
B121611	ON1-A short to ground	ON1-A Control Circuit (Wiring Harness and Connectors) Fault	Check the ON1-A control circuit (wiring harness and connectors)
B120219	ON1-B current exceeds threshold	ON1-B control circuit (wiring harness and connectors) fault	Check the ON1-B control circuit (wiring harness and connectors)
B121711	ON1-B short to ground	ON1-B control circuit (wiring harness and connectors) fault	Check the ON1-B control circuit (wiring harness and connectors)
B120319	ON2-A current exceeds threshold	ON2-A Control Circuit (Wiring Harness and Connectors) Fault	Check the ON2-A control circuit (wiring harness and connectors)
B121811	ON2-A short to ground	ON2-A Control Circuit (Wiring Harness and Connectors) Fault	Check the ON2-A control circuit (wiring harness and connectors)
B120412	ON2-B Short to Power	1. ON2-B relay drive circuit (wiring harness and connectors) fault 2. ON2-B relay damaged	1. Check the ON2-B relay drive circuit (wiring harness and connectors) 2.Check the ON2-B relay
B120512	ON2-C Short to Power	1. ON2-C relay drive circuit (wiring harness and connectors) fault 2.ON2-C relay damaged	1. Check the ON2-C relay drive circuit (wiring harness and connectors) 2.Check the ON2-C relay
B120612	ON3 short to power	1.ON3 relay drive circuit (wiring harness and connector) fault 2.ON3 relay damaged	1. Check the ON3 relay drive circuit (wiring harness and connectors) 2.Check the ON3 relay

DTC: B1A0400-VIU

Fault code	Description
B1A0400	Rear right turn signal lamp Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

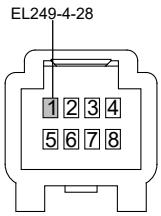
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the right rear combination lamp strip cover.

EL249-4 Main Zone Controller

B10DMVIU1221349

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221350

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector EL062 of the right rear combination lamp light strip trim.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 28 of harness connector EL249-4 of the main zone controller and terminal 1 of harness connector EL062 of the right rear combination lamp strip cover to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 28 of the main zone controller harness connector EL249-4 and the body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H. Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 28 of the harness connector EL249-4 of the main zone controller and the body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear right combination lamp and trim panel.

A Replace the right rear combination lamp cover.
B After replacing the right rear combination lamp strip guard plate, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

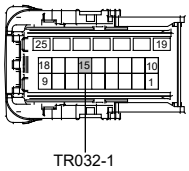
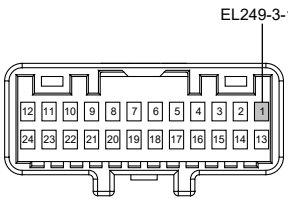
DTC: B1A0211-VIU

Fault code	Description
B1A0211	Right exterior rearview mirror glass vertical adjustment short to grou nd





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221218 TR032 Right Exterior Rearview Mirror Assembly  B10DMVIU1221219	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly. D Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 15 of harness co nnector EL249-3 of the main zone controller and terminal 1 of harness connector TR032 of the right outside rearview m irror assembly is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 15 of the harness connec tor EL249-3 of the main zone controller and the body grou nd to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror glass adjustment motor assembly and the right exterio r rearview mirror assembly.	
	A Check the wiring harness between the mirror adjustment motor assembly and the right exterior mirror assembly for a s hort or open circuit.
	Yes 》 》 》 Repair or replace the wiring harness.
	No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.	
	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B1A0419-VIU

Fault code	Description
B1A0419	Right turn signal overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

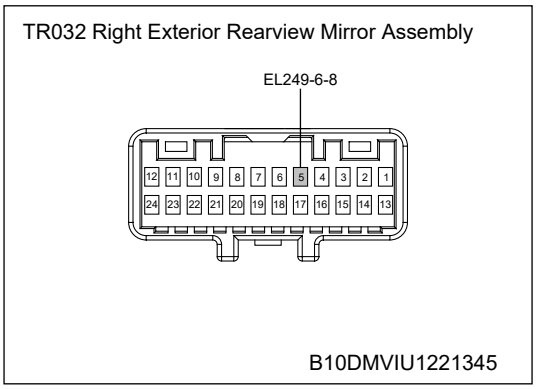
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the right turn signal lamp.

[错误] 翻译失败(已重试 3 次): HTTP 429:
{"error":{"message":"Request rate increased too quickly. To ensure system stability, please adjust your client logic to scale

B10DMVIU1221344

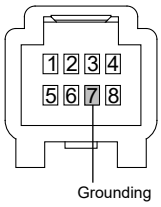
TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221345

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221346

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector EL062 of the right rear combination lamp light strip trim.
D Disconnect the wire harness connector TR032 of the righ t exterior rearview mirror assembly.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 8 of the wire harness c onnector EL249-6 of the main zone controller and terminal 4 of the wire harness connector EL062 of the right rear co mbination lamp strip cover to check whether the resistance value is normal.
F Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of wire harness connec tor EL249-6 of the main zone controller and terminal 5 of w ire harness connector TR032 of the right exterior rearview mirror assembly to check whether the resistance value is no rmal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of the wire harness con nector EL249-6 of the main zone controller and the body g round to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 8 of the main zone controll er harness connector EL249-6 and the body ground to che ck whether it is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard va lue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

© 2026, All rights reserved

Step 3 Check the ground wire harness of the right turn signal lamp.

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221327

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221347

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL062 of the right rear combination lamp trim cover.
C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of the harness conne ctor EL062 for the right rear combination lamp strip cover a nd the body ground to check whether it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of the wiring harness c onnector TR032 of the right exterior rearview mirror assem bly and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the right turn signal lamp assembly and the right exterior rearvie w mirror assembly.

A Check the wiring harness between the right turn signal la mp assembly and the right exterior rearview mirror assembl y for short circuit or open circuit.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the rear right combination lamp with guard or the right turn signal lamp assembly.

A Replace the right rear combination lamp with protective c over or right turn signal lamp assembly.
B. Is the fault cleared after replacing the right rear combina tion lamp trim cover or the right turn signal lamp assembly?

Yes 》》》 System normal.

No 》》》

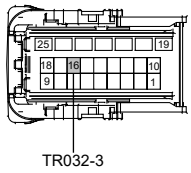
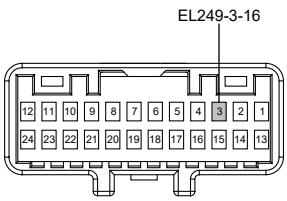
DTC: B1A0111-VIU

Fault code	Description
B1A0111	Right exterior rearview mirror glass horizontal adjustment short to gr ound





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221216 TR032 Right Exterior Rearview Mirror Assembly  B10DMVIU1221217	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of harness connector EL249-3 of the main zone controller and terminal 3 of harn ess connector TR032 of the right outside mirror assembly t o check if the resistance value is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of the harness conn ector EL249-3 of the main zone controller and the body gr ound to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror glass adjustment motor assembly and the right exterio r rearview mirror assembly.	
	A Check the wiring harness between the mirror adjustment motor assembly and the right exterior mirror assembly for a s hort or open circuit.
	Yes 》 》 》 Repair or replace the wiring harness.
	No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.	
	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221327

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221347

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL062 of the right rear combination lamp trim cover.
C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 7 of the harness conne ctor EL062 for the right rear combination lamp strip cover a nd the body ground to check whether it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of the wiring harness c onnector TR032 of the right exterior rearview mirror assem bly and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the right turn signal lamp assembly and the right exterior rearvie w mirror assembly.

A Check the wiring harness between the right turn signal la mp assembly and the right exterior rearview mirror assembl y for short circuit or open circuit.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the rear right combination lamp with guard or the right turn signal lamp assembly.

A Replace the right rear combination lamp with protective c over or right turn signal lamp assembly.
B. Is the fault cleared after replacing the right rear combina tion lamp trim cover or the right turn signal lamp assembly?

Yes 》》》 System normal.

No 》》》
Go to step 6.

Step 6 Replacement of master zone controller

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

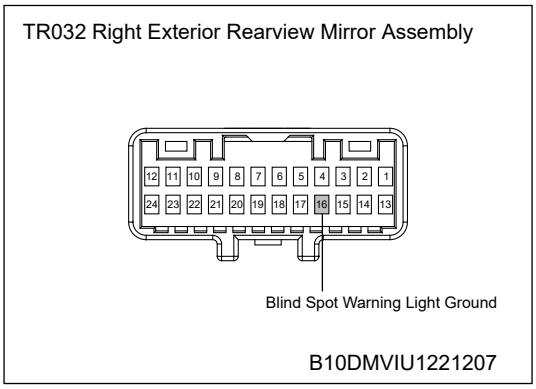
Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.

EL249-5 Main Zone Controller

B10DMVIU1221205

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221206



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 43 of harness connector EL249-5 of the main zone controller and terminal 15 of har ness connector TR032 of the right exterior rearview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 43 of the wire harness co nnector EL249-5 of the main zone controller and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 43 of the main zone contr oller harness connector EL249-5 and the body ground to c heck whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the blind spot warning lamp on the right exterior rearview mirror assembly.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector TR032 of the right exterior rearview mirror assembly. C Use a multimeter, set it to the resistance range, and measure the resistance value between terminal 16 of the wire harness connector TR032 of the right exterior rearview mirror assembly and the body ground to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the wiring harness between the right blind spot indicator assembly and the right exterior rear view mirror assembly.	
	A Check the wiring harness between the right blind spot indicator lamp assembly and the right exterior rearview mirror assembly for short or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 5.	
Step 5 Replace the right blind spot indicator assembly.	
	A Replace the right blind spot indicator lamp assembly. B After replacing the right blind spot indicator lamp assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.

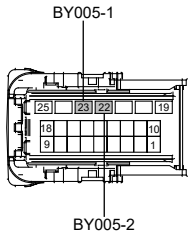
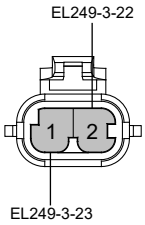
DTC: B1A0713-VIU

Fault code	Description
B1A0713	Rear right window open circuit





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

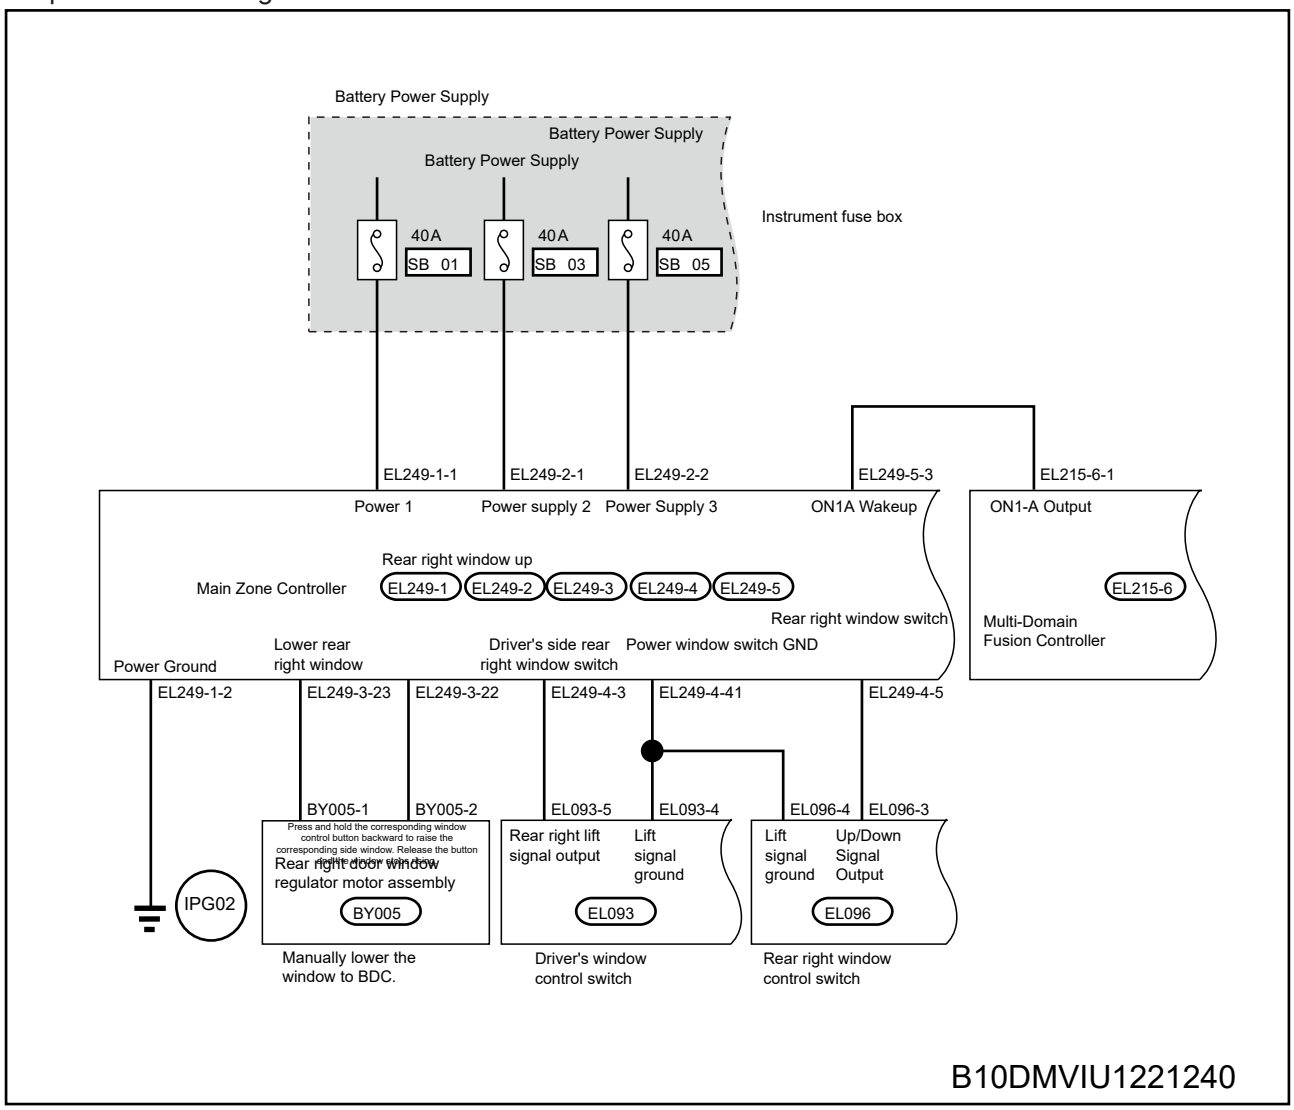
	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the rear right window regulator mot or assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221241 BY005 Right Rear Door Window Regulator Motor Assembly  B10DMVIU1221242	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the harness connector BY005 of the rear right power window regulator motor assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 23 of harness connector EL249-3 of the main zone controller and terminal 1 of harn ess connector BY005 of the right rear door window regulat or motor assembly to check if it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 22 of harness connect or EL249-3 of the main zone controller and terminal 2 of ha rness connector BY005 of the right rear door window regul ator motor assembly to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the right rear door window regulator motor assembly.	
	A Replace the rear right door window regulator motor asse mbly. B After replacing the right rear door window regulator mot or assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

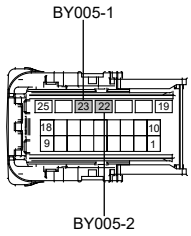
DTC: B1A0712-VIU

Fault code	Description
B1A0712	Rear right window short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

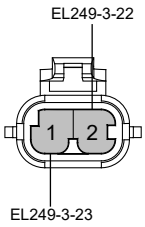
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear right window regulator mot or assembly.

EL249-3 Main Zone Controller

B10DMVIU1221241

BY005 Right Rear Door
Window Regulator Motor Assembly

B10DMVIU1221242

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector BY005 of the rear right power window regulator motor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 23 of harness connector EL249-3 of the main zone controller and terminal 1 of harn ess connector BY005 of the right rear door window regulat or motor assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 22 of harness connect or EL249-3 of the main zone controller and terminal 2 of ha rness connector BY005 of the right rear door window regul ator motor assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 22 and 23 of harness co nnector EL249-3 of the main zone controller and the body ground to check whether the voltage is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the right rear door window regulator motor assembly.

A Replace the rear right door window regulator motor asse mbly.
B After replacing the right rear door window regulator mot or assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

Fault code	Description
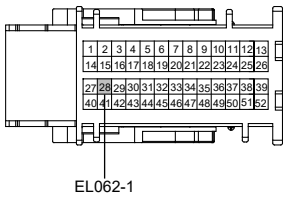
B1A0400	Rear right turn signal lamp Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

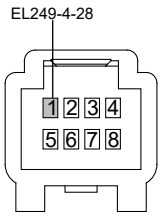
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the right rear combination lamp strip cover.

EL249-4 Main Zone Controller

B10DMVIU1221349

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221350

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector EL062 of the right rear combination lamp light strip trim.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 28 of harness connector EL249-4 of the main zone controller and terminal 1 of harness connector EL062 of the right rear combination lamp strip cover to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter set to the resistance range to check whether the resistance between terminal 28 of the main zone controller harness connector EL249-4 and the body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H. Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 28 of the harness connector EL249-4 of the main zone controller and the body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear right combination lamp and trim panel.

A Replace the right rear combination lamp cover.
B After replacing the right rear combination lamp strip guard plate, is the fault cleared?

Yes》》》 System normal.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221216 TR032 Right Exterior Rearview Mirror Assembly  B10DMVIU1221217	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the wiring harness connector TR032 of the rig ht exterior rearview mirror assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of harness connector EL249-3 of the main zone controller and terminal 3 of harn ess connector TR032 of the right outside mirror assembly t o check if the resistance value is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of the harness conn ector EL249-3 of the main zone controller and the body gr ound to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror glass adjustment motor assembly and the right exterio r rearview mirror assembly.	
	A Check the wiring harness between the mirror adjustment motor assembly and the right exterior mirror assembly for a s hort or open circuit.
	Yes 》 》 》 Repair or replace the wiring harness.
	No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.	
	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1A0612-VIU

Fault code	Description
B1A0612	Right front window shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

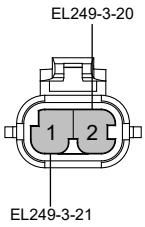
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the right front door window regulator motor assembly.

EL249-3 Main Zone Controller

B10DMVIU1221238

BY003 Right Front Door
Window Regulator Motor Assembly

B10DMVIU1221239

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main zone controller.
C Disconnect the wiring harness connector BY003 of the right front door window regulator motor assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 21 of harness connector EL249-3 of the main zone controller and terminal 1 of harness connector BY003 of the right front door window regulator motor assembly is normal.
E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 20 of the harness connector EL249-3 of the main zone controller and terminal 2 of the harness connector BY003 of the right front door window regulator motor assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 20 and 21 of the harness connector EL249-3 of the main zone controller and the body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front right door window regulator motor assembly.

A Replace the front right door window regulator motor assembly.
B After replacing the front right door window regulator motor assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221220 TR032 Right Exterior Rearview Mirror Assembly  B10DMVIU1221221	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main zone controller. C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL249-3 of the main zone controller and terminal 2 of harness connector TR032 of the right outside rearview mirror assembly is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 13 of the harness connector EL249-3 of the main zone controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror glass adjustment motor assembly and the right exterior rearview mirror assembly.	
	A Check the wiring harness between the mirror adjustment motor assembly and the right exterior mirror assembly for a short or open circuit.
	Yes 》 》 》 Repair or replace the wiring harness.
	No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.	

© 2026, All rights reserved

	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right front door window regulator motor assembly.

EL249-3 Main Zone Controller

B10DMVIU1221238

BY003 Right Front Door
Window Regulator Motor Assembly

B10DMVIU1221239

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main zone controller.
C Disconnect the wiring harness connector BY003 of the right front door window regulator motor assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 21 of harness connector EL249-3 of the main zone controller and terminal 1 of harness connector BY003 of the right front door window regulator motor assembly is normal.
E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 20 of the harness connector EL249-3 of the main zone controller and terminal 2 of the harness connector BY003 of the right front door window regulator motor assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Replace the front right door window regulator motor assembly.

	A Replace the front right door window regulator motor assembly. B After replacing the front right door window regulator motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?

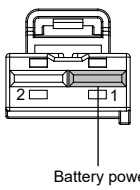
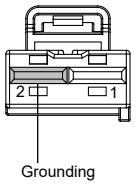
DTC: B1A0F17-VIU

Fault code	Description
B1A0F17	Onboard 12V power supply 1 voltage exceeds threshold



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 1 fuse of the main zone controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the Power 1 fuse SB01 of the main zone controller. Fuse specification: SB01 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 1 wiring harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221230	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main zone controller. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL249-1 of the main zone controller and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221233	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main z one controller. C. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 2 of the harness conn ector EL249-1 of the main zone controller and the body gr ound to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

BY015 Rear left door lock body

B10DMVIU1221246

BY016 Right Rear Door Lock Body

B10DMVIU1221247

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the wiring harness connector BY014 of the rig ht front door lock body.
D Disconnect the harness connector BY015 of the left rear door lock body.
E Disconnect the harness connector BY016 of the right rear door lock body.
F Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 20 of harness con nector EL249-6 of the main zone controller and terminal 3 of harness connector BY014 of the right front door lock bo dy is normal.
G. Use a multimeter set to the resistance range to measure the resistance between terminal 22 of harness connector E L249-6 for the main zone controller and terminal 1 of harne ss connector BY014 for the right front door lock body, and check if the resistance is normal.
H Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 20 of the wire harness connector EL249-6 of the main zone controller and termina l 5 of the wire harness connector BY015 of the left rear doo r lock body to check whether it is normal.
I. Use a multimeter, select the resistance range, and check whether the resistance between terminal 22 of harness con nector EL249-6 of the main zone controller and terminal 7 of harness connector BY015 of the left rear door lock body is normal.
J Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 20 of the main z one controller harness connector EL249-6 and terminal 3 o f the right rear door lock body harness connector BY016 is normal.
K Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 22 of harness connect or EL249-6 of the main zone controller and terminal 1 of ha rness connector BY016 of the right rear door lock body to c heck whether it is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	L Use a multimeter, select the resistance range, and check whether the resistance between terminals 20 and 22 of the harness connector EL249-6 for the main zone controller an d the body ground is normal. Standard resistance value: 10kΩ or higher M Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Replace the right front door lock latch, left rear door lock latch, or right rear door lock latch.	
	A Replace the right front door lock body, left rear door lock body, or right rear door lock body. B After replacing the right front door lock body, left rear do or lock body, or right rear door lock body, is the fault cleare d?
Yes 》》》 System normal.	
No 》》》 Go to step 4.	
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

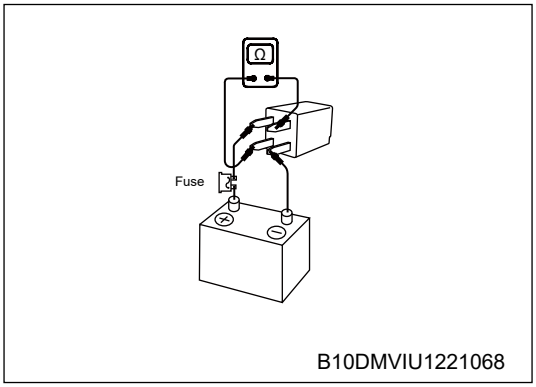
DTC: B1A0A19-VIU

Fault code	Description
B1A0A19	Horn output overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps



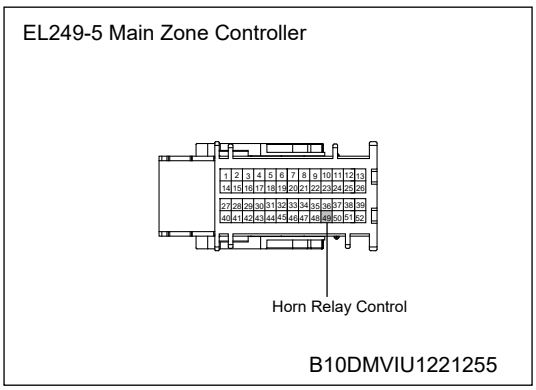
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the horn relay.



A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the horn relay RELY11, connect the positive power supply of th e battery to one side of the coil terminal of the horn relay R ELY11, connect the other side to ground, and check whethe r there is continuity between the two ends of the relay swit ch contacts.

No》》》 Replace the horn relay RELY11.

Yes》》》
Go to step 3.

Step 3 Check the horn relay control circuit.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Remove the horn relay RELY11.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 49 of the main zo ne controller harness connector EL249-5 and socket 85# of the horn relay RELY11 is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 49 of the harness connec tor EL249-5 of the main zone controller and the body grou nd to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 49 of the harness connec tor EL249-5 of the Main Zone Controller and the body grou nd to check whether it is normal.
Voltage standard value: 0V

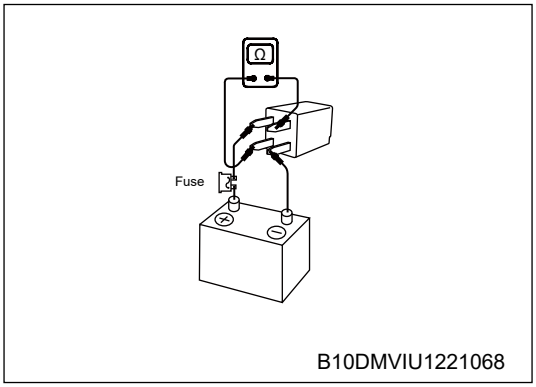
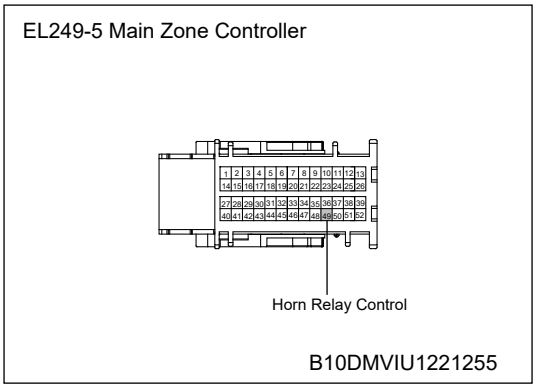
DTC: B1A0C11-VIU

Fault code	Description
B1A0C11	Anti-theft horn output shorted to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the horn relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the horn relay RELY11, connect the positive power supply of th e battery to one side of the coil terminal of the horn relay R ELY11, connect the other side to ground, and check whethe r there is continuity between the two ends of the relay swit ch contacts.
	No 》 》 》 Replace the horn relay RELY11.
	Yes 》 》 》 Go to step 3.
Step 3 Check the horn relay control circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Remove the horn relay RELY11. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 49 of the main zo ne controller harness connector EL249-5 and socket 85# of the horn relay RELY11 is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 49 of the harness connec tor EL249-5 of the main zone controller and the body grou nd to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller.

© 2026, All rights reserved

	B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

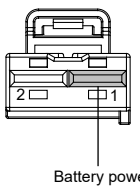
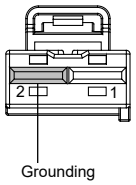
DTC: B1A0F16-VIU

Fault code	Description
B1A0F16	Onboard 12V power supply 1 voltage below threshold



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 1 fuse of the main zone controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the Power 1 fuse SB01 of the main zone controller. Fuse specification: SB01 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 1 wiring harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221230	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main zone controller. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL249-1 of the main zone controller and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221233	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main z one controller. C. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 2 of the harness conn ector EL249-1 of the main zone controller and the body gr ound to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

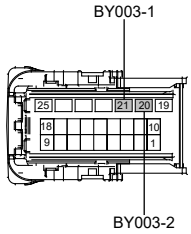
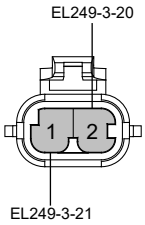
DTC: B1A0611-VIU

Fault code	Description
B1A0611	Front right window short to ground





1. Simplified Circuit Diagram

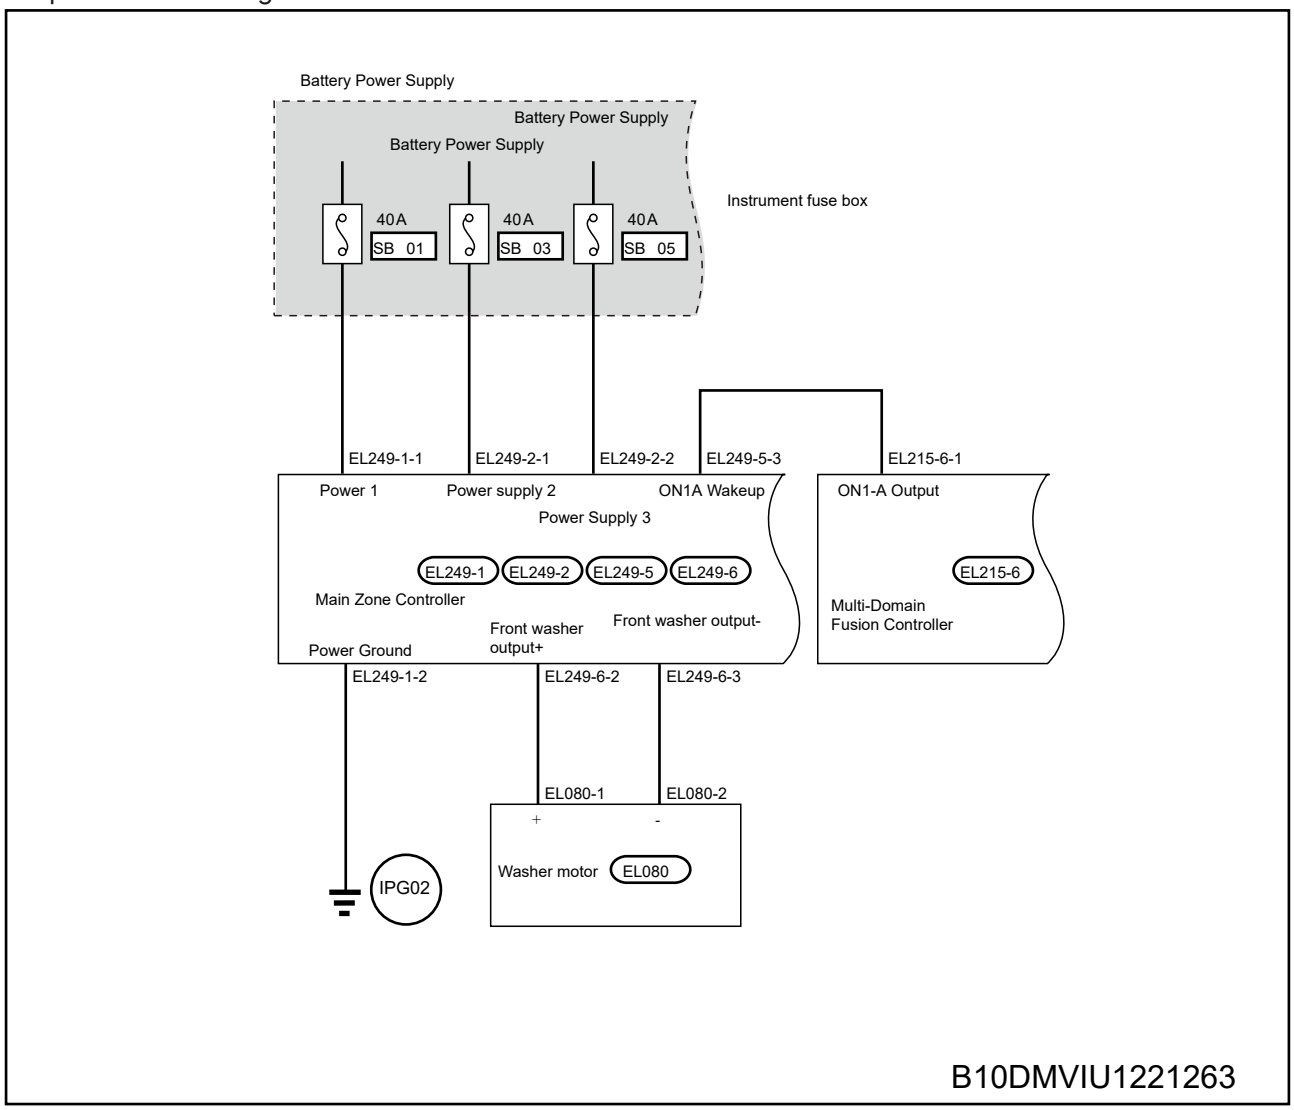
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the right front door window regulator motor assembly.	
EL249-3 Main Zone Controller  B10DMVIU1221238 BY003 Right Front Door Window Regulator Motor Assembly  B10DMVIU1221239	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main zone controller. C Disconnect the wiring harness connector BY003 of the right front door window regulator motor assembly. D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 21 of harness connector EL249-3 of the main zone controller and terminal 1 of harness connector BY003 of the right front door window regulator motor assembly is normal. E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 20 of the harness connector EL249-3 of the main zone controller and terminal 2 of the harness connector BY003 of the right front door window regulator motor assembly is normal. Resistance standard value: Less than 1 Ω F. Use a multimeter, select the resistance range, and measure the resistance between terminals 20 and 21 of the wiring harness connector EL249-3 of the main zone controller and the body ground to check if the resistance value is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front right door window regulator motor assembly.	
	A Replace the front right door window regulator motor assembly. B After replacing the front right door window regulator motor assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.

© 2026, All rights reserved



Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

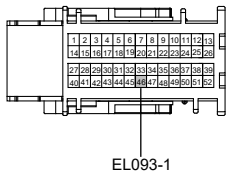
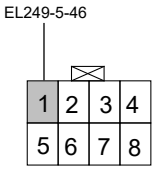
DTC: B1A1011-VIU

Fault code	Description
B1A1011	Backlight short to ground

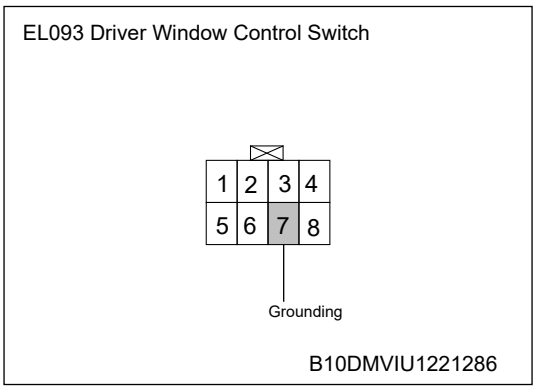
1. Simplified Circuit Diagram





2. Diagnostic Steps

CAUTION



This diagnostic procedure takes the backlight of the driver's window control switch as an example. Refer to this diagnostic procedure for other backlights.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port.

© 2026, All rights reserved

	B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No 》 》 》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the wiring harness between the main zone controller and the driver's window control switch.	
EL249-5 Main Zone Controller  B10DMVIU1221284 EL093 Driver Window Control Switch  B10DMVIU1221285	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Disconnect the harness connector EL093 of the driver's w indow control switch. D Use a multimeter set to the resistance range to measure t he resistance between terminal 46 of harness connector EL 249-5 of the main zone controller and terminal 1 of harness connector EL093 of the driver's window control switch to c heck if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 46 of the harness connec tor EL249-5 of the main zone controller and the vehicle bo dy ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the ground wire harness for the backlight of the driver's window control switch.	

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL093 of the driver's window control switch. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 7 of harness connector EL093 for the driver window control switch and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the driver's window control switch.	
	A Replace the driver's power window control switch. B After replacing the driver's window control switch, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

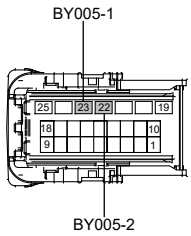
DTC: B1A0719-VIU

Fault code	Description
B1A0719	Rear right window overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

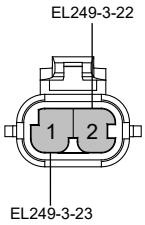
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear right window regulator mot or assembly.

EL249-3 Main Zone Controller

B10DMVIU1221241

BY005 Right Rear Door
Window Regulator Motor Assembly

B10DMVIU1221242

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector BY005 of the rear right power window regulator motor assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 23 of harness connector EL249-3 of the main zone controller and terminal 1 of harn ess connector BY005 of the right rear door window regulat or motor assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 22 of harness connect or EL249-3 of the main zone controller and terminal 2 of ha rness connector BY005 of the right rear door window regul ator motor assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 22 and 23 of the wirin g harness connector EL249-3 of the main zone controller a nd the body ground to check whether the resistance value i s normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 22 and 23 of the wire harn ess connector EL249-3 of the main zone controller and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the right rear door window regulator motor assembly.

© 2026, All rights reserved

	A Replace the rear right door window regulator motor assembly. B After replacing the right rear door window regulator motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

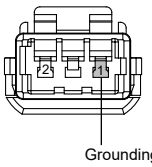
EL067-2

B10DMVIU1221296

EL067 Trunk Light

EL249-6-13

B10DMVIU1221297



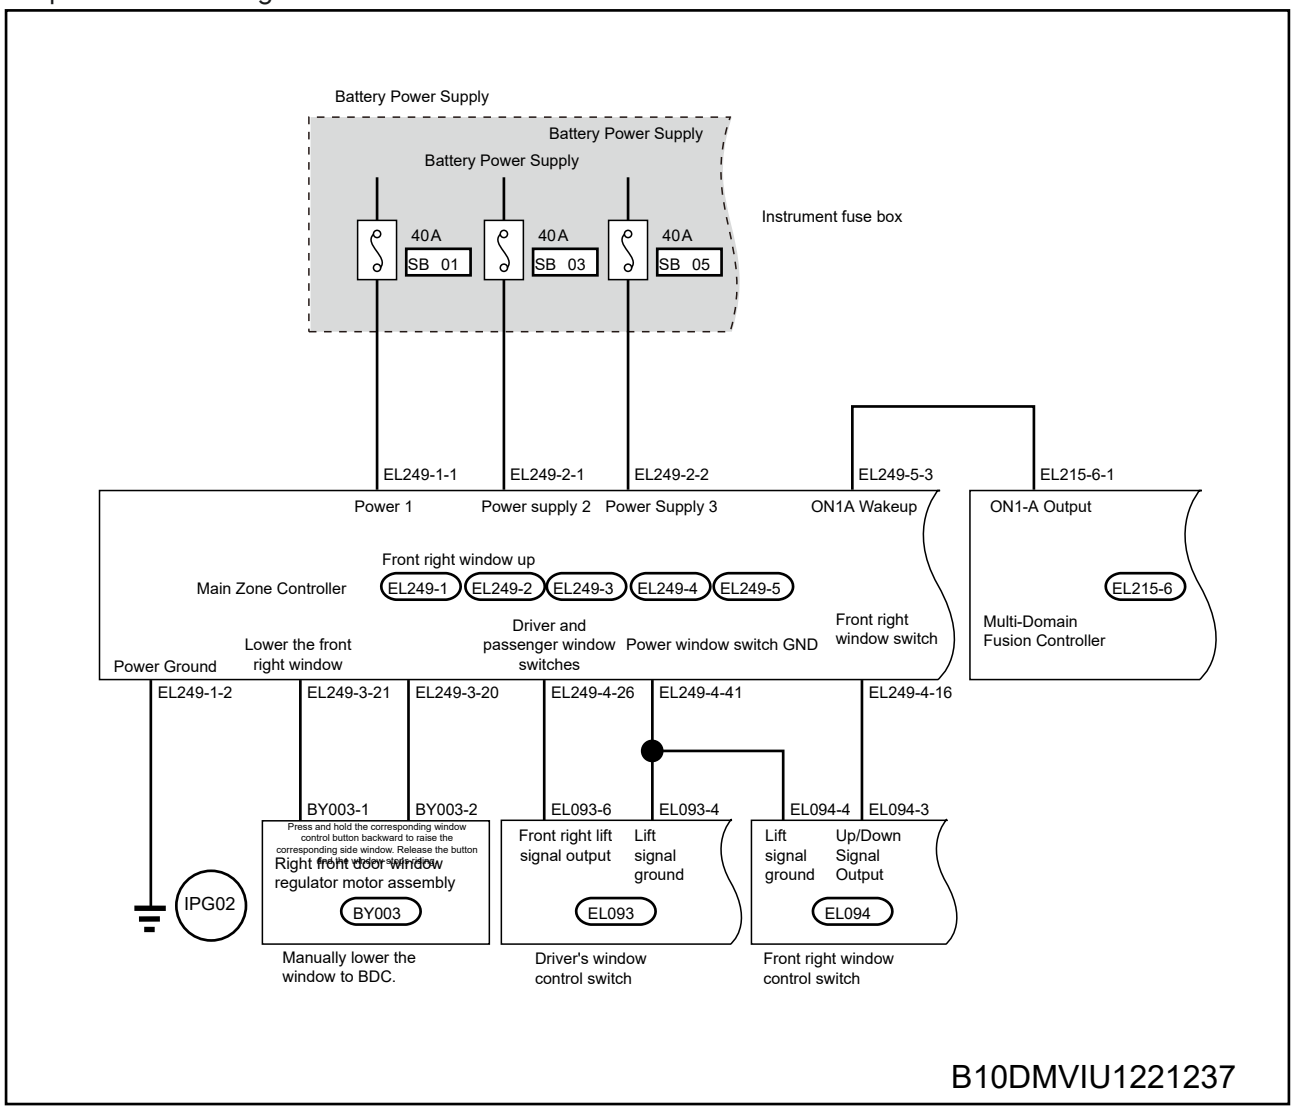
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector EL067 of the luggage c ompartment lamp.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 13 of the wire harness co nnector EL249-6 of the main zone controller and terminal 2 of the wire harness connector EL067 of the luggage compar tment lamp to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 13 of the harness connector EL249-6 of the main zone controller and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 13 of harness connector EL249-6 of the main zone controller and the vehicle body g round to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the luggage compartment lamp.

© 2026, All rights reserved



EL067 Trunk Light  B10DMVIU1221298	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL067 of the luggage compartment lamp. C Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL067 for the luggage compartment lamp and the vehicle body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the trunk light.	
	A Replace the luggage compartment lamp. B After replacing the luggage compartment lamp, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B1A1654-VIU

Fault code	Description
B1A1654	Front right window not learned

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Relearn the front right window.	
	A Relearn the front right power window. B After relearning the front right window, check whether th e fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the master window control switch, the right front individual door window control switch, and the master zone controller.	
	A Check whether the wiring harness between the driver's w indow control switch, the right front individual door windo w control switch, and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the wiring harness between the front right door window regulator motor assembly and the m ain zone controller.	
	A Check whether the harness between the front right door glass lifter motor assembly and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the driver's window control switch or the right front door window control switch.	
	A Replace the driver's door window control switch or the ri ght front door window control switch, and relearn the right front window B Replace the driver's window control switch or the right fr ont door window control switch, and relearn the right front window. Is the fault resolved?
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replace the front right door window regulator motor assembly.	
	A Replace the front right door window regulator motor assembly, and relearn the front right window. B After replacing the right front door window regulator motor assembly and relearning the right front window, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 7.	
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

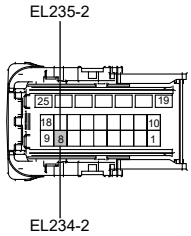
DTC: B1C1411-VIU

Fault code	Description
B1C1411	Rear fog lamp short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

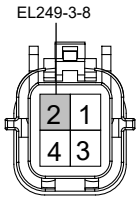
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

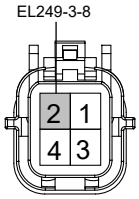
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear fog lamp.

EL249-3 Main Zone Controller



B10DMVIU1221304

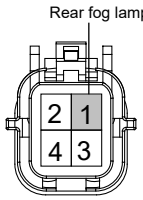
EL234 Rear left fog lamp retroreflector assembly

B10DMVIU1221305

EL235 Rear Right Fog Lamp Reflector Assembly

B10DMVIU1221287

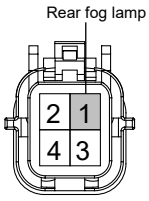
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the wiring harness connector EL234 of the lef t rear fog lamp assembly.
D Disconnect the right rear fog lamp assembly wiring harne ss connector EL235.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 8 of harness conn ector EL249-3 of the main zone controller and terminal 2 of harness connector EL234 of the left rear fog lamp assembl y is normal.
F. Use a multimeter set to the resistance range to measure t he resistance between terminal 8 of harness connector EL2 49-3 of the main zone controller and terminal 2 of harness connector EL235 of the right rear fog lamp reflector assem bly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of the wiring harness c onnector EL249-3 of the main zone controller and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the rear fog lamp.



© 2026, All rights reserved

EL234 Rear left fog lamp retroreflector assembly

B10DMVIU1221306

EL235 Rear Right Fog Lamp Reflector Assembly

B10DMVIU1221288

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL234 of the left rear fog lamp assembly.
C Disconnect the wiring harness connector EL235 of the right rear fog lamp assembly.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 1 of harness connector EL234 of the left rear fog lamp reflector assembly and body ground to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 1 of the wire harness connector EL235 for the right rear fog lamp assembly and the body ground is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left rear fog lamp reflector assembly or the right rear fog lamp reflector assembly.

A Replace the left rear fog lamp reflector assembly or the right rear fog lamp reflector assembly.
B After replacing the left rear fog lamp reflector assembly or right rear fog lamp reflector assembly, is the fault cleared?

Yes 》》》 System normal.

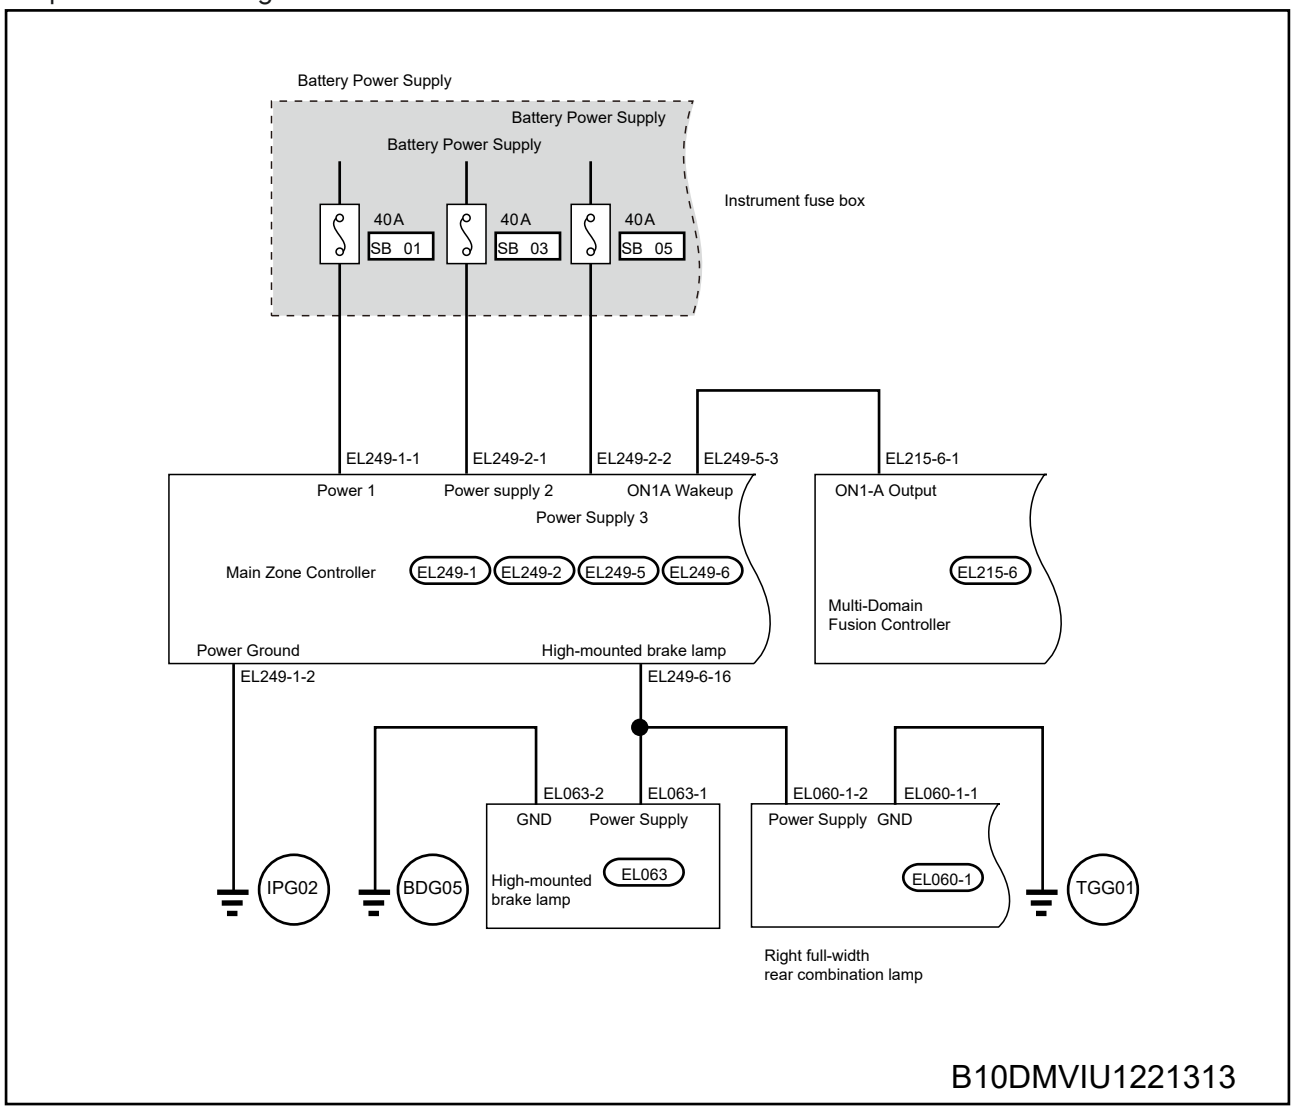
No 》》》
Go to step 5.

Step 5 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 6.



Step 6 Diagnosis complete.

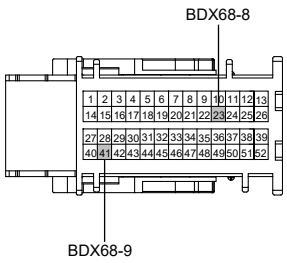
DTC: B1C2500-VIU

Fault code	Description
B1C2500	Abnormal NTC resistance at the positive terminal of the DC fast charg ing port

1. Simplified Circuit Diagram

2. Diagnostic Steps

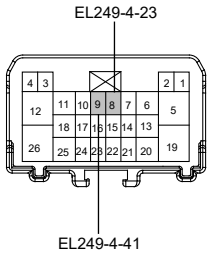
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wire harness between the fast and slow charging harness connection and the main zone controller.

EL249-4 Main Zone Controller

B10DMVIU1221391

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221392

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector BDX68 connected to the fast and slow charging harness.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of wire harness connector BDX68 mated with the AC/DC charging wire harness and terminal 23 of wire harness connector EL249-4 of the main zone controller to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 9 of the wire harness connector BDX68 mated with the fast and slow charging wire harness and terminal 41 of the wire harness connector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter, select the resistance range, and measure the resistance between terminals 23 and 41 of the harness connector EL249-4 of the main zone controller and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 23 and 41 of the wiring harness connector EL249-4 of the main zone controller and the body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

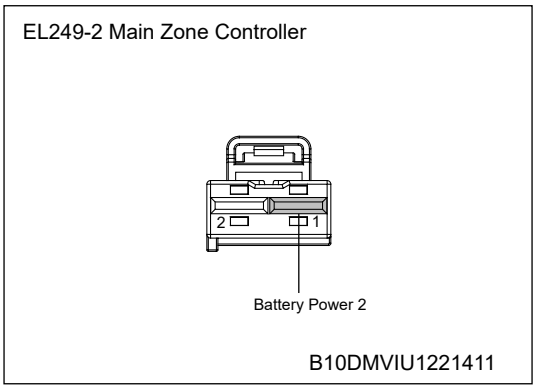
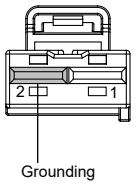
DTC: B1A1017-VIU

Fault code	Description
B1A1017	Onboard 12V power supply 2 voltage exceeds threshold



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 2 fuse of the main zone controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the Power 2 fuse SB03 of the main zone controller. Fuse specification: SB03 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 2 wiring harness of the main zone controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-2 of the main zone controller. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the harness connector EL249-2 of the main zone controller and the body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221233	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main z one controller. C. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 2 of the harness conn ector EL249-1 of the main zone controller and the body gr ound to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

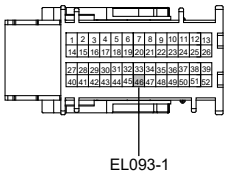
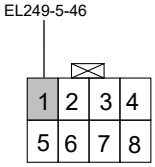
DTC: B1A1019-VIU

Fault code	Description
B1A1019	Backlight overcurrent

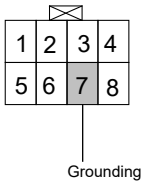
1. Simplified Circuit Diagram





2. Diagnostic Steps

CAUTION



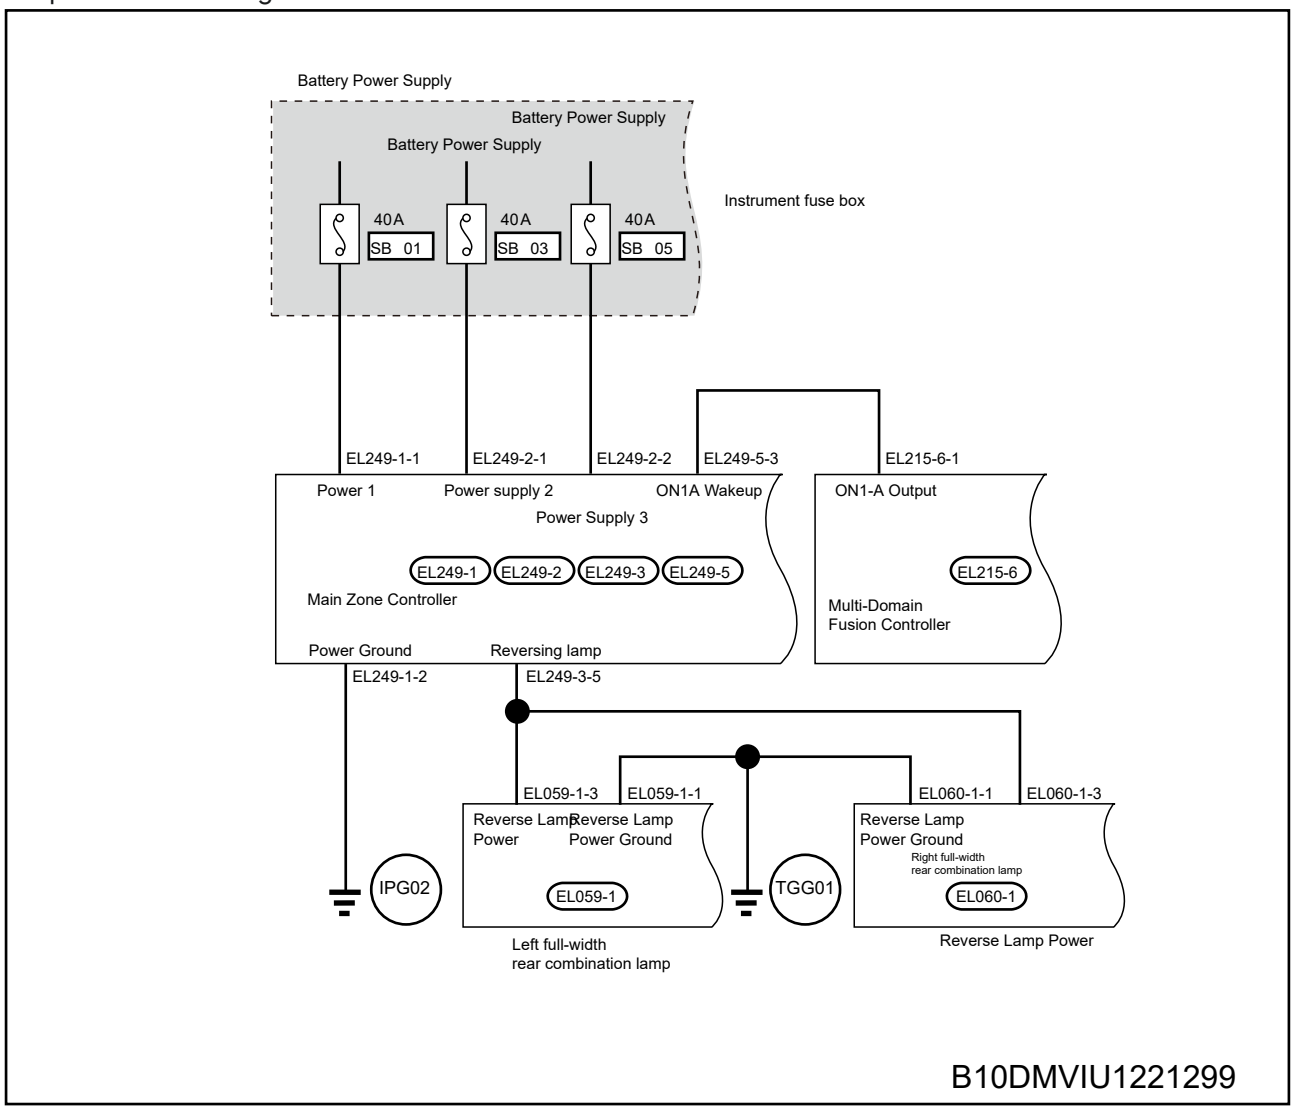
This diagnostic procedure takes the backlight of the driver's window control switch as an example. Refer to this diagnostic procedure for other backlights.

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port.

© 2026, All rights reserved

	B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
No》》》 Trigger cause of the fault code May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the wiring harness between the main zone controller and the driver's window control switch.	
EL249-5 Main Zone Controller  B10DMVIU1221284 EL093 Driver Window Control Switch  B10DMVIU1221285	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Disconnect the harness connector EL093 of the driver's w indow control switch. D Use a multimeter set to the resistance range to measure t he resistance between terminal 46 of harness connector EL 249-5 of the main zone controller and terminal 1 of harness connector EL093 of the driver's window control switch to c heck if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 46 of the harness connec tor EL249-5 of the main zone controller and the vehicle bo dy ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 46 of harness conne ctor EL249-5 of the Main Zone Controller and the body gro und is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard val ue.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	
Step 3 Check the ground wire harness for the backlight of the driver's window control switch.	

© 2026, All rights reserved



EL093 Driver Window Control Switch  B10DMVIU1221286	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL093 of the driver's window control switch. C Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 7 of harness connector EL093 for the driver window control switch and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the driver's window control switch.	
	A Replace the driver's power window control switch. B After replacing the driver's window control switch, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B1C1501-VIU

Fault code	Description
B1C1501	Reversing lamp shorted to ground or overcurrent

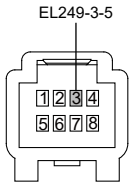
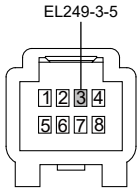
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the reversing lamp.

EL249-3 Main Zone Controller



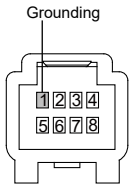
B10DMVIU1221300

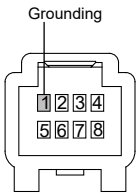
EL059-1 Left full-width rear combination lamp

B10DMVIU1221301

EL060-1 Right full-width rear combination lamp

B10DMVIU1221289





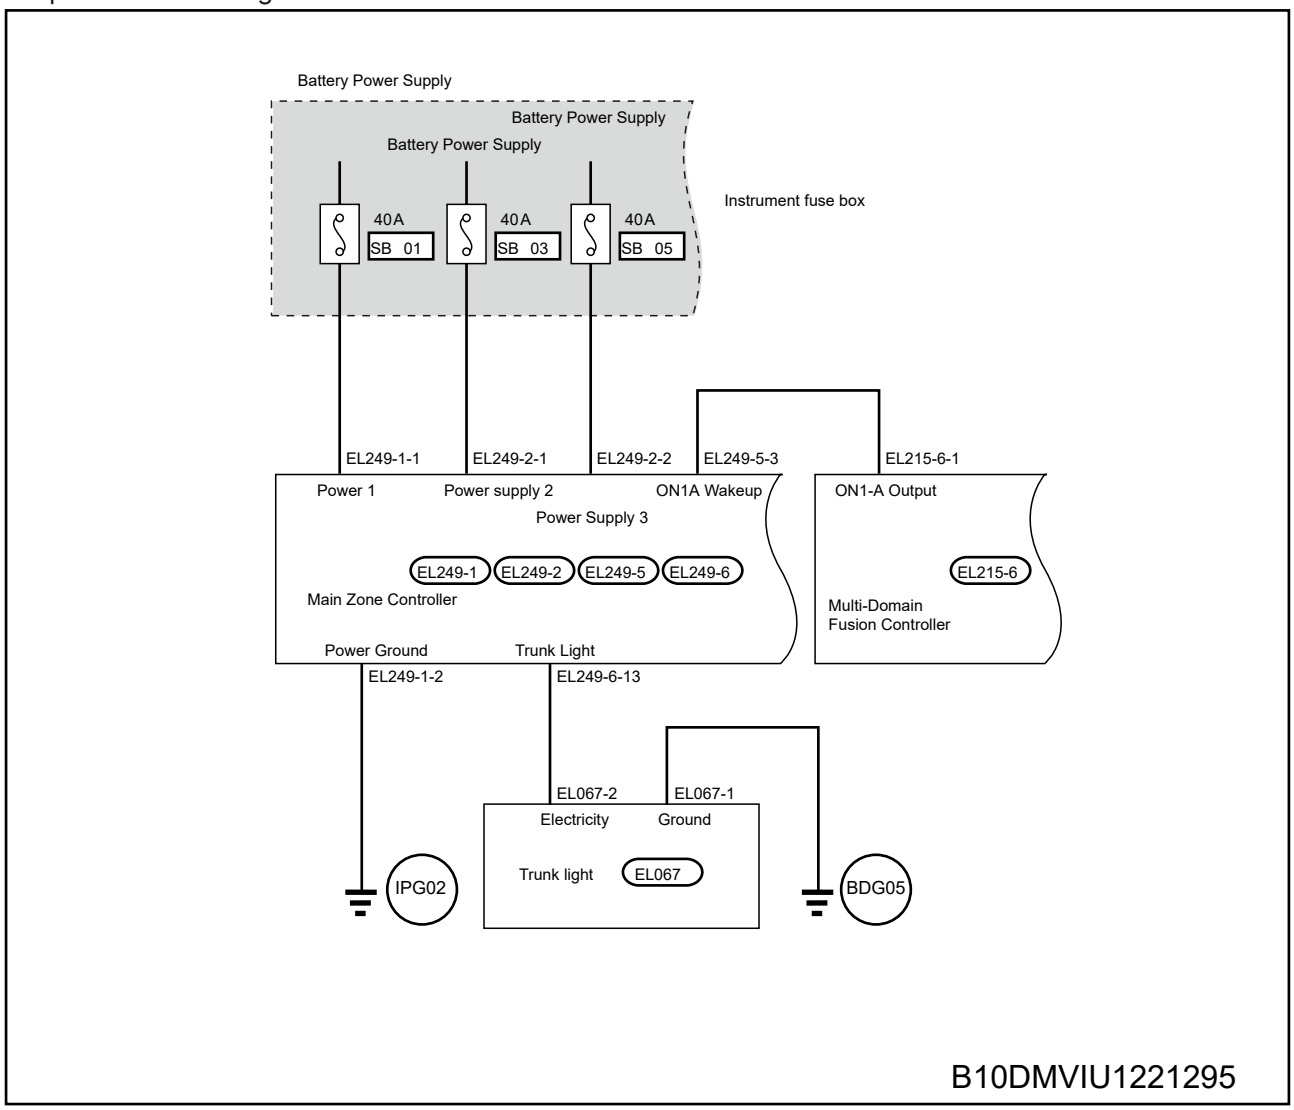
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector EL059-1 of the left full -width rear combination lamp.
D Disconnect the harness connector EL060-1 of the right f ull-width rear combination lamp.
E Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 5 of harness co nnector EL249-3 of the main zone controller and terminal 3 of harness connector EL059-1 of the left full-width rear co mbination lamp is normal.
F Use a multimeter set to the resistance range to measure t he resistance between terminal 5 of the wire harness conne ctor EL249-3 of the main zone controller and terminal 3 of the wire harness connector EL060-1 of the right full-width rear combination lamp to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 5 of the main zone contr oller harness connector EL249-3 and the body ground to c heck if it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the reversing lamp.

© 2026, All rights reserved



EL059-1 Left full-width rear combination lamp  B10DMVIU1221322 EL060-1 Right full-width rear combination lamp  B10DMVIU1221328	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL059-1 of the left full-width rear combination lamp. C Disconnect the wiring harness connector EL060-1 for the right full-width rear combination lamp. D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wiring harness connector EL059-1 for the left full-width rear combination lamp and the vehicle body ground to check whether it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL060-1 for the right through-type rear combination lamp and the vehicle body ground to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the full-width rear combination lamp.	
	A Replace the full-width rear combination lamp. B After replacing the full-width rear combination lamp, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

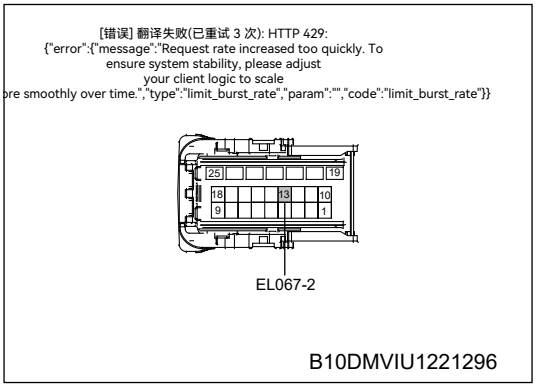
DTC: B1C1B01-VIU

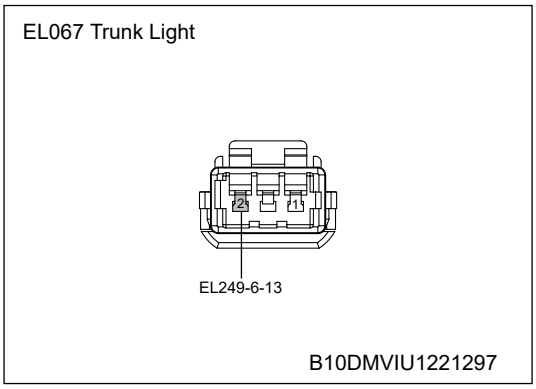
Fault code	Description
B1C1B01	Trunk lamp shorted to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

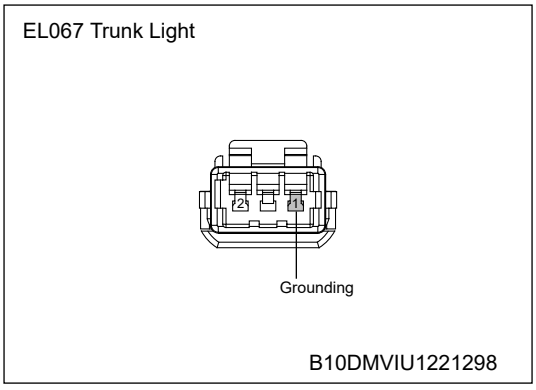


© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the trunk lamp.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector EL067 of the luggage c ompartment lamp.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 13 of the wire harness co nnector EL249-6 of the main zone controller and terminal 2 of the wire harness connector EL067 of the luggage compar tment lamp to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 13 of the harness connector EL249-6 of the main zone controller and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the luggage compartment lamp.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL067 of the luggage c ompartment lamp.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 1 of the wire harness c onnector EL067 for the luggage compartment lamp and th e vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

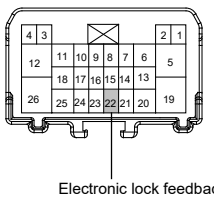
B10DMVIU1221407

EL249-4 Main Zone Controller

B10DMVIU1221408

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221409



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-4 and EL249-6 of the main zone controller.
C Disconnect the harness connector BDX68 connected to the fast and slow charging harness.
D Use a multimeter, set it to the resistance range, and measure whether the resistance value between terminal 17 of the wire harness connector BDX68, which mates with the fast and slow charging wire harness, and terminal 4 of the wire harness connector EL249-6 of the main zone controller is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the wire harness connector BDX68 mating with the fast and slow charging wire harness and terminal 5 of the wire harness connector EL249-6 of the main zone controller to check whether it is normal.
F Use a multimeter, select the resistance range, and check whether the resistance between terminal 21 of the wire harness connector BDX68 connected to the fast and slow charging wire harness and terminal 43 of the wire harness connector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measure the resistance between terminals 16, 17, and 21 of the wire harness connector BDX68 that mates with the fast and slow charging wire harness and the vehicle body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the feedback ground harness of the electronic lock assembly connected to the AC/DC charging harness.

© 2026, All rights reserved

BDX68 Connection to Fast/Slow Charging Harness  Electronic lock feedback ground B10DMVIU1221410	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector BDX68 connected to t he fast and slow charging harness. C. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 22 of the wire harness connector BDX68 mated with the fast and slow cha rging wire harness and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the wiring harness between the fast and slow charging harness connection (fast and slow cha rging cable end) and the electronic lock assembly.	
	A Check whether the wire harness between the fast and slo w charging wire harness connector (fast and slow charging cable end) and the electronic lock assembly is short-circuit ed or open-circuited.
Yes 》》》 Replace the fast and slow charging cable assembly.	
No 》》》 Go to step 5.	
Step 5 Replace the electronic lock assembly.	
	A Replace the electronic lock assembly. B After replacing the electronic lock assembly, is the fault cl eared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.

DTC: B1A1754-VIU

Fault code	Description
B1A1754	Right rear window not learned

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Relearn the rear right window.	
	A Relearn the rear right window. B After relearning the right rear window, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the driver's power window control switch, the right rear door window control switch, and the main zone controller.	
	A Check whether the wiring harness between the driver side window control switch, the right rear door window control switch, and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the wiring harness between the rear right window regulator motor assembly and the main zone controller.	
	A Check whether the wiring harness between the right rear door window regulator motor assembly and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the driver's window control switch or the right rear door window control switch.	
	A Replace the driver's door window control switch or the right rear door window control switch, and relearn the right rear window. B Replace the driver's side window control switch or the rear right single door window control switch, and relearn the rear right window. Is the fault cleared?
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replace the right rear door window regulator motor assembly.	
	A Replace the right rear window regulator motor assembly, and relearn the right rear window. B After replacing the right rear door window regulator mot or assembly and relearning the right rear window, is the fau lt cleared?
Yes》》》 System normal.	
No》》》 Go to step 7.	
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.

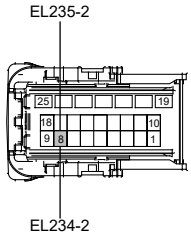
DTC: B1C1419-VIU

Fault code	Description
B1C1419	Rear fog lamp overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

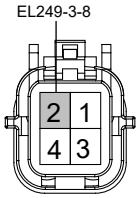
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

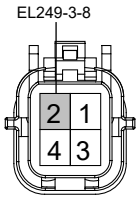
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear fog lamp.

EL249-3 Main Zone Controller



B10DMVIU1221304

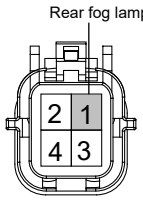
EL234 Rear left fog lamp retroreflector assembly

B10DMVIU1221305

EL235 Rear Right Fog Lamp Reflector Assembly

B10DMVIU1221287

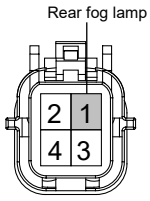
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the wiring harness connector EL234 of the lef t rear fog lamp assembly.
D Disconnect the right rear fog lamp assembly wiring harne ss connector EL235.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 8 of harness conn ector EL249-3 of the main zone controller and terminal 2 of harness connector EL234 of the left rear fog lamp assembl y is normal.
F. Use a multimeter set to the resistance range to measure t he resistance between terminal 8 of harness connector EL2 49-3 of the main zone controller and terminal 2 of harness connector EL235 of the right rear fog lamp reflector assem bly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of the wiring harness c onnector EL249-3 of the main zone controller and the body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 8 of the harness connector EL249-3 of the main zone controller and the body ground t o check whether it is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard va lue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear fog lamp.



© 2026, All rights reserved

EL234 Rear left fog lamp retroreflector assembly

B10DMVIU1221306

EL235 Rear Right Fog Lamp Reflector Assembly

B10DMVIU1221288

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL234 of the left rear fog lamp assembly.
C Disconnect the wiring harness connector EL235 of the right rear fog lamp assembly.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 1 of harness connector EL234 of the left rear fog lamp reflector assembly and body ground to check if the resistance value is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 1 of the wire harness connector EL235 for the right rear fog lamp assembly and the body ground is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the left rear fog lamp reflector assembly or the right rear fog lamp reflector assembly.

A Replace the left rear fog lamp reflector assembly or the right rear fog lamp reflector assembly.
B After replacing the left rear fog lamp reflector assembly or right rear fog lamp reflector assembly, is the fault cleared?

Yes 》》》 System normal.

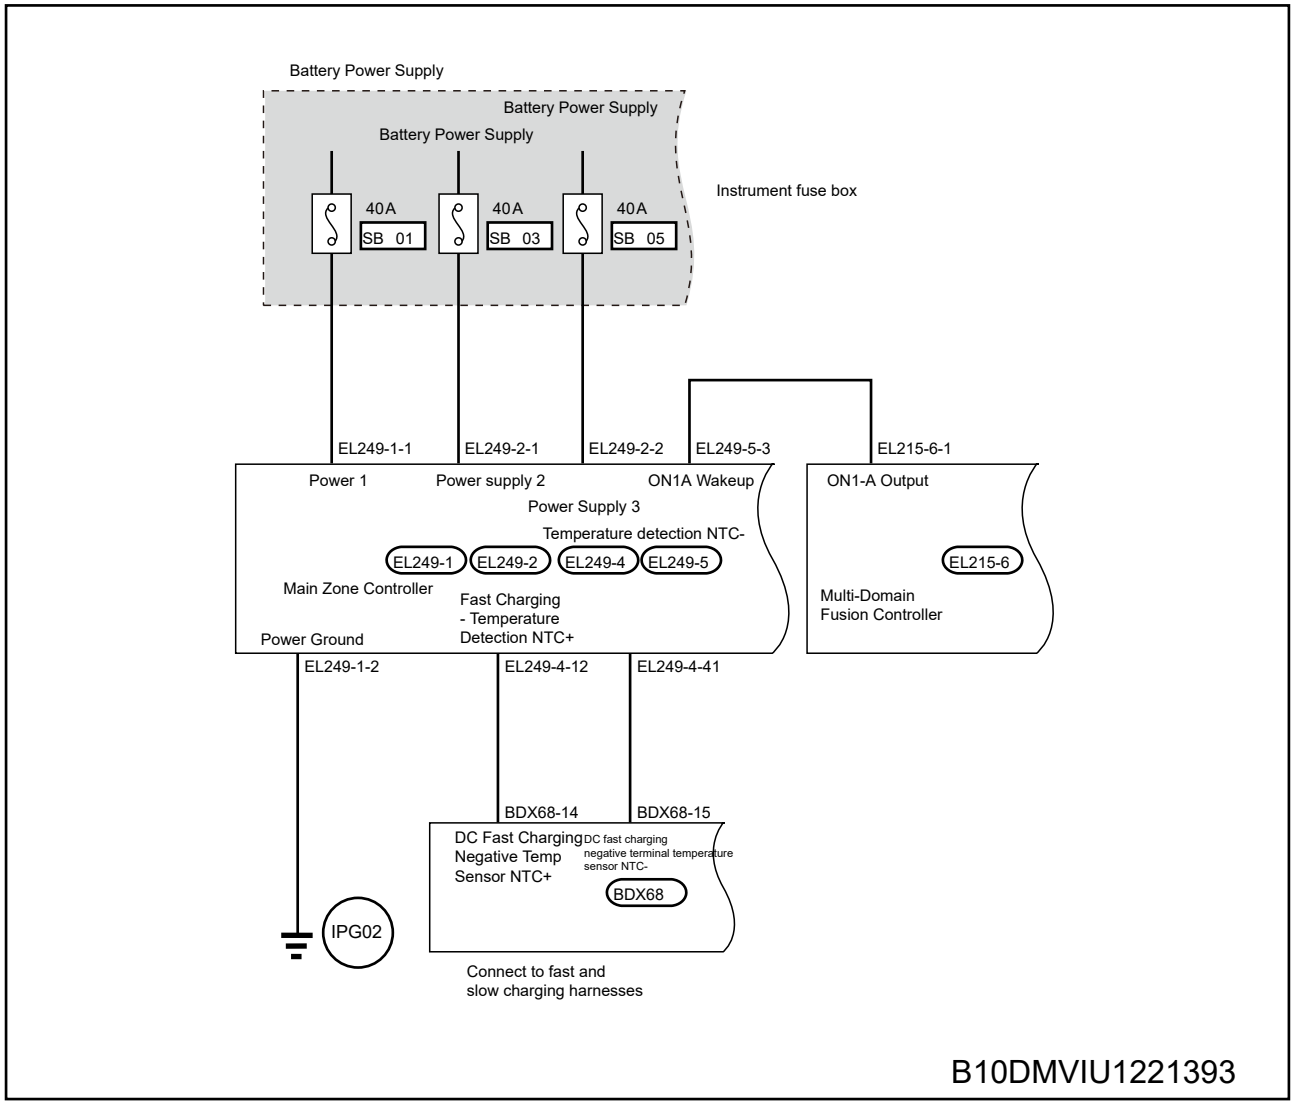
No 》》》
Go to step 5.

Step 5 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 6.



Step 6 Diagnosis complete.

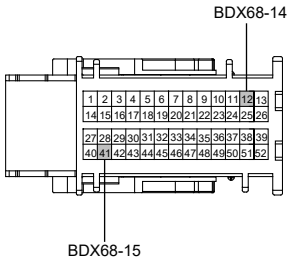
DTC: B1C2600-VIU

Fault code	Description
B1C2600	Abnormal NTC resistance of negative terminal temperature at DC fast charging port

1. Simplified Circuit Diagram

2. Diagnostic Steps

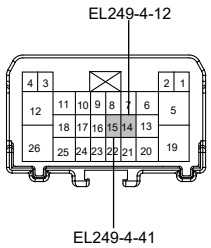
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wire harness between the fast and slow charging harness connection and the main zone controller.

EL249-4 Main Zone Controller

B10DMVIU1221394

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221395

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector BDX68 connected to the fast and slow charging harness.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the wire harness connector BDX68 connected to the fast and slow charging wire harness and terminal 12 of the wire harness connector EL249-4 of the main zone controller to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 15 of the wire harness connector BDX68 connected to the fast and slow charging wire harness and terminal 41 of the wire harness connector EL249-4 of the main zone controller to check whether it is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter set to the resistance range to measure the resistance between terminals 12 and 41 of the main zone controller harness connector EL249-4 and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 12 and 41 of the harness connector EL249-4 of the main zone controller and the body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

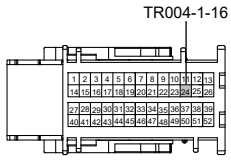
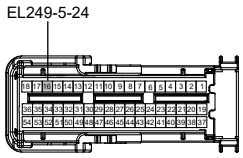
DTC: B1A2600-VIU

Fault code	Description
B1A2600	In the event of a collision





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag control module assembly, and record them. C Check for collision-related faults.
Yes》》》 Prioritize the repair of faults related to the airbag control module assembly.	
	No》》》 Go to step 3.
Step 3 Check the crash signal circuit between the airbag control module assembly and the main zone controller.	
EL249-5 Main Zone Controller  B10DMVIU1221388 TR004-1 Airbag Control Module Assembly  B10DMVIU1221389	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D Using a multimeter, select the resistance range and measure whether the resistance value between terminal 16 of the wire harness connector TR004-1 of the airbag control module assembly and terminal 24 of the wire harness connector EL249-5 of the main zone controller is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
	Yes》》》 Go to step 4.
Step 4 Check the power and ground wire harness of the airbag control module assembly.	
	A Check whether the power and ground wiring harness of the airbag control module assembly is normal.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

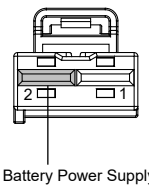
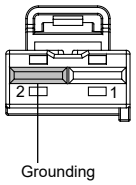
DTC: B1A1116-VIU

Fault code	Description
B1A1116	Onboard 12V Power Supply 3 voltage below threshold



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply 3 fuse of the main zone controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the Power 3 fuse SB05 of the main zone controller. Fuse specification: SB05 40A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 3 harness of the main zone controller.	
EL249-2 Main Zone Controller  Battery Power Supply 3 B10DMVIU1221412	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-2 of the main zone controller. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 of the harness connector EL249-2 of the main zone controller and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ground wire harness of the main zone controller.	
EL249-1 Main Zone Controller  B10DMVIU1221233	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-1 of the main z one controller. C. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 2 of the harness conn ector EL249-1 of the main zone controller and the body gr ound to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

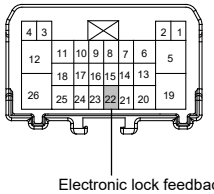
B10DMVIU1221408

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221409

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-4 and EL249-6 of the main zone controller.
C Disconnect the harness connector BDX68 connected to t he fast and slow charging harness.
D Use a multimeter, set it to the resistance range, and meas ure whether the resistance value between terminal 17 of th e wire harness connector BDX68, which mates with the fast and slow charging wire harness, and terminal 4 of the wire harness connector EL249-6 of the main zone controller is n ormal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 16 of the wire harness co nnector BDX68 mating with the fast and slow charging wire harness and terminal 5 of the wire harness connector EL24 9-6 of the main zone controller to check whether it is norm al.
F Use a multimeter, select the resistance range, and check whether the resistance between terminal 21 of the wire har ness connector BDX68 connected to the fast and slow char ging wire harness and terminal 43 of the wire harness conn ector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 16, 17, and 21 of the harness connector BDX68 mated with the fast and slow charging harness and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved

Step 3 Check the feedback ground harness of the electronic lock assembly connected to the AC/DC chargin g harness.

BDX68 Connection to Fast/Slow Charging Harness

Electronic lock feedback ground

B10DMVIU1221410

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BDX68 connected to t he fast and slow charging harness.
C. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 22 of the wire harness connector BDX68 mated with the fast and slow cha rging wire harness and the vehicle body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the wiring harness between the fast and slow charging harness connection (fast and slow cha rging cable end) and the electronic lock assembly.

A Check whether the wire harness between the fast and slo w charging wire harness connector (fast and slow charging cable end) and the electronic lock assembly is short-circuit ed or open-circuited.

Yes》》》 Replace the fast and slow charging cable assembly.

No》》》
Go to step 5.

Step 5 Replace the electronic lock assembly.

A Replace the electronic lock assembly.
B After replacing the electronic lock assembly, is the fault cl eared?

Yes》》》 System normal.

No》》》
Go to step 6.

Step 6 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault elimin ated?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

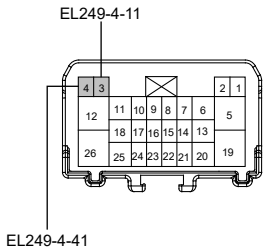
Yes》》》
Go to step 2.



Step 2 Check the wire harness between the fast and slow charging harness connection and the main zone controller.

EL249-4 Main Zone Controller

B10DMVIU1221397

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221398

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector BDX68 connected to the fast and slow charging harness.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 3 of the wire harness connector BDX68 mated with the fast and slow charging wire harness and terminal 11 of the wire harness connector EL249-4 of the main zone controller is normal.
E. Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wire harness connector BDX68 (mating with the fast and slow charging wire harness) and terminal 41 of the wire harness connector EL249-4 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, set it to the resistance range, and measure the resistance between terminals 11 and 41 of the main zone controller harness connector EL249-4 and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, set to the DC voltage range, to measure the voltage between terminals 11 and 41 of the harness connector EL249-4 of the main zone controller and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the fast and slow charging cable assembly.

A Replace the fast and slow charging cable assembly.

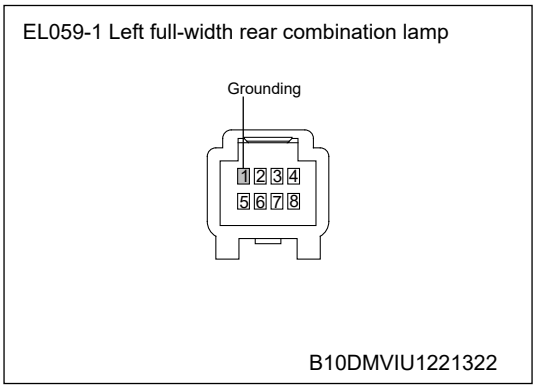
May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the brake lamp.

EL249-3 Main Zone Controller

B10DMVIU1221430

EL059-1 Left full-width rear combination lamp



B10DMVIU1221431

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector EL059-1 of the left full -width rear combination lamp.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of harness connector E L249-3 of the main zone controller and terminal 2 of harne ss connector EL059-1 of the left full-width rear combinatio n lamp to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect or EL249-3 of the main zone controller and the body groun d to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 9 of the harness connect or EL249-3 of the main zone controller and the body groun d to check whether the voltage value is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the ground wire harness of the brake lamp.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL059-1 of the left full-width rear combination lamp. D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the wiring harness connector EL059-1 for the left full-width rear combination lamp and the vehicle body ground to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the full-width rear combination lamp.	
	A Replace the full-width rear combination lamp. B After replacing the full-width rear combination lamp, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

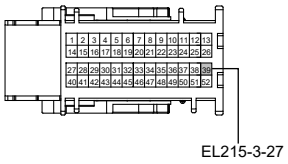
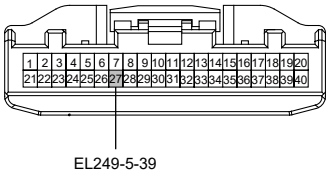
DTC: B1C1711-VIU

Fault code	Description
B1C1711	VIU wake-up output short to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the multi-domain fusion controller.	
EL249-5 Main Zone Controller  B10DMVIU1221373 EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221374	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 39 of the wire harness connector EL249-5 of the main zone controlle r and terminal 27 of the wire harness connector EL215-3 of the multi-domain fusion controller is normal. Resistance standard value: Less than 1 Ω E. Use a multimeter, select the resistance range, and measu re the resistance between terminal 39 of the harness conne ctor EL249-5 of the main zone controller and the body gro und to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.

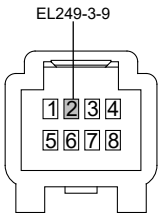
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



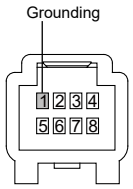
Step 2 Check the wiring harness between the main zone controller and the brake lamp.

EL249-3 Main Zone Controller

B10DMVIU1221430

EL059-1 Left full-width rear combination lamp

B10DMVIU1221431



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector EL059-1 of the left full -width rear combination lamp.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of harness connector E L249-3 of the main zone controller and terminal 2 of harne ss connector EL059-1 of the left full-width rear combinatio n lamp to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect or EL249-3 of the main zone controller and the body groun d to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the brake lamp.

EL059-1 Left full-width rear combination lamp

B10DMVIU1221322

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL059-1 of the left full -width rear combination lamp.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 1 of the wiring harness c onnector EL059-1 for the left full-width rear combination la mp and the vehicle body ground to check whether it is nor mal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

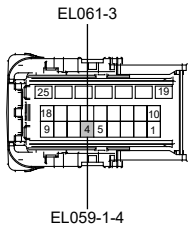
DTC: B1C4F01-VIU

Fault code	Description
B1C4F01	Left rear position lamp power supply short to ground or overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

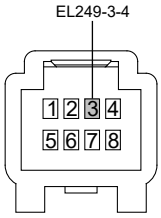
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

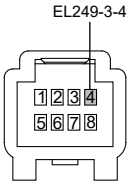
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the left rear position lamp.

EL249-3 Main Zone Controller



B10DMVIU1221318

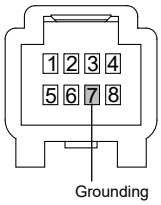
EL061 Left rear combination lamp with protective cover

B10DMVIU1221319

EL059-1 Left full-width rear combination lamp

B10DMVIU1221320

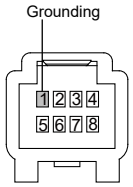
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the wiring harness connector EL061 of the lef t rear combination lamp strip cover.
D Disconnect the wiring harness connector EL059-1 of the l eft full-width rear combination lamp.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of harness connector EL249-3 of the main zone controller and terminal 3 of harn ess connector EL061 of the left rear combination lamp strip guard to check whether the resistance value is normal.
F. Use a multimeter set to the resistance range to check wh ether the resistance between terminal 4 of harness connect or EL249-3 of the main zone controller and terminal 4 of ha rness connector EL059-1 of the left through-type rear com bination lamp is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the main zon e controller harness connector EL249-3 and the body grou nd is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear position lamp.



© 2026, All rights reserved

EL061 Left rear combination lamp with protective cover

B10DMVIU1221321

EL059-1 Left full-width rear combination lamp

B10DMVIU1221322

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL061 of the left rear combination lamp strip cover.
C Disconnect the harness connector EL059-1 of the left full-width rear combination lamp.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 7 of the harness connector EL061 for the left rear combination lamp strip guard plate and the body ground is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of harness connector EL059-1 for the left full-width rear combination lamp and the body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the rear left combination lamp trim or the full-width rear combination lamp.

A Replace the left rear combination lamp with trim or the full-width rear combination lamp.
B After replacing the left rear combination lamp with protective cover or the full-width rear combination lamp, is the fault cleared?

Yes 》》》 System normal.

No 》》》
Go to step 5.

Step 5 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 6.

Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

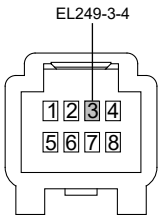
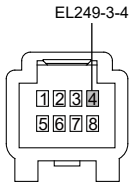
Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the left rear position lamp.

EL249-3 Main Zone Controller



B10DMVIU1221318

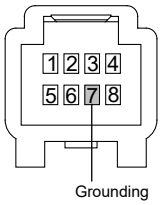
EL061 Left rear combination lamp with protective cover

B10DMVIU1221319

EL059-1 Left full-width rear combination lamp

B10DMVIU1221320

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the wiring harness connector EL061 of the lef t rear combination lamp strip cover.
D Disconnect the wiring harness connector EL059-1 of the l eft full-width rear combination lamp.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 4 of harness connector EL249-3 of the main zone controller and terminal 3 of harn ess connector EL061 of the left rear combination lamp strip guard to check whether the resistance value is normal.
F. Use a multimeter set to the resistance range to check wh ether the resistance between terminal 4 of harness connect or EL249-3 of the main zone controller and terminal 4 of ha rness connector EL059-1 of the left through-type rear com bination lamp is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminal 4 of the wire harne ss connector EL249-3 of the main zone controller and the v ehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear position lamp.

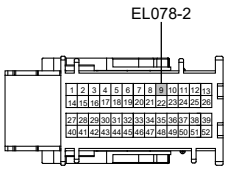
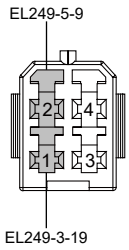
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear wiper motor.

EL249-3 Main Zone Controller



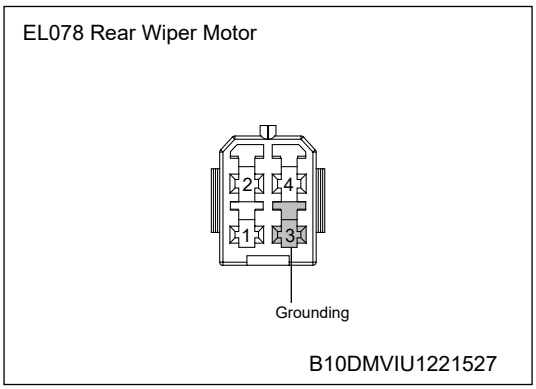
B10DMVIU1221524

EL249-5 Main Zone Controller

B10DMVIU1221525

EL078 Rear Wiper Motor

B10DMVIU1221526



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-3 and EL249-5 of the main zone controller.
C Disconnect the wiring harness connector EL078 of the rear wiper motor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the main zone controller harness connector EL249-5 and terminal 2 of the rear wiper motor harness connector EL078 to check whether it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 19 of the main zone controller harness connector EL249-3 and terminal 1 of the rear wiper motor harness connector EL078 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 1 and 2 of the rear wiper motor wiring harness connector EL078 and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 1 and 2 of the rear wiper motor wire harness connector EL078 and the body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the rear wiper motor.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL078 of the re ar wiper motor. C Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 3 of the rear wiper motor wire harness connector EL078 and the body gr ound is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.

DTC: B1C3154-VIU

Fault code	Description
B1C3154	Rear left tire pressure sensor not learned

1. Simplified Circuit Diagram

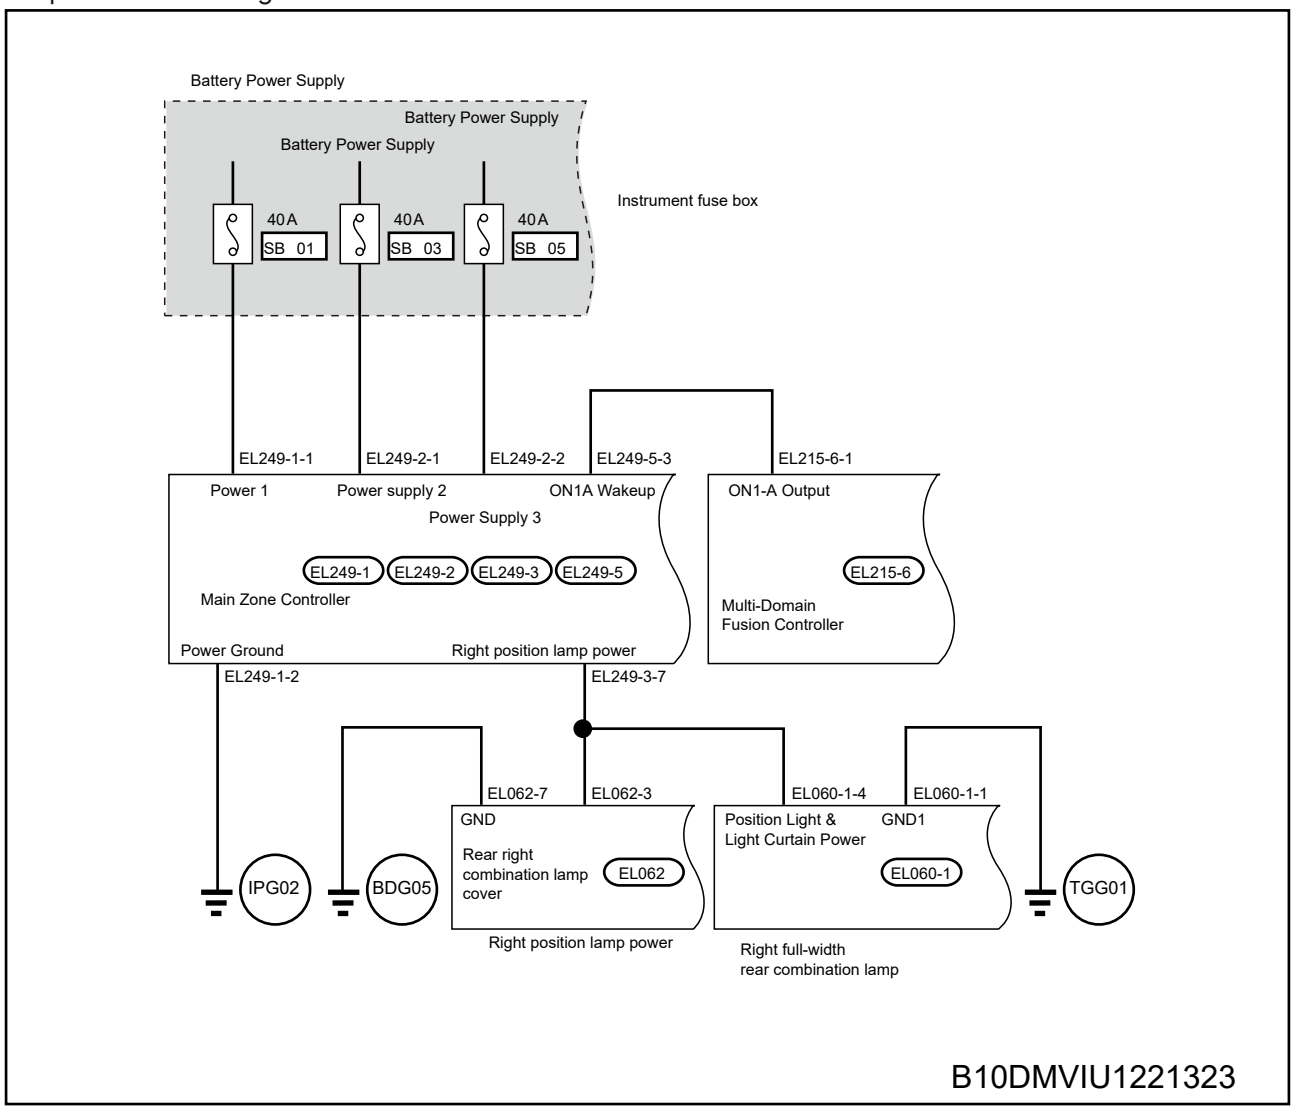
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Relearn the tire pressure sensor.	
	A Adjust the tire pressure to the standard tire pressure. B Connect the diagnostic tool to the OBD port. C Power on the vehicle and follow the prompts on the diagnostic tool to relearn the tire pressure sensors. D Clear fault codes. E Read the fault codes again. F Check whether the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Perform interference troubleshooting for added or modified electrical equipment on the vehicle.	
	A Check whether any electronic devices have been installed in the vehicle. B After removing the electronic device, relearn the tire pressure sensors and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Check the tire pressure sensor.	
	A Remove and unseat the unlearned tire, and check whether the tire pressure sensor is damaged.
	Yes》》》 Replace the tire pressure sensor and relearn.
	No》》》 Go to step 5.
Step 5 Check the power supply and ground of the main zone controller.	
	A Check whether the power supply and grounding of the main zone controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.

© 2026, All rights reserved



Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

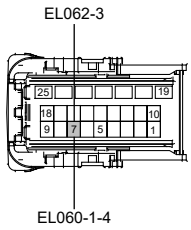
DTC: B1C5013-VIU

Fault code	Description
B1C5013	Rear right position lamp power supply open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

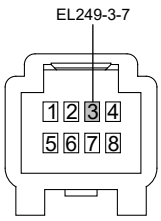
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

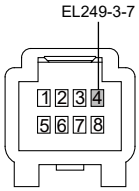
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear right position lamp.

EL249-3 Main Zone Controller



B10DMVIU1221324

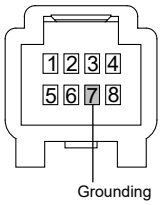
EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221325

EL060-1 Right full-width rear combination lamp

B10DMVIU1221326

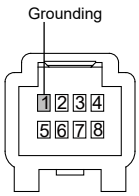
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector EL062 of the right rear combination lamp light strip trim.
D Disconnect the harness connector EL060-1 of the right f ull-width rear combination lamp.
E Use a multimeter set to the resistance range to check wh ether the resistance between terminal 7 of harness connect or EL249-3 of the main zone controller and terminal 3 of ha rness connector EL062 of the right rear combination lamp s trip cover is normal.
F Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 7 of the wire harn ess connector EL249-3 of the main zone controller and ter minal 4 of the wire harness connector EL060-1 of the right through-type rear combination lamp is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear position lamp.



© 2026, All rights reserved

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221327

EL060-1 Right full-width rear combination lamp

B10DMVIU1221328

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL062 of the right rear combination lamp trim cover.
C Disconnect the wiring harness connector EL060-1 for the right full-width rear combination lamp.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of the harness connector EL062 for the right rear combination lamp strip cover and the body ground to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL060-1 for the right through-type rear combination lamp and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the rear right combination lamp light strip cover or the full-width rear combination lamp.

A Replace the right rear combination lamp with protective cover or the full-width rear combination lamp.
B After replacing the right rear combination lamp garnish or the full-width rear combination lamp, is the fault cleared?

Yes 》》》 System normal.

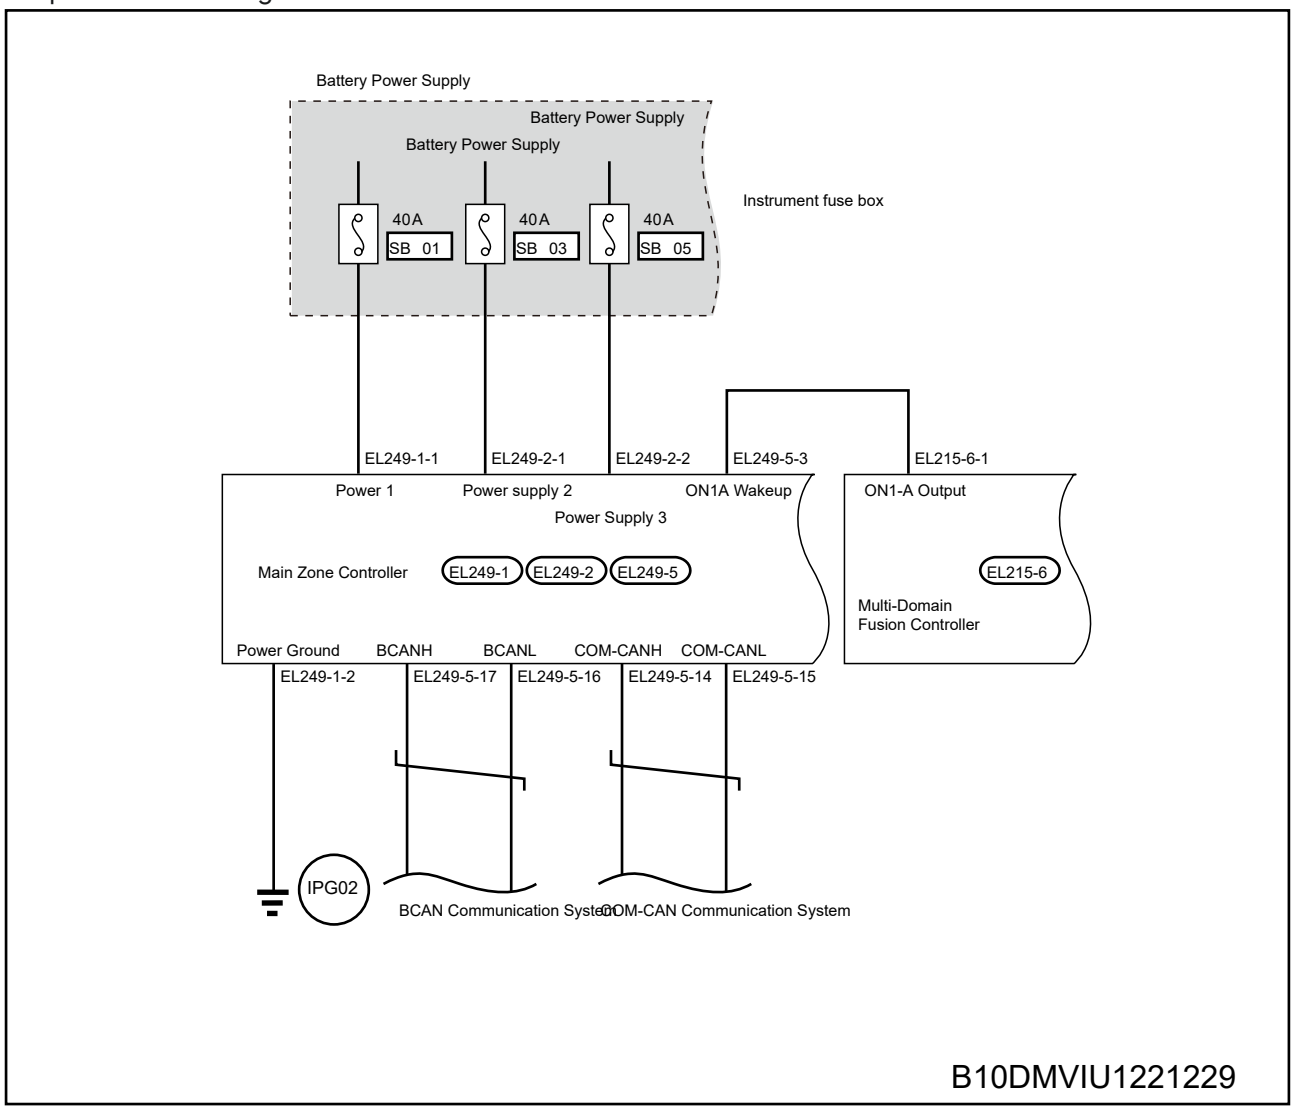
No 》》》
Go to step 5.

Step 5 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 6.



Step 6 Diagnosis complete.

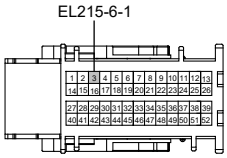
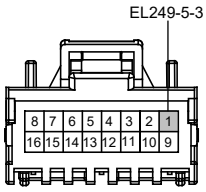
DTC: B1C4600-VIU

Fault code	Description
B1C4600	ON1 Status Inconsistent





1. Simplified Circuit Diagram

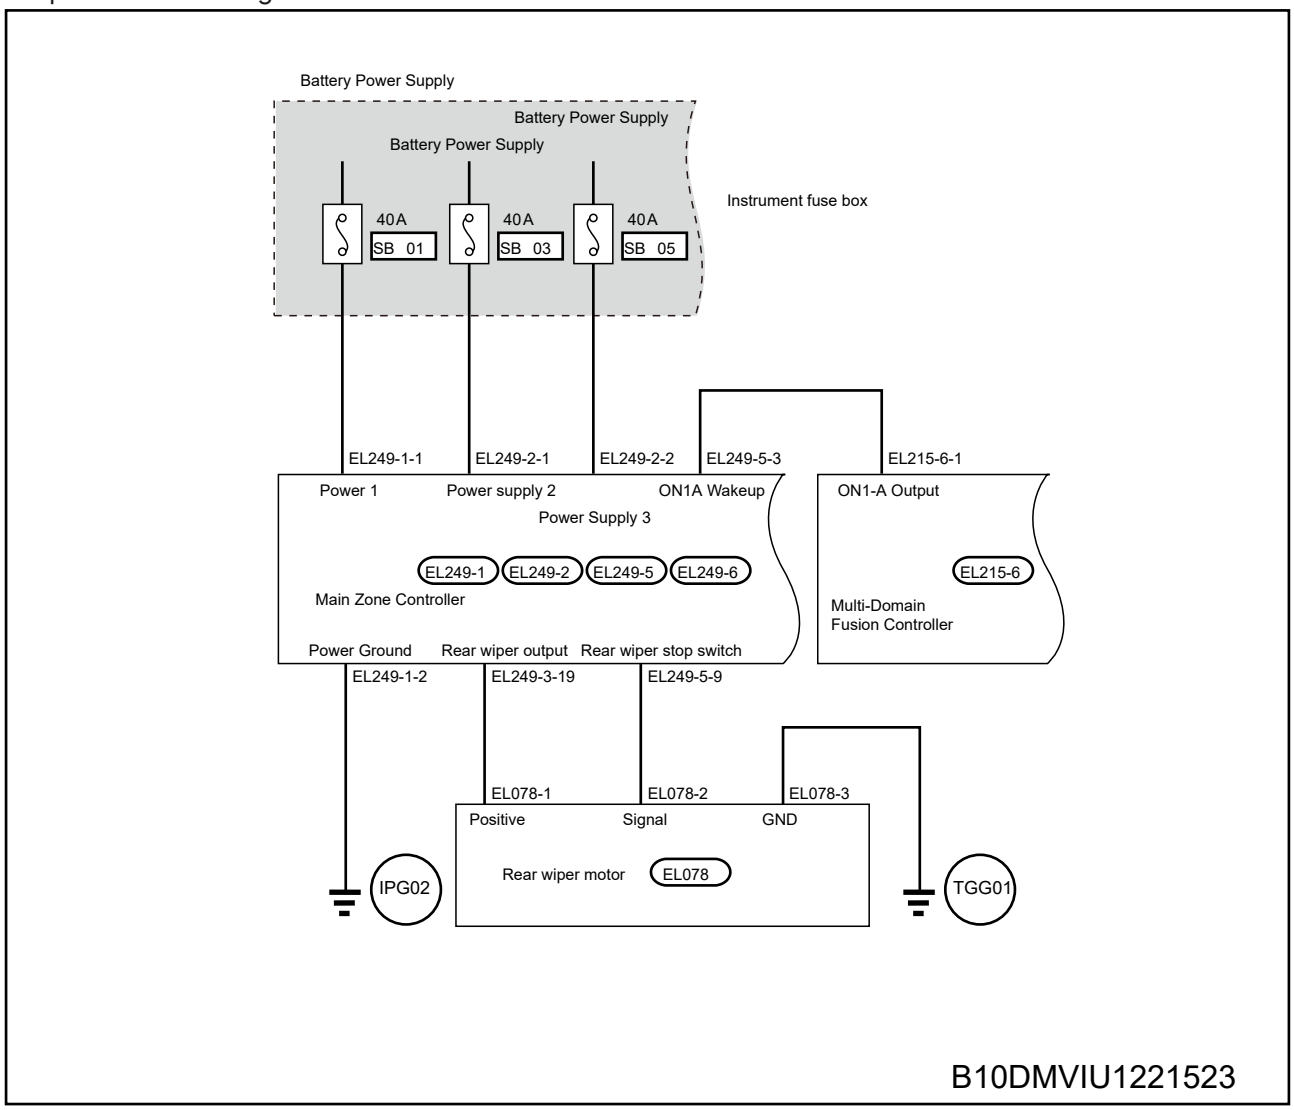
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON1A harness between the multi-domain fusion controller and the main zone controller.	
EL249-5 Main Zone Controller  B10DMVIU1221404 EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221405	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of wire harness connector EL215-6 of the multi-domain fusion controller and terminal 3 of wire harness connector EL249-5 of the main zone controller to check whether it is normal. Resistance standard value: Less than 1 Ω E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector EL249-5 of the main zone controller and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 3 of the harness connector EL249-5 of the main zone controller and the vehicle body ground to check whether it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power supply and ground harness of the multi-domain fusion controller.	
	A Check whether the power supply and ground wiring harness of the multi-domain fusion controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.

© 2026, All rights reserved



Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

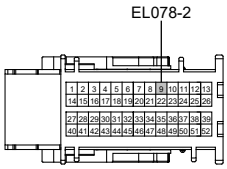
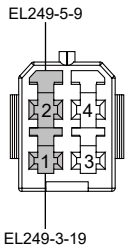
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear wiper motor.

EL249-3 Main Zone Controller



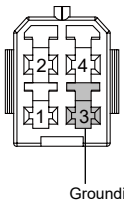
B10DMVIU1221524

EL249-5 Main Zone Controller

B10DMVIU1221525

EL078 Rear Wiper Motor

B10DMVIU1221526



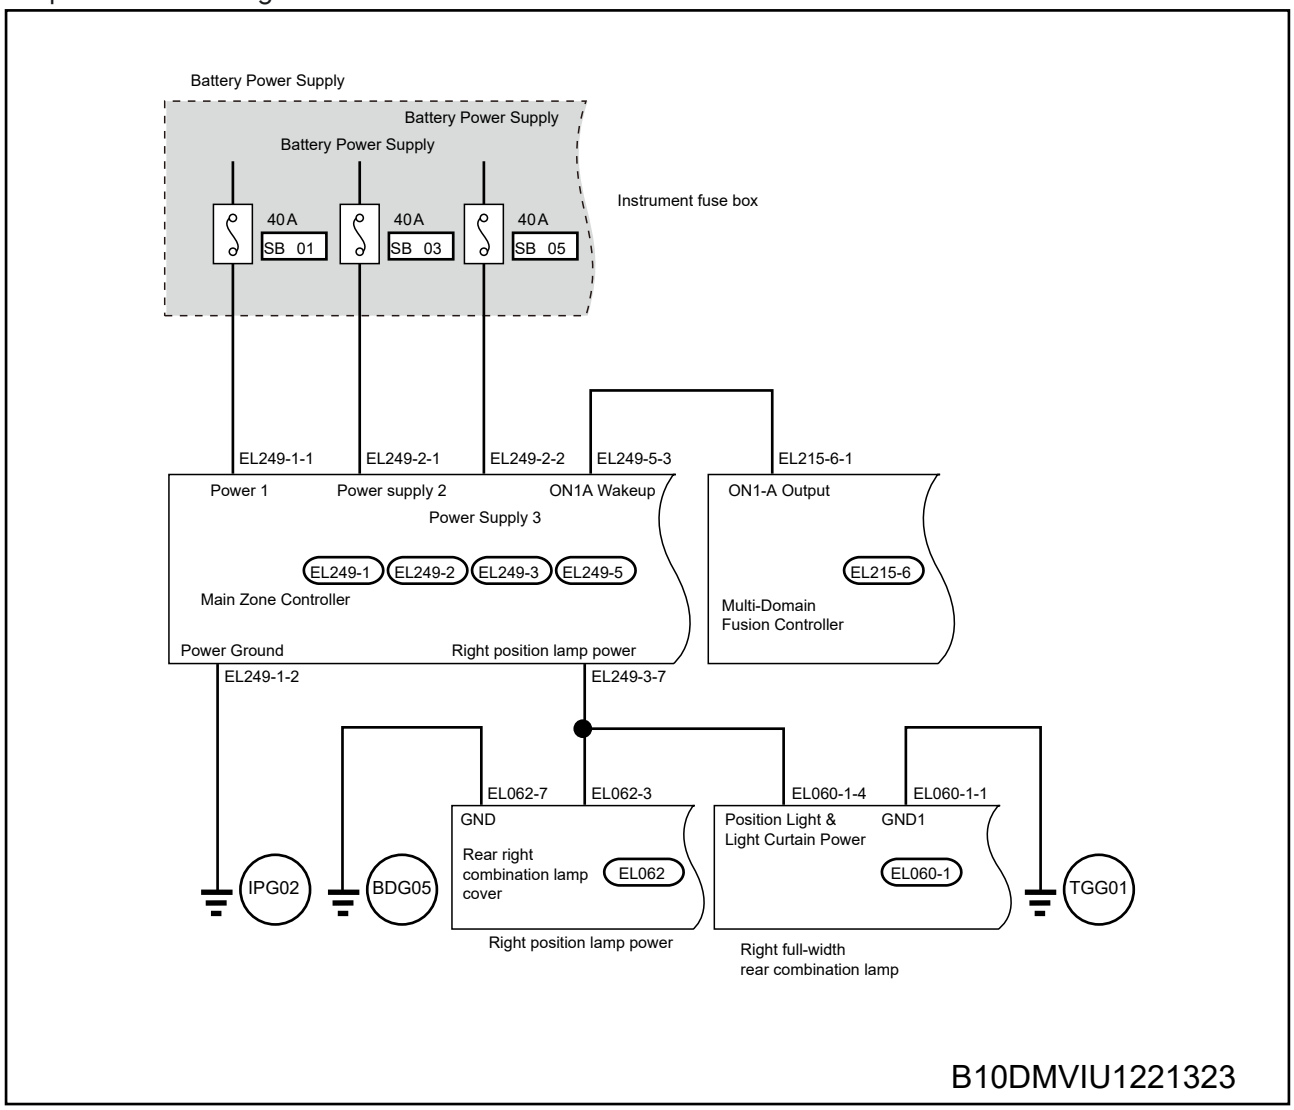
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-3 and EL249-5 of the main zone controller.
C Disconnect the wiring harness connector EL078 of the rear wiper motor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the main zone controller harness connector EL249-5 and terminal 2 of the rear wiper motor harness connector EL078 to check whether it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 19 of the main zone controller harness connector EL249-3 and terminal 1 of the rear wiper motor harness connector EL078 to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 2 of the rear wiper motor wire harness connector EL078 and the body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the rear wiper motor.

© 2026, All rights reserved



EL078 Rear Wiper Motor  B10DMVIU1221527	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL078 of the re ar wiper motor. C Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 3 of the rear wiper motor wire harness connector EL078 and the body gr ound is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the rear wiper motor.	
	A Replace the rear wiper motor. B After replacing the rear wiper motor, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

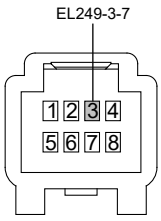
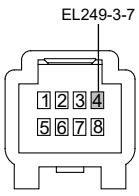
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the rear right position lamp.

EL249-3 Main Zone Controller



B10DMVIU1221324

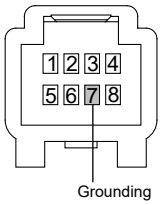
EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221325

EL060-1 Right full-width rear combination lamp

B10DMVIU1221326

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector EL062 of the right rear combination lamp light strip trim.
D Disconnect the harness connector EL060-1 of the right f ull-width rear combination lamp.
E Use a multimeter set to the resistance range to check wh ether the resistance between terminal 7 of harness connect or EL249-3 of the main zone controller and terminal 3 of ha rness connector EL062 of the right rear combination lamp s trip cover is normal.
F Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 7 of the wire harn ess connector EL249-3 of the main zone controller and ter minal 4 of the wire harness connector EL060-1 of the right through-type rear combination lamp is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminal 7 of the harness connector EL249-3 of the main zone controller and the vehicle body g round to check whether it is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the rear position lamp.

EL062 Right Rear Combination Lamp with Cover

B10DMVIU1221327

EL060-1 Right full-width rear combination lamp

B10DMVIU1221328

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL062 of the right rear combination lamp trim cover.
C Disconnect the wiring harness connector EL060-1 for the right full-width rear combination lamp.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of the harness connector EL062 for the right rear combination lamp strip cover and the body ground to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 1 of the wire harness connector EL060-1 for the right through-type rear combination lamp and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Replace the rear right combination lamp light strip cover or the full-width rear combination lamp.

A Replace the right rear combination lamp with protective cover or the full-width rear combination lamp.
B After replacing the right rear combination lamp garnish or the full-width rear combination lamp, is the fault cleared?

Yes 》》》 System normal.

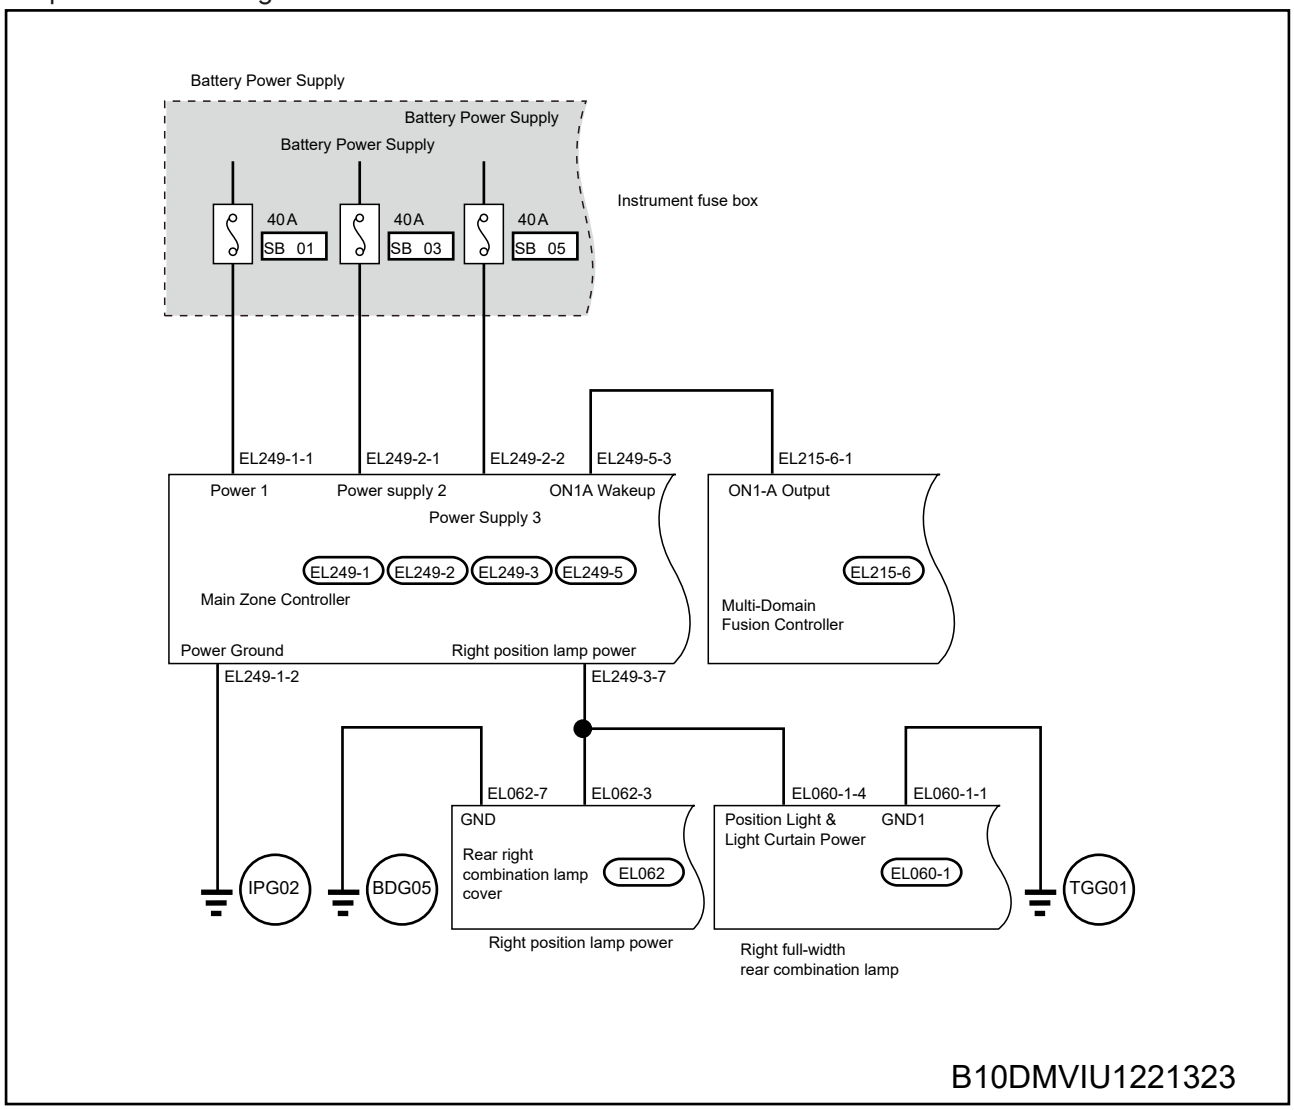
No 》》》
Go to step 5.

Step 5 Replacement of master zone controller

A Replace the main zone controller.
B After replacing the main zone controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 6.



Step 6 Diagnosis complete.

DTC: B1C4A00-VIU

Fault code	Description
B1C4A00	TDA5235 Chip Initialization Failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Cycle the power.	
	A Cycle the power and check whether the fault is cleared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the power supply and ground of the main zone controller.	
	A Check whether the power supply and grounding of the m ain zone controller are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B110919-VIU

Fault code	Description
B110919	Left headlamp leveling motor high-side switch current exceeds thres hold

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left f ront combination lamp are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the faul t cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

DTC: B111614-VIU

Fault code	Description
B111614	Left headlamp daytime running lamp B drive output short to ground/ open

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》》》 Inspect the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

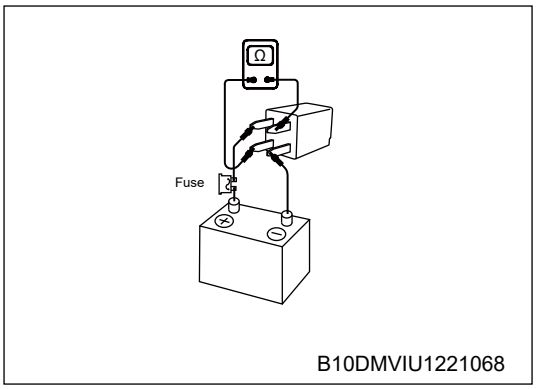
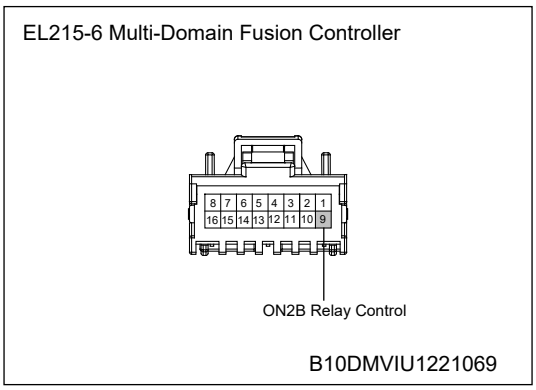
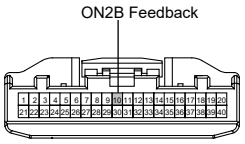
DTC: B120812-VIU

Fault code	Description
B120812	ON2-B relay short to power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

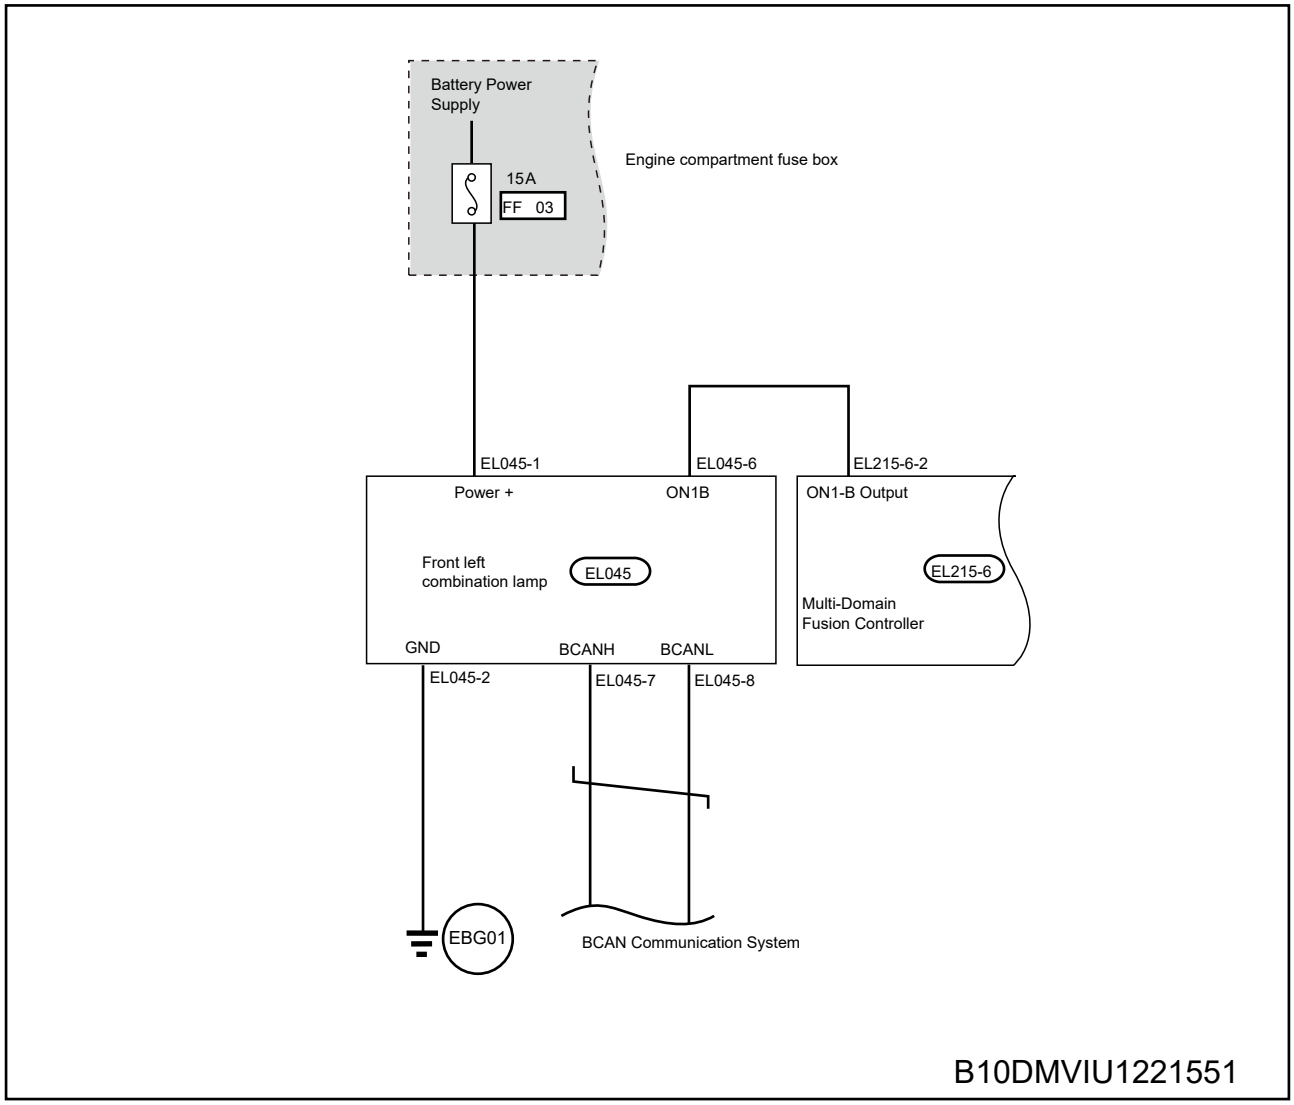
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2B relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2B relay fuses SF12 and FF19. Fuse specifications: SF12 30A, FF19 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2B relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the ON2B relay RELY8, connect the positive power supply of th e battery to one side of the coil terminal of the ON2B relay RELY8, and connect the other side to ground. Check wheth er the two ends of the relay switch contacts are conductive at this time.
	No》》》 Replace the ON2B relay RELY8.
	Yes》》》 Go to step 4.
Step 4 Check the ON2B relay control circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2B relay RELY8. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect or EL215-6 of the multi-domain fusion controller and socke t 85# of the ON2B relay RELY8 to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 9 of the wire harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON2B relay feedback circuit.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221070	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Remove fuse FF19. D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 10 of the multi-domain fusion controller harness connector EL215-3 and the fuse FF19 socket is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 10 of the multi-domain fusion controller wire harness connector EL215-3 and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

© 2026, All rights reserved

DTC: B111914-VIU

Fault code	Description
B111914	Left headlamp turn signal C driver output short to ground/open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》 》 》 Inspect the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B111216-VIU

Fault code	Description
B111216	The supply voltage of the turn signal bulb in the left headlamp is below the threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》》》 Inspect the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

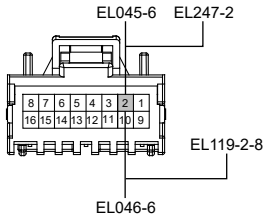
DTC: B120219-VIU

Fault code	Description
B120219	ON1-B current exceeds threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

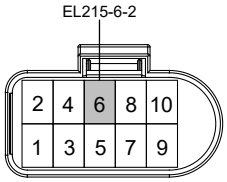
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

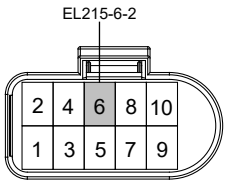
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



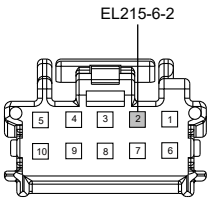
Step 2 Check the ON1B output circuit.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221060

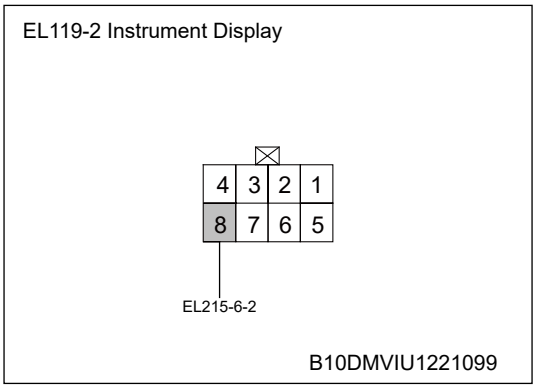
EL045 Front left combination lamp



B10DMVIU1221061

EL046 Front right combination lamp

B10DMVIU1221062



EL247 Trailer Hitch Wiring Harness Connector

B10DMVIU1221086

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL045 of the left front combination lamp.
D Disconnect the right front combination lamp harness con nector EL046.
E Disconnect the harness connector EL119-2 of the instrum ent display.
F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d terminal 6 of the wire harness connector EL045 of the left front combination lamp to check whether the resistance val ue is normal.
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-6 of the multi-domain fusion controller and termi nal 6 of the harness connector EL046 of the right front com bination lamp to check whether the resistance value is nor mal.
H Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL215-6 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL2 47 of the towing hook wire harness interface is normal.
I Use a multimeter, select the resistance range, and check w hether the resistance between terminal 2 of the wire harnes s connector EL215-6 of the multi-domain fusion controller and terminal 8 of the wire harness connector EL119-2 of th e instrument display screen is normal.
Resistance standard value: Less than 1 Ω
J Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-6 of the multi-domain fusion controller and the b ody ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
K Check whether the resistance value meets the standard v alue.
L Connect the negative terminal of the battery, and power on the vehicle.

© 2026, All rights reserved

M Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 of the harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether the voltage is normal.
Voltage standard value: 0V
N Check whether the voltage value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 3.

Step 3 Check the power supply ground of the multi-domain fusion controller.

A Check whether the power supply and ground of the multi-domain fusion controller are normal.

No 》》》 Repair or replace the wiring harness.

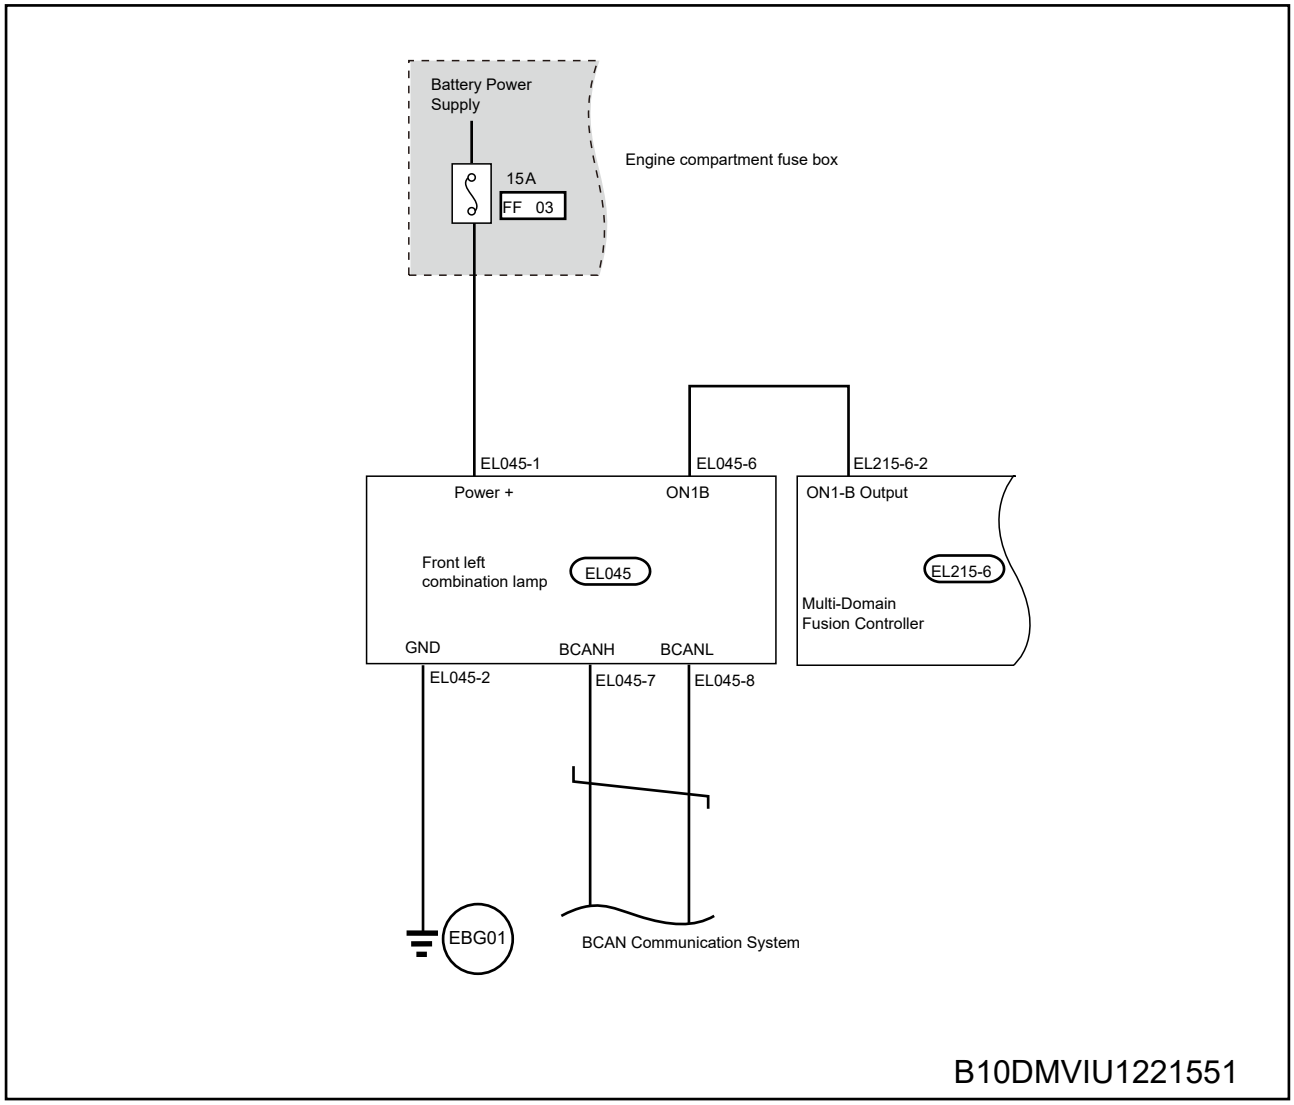
Yes 》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 5.



Step 5 Diagnosis complete.

Fault code	Description
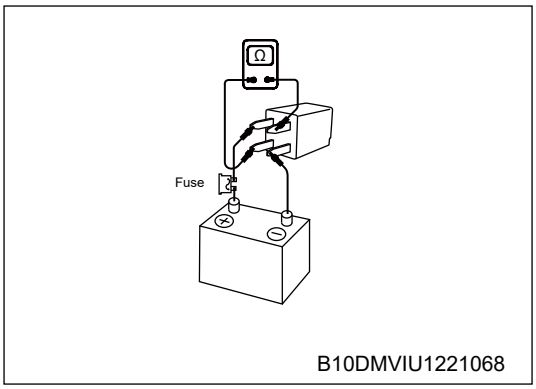
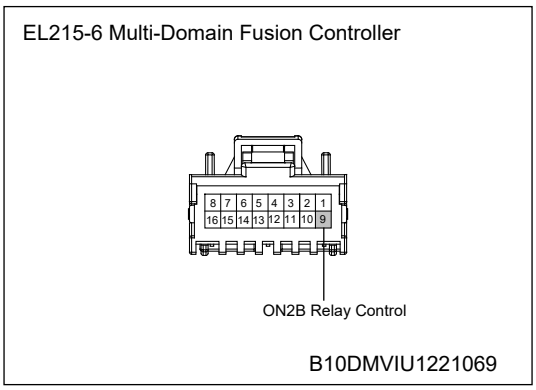
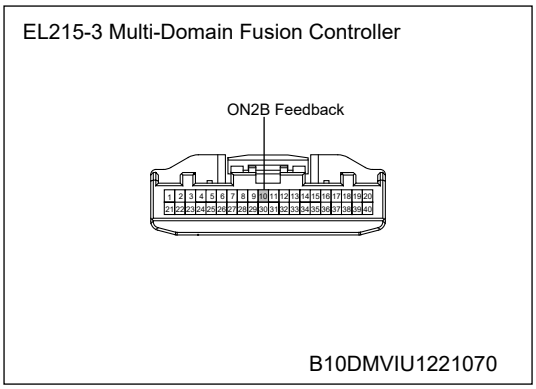
B120711	ON2-B Relay Short to Ground





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2B relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2B relay fuses SF12 and FF19. Fuse specifications: SF12 30A, FF19 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2B relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the ON2B relay RELY8, connect the positive power supply of th e battery to one side of the coil terminal of the ON2B relay RELY8, and connect the other side to ground. Check wheth er the two ends of the relay switch contacts are conductive at this time.
	No》》》 Replace the ON2B relay RELY8.
	Yes》》》 Go to step 4.
Step 4 Check the ON2B relay control circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2B relay RELY8. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect or EL215-6 of the multi-domain fusion controller and socke t 85# of the ON2B relay RELY8 to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect

© 2026, All rights reserved

	or EL215-6 of the multi-domain fusion controller and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON2B relay feedback circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Remove fuse FF19. D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 10 of the multi-domain fusion controller harness connector EL215-3 and the fuse FF19 socket is normal. Resistance standard value: Less than 1 Ω E. Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of the wire harness connector EL215-3 of the multi-domain fusion controller and the vehicle body ground to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

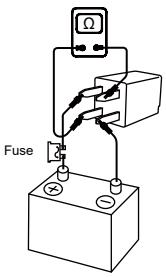
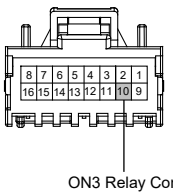
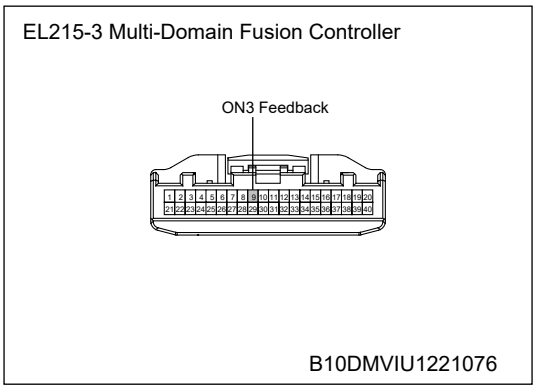
DTC: B120612-VIU

Fault code	Description
B120612	ON3 short to power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

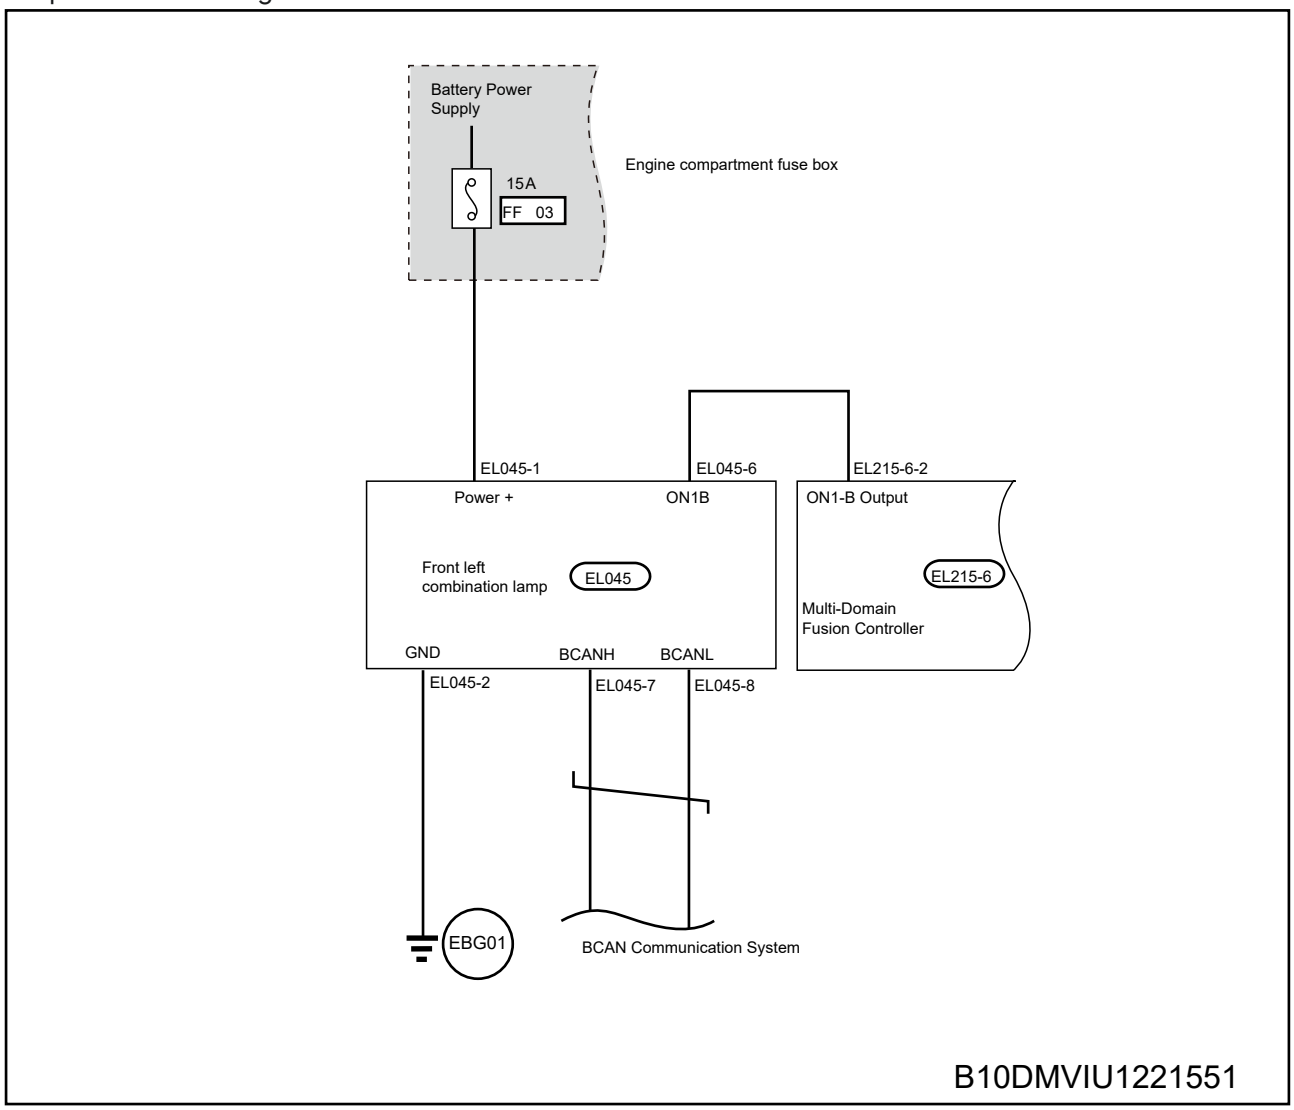
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON3 relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON3 relay fuses FF13, RF02. Fuse specifications: FF13 10A, RF02 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON3 relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON3 relay RELY9. Connect the positive battery power to o ne side of the ON3 relay RELY9 coil and ground the other si de. Check whether the switch contacts at both ends of the r elay are conductive.
	No》》》 Replace the ON3 relay RELY9.
	Yes》》》 Go to step 4.
Step 4 Check the ON3 relay control circuit.	
EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221075	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON3 relay RELY9. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of harness connector EL215-6 of the multi-domain fusion controller and socket 8 5# of ON3 relay RELY9 to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 10 of the harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON3 relay feedback circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C. Remove fuse RF02. D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the multi-domain fusion controller harness connector EL215-3 and the socket of fuse RF02 to check whether it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 9 of the multi-domain fusion controller harness connector EL215-3 and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

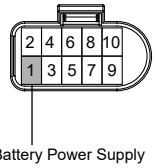
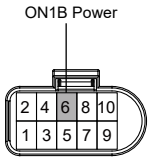
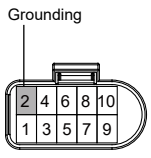
DTC: B110016-VIU

Fault code	Description
B110016	Left headlamp power supply undervoltage



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front combination lamp fuse FF03. Fuse specification: FF03 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221552	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL045 of the left front combination lamp and the body ground to check whether it is normal Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ON1B power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221553	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL045 of the left front combination lamp and the ve hicle body ground to check whether the voltage value is no rmal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
No 》 》 》 Inspect and repair the ON1B power supply.	
Yes 》 》 》 Go to step 6.	
Step 6 Check the ground wire harness of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221554	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL045 of the left front combination l amp and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 7.	
Step 7 Replace the front left combination lamp.	
	A Replace the front left combination lamp.

© 2026, All rights reserved

	B After replacing the left front combination lamp, is the faul t cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

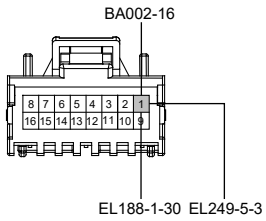
DTC: B120119-VIU

Fault code	Description
B120119	ON1-A current exceeds threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

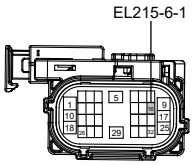
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

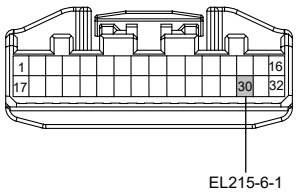
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



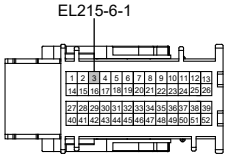
Step 2 Check the ON1A output circuit.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221055

BA002 Power Battery Pack Assembly



B10DMVIU1221056

EL188-1 Telematics Main Unit

B10DMVIU1221057

EL249-5 Main Zone Controller

B10DMVIU1221058

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL188-1 of the t elematics host.
D Disconnect the wiring harness connector EL249-5 of the main zone controller.
E Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
F. Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of wire harnes s connector EL215-6 of the multi-domain fusion controller and terminal 30 of wire harness connector EL188-1 of the t elematics host is normal.
G. Use a multimeter, select the resistance range, and measu re the resistance between terminal 1 of harness connector EL215-6 of the multi-domain fusion controller and terminal 3 of harness connector EL249-5 of the main zone controller to check if it is normal.
H Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of the wire ha rness connector EL215-6 of the multi-domain fusion contr oller and terminal 16 of the wire harness connector BA002 of the power battery pack assembly is normal.
Resistance standard value: Less than 1 Ω
I. Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of the wire ha rness connector EL215-6 of the multi-domain fusion contr oller and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
J Confirm whether the resistance value meets the standard value.
K Connect the negative terminal of the battery, and power on the vehicle.
L Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 1 of wiring harness connec tor EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	M Confirm whether the voltage value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: B111814-VIU

Fault code	Description
B111814	Left headlamp daytime running lamp C driver output short to ground /open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》》》 Inspect the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B111514-VIU

Fault code	Description
B111514	Left headlamp turn signal lamp A drive output short to ground/open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》》》 Inspect the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

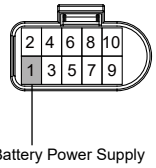
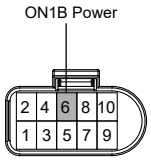
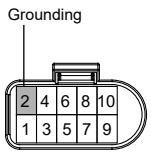
DTC: B110017-VIU

Fault code	Description
B110017	Left headlamp power supply overvoltage



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front combination lamp fuse FF03. Fuse specification: FF03 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221552	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL045 of the left front combination lamp and the body ground to check whether it is normal Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221553	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL045 of the left front combination lamp and the ve hicle body ground to check whether the voltage value is no rmal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221554	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL045 of the left front combination l amp and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front left combination lamp.	
	A Replace the front left combination lamp.

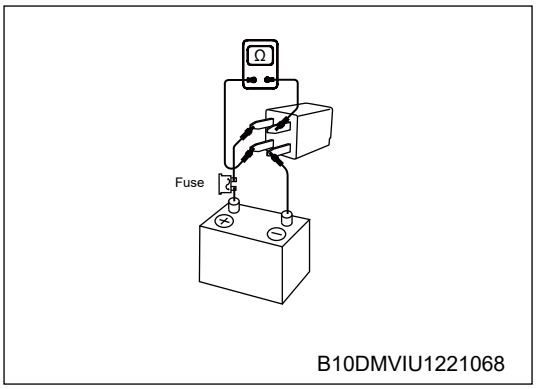
© 2026, All rights reserved

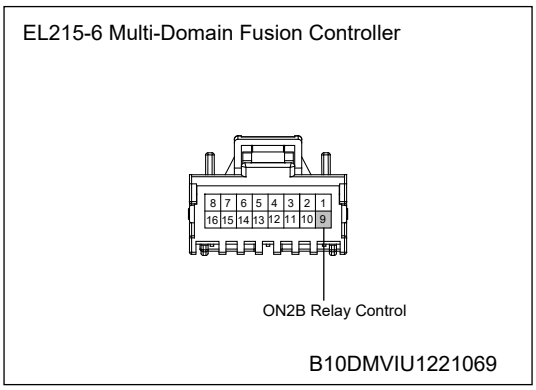
	B After replacing the left front combination lamp, is the faul t cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

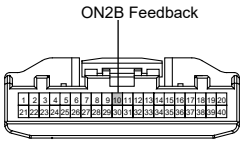
DTC: B120412-VIU

Fault code	Description
B120412	ON2-B Short to Power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

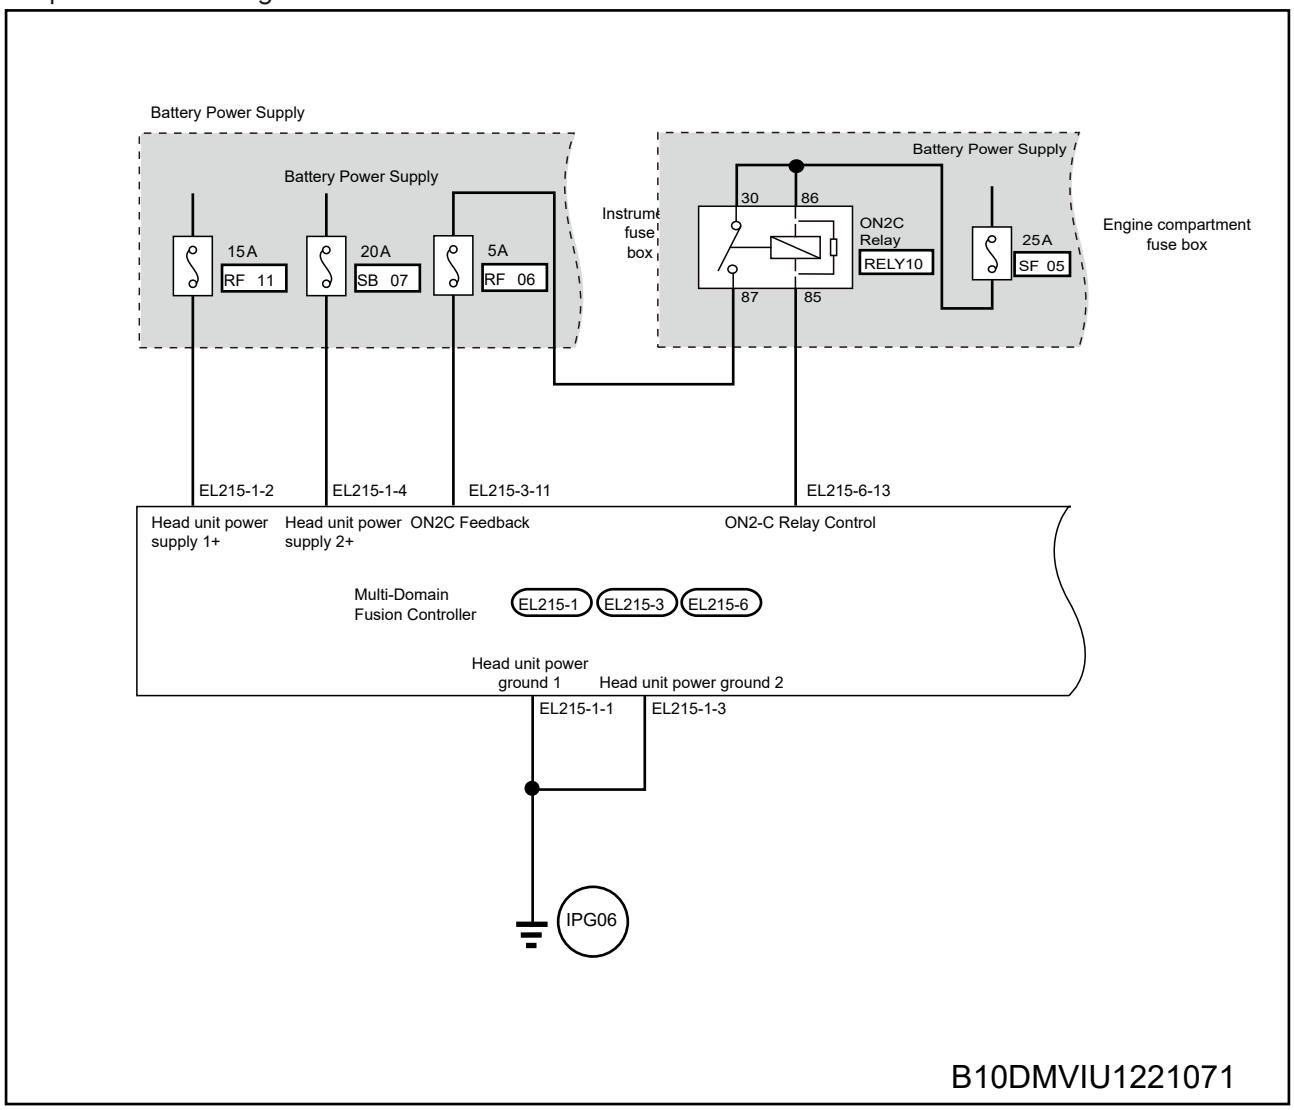
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2B relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2B relay fuses SF12 and FF19. Fuse specifications: SF12 30A, FF19 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2B relay.	
	A Power off the vehicle, disconnect the negative terminal of the battery, and wait for more than 5 minutes. Remove the ON2B relay RELY8, connect the positive power supply of th e battery to one side of the coil terminal of the ON2B relay RELY8, and connect the other side to ground. Check wheth er the two ends of the relay switch contacts are conductive at this time.
	No》》》 Replace the ON2B relay RELY8.
	Yes》》》 Go to step 4.
Step 4 Check the ON2B relay control circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2B relay RELY8. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the harness connect or EL215-6 of the multi-domain fusion controller and socke t 85# of the ON2B relay RELY8 to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 9 of the wire harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Check the ON2B relay feedback circuit.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221070	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Remove fuse FF19. D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 10 of the multi-domain fusion controller harness connector EL215-3 and the fuse FF19 socket is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 10 of the multi-domain fusion controller wire harness connector EL215-3 and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved

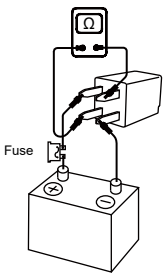


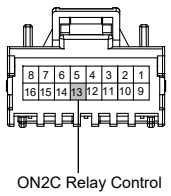
Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

© 2026, All rights reserved

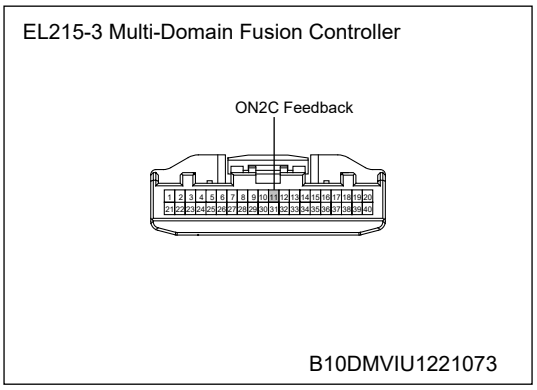
DTC: B120512-VIU

Fault code	Description
B120512	ON2-C Short to Power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

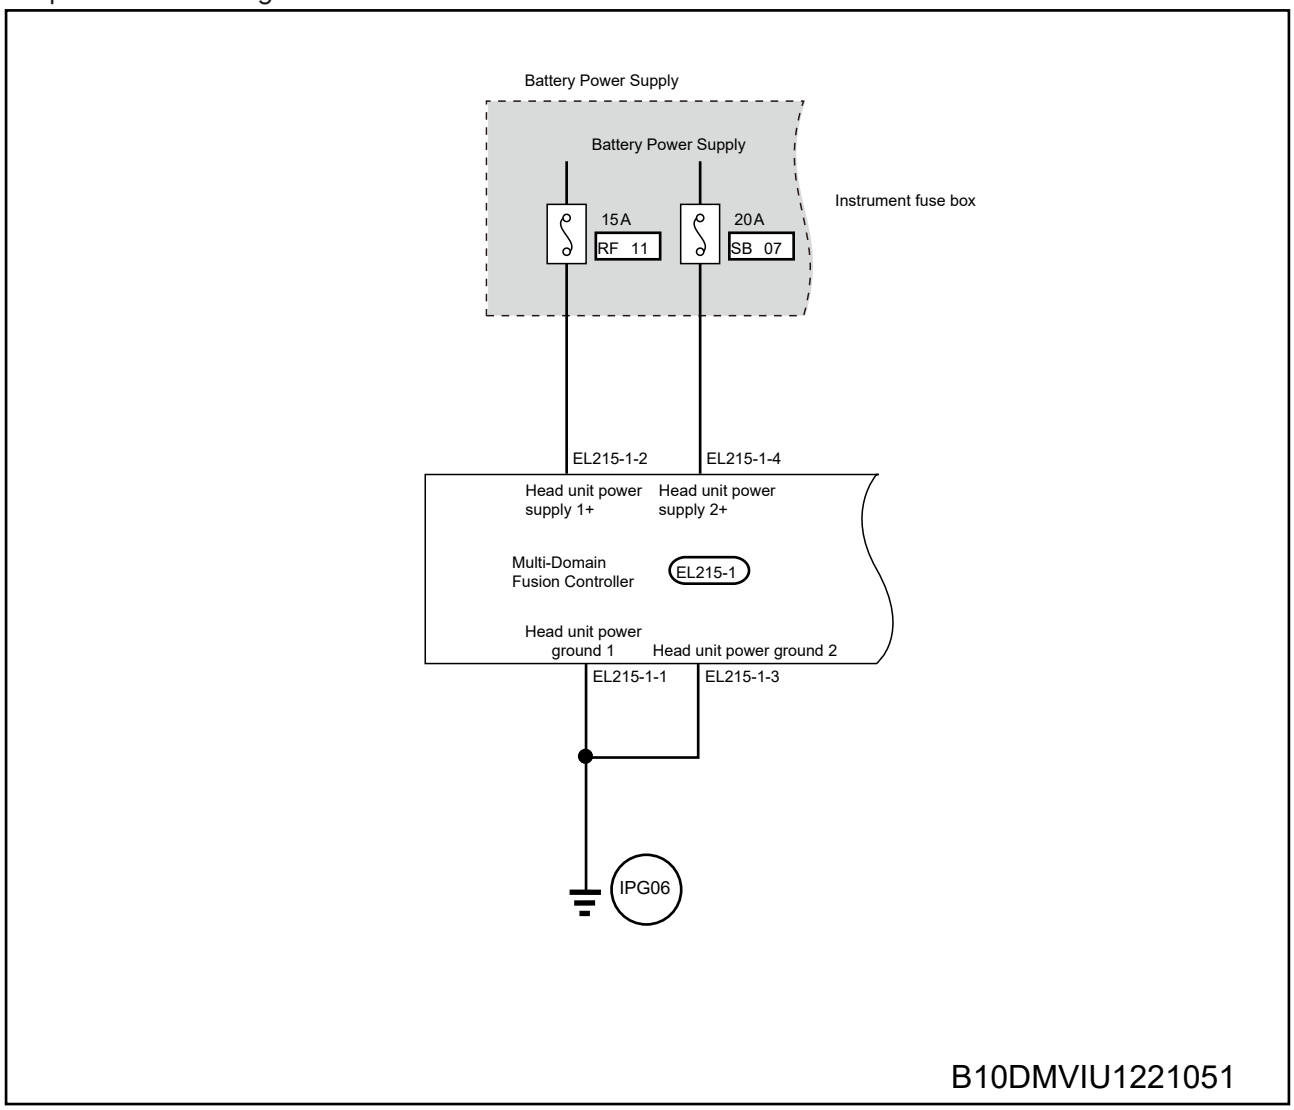
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2C relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2C relay fuses SF05 and RF06. Fuse specification: SF05 25A, RF06 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2C relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON2C relay RELY10, connect the positive power supply of the battery to one side of the coil terminal of the ON2C rela y RELY10, and connect the other side to ground. Check whe ther there is continuity across the two ends of the relay swi tch contacts.
	No》》》 Replace the ON2C relay RELY10.
	Yes》》》 Go to step 4.
Step 4 Check the ON2C relay control circuit.	
EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2C relay RELY10. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 13 of the wire har ness connector EL215-6 of the multi-domain fusion control ler and socket 85# of the ON2C relay RELY10 is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 13 of harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the ON2C relay feedback circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Remove fuse RF06. D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 11 of the wire harness connector EL215-3 of the multi-domain fusion controller and the socket of fuse RF06 is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 11 of the wire harness connector EL215-3 of the multi-domain fusion controller and the vehicle body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》》》 System normal.
Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

© 2026, All rights reserved

DTC: B120043-VIU

Fault code	Description
B120043	External storage electronic device specific area fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 4.
Step 4 Diagnosis complete.

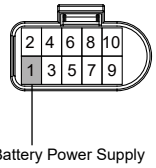
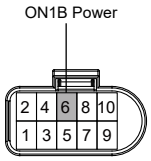
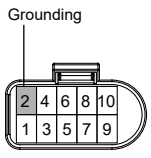
DTC: B110A17-VIU

Fault code	Description
B110A17	Left headlamp Buck-Boost power supply voltage exceeds the threshold



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front combination lamp fuse FF03. Fuse specification: FF03 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221552	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL045 of the left front combination lamp and the body ground to check whether it is normal Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221553	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL045 of the left front combination lamp and the ve hicle body ground to check whether the voltage value is no rmal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221554	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL045 of the left front combination l amp and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front left combination lamp.	
	A Replace the front left combination lamp.

© 2026, All rights reserved

	B After replacing the left front combination lamp, is the faul t cleared?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

DTC: B111A09-VIU

Fault code	Description
B111A09	Left headlamp signal lamp LED board NTC fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left front combination lamp are normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 3.
Step 3 Check the wiring harness between the left front combination lamp and the left front position, turn signal, and daytime running lamp assembly.	
	A Check whether the wiring harness between the left front combination lamp and the left front position, turn, and daytime running lamp assembly is normal.
	No 》》》 Inspect the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the front left turn signal and daytime running lamp assembly.	
	A Replace the left front position turn signal and daytime running lamp assembly. B After replacing the front left position steering daytime running lamp assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

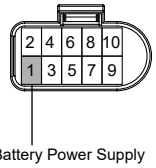
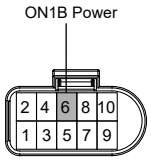
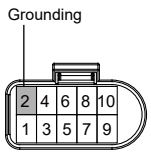
DTC: B110A16-VIU

Fault code	Description
B110A16	Left headlamp buck-boost power supply voltage below threshold



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse of the front left combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the left front combination lamp fuse FF03. Fuse specification: FF03 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221552	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL045 of the left front combination lamp and the body ground to check whether it is normal Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221553	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL045 of the left front combination lamp and the ve hicle body ground to check whether the voltage value is no rmal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the front left combination lamp.	
EL045 Front left combination lamp  B10DMVIU1221554	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL045 of the left front combination lamp. C Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL045 of the left front combination l amp and the vehicle body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front left combination lamp.	
	A Replace the front left combination lamp.

© 2026, All rights reserved

	B After replacing the left front combination lamp, is the faul t cleared?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: B110209-VIU

Fault code	Description
B110209	Left headlamp low beam LED board NTC fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the front left combination lamp.	
	A Check whether the power supply and ground of the left f ront combination lamp are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front left combination lamp.	
	A Replace the front left combination lamp. B After replacing the left front combination lamp, is the faul t cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

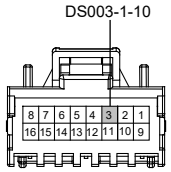
DTC: B120319-VIU

Fault code	Description
B120319	ON2-A current exceeds threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

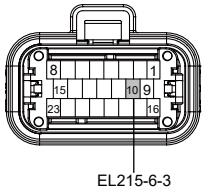
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the ON2A circuit between the multi-domain fusion controller and the controller assembly.

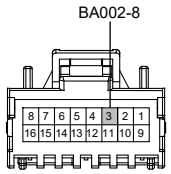
EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221064

DS003-1 Controller Assembly

B10DMVIU1221065

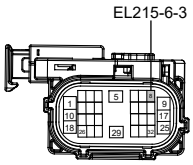
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector DS003-1 of the control ler assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of harness connector E L215-6 of the multi-domain fusion controller and terminal 10 of harness connector DS003-1 of the controller assembl y to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 3 of the wire harness con nector EL215-6 of the multi-domain fusion controller and t he body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ON2A circuit between the multi-domain fusion controller and the power battery pack ass embly.



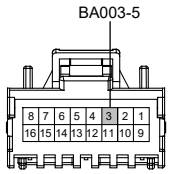
© 2026, All rights reserved

EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221087

BA002 Power Battery Pack Assembly

B10DMVIU1221066



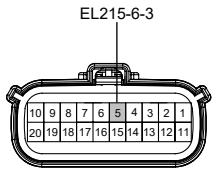
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector BA002 of the p ower battery pack assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the multi-domain fu sion controller harness connector EL215-6 and terminal 8 o f the power battery pack assembly harness connector BA00 2 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 3 of the wire harness con nector EL215-6 of the multi-domain fusion controller and t he body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 4.

Step 4 Check the ON2A circuit between the multi-domain fusion controller and the charging protocol conv erter.

EL215-6 Multi-Domain Fusion Controller



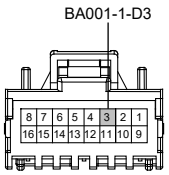
B10DMVIU1221088

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector BA003 of the charging protocol converter.
D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 3 of the w ire harness connector EL215-6 of the multi-domain fusion controller and terminal 5 of the wire harness connector BA 003 of the charging protocol converter is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

BA003 Charging Protocol Converter

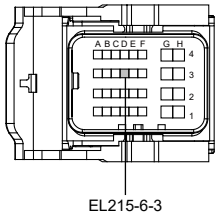
B10DMVIU1221089



E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 3 of the wire harness con nector EL215-6 of the multi-domain fusion controller and t he body ground to check if it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.



Step 5 Check the ON2A circuit between the multi-domain fusion controller and the 2-in-1 power assembly.

EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221090

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221091

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor EL215-6 of the multi-domain fusion controller and term inal D3 of wire harness connector BA001-1 of the 2-in-1 po wer supply assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 3 of the wire harness con nector EL215-6 of the multi-domain fusion controller and t he body ground to check if it is normal.

© 2026, All rights reserved

	Voltage standard value: 0V I Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 7.	
Step 7 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

DTC: B140A08-VIU

Fault code	Description
B140A08	Rear left ultrasonic sensor communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear left is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear left.	
	A Replace the reversing ultrasonic sensor - rear left. B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

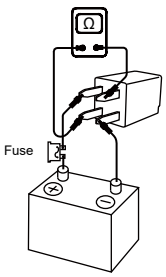
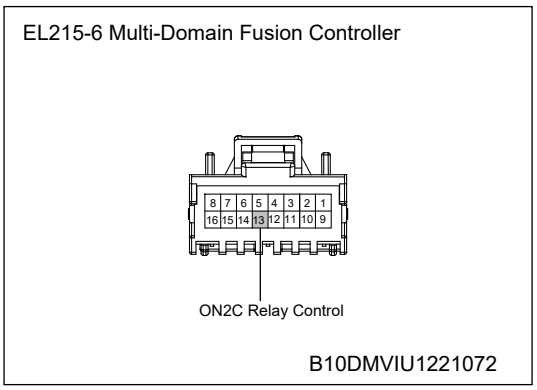
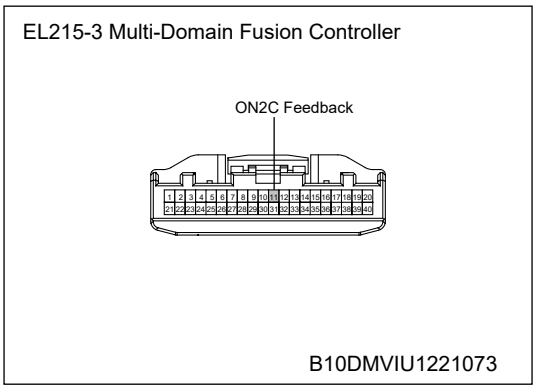
DTC: B120A12-VIU

Fault code	Description
B120A12	ON2-C Relay Short to Power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

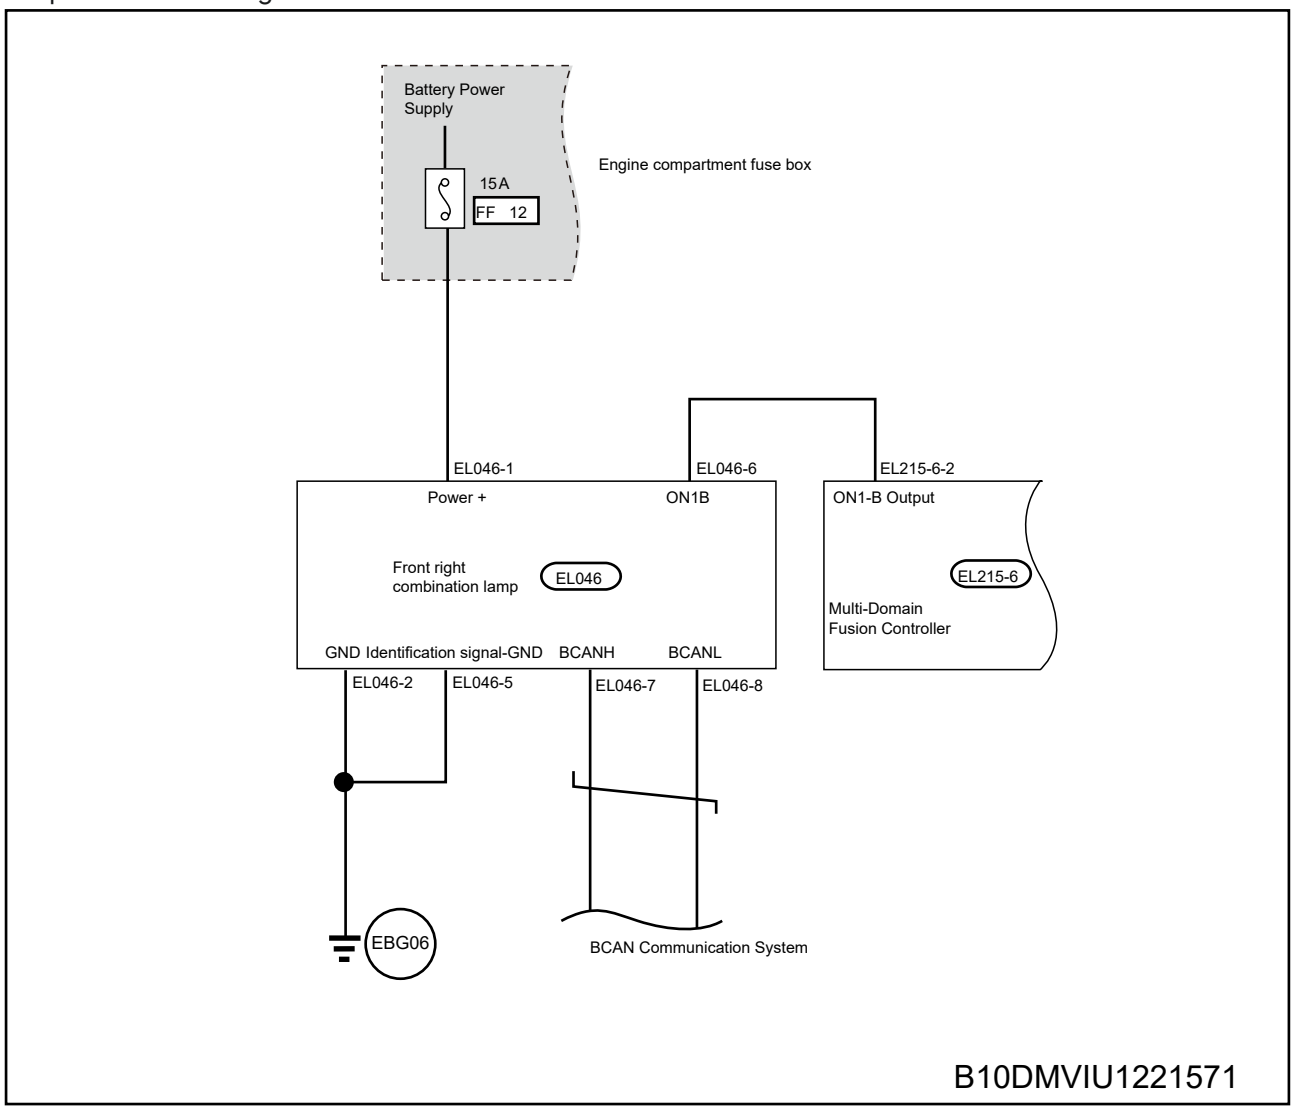
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2C relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2C relay fuses SF05 and RF06. Fuse specification: SF05 25A, RF06 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2C relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON2C relay RELY10, connect the positive power supply of the battery to one side of the coil terminal of the ON2C rela y RELY10, and connect the other side to ground. Check whe ther there is continuity across the two ends of the relay swi tch contacts.
	No》》》 Replace the ON2C relay RELY10.
	Yes》》》 Go to step 4.
Step 4 Check the ON2C relay control circuit.	
 B10DMVIU1221072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2C relay RELY10. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 13 of the wire har ness connector EL215-6 of the multi-domain fusion control ler and socket 85# of the ON2C relay RELY10 is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G. Use a multimeter, select the DC voltage range, and measure the voltage between terminal 13 of harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON2C relay feedback circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Remove fuse RF06. D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 11 of the wire harness connector EL215-3 of the multi-domain fusion controller and the socket of fuse RF06 is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 11 of the wire harness connector EL215-3 of the multi-domain fusion controller and the vehicle body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved

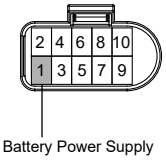


Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

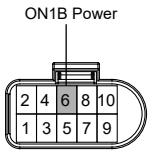
© 2026, All rights reserved

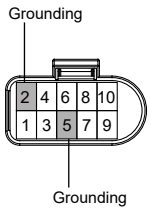
DTC: B130A16-VIU

Fault code	Description
B130A16	Right headlamp BUCK-BOOST power supply voltage below threshold



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

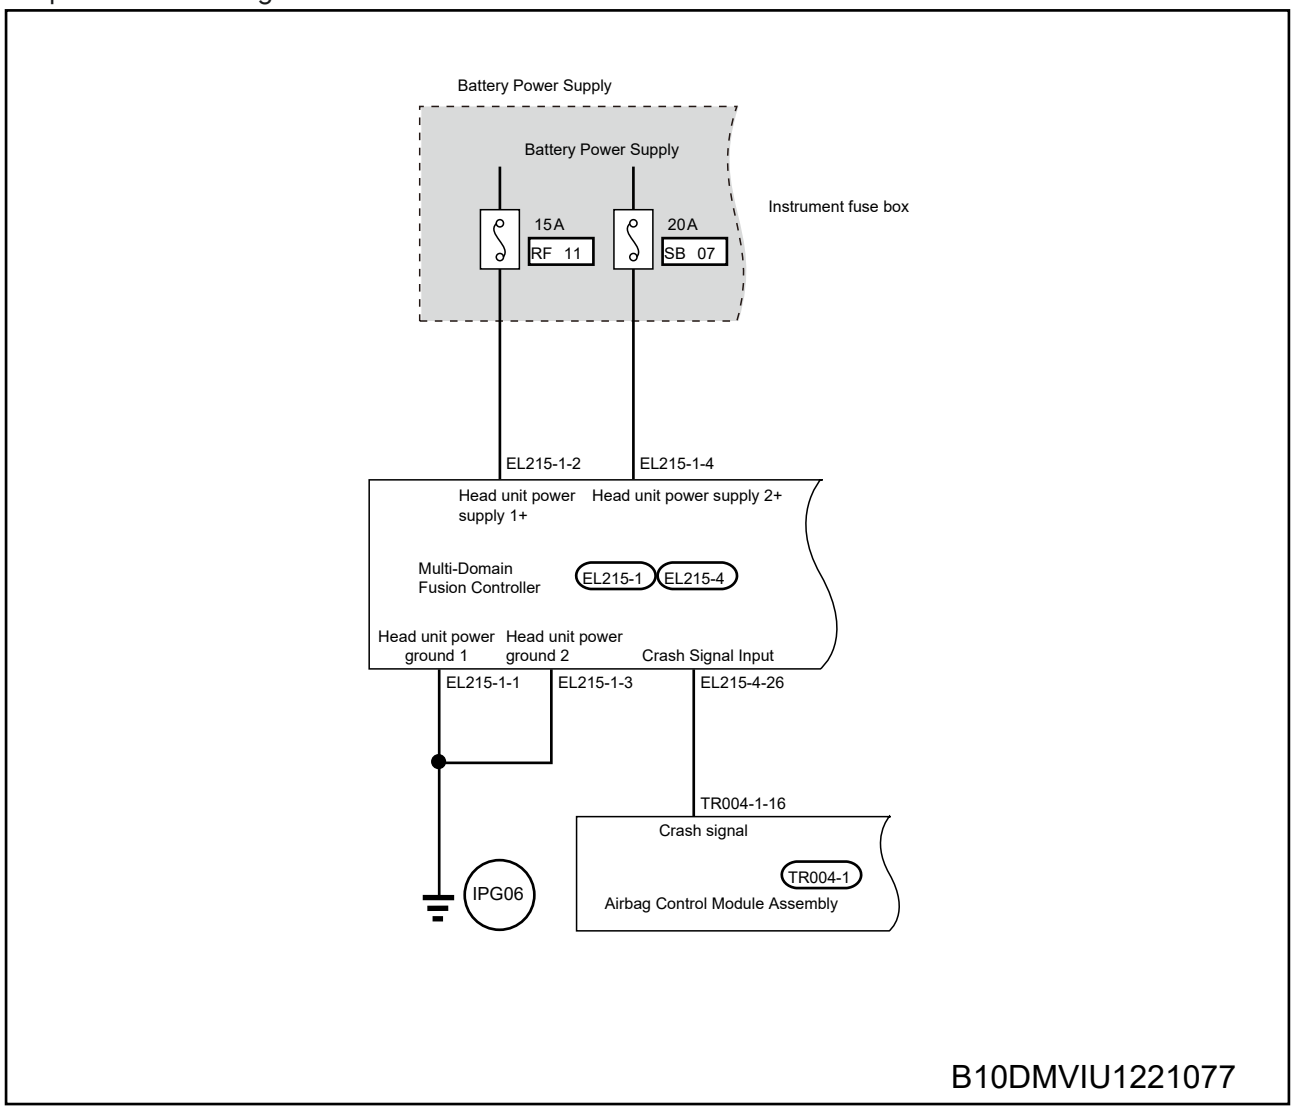
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front right combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right front combination lamp fuse FF12. Fuse specification: FF12 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221572	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL046 of the right front combination lamp and the body ground to check whether the voltage is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front right combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221573	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL046 for the right front combination lamp and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221574	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminals 2 and 5 of the harness connector EL046 for the right front combination la mp and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

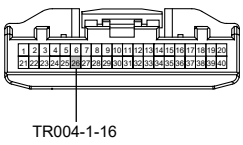
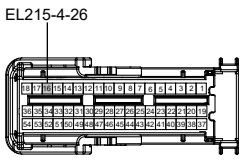
DTC: B121900-VIU

Fault code	Description
B121900	In the event of a collision





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the diagnostic trouble codes of the airbag control module assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the airbag c ontrol module assembly, and record them. C Check for collision-related faults.
Yes 》 》 》 Prioritize the repair of faults related to the airbag control module assembly.	
	No 》 》 》 Go to step 3.
Step 3 Check the crash signal circuit between the airbag control module assembly and the multi-domain fu sion controller.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221078 TR004-1 Airbag Control Module Assembly  B10DMVIU1221079	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of harness connect or TR004-1 of the airbag control module assembly and ter minal 26 of harness connector EL215-4 of the multi-domai n fusion controller to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power and ground wire harness of the airbag control module assembly.	
	A Check whether the power and ground wiring harness of t he airbag control module assembly is normal.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: B130119-VIU

Fault code	Description
B130119	Right headlamp high beam overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the front right combination lamp.	
	A Check whether the power supply and ground of the right front combination lamp are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

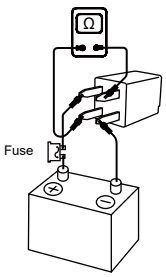
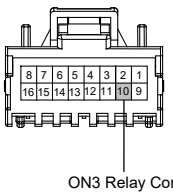
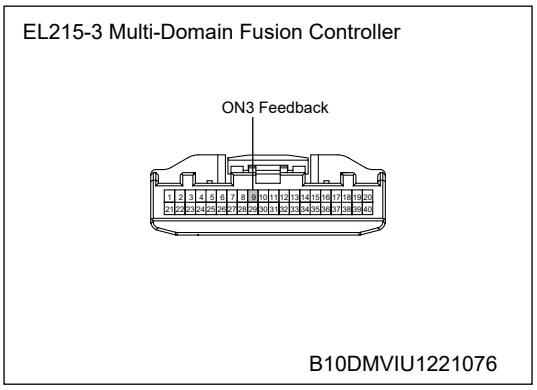
DTC: B120C12-VIU

Fault code	Description
B120C12	ON3 Relay Short to Power





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

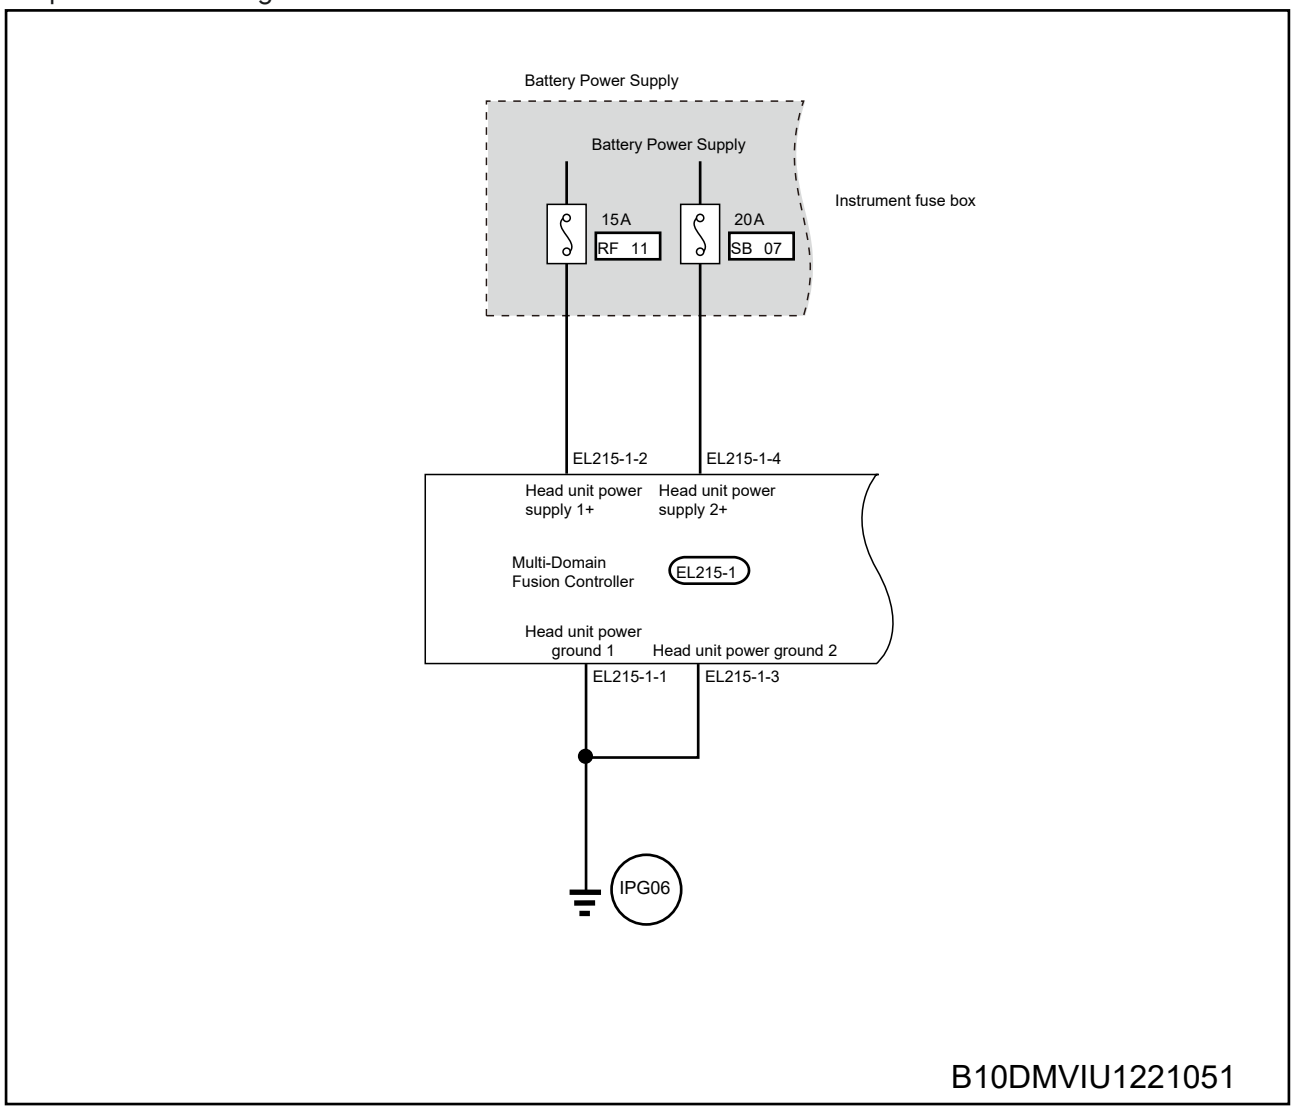
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON3 relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON3 relay fuses FF13, RF02. Fuse specifications: FF13 10A, RF02 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON3 relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON3 relay RELY9. Connect the positive battery power to o ne side of the ON3 relay RELY9 coil and ground the other si de. Check whether the switch contacts at both ends of the r elay are conductive.
	No》》》 Replace the ON3 relay RELY9.
	Yes》》》 Go to step 4.
Step 4 Check the ON3 relay control circuit.	
EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221075	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON3 relay RELY9. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of harness connector EL215-6 of the multi-domain fusion controller and socket 8 5# of ON3 relay RELY9 to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 10 of the harness connector EL215-6 of the multi-domain fusion controller and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON3 relay feedback circuit.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C. Remove fuse RF02. D Use a multimeter, select the resistance range, and measure the resistance between terminal 9 of the multi-domain fusion controller harness connector EL215-3 and the socket of fuse RF02 to check whether it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 9 of the multi-domain fusion controller harness connector EL215-3 and the body ground to check whether it is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

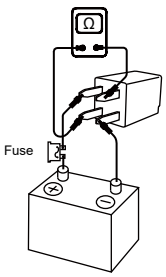
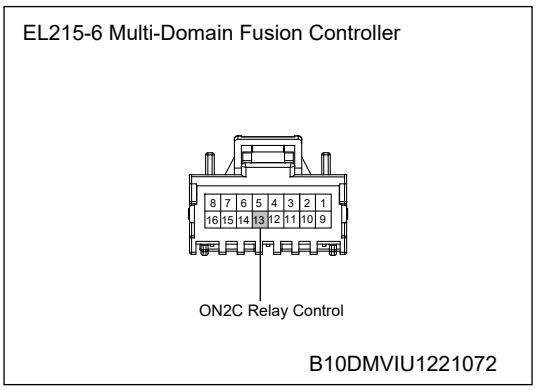
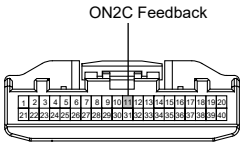
DTC: B120911-VIU

Fault code	Description
B120911	ON2-C relay shorted to ground





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON2C relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON2C relay fuses SF05 and RF06. Fuse specification: SF05 25A, RF06 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON2C relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON2C relay RELY10, connect the positive power supply of the battery to one side of the coil terminal of the ON2C rela y RELY10, and connect the other side to ground. Check whe ther there is continuity across the two ends of the relay swi tch contacts.
	No》》》 Replace the ON2C relay RELY10.
	Yes》》》 Go to step 4.
Step 4 Check the ON2C relay control circuit.	
 B10DMVIU1221072	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON2C relay RELY10. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 13 of the wire har ness connector EL215-6 of the multi-domain fusion control ler and socket 85# of the ON2C relay RELY10 is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 13 of the harness conn

© 2026, All rights reserved

	ector EL215-6 of the multi-domain fusion controller and th e vehicle body ground to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ON2C relay feedback circuit.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221073	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Remove fuse RF06. D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 11 of the wire harness connector EL215-3 of the multi-domain fusio n controller and the socket of fuse RF06 is normal. Resistance standard value: Less than 1 Ω E Use a multimeter set to the resistance range to measure t he resistance between terminal 11 of the multi-domain fusi on controller harness connector EL215-3 and the body gro und to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

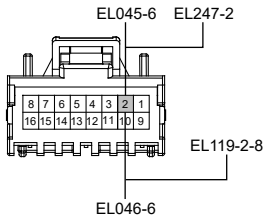
DTC: B121711-VIU

Fault code	Description
B121711	ON1-B short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

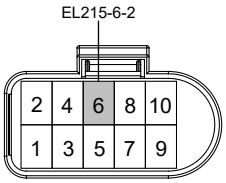
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

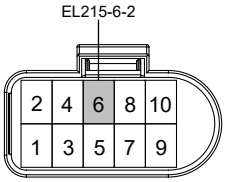
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



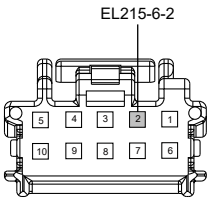
Step 2 Check the ON1B output circuit.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221060

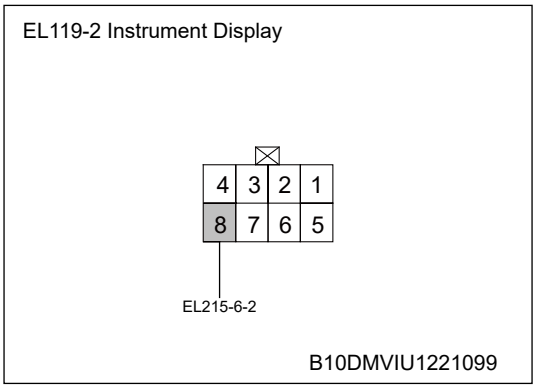
EL045 Front left combination lamp



B10DMVIU1221061

EL046 Front right combination lamp

B10DMVIU1221062



EL247 Trailer Hitch Wiring Harness Connector

B10DMVIU1221086

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL045 of the left front combination lamp.
D Disconnect the right front combination lamp harness con nector EL046.
E Disconnect the harness connector EL119-2 of the instrum ent display.
F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d terminal 6 of the wire harness connector EL045 of the left front combination lamp to check whether the resistance val ue is normal.
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-6 of the multi-domain fusion controller and termi nal 6 of the harness connector EL046 of the right front com bination lamp to check whether the resistance value is nor mal.
H Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 2 of the w ire harness connector EL215-6 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL2 47 of the towing hook wire harness interface is normal.
I Use a multimeter, select the resistance range, and check w hether the resistance between terminal 2 of the wire harnes s connector EL215-6 of the multi-domain fusion controller and terminal 8 of the wire harness connector EL119-2 of th e instrument display screen is normal.
Resistance standard value: Less than 1 Ω
J Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-6 of the multi-domain fusion controller and the b ody ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
K Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the power supply ground of the multi-domain fusion controller.

A Check whether the power supply and ground of the multi-domain fusion controller are normal.

No 》 》 》 Repair or replace the wiring harness.

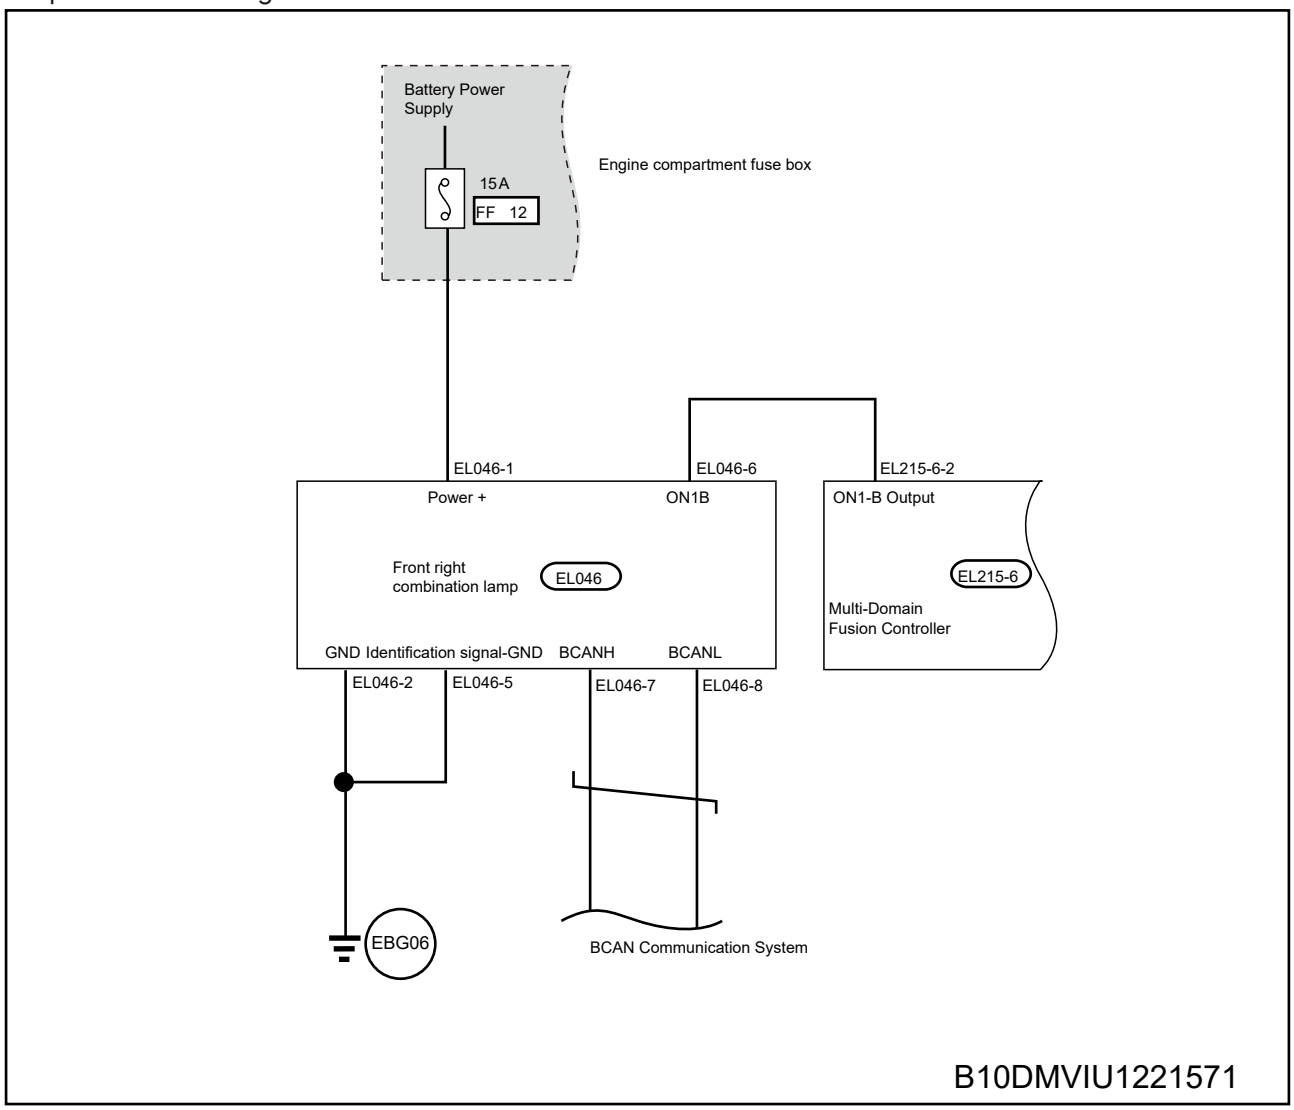
Yes 》 》 》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》 》 》 System normal.

Next 》 》 》
Go to step 5.



Step 5 Diagnosis complete.

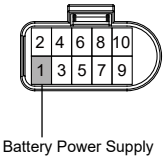
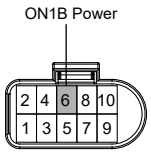
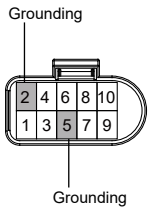
DTC: B130017-VIU

Fault code	Description
B130017	Right headlamp power supply overvoltage



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

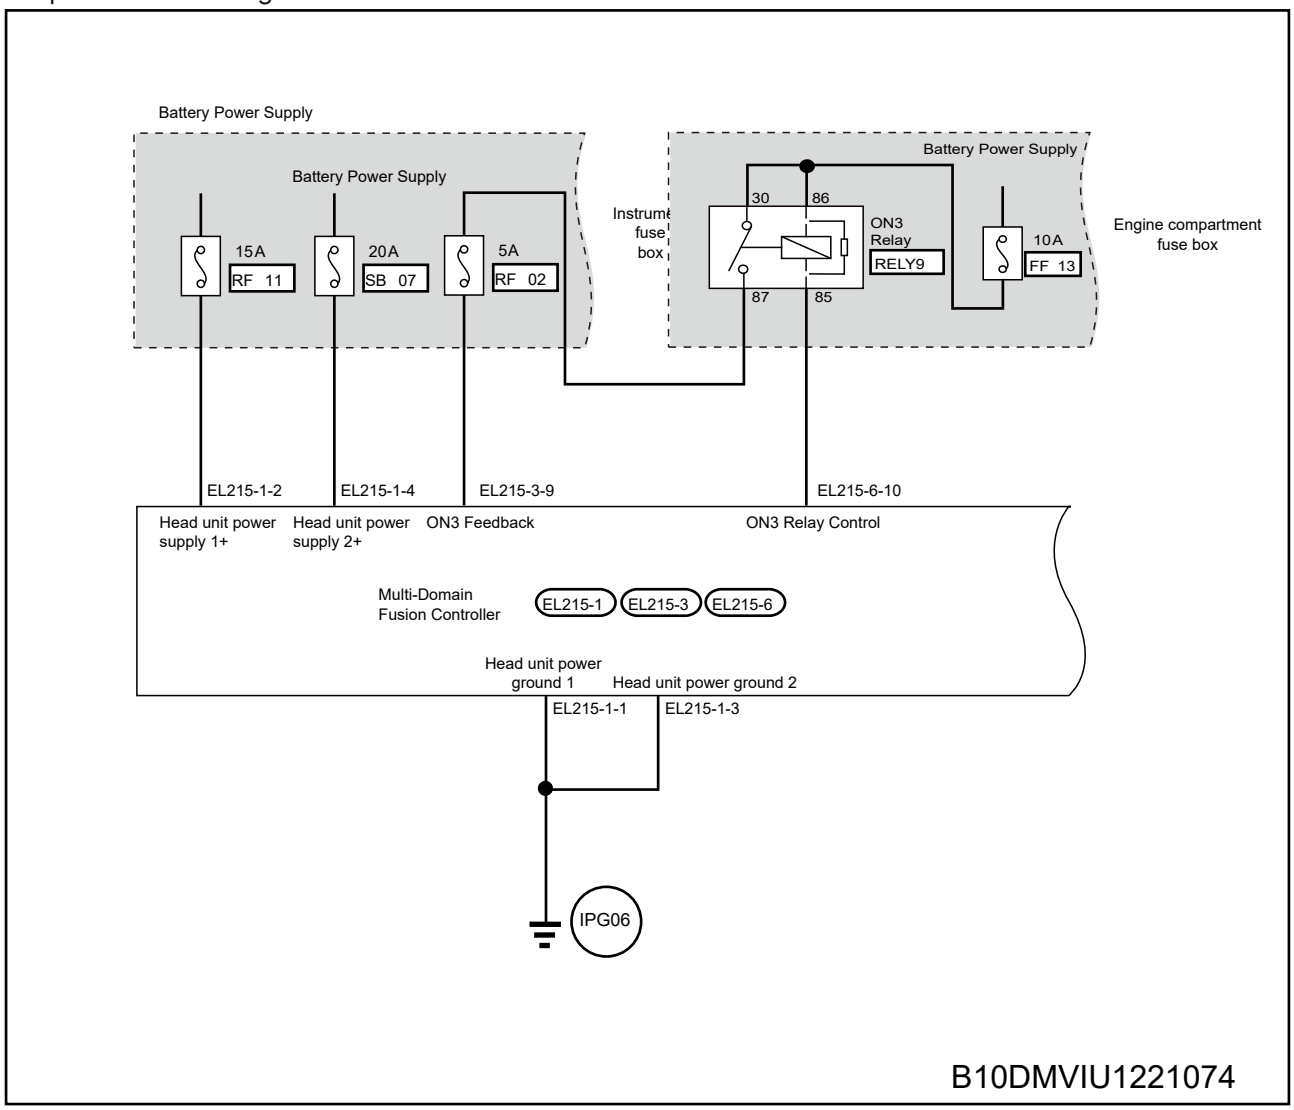
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front right combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right front combination lamp fuse FF12. Fuse specification: FF12 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221572	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL046 of the right front combination lamp and the body ground to check whether the voltage is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front right combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221573	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL046 for the right front combination lamp and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221574	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminals 2 and 5 of the harness connector EL046 for the right front combination la mp and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?

© 2026, All rights reserved

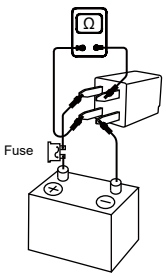


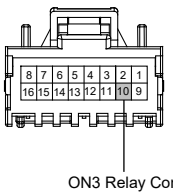
Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

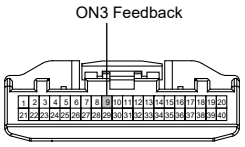
DTC: B120B11-VIU

Fault code	Description
B120B11	ON3 Relay Short to Ground





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ON3 relay fuse.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the ON3 relay fuses FF13, RF02. Fuse specifications: FF13 10A, RF02 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 3.
Step 3 Check the ON3 relay.	
 B10DMVIU1221068	A. Power off the vehicle, disconnect the negative terminal o f the battery, and wait for more than 5 minutes. Remove th e ON3 relay RELY9. Connect the positive battery power to o ne side of the ON3 relay RELY9 coil and ground the other si de. Check whether the switch contacts at both ends of the r elay are conductive.
	No》》》 Replace the ON3 relay RELY9.
	Yes》》》 Go to step 4.
Step 4 Check the ON3 relay control circuit.	
EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221075	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller. C Remove the ON3 relay RELY9. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 10 of harness connector EL215-6 of the multi-domain fusion controller and socket 8 5# of ON3 relay RELY9 to check if it is normal. Resistance standard value: Less than 1 Ω E. Use a multimeter, select the resistance range, and measu re the resistance between terminal 10 of harness connector

© 2026, All rights reserved

	EL215-6 for the multi-domain fusion controller and the bo dy ground to check whether the resistance value is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the ON3 relay feedback circuit.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221076	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C. Remove fuse RF02. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of the multi-domain fu sion controller harness connector EL215-3 and the socket of fuse RF02 to check whether it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter set to the resistance range to check wh ether the resistance between terminal 9 of the multi-domai n fusion controller harness connector EL215-3 and the bod y ground is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

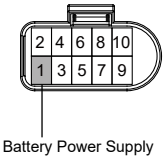
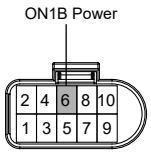
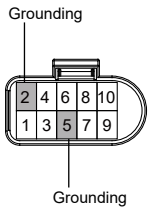
DTC: B130016-VIU

Fault code	Description
B130016	Right headlamp power supply under-voltage



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

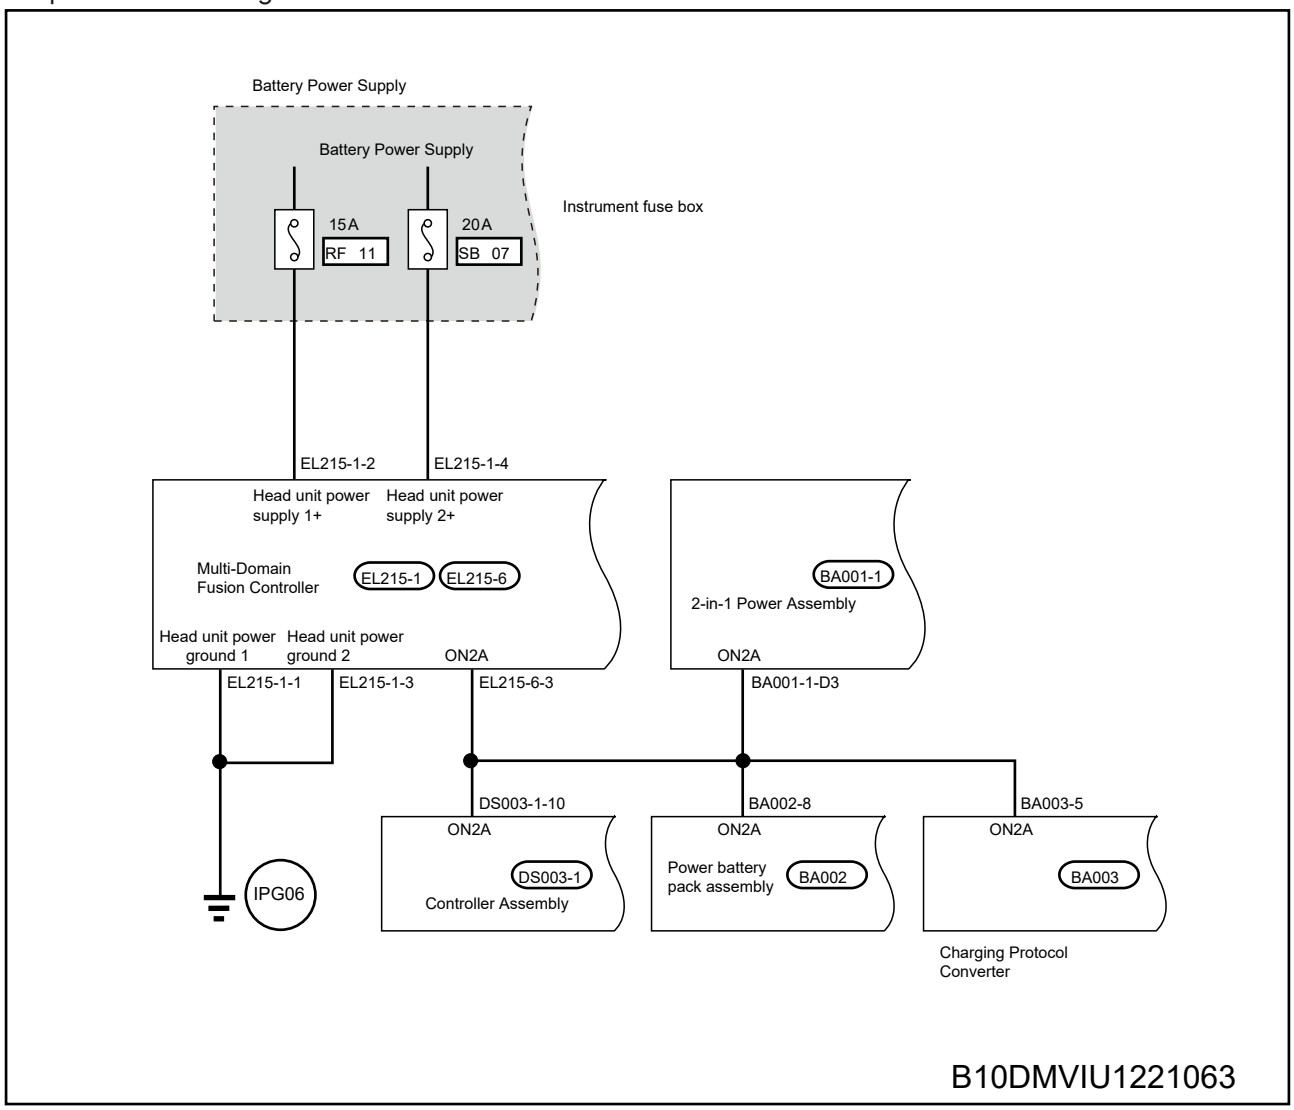
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front right combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right front combination lamp fuse FF12. Fuse specification: FF12 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221572	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL046 of the right front combination lamp and the body ground to check whether the voltage is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Check the ON1B power supply of the front right combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221573	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL046 for the right front combination lamp and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》》》 Inspect and repair the ON1B power supply.
	Yes 》》》 Go to step 6.
Step 6 Check the ground wire harness of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221574	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminals 2 and 5 of the harness connector EL046 for the right front combination la mp and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 7.
Step 7 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

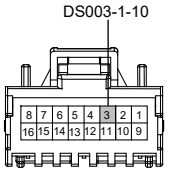
DTC: B121811-VIU

Fault code	Description
B121811	ON2-A short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

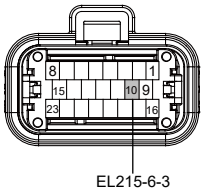
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



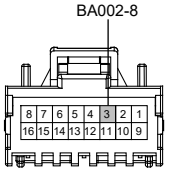
Step 2 Check the ON2A circuit between the multi-domain fusion controller and the controller assembly.

EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221064

DS003-1 Controller Assembly

B10DMVIU1221065



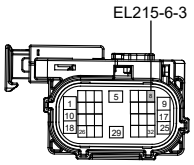
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector EL215-6 of the multi-domain fusion controller and terminal 10 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of the wire harness connector EL215-6 of the multi-domain fusion controller and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ON2A circuit between the multi-domain fusion controller and the power battery pack assembly.

EL215-6 Multi-Domain Fusion Controller



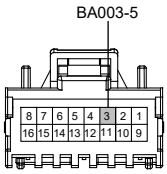
B10DMVIU1221087

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the multi-domain fusion controller harness connector EL215-6 and terminal 8 of the power battery pack assembly harness connector BA002 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of the wire harness c

© 2026, All rights reserved

BA002 Power Battery Pack Assembly

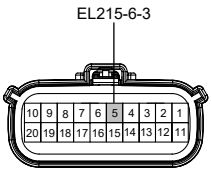
B10DMVIU1221066



onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.



Step 4 Check the ON2A circuit between the multi-domain fusion controller and the charging protocol conv erter.

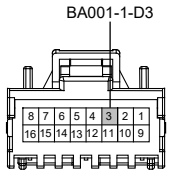
EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221088

BA003 Charging Protocol Converter

B10DMVIU1221089

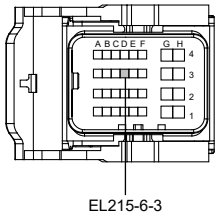
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector BA003 of the charging protocol converter.
D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 3 of the w ire harness connector EL215-6 of the multi-domain fusion controller and terminal 5 of the wire harness connector BA 003 of the charging protocol converter is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of the wire harness c onnector EL215-6 of the multi-domain fusion controller an d the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.



No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 5.

Step 5 Check the ON2A circuit between the multi-domain fusion controller and the 2-in-1 power assembly.



© 2026, All rights reserved

EL215-6 Multi-Domain Fusion Controller

B10DMVIU1221090

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221091

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of wire harness connector EL215-6 of the multi-domain fusion controller and terminal D3 of wire harness connector BA001-1 of the 2-in-1 power supply assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of the wire harness connector EL215-6 of the multi-domain fusion controller and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the power supply ground of the multi-domain fusion controller.

A Check whether the power supply and ground of the multi-domain fusion controller are normal.

No 》》》 Repair or replace the wiring harness.

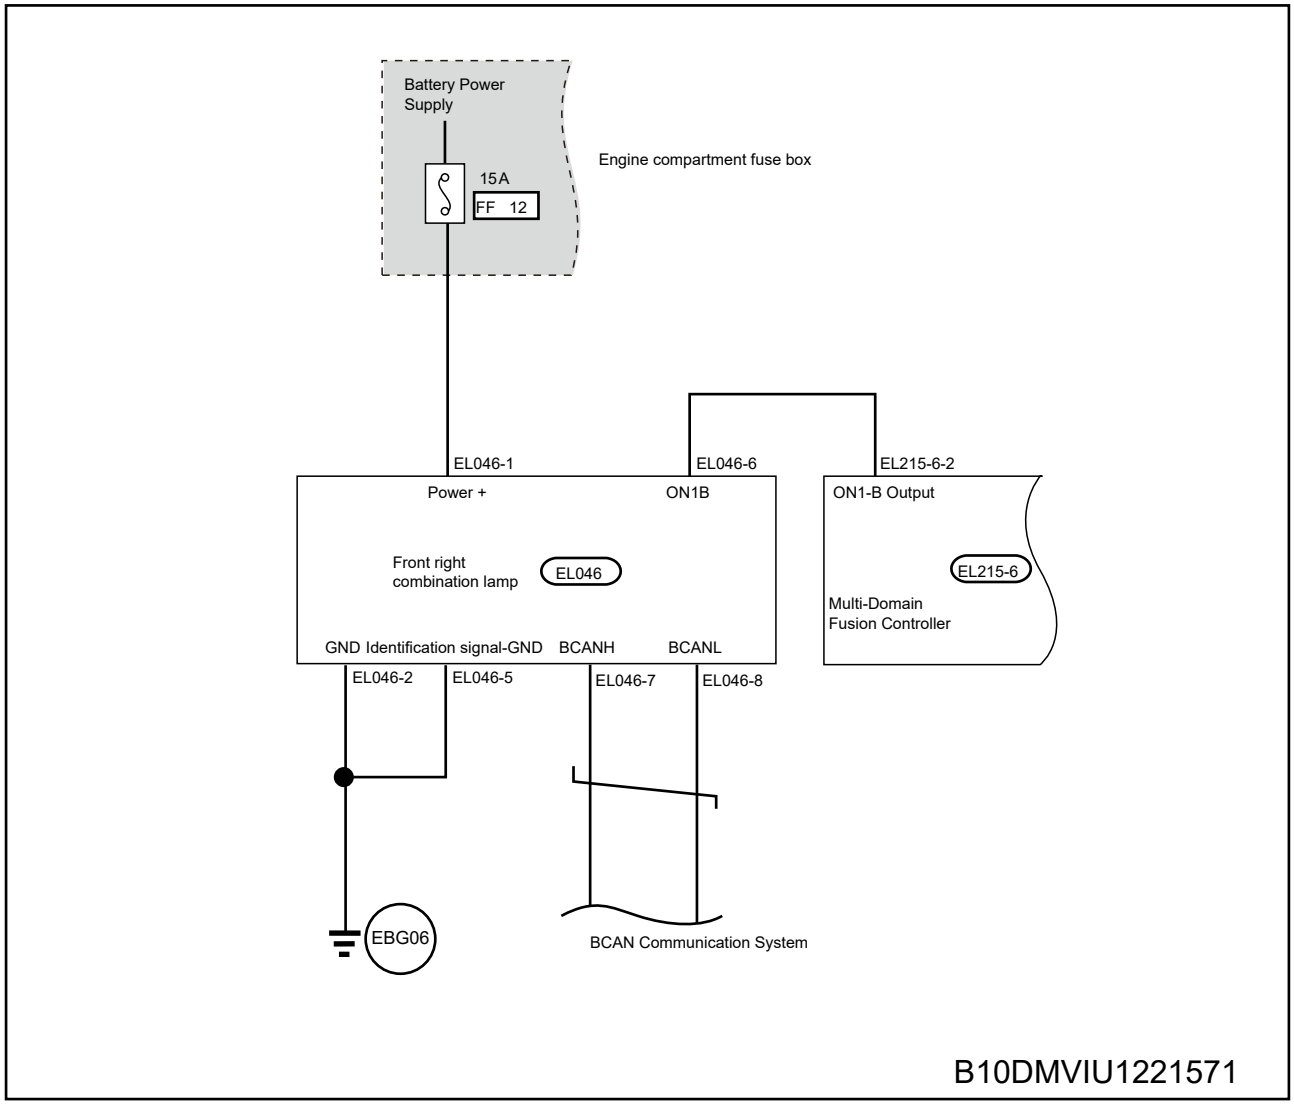
Yes 》》》
Go to step 7.

Step 7 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》》》 System normal.

Next 》》》
Go to step 8.



Step 8 Diagnosis complete.

DTC: B131216-VIU

Fault code	Description
B131216	Supply voltage of the right headlamp turn signal lamp LED is below t he threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply and ground of the front right combination lamp.	
	A Check whether the power supply and ground of the right front combination lamp are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the right front combination lamp and the right front position, tur n, and daytime running lamp assembly.	
	A Check whether the wiring harness between the right fron t combination lamp and the right front position, turn, and d aytime running lamp assembly is normal.
	No 》 》 》 Inspect the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right turn signal daytime running light assembly.	
	A Replace the front right position, turn signal, and daytime running lamp assembly. B After replacing the right front turn signal and daytime ru nning light assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B121355-VIU

Fault code	Description
B121355	BCM EOL not configured

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Reconfigure the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to execute the multi-domain fusion controller co nfiguration procedure. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

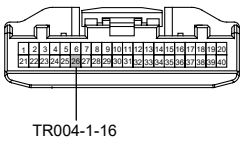
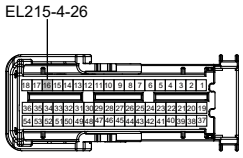
DTC: B120D15-VIU

Fault code	Description
B120D15	Crash signal open or shorted to power





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes 》 》 》 Go to step 2.	
Step 2 Check the crash signal circuit between the airbag control module assembly and the multi-domain fu sion controller.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221078 TR004-1 Airbag Control Module Assembly  B10DMVIU1221079	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of harness connect or TR004-1 of the airbag control module assembly and ter minal 26 of harness connector EL215-4 of the multi-domai n fusion controller to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue. F. Connect the negative terminal of the battery and power on the vehicle. G Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 26 of harness conne ctor EL215-4 of the multi-domain fusion controller and the body ground is normal. Voltage standard value: 0V H Confirm whether the voltage value meets the standard v alue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 3.	
Step 3 Check the power and ground wire harness of the airbag control module assembly.	
	A Check whether the power and ground wiring harness of t he airbag control module assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly.

© 2026, All rights reserved

	B After replacing the airbag control module assembly, is th e fault eliminated?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

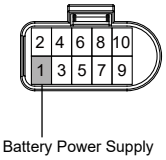
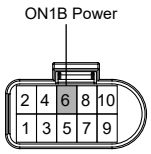
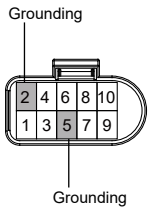
DTC: B130A17-VIU

Fault code	Description
B130A17	Right headlamp BUCK-BOOST power supply voltage exceeds the thre shold



1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

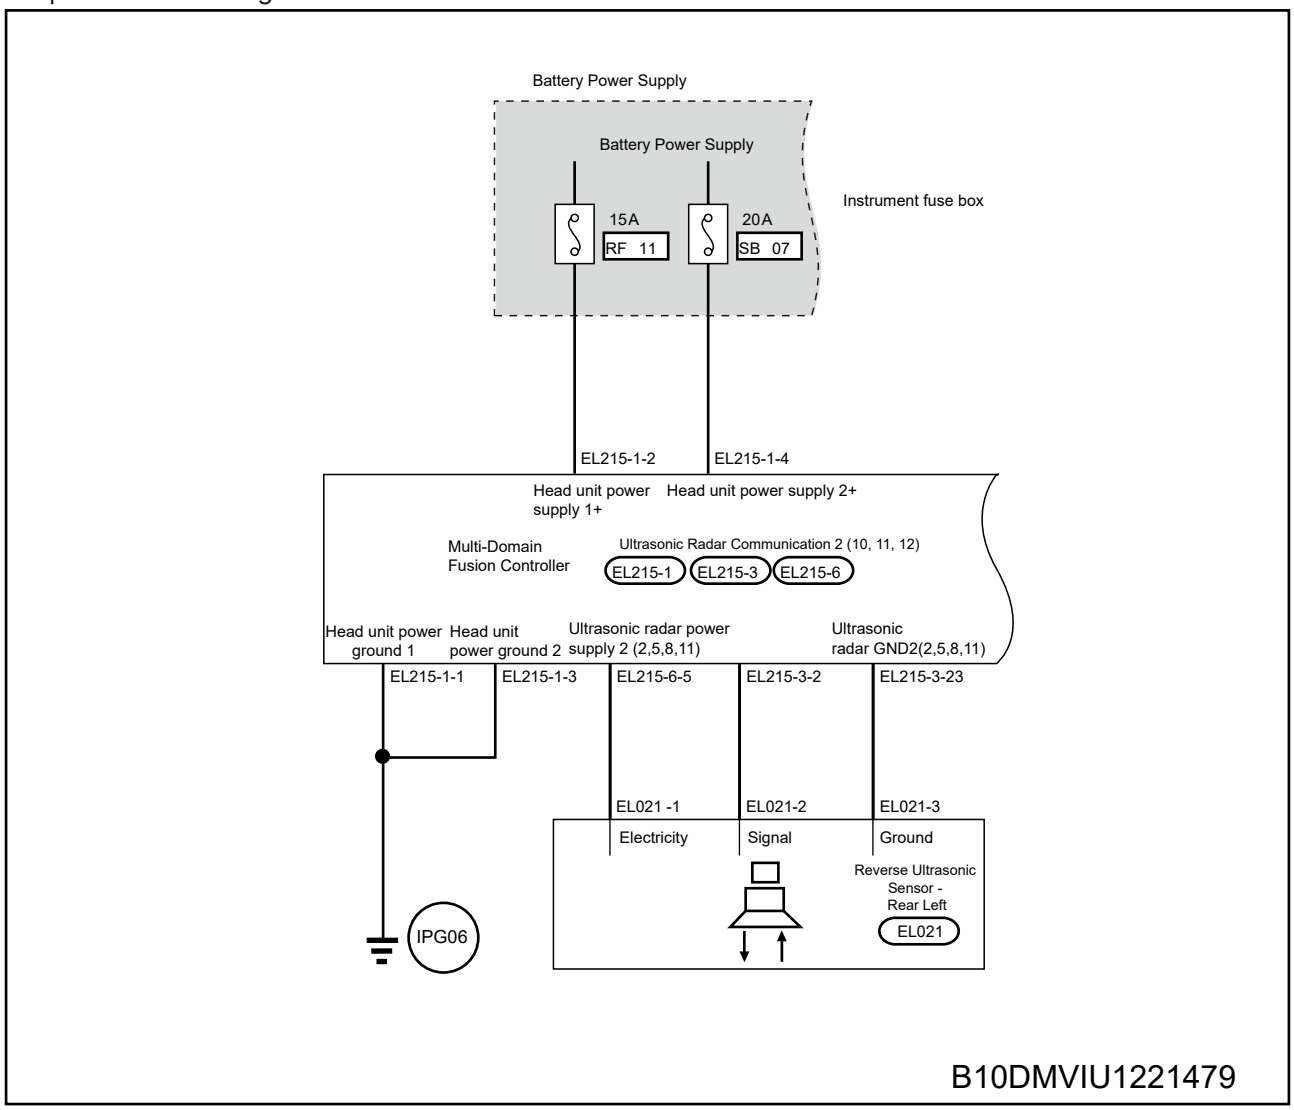
© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the front right combination lamp.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the right front combination lamp fuse FF12. Fuse specification: FF12 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the battery power supply of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221572	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right front combination lamp. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminal 1 of the wire harness connector EL046 of the right front combination lamp and the body ground to check whether the voltage is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Check the ON1B power supply of the front right combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221573	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 6 of the wire harness con nector EL046 for the right front combination lamp and the vehicle body ground to check whether it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Inspect and repair the ON1B power supply.
	Yes 》 》 》 Go to step 6.
Step 6 Check the ground wire harness of the right front combination lamp.	
EL046 Front right combination lamp  B10DMVIU1221574	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL046 of the right fron t combination lamp. C. Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminals 2 and 5 of the harness connector EL046 for the right front combination la mp and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

© 2026, All rights reserved

DTC: B140A00-VIU

Fault code	Description
B140A00	Rear left ultrasonic sensor ringing abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the reverse ultrasonic sensor - rear left.	
	A Check for objects in the close range around the rear left p eriphery of the reverse ultrasonic sensor.
	Yes 》 》 》 Remove the object and re-detect.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultr asonic sensor.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear left is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear left.	
	A Replace the reversing ultrasonic sensor - rear left. B Replace the reversing ultrasonic sensor - rear left, is the f ault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

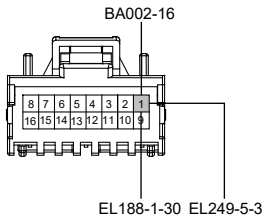
DTC: B121611-VIU

Fault code	Description
B121611	ON1-A short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

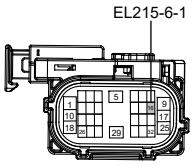
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

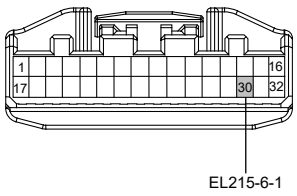
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



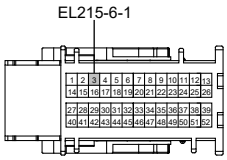
Step 2 Check the ON1A output circuit.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221055

BA002 Power Battery Pack Assembly



B10DMVIU1221056

EL188-1 Telematics Main Unit

B10DMVIU1221057

EL249-5 Main Zone Controller

B10DMVIU1221058

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL188-1 of the t elematics host.
D Disconnect the wiring harness connector EL249-5 of the main zone controller.
E Disconnect the wiring harness connector BA002 of the po wer battery pack assembly.
F. Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of wire harnes s connector EL215-6 of the multi-domain fusion controller and terminal 30 of wire harness connector EL188-1 of the t elematics host is normal.
G. Use a multimeter, select the resistance range, and measu re the resistance between terminal 1 of harness connector EL215-6 of the multi-domain fusion controller and terminal 3 of harness connector EL249-5 of the main zone controller to check if it is normal.
H Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of the wire ha rness connector EL215-6 of the multi-domain fusion contr oller and terminal 16 of the wire harness connector BA002 of the power battery pack assembly is normal.
Resistance standard value: Less than 1 Ω
I. Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 1 of the wire ha rness connector EL215-6 of the multi-domain fusion contr oller and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
J Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

© 2026, All rights reserved

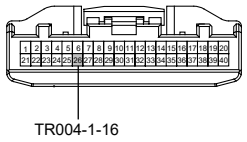
	Yes》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.	

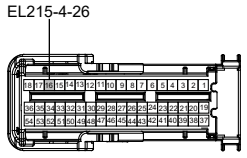
© 2026, All rights reserved

DTC: B120D11-VIU

Fault code	Description
B120D11	Crash signal shorted to ground

1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.

Step 2 Check the crash signal circuit between the airbag control module assembly and the multi-domain fu sion controller.

EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221078 TR004-1 Airbag Control Module Assembly  B10DMVIU1221079	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR004-1 of the airbag control module assembly. C Disconnect the wiring harness connector EL215-4 of the multi-domain fusion controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 16 of harness connect or TR004-1 of the airbag control module assembly and ter minal 26 of harness connector EL215-4 of the multi-domai n fusion controller to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 26 of the wire harness co nnector EL215-4 of the multi-domain fusion controller and the body ground to check whether it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	

Step 3 Check the power and ground wire harness of the airbag control module assembly.

	A Check whether the power and ground wiring harness of t he airbag control module assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	

Step 4 Replacement of airbag control module assembly

	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is th e fault eliminated?
Yes》》》 System normal.	

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B130209-VIU

Fault code	Description
B130209	Right headlamp low beam LED board NTC fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply and ground of the front right combination lamp.	
	A Check whether the power supply and ground of the right front combination lamp are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.	

© 2026, All rights reserved

DTC: B131A09-VIU

Fault code	Description
B131A09	Right headlamp signal lamp LED board NTC fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply and ground of the front right combination lamp.	
	A Check whether the power supply and ground of the right front combination lamp are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the right front combination lamp and the right front position, tur n, and daytime running lamp assembly.	
	A Check whether the wiring harness between the right fron t combination lamp and the right front position, turn, and d aytime running lamp assembly is normal.
	No 》 》 》 Inspect the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front right turn signal daytime running light assembly.	
	A Replace the front right position, turn signal, and daytime running lamp assembly. B After replacing the right front turn signal and daytime ru nning light assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replace the front right combination lamp.	
	A Replace the front right combination lamp. B After replacing the right front combination lamp, is the fa ult cleared?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

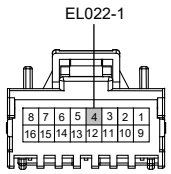
DTC: B140B1C-VIU

Fault code	Description
B140B1C	Abnormal voltage of rear left center ultrasonic sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

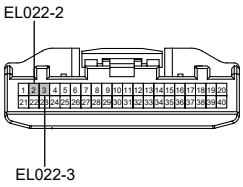
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

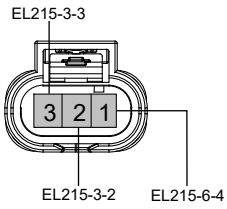
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221484

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221485

EL022 Reverse Ultrasonic Sensor - Rear Left Center

B10DMVIU1221486

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL022 in the reverse ultrasonic sensor - rear left.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 4 of harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of harness connector EL022 of the reversing ultrasonic sensor - rear left, and check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of wire harness connector EL022 of the rear left reversing ultrasonic sensor to check whether it is normal.
F Use a multimeter, set it to the resistance range, and measure whether the resistance value between terminal 3 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL022 of the reversing ultrasonic probe - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear left center reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear left center.
B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: B140B08-VIU

Fault code	Description
B140B08	Rear Left Center Ultrasonic Sensor Communication Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear left middle is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the rear left center reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear left center. B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

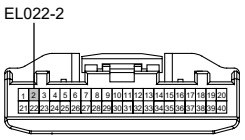
DTC: B140B11-VIU

Fault code	Description
B140B11	Rear left center ultrasonic sensor short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

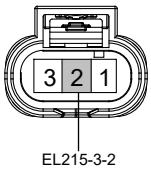
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221517

EL022 Reverse Ultrasonic Sensor - Rear Left Center

B10DMVIU1221518

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector EL022 in the reverse ultrasonic sensor - rear left.
D. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of wire harness connector EL022 of the reversing ultrasonic sensor - rear left is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 2 of the wire harness connector EL022 of the rear left reversing ultrasonic sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure whether the voltage between terminal 2 of the harness connector EL022 of the rear left reversing ultrasonic sensor and the body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear left center reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear left center.
B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?

Yes》》》 System normal.

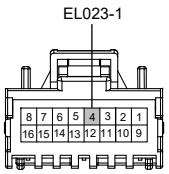
© 2026, All rights reserved

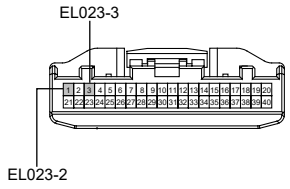
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

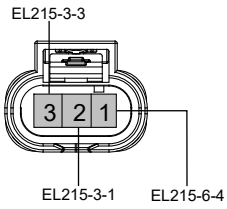
© 2026, All rights reserved

DTC: B140C96-VIU

Fault code	Description
B140C96	Rear right middle ultrasonic sensor hardware fault







1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.	
EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221488 EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221489 EL023 Reverse Ultrasonic Sensor - Rear Right Center  B10DMVIU1221490	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller. C Disconnect the wiring harness connector EL023 of the rear right reversing ultrasonic sensor. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal. E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 1 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal. F Use a multimeter set to the resistance range to check whether the resistance between terminal 3 of harness connector EL215-3 on the multi-domain fusion controller and terminal 3 of harness connector EL023 on the rear right reverse ultrasonic sensor is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the reversing ultrasonic sensor - rear right center.	
	A Replace the reversing ultrasonic sensor - Rear Right Middle. B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B140B98-VIU

Fault code	Description
B140B98	Abnormal temperature of rear left center ultrasonic sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ambient temperature around the vehicle.	
	A Check whether the ambient temperature around the vehicle is too high or too low.
Yes》》》 Move the vehicle to a location with a normal temperature, wait for a period of time, and then recheck.	
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear left middle is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the rear left center reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear left center. B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the reversing ultrasonic sensor - rear right center.	
	A Check whether the reverse ultrasonic sensor - rear right center is covered with rain, snow, or foreign objects.
	Yes》》》 Remove foreign objects and clean the probe surface.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear right center.	
	A Replace the reversing ultrasonic sensor - Rear Right Middle. B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

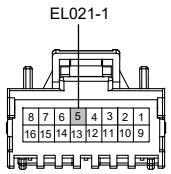
DTC: B140A13-VIU

Fault code	Description
B140A13	Rear left ultrasonic sensor open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

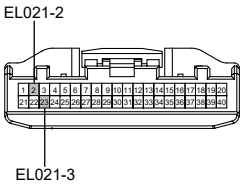
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

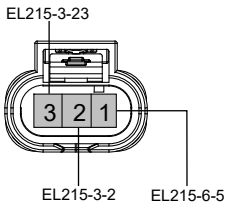
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221480

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221481

EL021 Reverse Ultrasonic Sensor-Rear Left

B10DMVIU1221482

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL021 of the rear left reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of wire harness connector EL021 of the rear left reversing ultrasonic sensor to check if the resistance value is normal.
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 2 of the multi-domain fusion controller harness connector EL215-3 and terminal 2 of the reversing ultrasonic sensor - rear left harness connector EL021 is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance between terminal 23 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL021 of the reversing ultrasonic sensor - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear left.

A Replace the reversing ultrasonic sensor - rear left.
B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

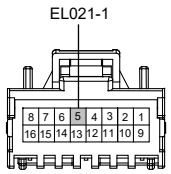
DTC: B140A1C-VIU

Fault code	Description
B140A1C	Rear left ultrasonic sensor voltage abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

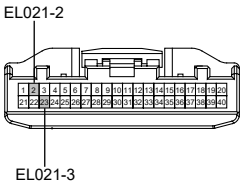
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

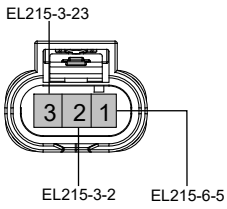
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221480

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221481

EL021 Reverse Ultrasonic Sensor-Rear Left

B10DMVIU1221482

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL021 of the rear left reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of wire harness connector EL021 of the rear left reversing ultrasonic sensor to check if the resistance value is normal.
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 2 of the multi-domain fusion controller harness connector EL215-3 and terminal 2 of the reversing ultrasonic sensor - rear left harness connector EL021 is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance between terminal 23 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL021 of the reversing ultrasonic sensor - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear left.

A Replace the reversing ultrasonic sensor - rear left.
B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B140C98-VIU

Fault code	Description
B140C98	Rear right center ultrasonic sensor temperature abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ambient temperature around the vehicle.	
	A Check whether the ambient temperature around the vehicle is too high or too low.
Yes》》》 Move the vehicle to a location with a normal temperature, wait for a period of time, and then recheck.	
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear right center.	
	A Replace the reversing ultrasonic sensor - Rear Right Middle. B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

B140C08	Rear right middle ultrasonic sensor communication fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear right center.	
	A Replace the reversing ultrasonic sensor - Rear Right Middle. B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B140B44-VIU

Fault code	Description
B140B44	Failed to write initialization data for rear left center ultrasonic sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle, reinitialize, and check whether the fault is cl eared.
	Yes 》》》 System normal.
	No 》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic se nsor - Rear Left Middle.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear left middle is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the rear left center reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear left center. B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B140D00-VIU

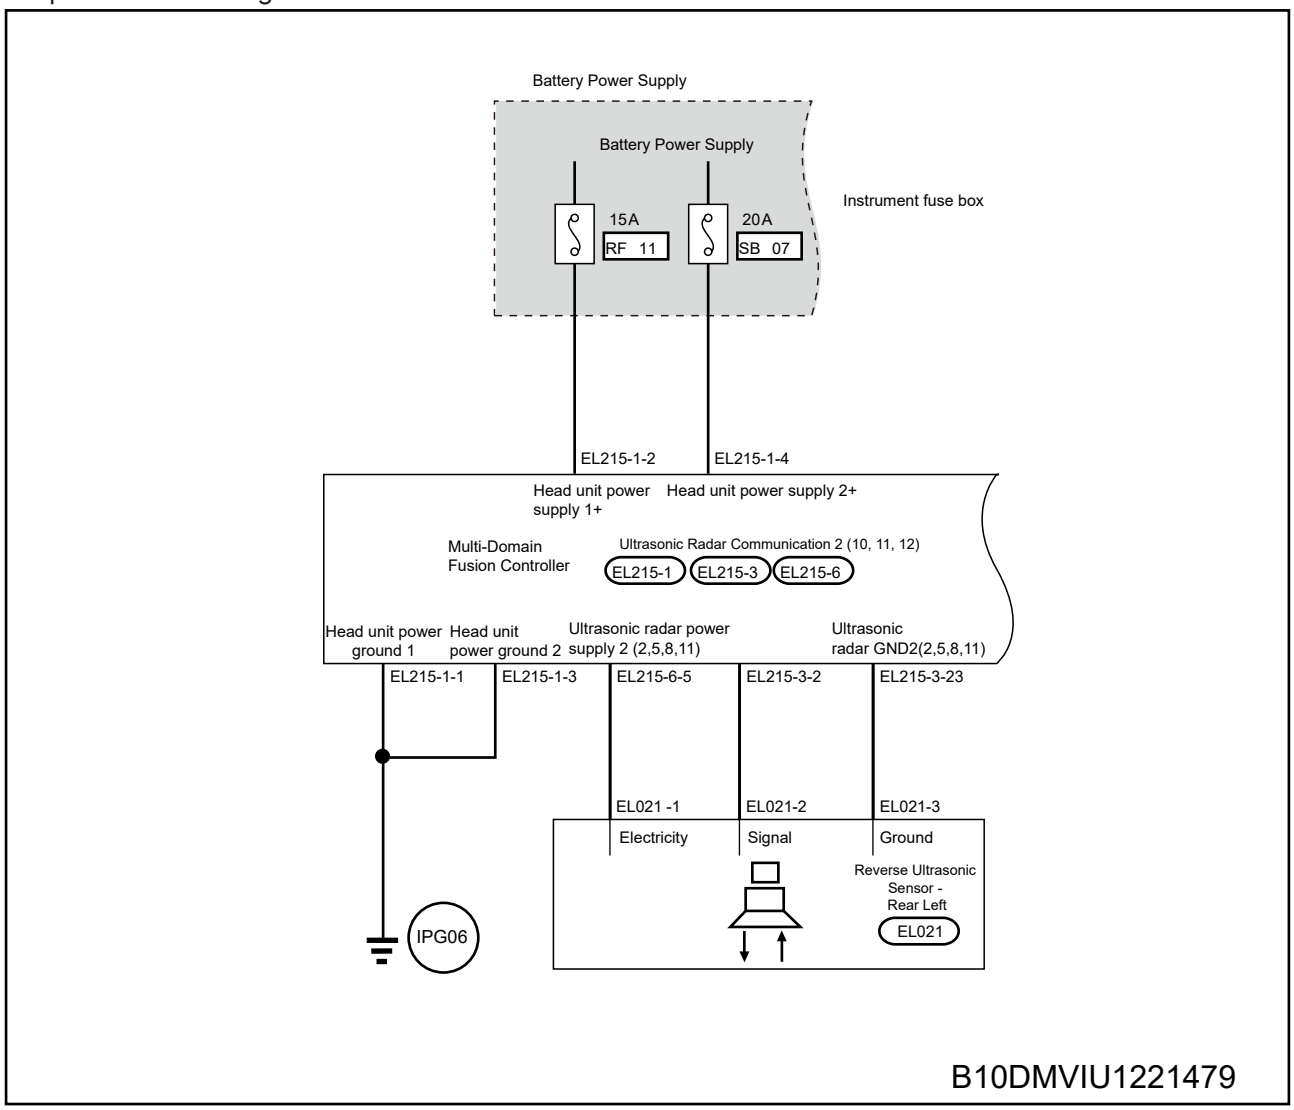
Fault code	Description
B140D00	Abnormal Residual Vibration of the Rear Right Ultrasonic Sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the reverse ultrasonic sensor - rear right.	
	A Check the reversing ultrasonic sensor - rear right periphe ral close range for objects.
Yes》》》 Remove the object and re-detect.	
No》》》 Go to step 3.	
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ult rasonic sensor.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear right is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the rear right reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear Right. B Replace the reverse ultrasonic sensor - rear right, is the f ault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

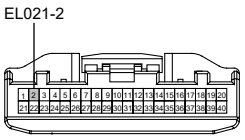
DTC: B140A11-VIU

Fault code	Description
B140A11	Rear left ultrasonic sensor short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

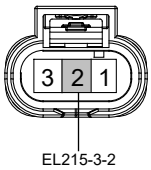
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221515

EL021 Reverse Ultrasonic Sensor-Rear Left

B10DMVIU1221516

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL021 of the rear left reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 2 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL021 of the reversing ultrasonic sensor - rear left is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of the wiring harness connector EL021 for the rear left reversing ultrasonic sensor and the vehicle body ground is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure the voltage between terminal 2 of the harness connector EL021 for the rear left reversing ultrasonic sensor and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear left.

A Replace the reversing ultrasonic sensor - rear left.
B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: B140A44-VIU

Fault code	Description
B140A44	Rear left ultrasonic sensor initialization data write failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle, reinitialize, and check whether the fault is cl eared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultr asonic sensor.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear left is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear left.	
	A Replace the reversing ultrasonic sensor - rear left. B Replace the reversing ultrasonic sensor - rear left, is the f ault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

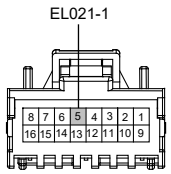
DTC: B140A96-VIU

Fault code	Description
B140A96	Rear Left Ultrasonic Sensor Hardware Fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

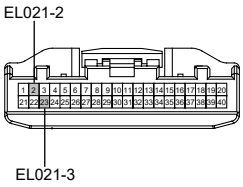
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

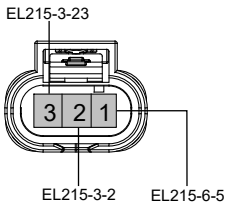
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221480

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221481

EL021 Reverse Ultrasonic Sensor-Rear Left

B10DMVIU1221482

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL021 of the rear left reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of wire harness connector EL021 of the rear left reversing ultrasonic sensor to check if the resistance value is normal.
E Use a multimeter set to the resistance range to measure whether the resistance between terminal 2 of the multi-domain fusion controller harness connector EL215-3 and terminal 2 of the reversing ultrasonic sensor - rear left harness connector EL021 is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance between terminal 23 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL021 of the reversing ultrasonic sensor - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear left.

A Replace the reversing ultrasonic sensor - rear left.
B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

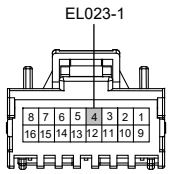
DTC: B140C13-VIU

Fault code	Description
B140C13	Rear Right Middle Ultrasonic Sensor Open Circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

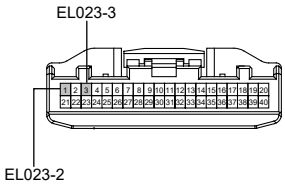
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

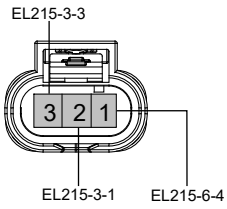
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221488

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221489

EL023 Reverse Ultrasonic Sensor
- Rear Right Center

B10DMVIU1221490

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL023 of the rear right reversing ultrasonic sensor.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal.
E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 1 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal.
F Use a multimeter set to the resistance range to check whether the resistance between terminal 3 of harness connector EL215-3 on the multi-domain fusion controller and terminal 3 of harness connector EL023 on the rear right reverse ultrasonic sensor is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear right center.

A Replace the reversing ultrasonic sensor - Rear Right Middle.
B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B140A98-VIU

Fault code	Description
B140A98	Abnormal temperature of rear left ultrasonic sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ambient temperature around the vehicle.	
	A Check whether the ambient temperature around the vehicle is too high or too low.
Yes》》》 Move the vehicle to a location with a normal temperature, wait for a period of time, and then recheck.	
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear left reversing ultrasonic sensor.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear left is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the reversing ultrasonic sensor - rear left.	
	A Replace the reversing ultrasonic sensor - rear left. B Replace the reversing ultrasonic sensor - rear left, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

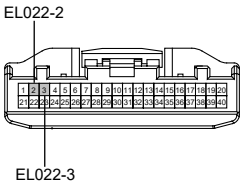
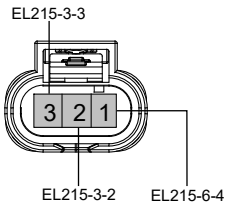
Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221484

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221485

EL022 Reverse Ultrasonic Sensor - Rear Left Center

B10DMVIU1221486

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL022 in the reverse ultrasonic sensor - rear left.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 4 of harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of harness connector EL022 of the reversing ultrasonic sensor - rear left, and check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of wire harness connector EL022 of the rear left reversing ultrasonic sensor to check whether it is normal.
F Use a multimeter, set it to the resistance range, and measure whether the resistance value between terminal 3 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL022 of the reversing ultrasonic probe - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear left center reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear left center.
B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

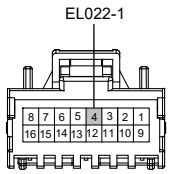
DTC: B140B96-VIU

Fault code	Description
B140B96	Rear left center ultrasonic sensor hardware fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

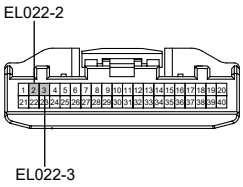
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

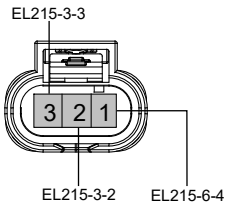
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - Rear Left Middle.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221484

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221485

EL022 Reverse Ultrasonic Sensor
- Rear Left Center

B10DMVIU1221486

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL022 in the reverse ultrasonic sensor - rear left.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 4 of harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of harness connector EL022 of the reversing ultrasonic sensor - rear left, and check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of wire harness connector EL022 of the rear left reversing ultrasonic sensor to check whether it is normal.
F Use a multimeter, set it to the resistance range, and measure whether the resistance value between terminal 3 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL022 of the reversing ultrasonic probe - rear left is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear left center reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear left center.
B Replace the reverse ultrasonic sensor - Rear Left Center Rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

EL215-6 Multi-Domain Fusion Controller  B10DMVIU1221488 EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221489 EL023 Reverse Ultrasonic Sensor - Rear Right Center  B10DMVIU1221490	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller. C Disconnect the wiring harness connector EL023 of the rear right reversing ultrasonic sensor. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal. E. Use a multimeter, select the resistance range, and measure whether the resistance between terminal 1 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL023 of the rear right reversing ultrasonic sensor is normal. F Use a multimeter set to the resistance range to check whether the resistance between terminal 3 of harness connector EL215-3 on the multi-domain fusion controller and terminal 3 of harness connector EL023 on the rear right reverse ultrasonic sensor is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the reversing ultrasonic sensor - rear right center.	
	A Replace the reversing ultrasonic sensor - Rear Right Middle. B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

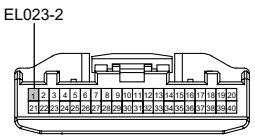
DTC: B140C11-VIU

Fault code	Description
B140C11	Rear right middle ultrasonic sensor short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

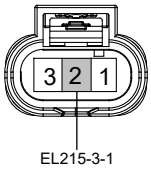
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right middle.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221519

EL023 Reverse Ultrasonic Sensor
- Rear Right Center

B10DMVIU1221520

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL023 of the rear right reversing ultrasonic sensor.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 1 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL023 of the reversing ultrasonic sensor - rear right is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of harness connector EL023 in the rear right reversing ultrasonic sensor and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 2 of harness connector EL023 in the rear right reversing ultrasonic sensor and the vehicle body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

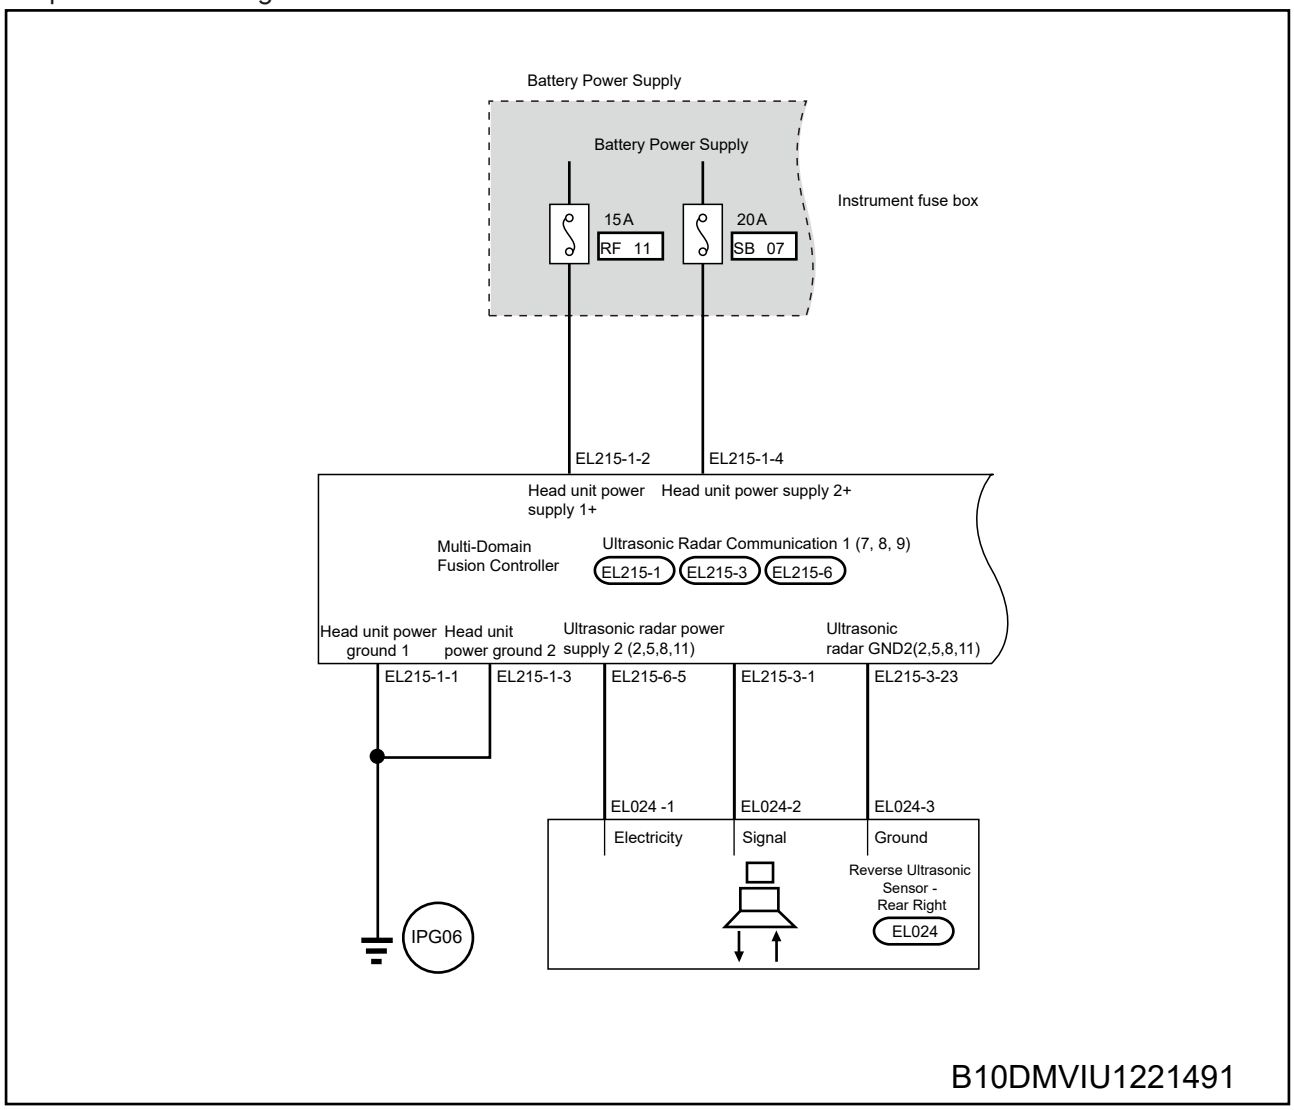
No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the reversing ultrasonic sensor - rear right center.

A Replace the reversing ultrasonic sensor - Rear Right Middle.
B Replace the reversing ultrasonic sensor - rear right middle and rear, is the fault cleared?

© 2026, All rights reserved



Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 5.	
Step 5 Diagnosis complete.	

© 2026, All rights reserved

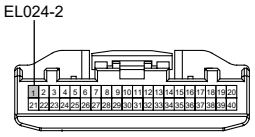
DTC: B140D11-VIU

Fault code	Description
B140D11	Rear right ultrasonic sensor short circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

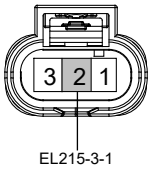
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ultrasonic sensor.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221521

EL024 Reverse Ultrasonic Sensor - Rear Right

B10DMVIU1221522

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL024 of the rear right reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 1 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL024 of the reversing ultrasonic probe - rear right is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the wiring harness connector EL024 for the rear right reversing ultrasonic sensor and the vehicle body ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and measure whether the voltage between terminal 2 of the wiring harness connector EL024 for the rear right reversing ultrasonic sensor and the vehicle body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear right reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear Right.
B Replace the reverse ultrasonic sensor - rear right, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

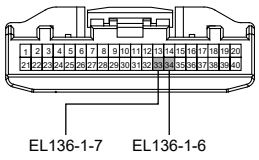
DTC: B180A38-VIU

Fault code	Description
B180A38	CCM outer end high voltage cable detection signal abnormal

1. Simplified Circuit Diagram

2. Diagnostic Steps

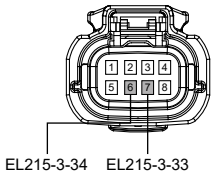
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the interlock signal circuit between the electric compressor assembly and the multi-domain fu sion controller.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221093

EL136-1 Electric Compressor Assembly

B10DMVIU1221094

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector EL136-1 of the el ectric compressor assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 7 of the harness connect or EL136-1 of the electric compressor assembly and termin al 33 of the harness connector EL215-3 of the Multi-Domai n Fusion Controller to check whether it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the electric compresso r assembly harness connector EL136-1 and terminal 34 of t he multi-domain fusion controller harness connector EL215 -3 to check if it is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 33 and 34 of the harn ess connector EL215-3 of the multi-domain fusion controll er and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 33 and 34 of the wire harness connector EL215-3 of the multi-domain fusio n controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground wire harness of the electric compressor assembly.

© 2026, All rights reserved

	A Check whether the power ground wire harness of the ele ctric compressor assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the f ault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B161C54-VIU

Fault code	Description
B161C54	Front left window not learned

1. Simplified Circuit Diagram

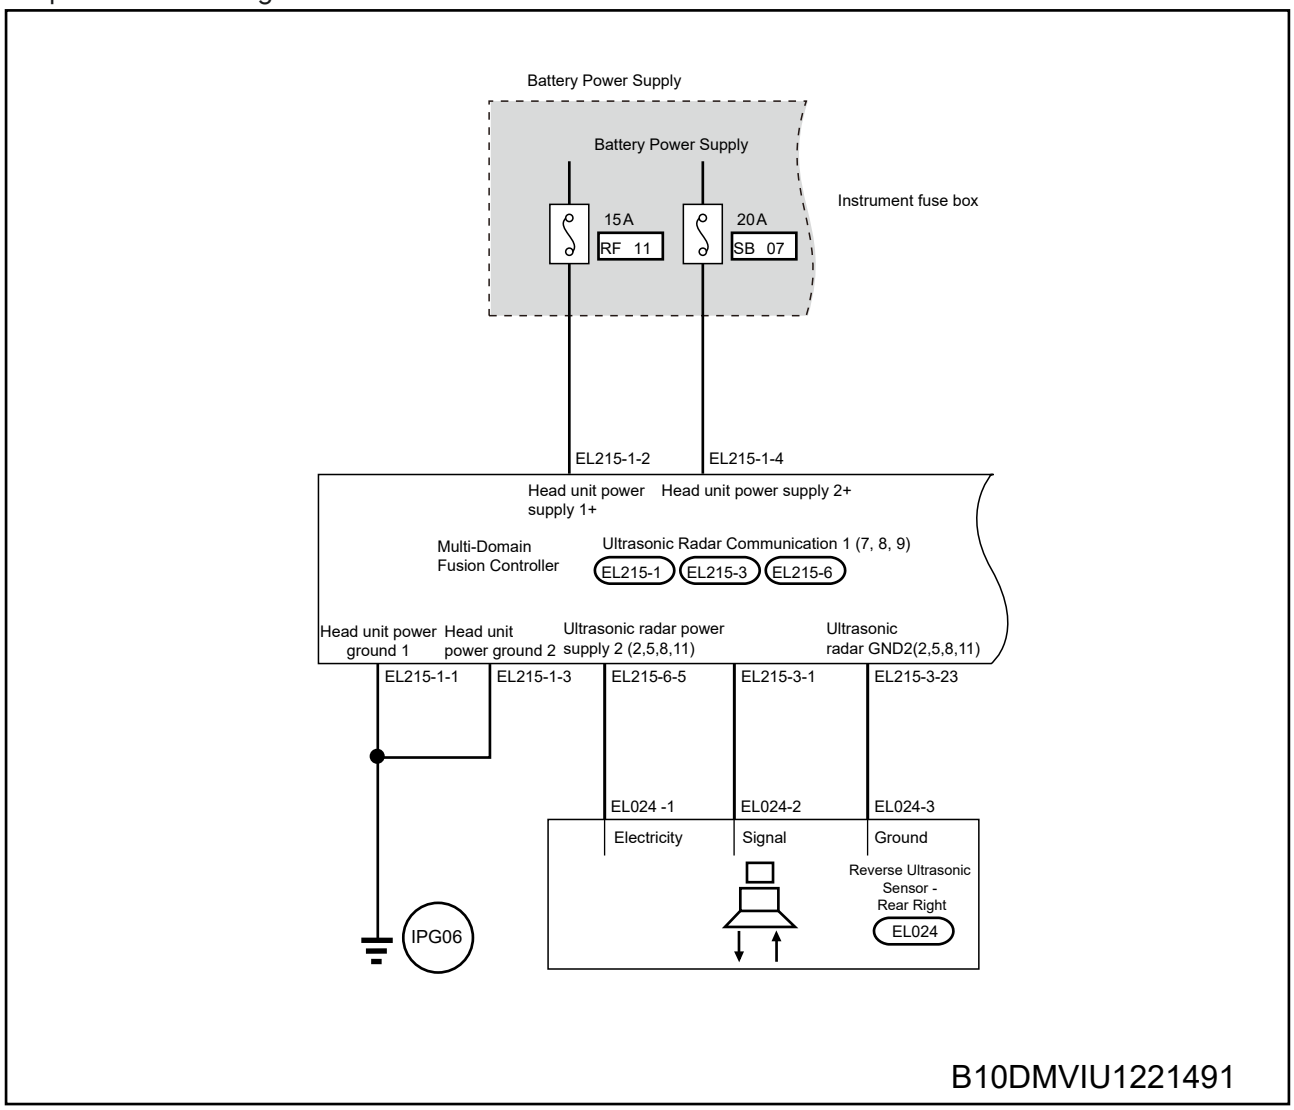
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Relearn the front left window.	
	A Relearn the front left window. B After relearning the front left window, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the driver's window control switch and the master zone controller .	
	A Check whether the wiring harness between the driver sid e window control switch and the main zone controller is nor mal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the wiring harness between the front left door window regulator motor assembly and the mai n zone controller.	
	A Check whether the wiring harness between the front left door window regulator motor assembly and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the driver's window control switch.	
	A Replace the driver's side master window control switch, a nd relearn the left front window. B After replacing the driver's side window control switch an d relearning the left front window, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 6.

© 2026, All rights reserved



Step 6 Replace the front left door window regulator motor assembly.	
	A Replace the front left door window regulator motor assembly, and relearn the front left window. B Replace the front left door window regulator motor assembly, and relearn the front left power window. Is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 7.	
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 8.	
Step 8 Diagnosis complete.

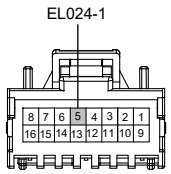
DTC: B140D1C-VIU

Fault code	Description
B140D1C	Rear right ultrasonic sensor voltage abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

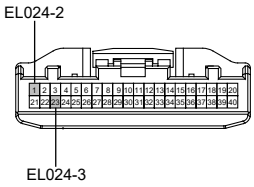
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

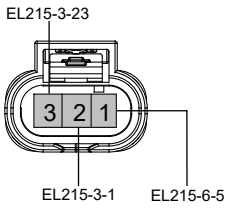
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ultrasonic sensor.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221492

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221493

EL024 Reverse Ultrasonic Sensor - Rear Right

B10DMVIU1221494

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL024 of the rear right reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 5 of harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of harness connector EL024 of the rear right reversing ultrasonic sensor is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 1 of the multi-domain fusion controller harness connector EL215-3 and terminal 2 of the rear right reversing ultrasonic sensor harness connector EL024 is normal.
F Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL024 of the rear right reversing ultrasonic probe is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear right reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear Right.
B Replace the reverse ultrasonic sensor - rear right, is the fault cleared?

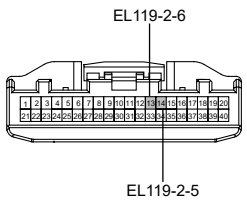
© 2026, All rights reserved

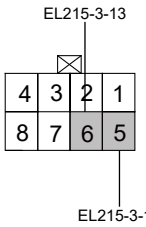
	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.	

© 2026, All rights reserved

DTC: B141C41-VIU

Fault code	Description
B141C41	Verification failed for the request to download USS configuration dat a from the ICU (CRC check)





1. Simplified Circuit Diagram

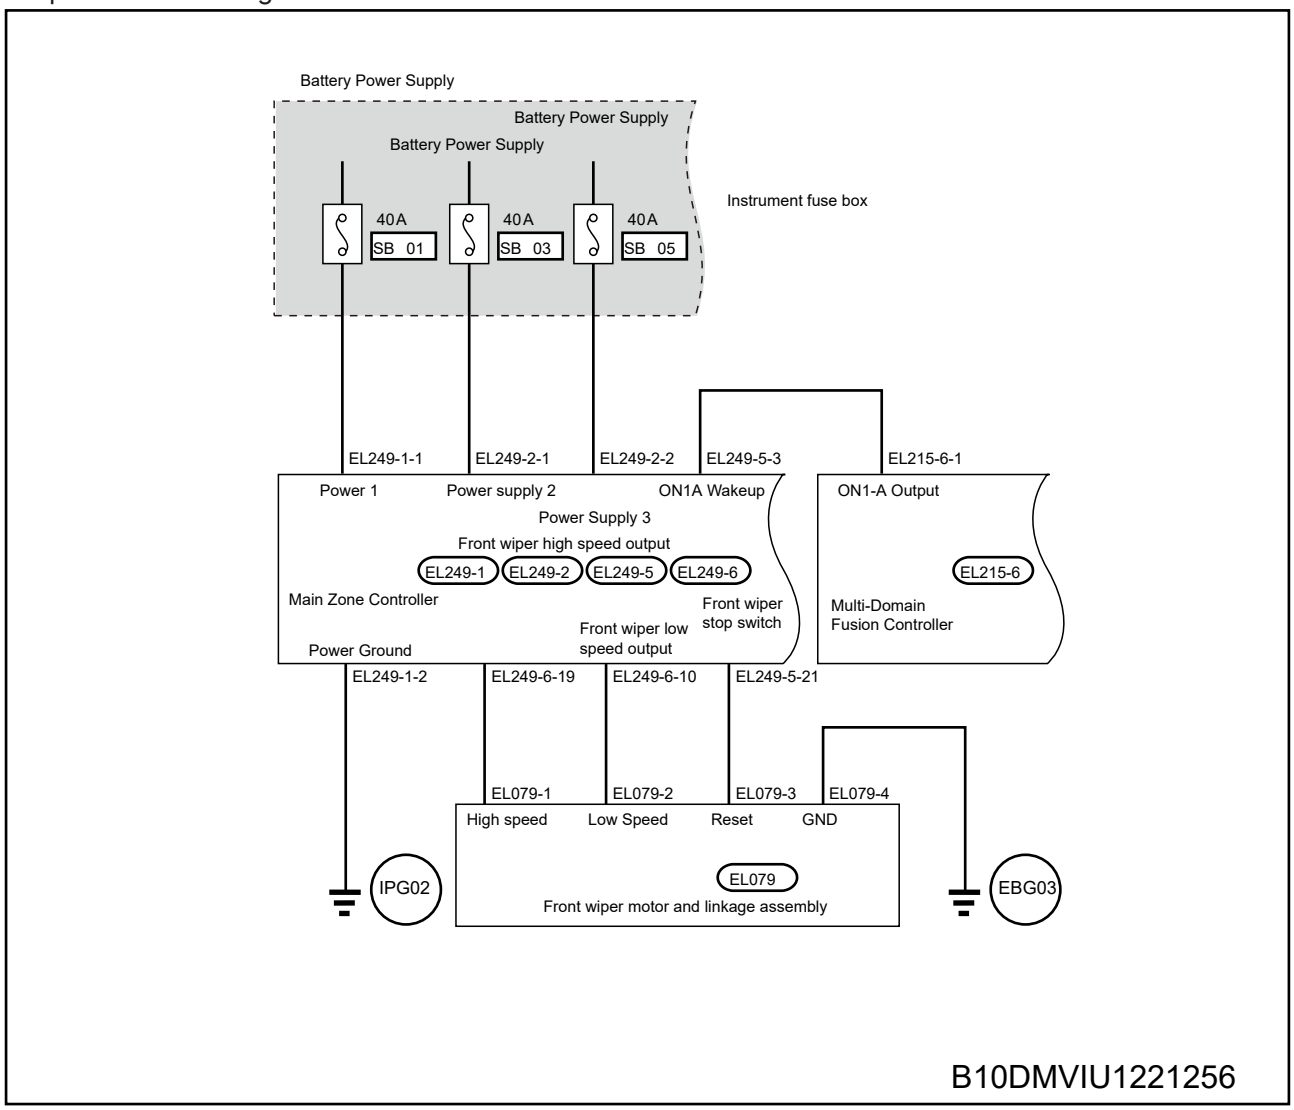
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the CAN wiring harness between the multi-domain fusion controller and the instrument displa y.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221182 EL119-2 Instrument Display  B10DMVIU1221183	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the instrument display harness connector EL1 19-2. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of wire harnes s connector EL215-3 of the multi-domain fusion controller and terminal 5 of wire harness connector EL119-2 of the in strument display is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 13 of harness connect or EL215-3 of the multi-domain fusion controller and termi nal 6 of harness connector EL119-2 of the instrument displ ay screen to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the instrument cluster display.	
	A Check whether the power ground circuit of the instrumen t display is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.

© 2026, All rights reserved



Step 5 Replace the instrument cluster display.	
	A Replace the instrument cluster display. B After replacing the instrument cluster display, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

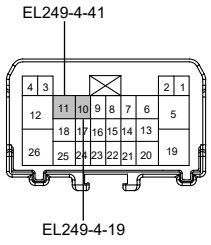
Yes》》》
Go to step 2.



Step 2 Check the wire harness between the fast and slow charging harness connection and the main zone controller.

EL249-4 Main Zone Controller

B10DMVIU1221400

BDX68 Connection to Fast/Slow Charging Harness

B10DMVIU1221401

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the harness connector BDX68 connected to the fast and slow charging harness.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 10 of the wire harness connector BDX68 mated with the AC/DC charging wire harness and terminal 19 of the wire harness connector EL249-4 of the main zone controller is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 11 of wire harness connector BDX68, which mates with the AC/DC charging harness, and terminal 41 of wire harness connector EL249-4 of the main zone controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter, select the resistance range, and measure the resistance between terminals 19 and 41 of the harness connector EL249-4 of the main zone controller and the body ground to check if the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure whether the voltage between terminals 19 and 41 of the harness connector EL249-4 of the main zone controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the fast and slow charging cable assembly.

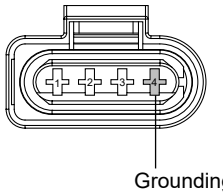
EL079 Front Wiper Motor and Linkage Assembly



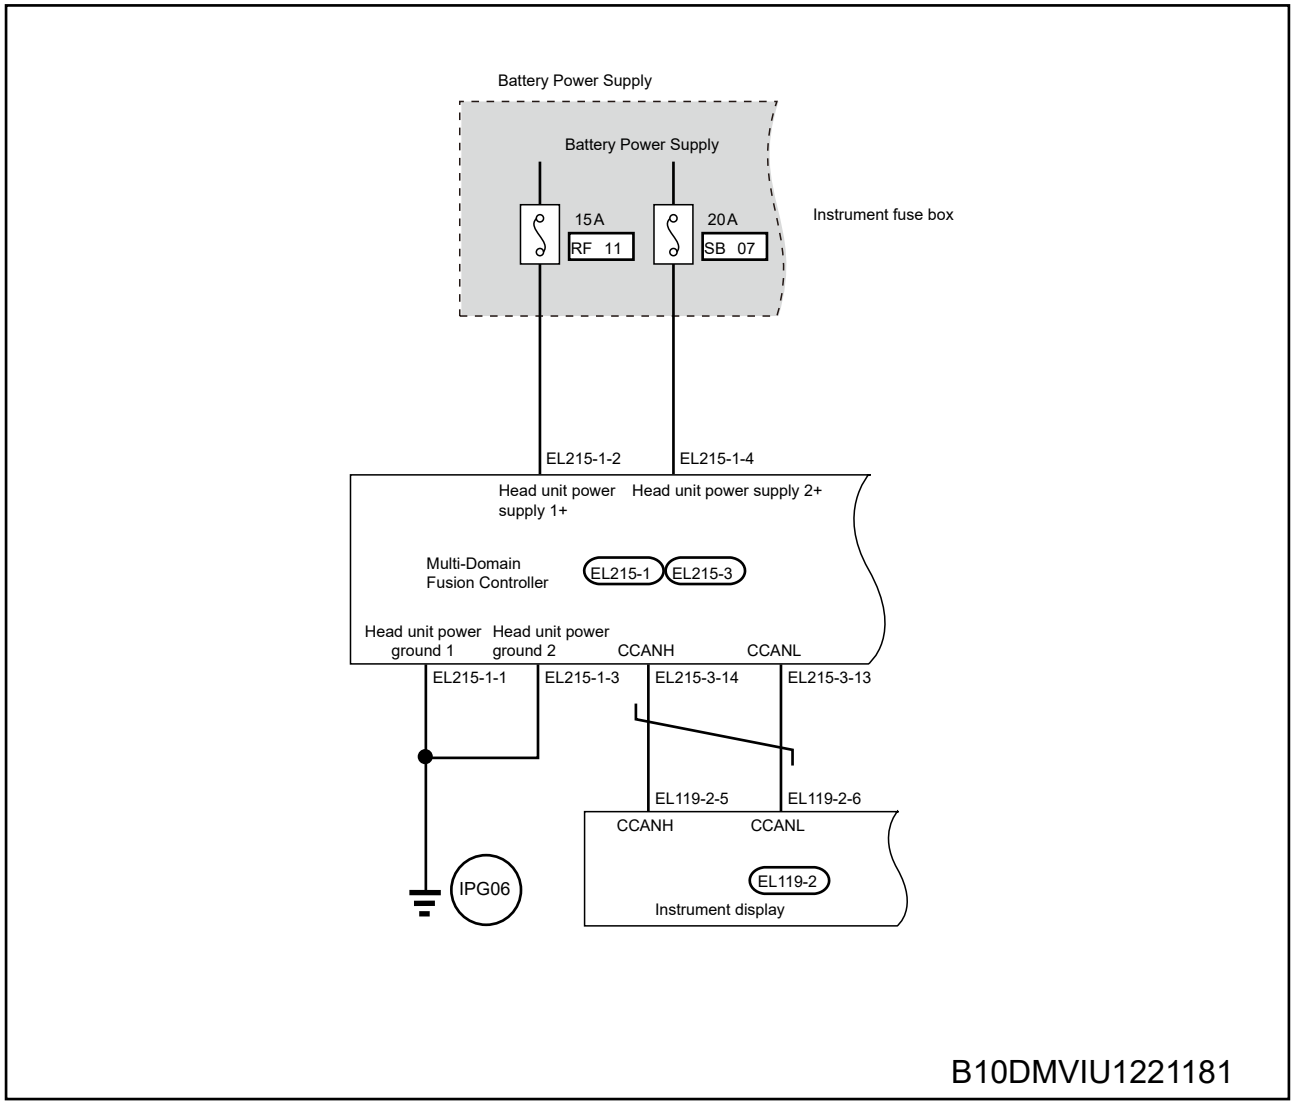
B10DMVIU1221259

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 19 of harness connector EL249-6 of the main zone controller and terminal 1 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between the body ground and terminals 1 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I. Use a multimeter, set it to the DC voltage range, and measure the voltage between terminals 1 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly and the vehicle body ground to check whether it is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

© 2026, All rights reserved



Step 3 Check the ground wire harness of the front wiper motor and linkage assembly.	
EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring ha rness connector EL079 for the front wiper motor and linkag e assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assemb ly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

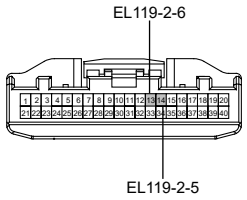
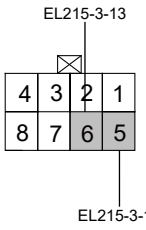
DTC: B141C55-VIU

Fault code	Description
B141C55	Communication failure when requesting ICU to deliver USS configurat ion data.





1. Simplified Circuit Diagram

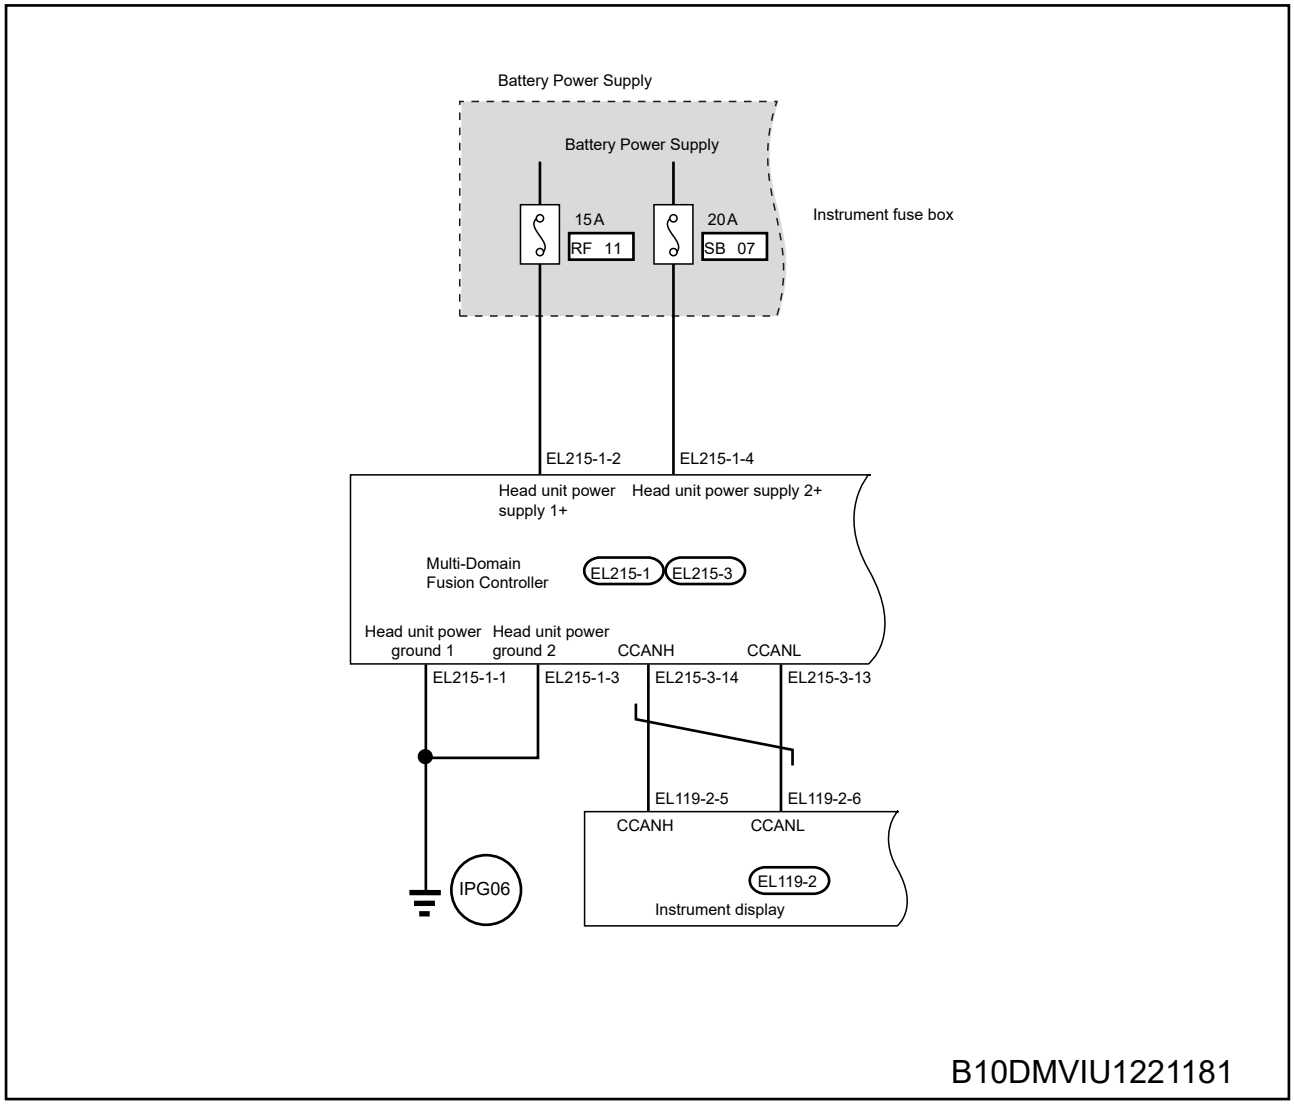
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the CAN wiring harness between the multi-domain fusion controller and the instrument display.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221182 EL119-2 Instrument Display  B10DMVIU1221183	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the instrument display harness connector EL119-2. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 14 of wire harness connector EL215-3 of the multi-domain fusion controller and terminal 5 of wire harness connector EL119-2 of the instrument display is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 6 of harness connector EL119-2 of the instrument display screen to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the instrument cluster display.	
	A Check whether the power ground circuit of the instrument display is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.

© 2026, All rights reserved



Step 5 Replace the instrument cluster display.	
	A Replace the instrument cluster display. B After replacing the instrument cluster display, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B161D54-VIU

Fault code	Description
B161D54	Rear left window not initialized

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Relearn the rear left window.	
	A Relearn the rear left window. B After relearning the rear left window, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the driver side power window control switch, the rear left single door power window control switch, and the main zone controller.	
	A Check whether the wiring harness between the driver side window control switch, the rear left single door window control switch, and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the wiring harness between the rear left door window regulator motor assembly and the main zone controller.	
	A Check whether the wiring harness between the rear left door window regulator motor assembly and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replace the driver's window control switch or the left rear single door window control switch.	
	A Replace the driver side window control switch or the rear left individual window control switch, and relearn the rear left window. B Replace the driver side window control switch or the left rear single door window control switch, and relearn the left rear window. Is the fault cleared?
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replace the rear left door window regulator motor assembly.	
	A Replace the rear left window regulator motor assembly, and relearn the rear left window. B Replace the left rear door window regulator motor assembly, and relearn the left rear window. Is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 7.	
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

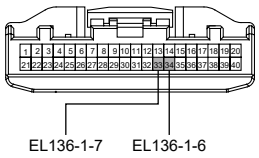
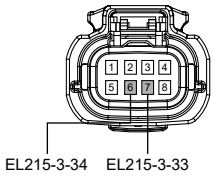
DTC: B180A11-VIU

Fault code	Description
B180A11	CCM outer end high-voltage cable detection signal shorted to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the interlock signal circuit between the electric compressor assembly and the multi-domain fu sion controller.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221093 EL136-1 Electric Compressor Assembly  B10DMVIU1221094	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wire harness connector EL136-1 of the el ectric compressor assembly. C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 7 of the harness connect or EL136-1 of the electric compressor assembly and termin al 33 of the harness connector EL215-3 of the Multi-Domai n Fusion Controller to check whether it is normal. E Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the electric compresso r assembly harness connector EL136-1 and terminal 34 of t he multi-domain fusion controller harness connector EL215 -3 to check if it is normal. Resistance standard value: Less than 1 Ω F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 33 and 34 of the harn ess connector EL215-3 of the multi-domain fusion controll er and the body ground to check if it is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground wire harness of the electric compressor assembly.	
	A Check whether the power ground wire harness of the ele ctric compressor assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly.

© 2026, All rights reserved

	B After replacing the electric compressor assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B140D98-VIU

Fault code	Description
B140D98	Rear Right Ultrasonic Sensor Temperature Abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the ambient temperature around the vehicle.	
	A Check whether the ambient temperature around the vehicle is too high or too low.
Yes》》》 Move the vehicle to a location with a normal temperature, wait for a period of time, and then recheck.	
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ultrasonic sensor.	
	A Check whether the wiring harness between the multi-domain fusion controller and the reversing ultrasonic sensor - rear right is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the rear right reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear Right. B Replace the reverse ultrasonic sensor - rear right, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B160C71-VIU

Fault code	Description
B160C71	Front wiper low speed stall

1. Simplified Circuit Diagram

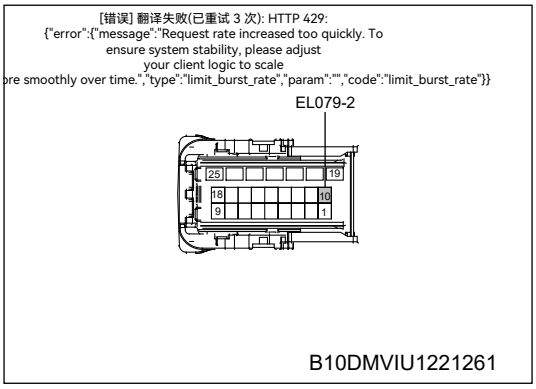
2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

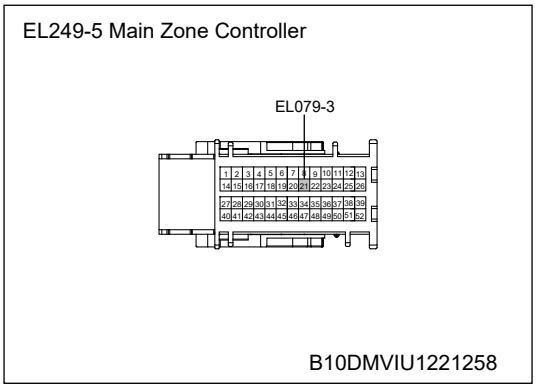
© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

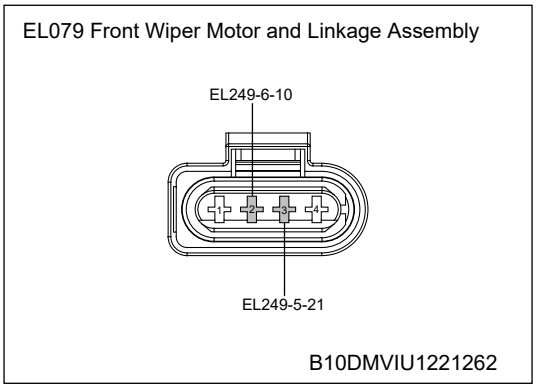
Yes》》》
Go to step 2.



Step 2 Check the front wiper motor and linkage assembly.



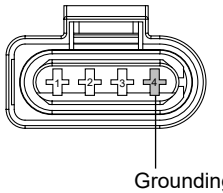
A Check the front wiper motor and linkage assembly for for eign objects causing jamming.



Yes》》》 Remove the foreign object and recheck.

No》》》
Go to step 3.

Step 3 Check the wiring harness between the main zone controller and the front wiper motor and linkage a ssembly.



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 10 of harness connector EL249-6 of the main zone controller and terminal 2 of harn ess connector EL079 of the front wiper motor and linkage a ssembly to check if it is normal.
E. Use a multimeter, select the resistance range, and measu re the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harn ess connector EL079 of the front wiper motor and linkage a ssembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 2 and 3 of the wiring ha rness connector EL079 of the front wiper motor and linkag e assembly and the body ground to check whether the resi stance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminals 2 and 3 of the wiring harn ess connector EL079 for the front wiper motor and linkage assembly and the body ground to check whether the voltag e is normal.

© 2026, All rights reserved

	Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the ground wire harness of the front wiper motor and linkage assembly.	
EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring ha rness connector EL079 for the front wiper motor and linkag e assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assemb ly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

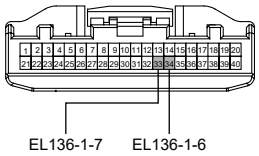
DTC: B180A15-VIU

Fault code	Description
B180A15	CCM Outer End High Voltage Cable Detection Signal Shorted to Power or Open Circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

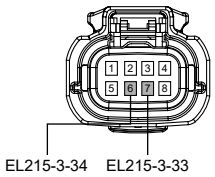
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the interlock signal circuit between the electric compressor assembly and the multi-domain fu sion controller.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221093

EL136-1 Electric Compressor Assembly

B10DMVIU1221094

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wire harness connector EL136-1 of the el ectric compressor assembly.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 7 of the harness connect or EL136-1 of the electric compressor assembly and termin al 33 of the harness connector EL215-3 of the Multi-Domai n Fusion Controller to check whether it is normal.
E Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of the electric compresso r assembly harness connector EL136-1 and terminal 34 of t he multi-domain fusion controller harness connector EL215 -3 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminals 33 and 34 of the wiring harness connector EL215-3 of the multi-domain fusion con troller and the body ground to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground wire harness of the electric compressor assembly.

A Check whether the power ground wire harness of the ele ctric compressor assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the electric compressor assembly.	
	A Replace the electric compressor assembly. B After replacing the electric compressor assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

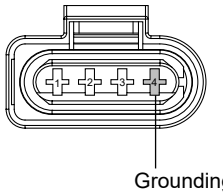
B10DMVIU1221261

EL249-5 Main Zone Controller

B10DMVIU1221258

EL079 Front Wiper Motor and Linkage Assembly



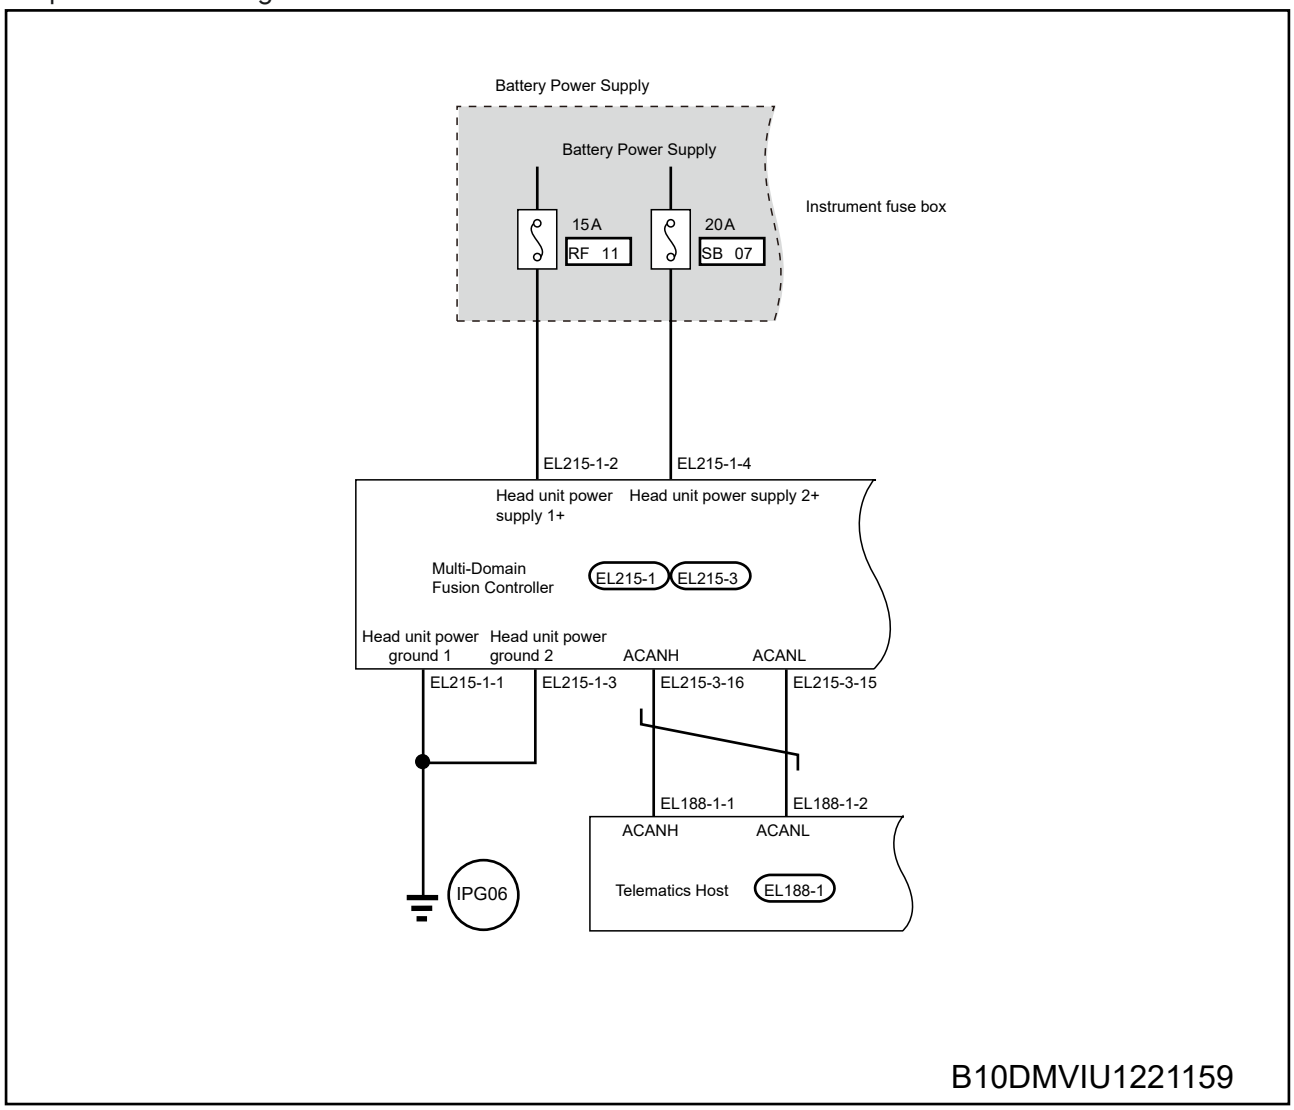
B10DMVIU1221262

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of harness connector EL249-6 of the main zone controller and terminal 2 of harness connector EL079 of the front wiper motor and linkage assembly to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 2 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 2 and 3 of the wiring harness connector EL079 for the front wiper motor and linkage assembly and the body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

© 2026, All rights reserved



Step 3 Check the ground wire harness of the front wiper motor and linkage assembly.	
EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring ha rness connector EL079 for the front wiper motor and linkag e assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assemb ly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

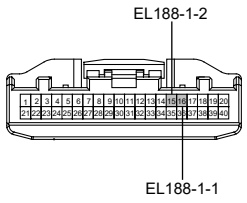
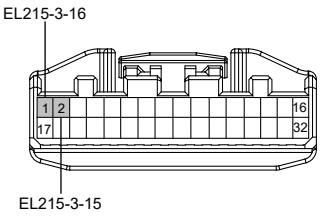
DTC: B1FD861-VIU

Fault code	Description
B1FD861	VIU and TBOX Authentication Failure or Timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the telematics host key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the key of the connected vehi cle host, and check whether it is written correctly.
	No》》》 Rewrite the telematics host key.
	Yes》》》 Go to step 3.
Step 3 Restart the vehicle.	
	A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Check the CAN harness between the multi-domain fusion controller and the telematics host.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221160 EL188-1 Telematics Main Unit  B10DMVIU1221161	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the wiring harness connector EL188-1 of the t elematics host. D Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 16 of harn ess connector EL215-3 of the multi-domain fusion controll er and terminal 1 of harness connector EL188-1 of the T-Bo x host is normal. E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fus ion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Check the power ground circuit of the telematics control unit.	
	A Check whether the power ground circuit of the telematics host is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 7.
Step 7 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

DTC: B141A55-VIU

Fault code	Description
B141A55	Flash read failed

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Rewrite the vehicle model drive parameters.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle and follow the prompts on the diag nostic tool to rewrite the vehicle model drive parameters. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》 》 》 System normal.
	Yes 》 》 》 Go to step 4.
Step 4 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B1FD361-VIU

Fault code	Description
B1FD361	VIU and BMS authentication failure or timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

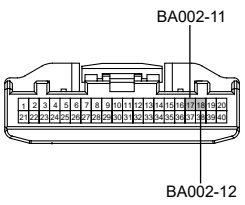
Step 2 Check the traction battery pack assembly key.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the power battery pack assembly key, and check whether it is correctly written.

No》》》 Rewrite the key of the power battery pack assembly.

Yes》》》
Go to step 3.

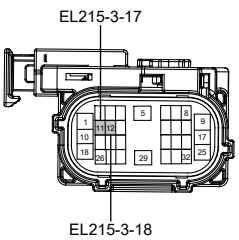
Step 3 Restart the vehicle.



A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.

Yes》》》 System normal.

No》》》
Go to step 4.



Step 4 Check the CAN wiring harness between the multi-domain fusion controller and the power battery pack assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221138

BA002 Power Battery Pack Assembly

B10DMVIU1221139

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 5.
Step 5 Check the power ground circuit of the power battery pack assembly.	
	A Check whether the power ground circuit of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

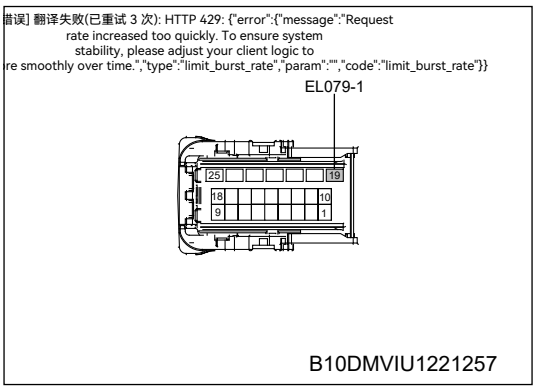
DTC: B160B12-VIU

Fault code	Description
B160B12	Front wiper high speed short to power or open circuit

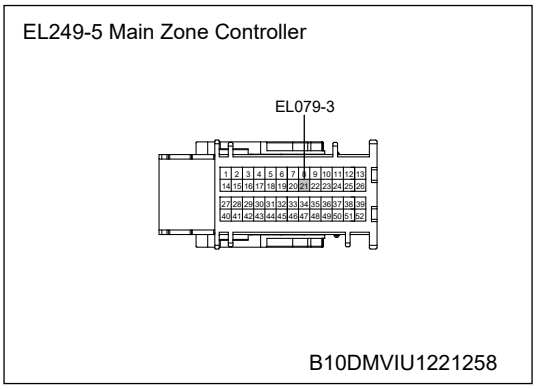
1. Simplified Circuit Diagram

2. Diagnostic Steps



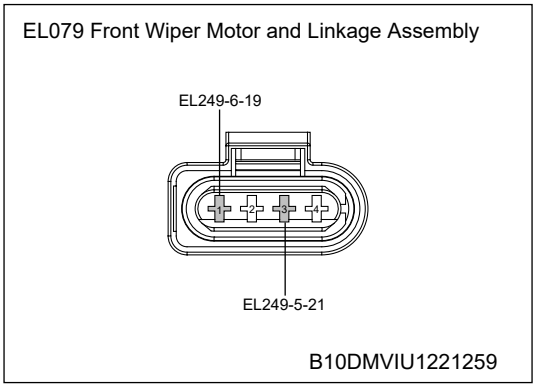
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

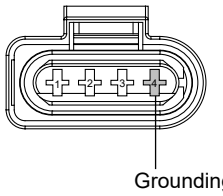


Step 2 Check the wiring harness between the main zone controller and the front wiper motor and linkage assembly.

B10DMVIU1221257

B10DMVIU1221258

B10DMVIU1221259



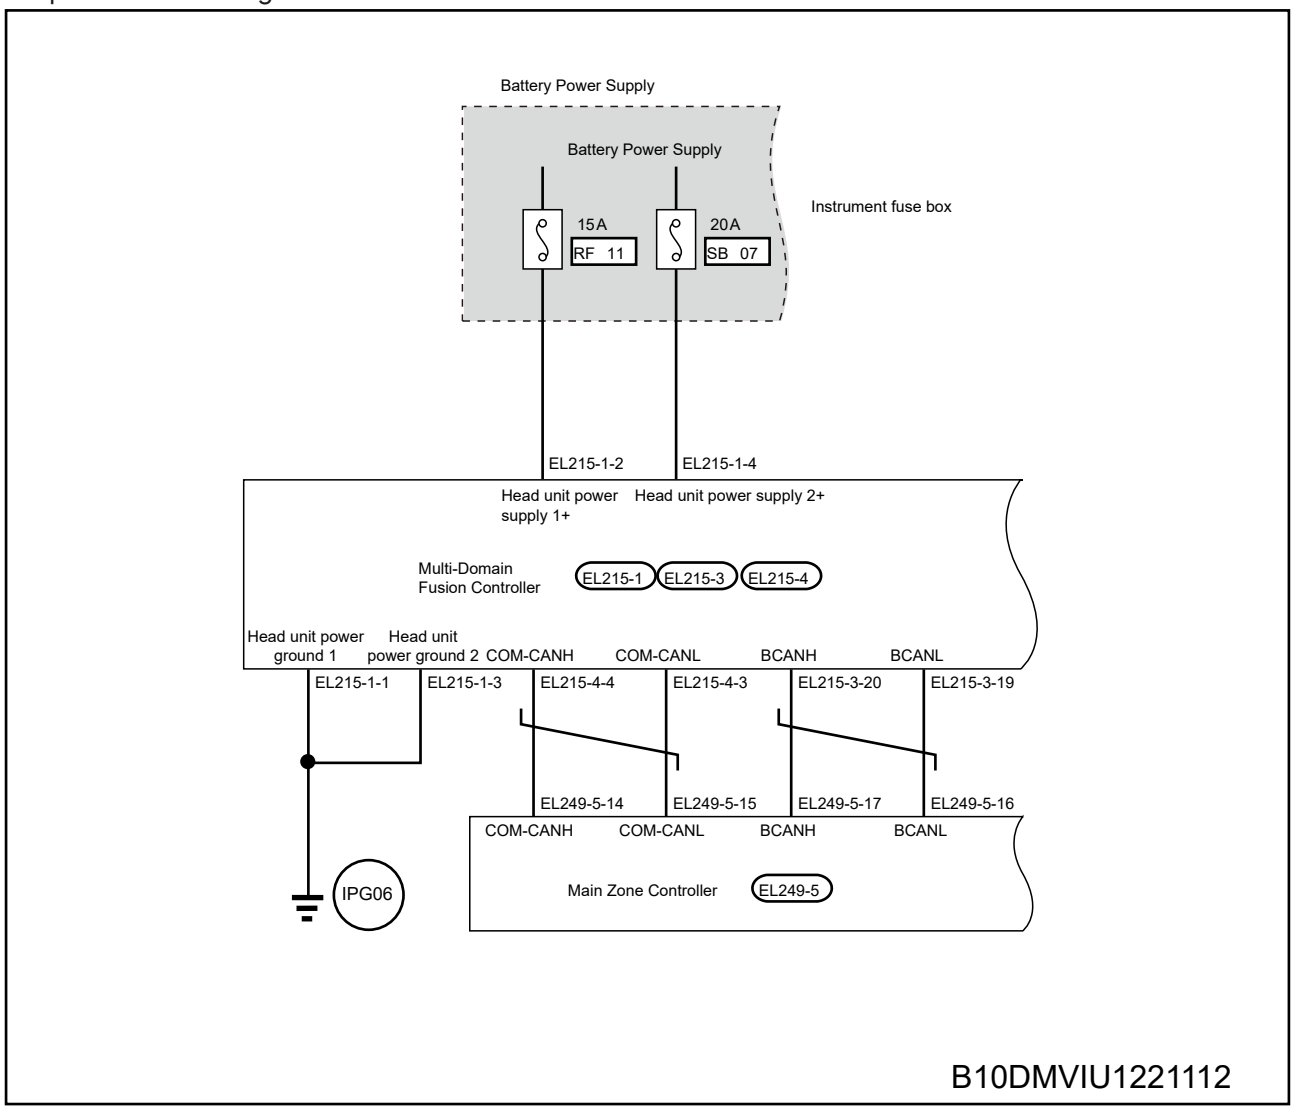
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 19 of harness connector EL249-6 of the main zone controller and terminal 1 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 1 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly and the vehicle body ground is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the front wiper motor and linkage assembly.

© 2026, All rights reserved

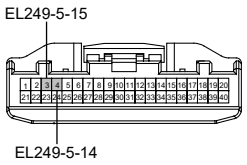


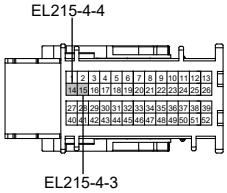
EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring harness connector EL079 for the front wiper motor and linkage assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

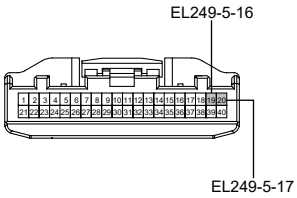
DTC: B1FD761-VIU

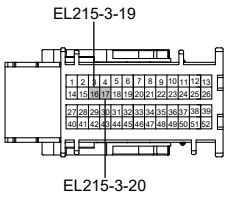
Fault code	Description
B1FD761	VIU and ZCUM authentication failure or timeout





1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the main zone controller key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the main zone controller key, and check whether it is written correctly.
	No》》》 Rewrite the main zone controller key.
	Yes》》》 Go to step 3.
Step 3 Restart the vehicle.	
	A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Check the COM-CAN harness between the Multi-Domain Fusion Controller and the Main Zone Controller.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221113 EL249-5 Main Zone Controller  B10DMVIU1221114	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of harness connector EL215-4 of the multi-domain fusion controller and terminal 14 of harness connector EL249-5 of the main zone controller to check if it is normal. E Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 15 of the wire harness connector EL249-5 of the main zone controller is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 5.
Step 5 Check the BCAN harness between the multi-domain fusion controller and the main zone controller.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221115 EL249-5 Main Zone Controller  B10DMVIU1221116	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 20 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller and terminal 17 of the wire harness connector EL249-5 of the Main Zone Controller to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and check whether the resistance between terminal 19 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 16 of the wire harness connector EL249-5 of the main zone controller is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Check the power ground circuit of the main zone controller.	
	A Check whether the power ground circuit of the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 7.
Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes》》》 System normal.
	No》》》

© 2026, All rights reserved

	Go to step 8.
Step 8 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to Step 9.
Step 9 Diagnosis complete.

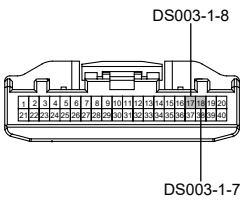
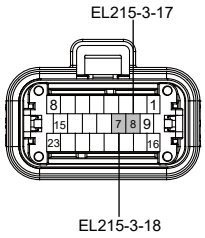
DTC: B1FD261-VIU

Fault code	Description
B1FD261	VIU and VCU Authentication Failure or Timeout



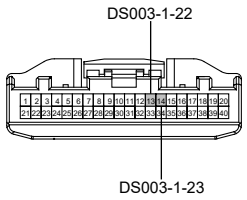


1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the controller assembly key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the controller assembly key, a nd check whether it is written correctly.
No》》》 Rewrite the controller assembly key.	
Yes》》》 Go to step 3.	
Step 3 Restart the vehicle.	
	A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221133 DS003-1 Controller Assembly  B10DMVIU1221134	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the harness connector DS003-1 of the control ler assembly. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller a nd terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal. E. Use a multimeter, select the resistance range, and measu re the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》

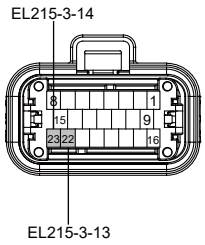
Go to step 5.



Step 5 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

DS003-1 Controller Assembly

B10DMVIU1221136

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 22 of harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 6.

Step 6 Check the power ground circuit of the controller assembly.

A Check whether the power ground circuit of the controller assembly is normal.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 7.

Step 7 Replace the controller assembly.

A Replace the controller assembly.
B After replacing the controller assembly, is the fault eliminated?

Yes 》》》 System normal.

No 》》》
Go to step 8.

Step 8 Replacement of Multi-Domain Fusion Controller.

© 2026, All rights reserved

	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to Step 9.	
Step 9 Diagnosis complete.

DTC: B140D44-VIU

Fault code	Description
B140D44	Failed to write initialization data for the rear right ultrasonic sensor

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power cycle, reinitialize, and check whether the fault is cl eared.
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ult rasonic sensor.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear right is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the rear right reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear Right. B Replace the reverse ultrasonic sensor - rear right, is the f ault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

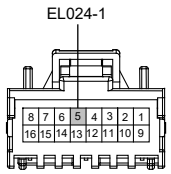
DTC: B140D13-VIU

Fault code	Description
B140D13	Rear right ultrasonic sensor open circuit

1. Simplified Circuit Diagram

2. Diagnostic Steps

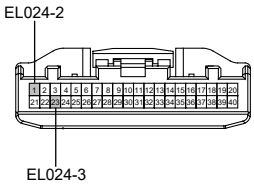
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

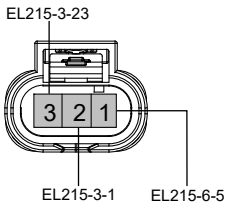
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ultrasonic sensor.

EL215-6 Multi-Domain Fusion Controller



B10DMVIU1221492

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221493

EL024 Reverse Ultrasonic Sensor - Rear Right

B10DMVIU1221494

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL215-3 and EL215-6 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL024 of the rear right reverse ultrasonic sensor.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 5 of harness connector EL215-6 of the multi-domain fusion controller and terminal 1 of harness connector EL024 of the rear right reversing ultrasonic sensor is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 1 of the multi-domain fusion controller harness connector EL215-3 and terminal 2 of the rear right reversing ultrasonic sensor harness connector EL024 is normal.
F Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 23 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL024 of the rear right reversing ultrasonic probe is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Replace the rear right reversing ultrasonic sensor.

A Replace the reversing ultrasonic sensor - Rear Right.
B Replace the reverse ultrasonic sensor - rear right, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B140D97-VIU

Fault code	Description
B140D97	The surface of the rear right ultrasonic sensor is covered

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》》》 Go to step 2.
Step 2 Check the reverse ultrasonic sensor - rear right.	
	A Check whether the rear right reversing ultrasonic sensor i s covered by rain, snow, or foreign objects.
	Yes 》》》 Remove foreign objects and clean the probe surface.
	No 》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the rear right reversing ult rasonic sensor.	
	A Check whether the wiring harness between the multi-do main fusion controller and the reversing ultrasonic sensor - rear right is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Replace the rear right reversing ultrasonic sensor.	
	A Replace the reversing ultrasonic sensor - Rear Right. B Replace the reverse ultrasonic sensor - rear right, is the f ault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

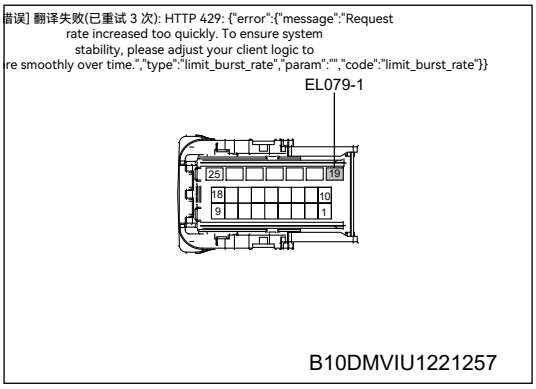
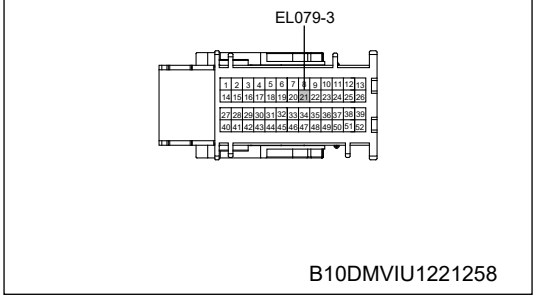
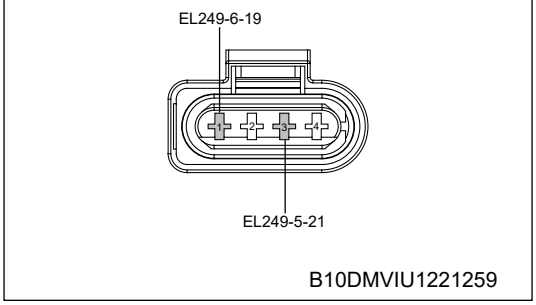
DTC: B160B71-VIU

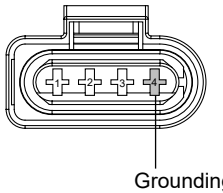
Fault code	Description
B160B71	Front wiper high-speed stall







1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the front wiper motor and linkage assembly.	
	A Check the front wiper motor and linkage assembly for for eign objects causing jamming.
	Yes》》》 Remove the foreign object and recheck.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the main zone controller and the front wiper motor and linkage a ssembly.	
 EL249-5 Main Zone Controller  EL079 Front Wiper Motor and Linkage Assembly 	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller. C Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 19 of harness connector EL249-6 of the main zone controller and terminal 1 of harn ess connector EL079 of the front wiper motor and linkage a ssembly to check whether the resistance value is normal. E. Use a multimeter, select the resistance range, and measu re the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harn ess connector EL079 of the front wiper motor and linkage a ssembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, select the resistance range, and measur e the resistance between the body ground and terminals 1 and 3 of the wiring harness connector EL079 of the front wi per motor and linkage assembly to check whether it is nor mal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue. H. Connect the negative terminal of the battery, and power on the vehicle. I. Use a multimeter, set it to the DC voltage range, and mea sure the voltage between terminals 1 and 3 of the wiring ha rness connector EL079 of the front wiper motor and linkag e assembly and the vehicle body ground to check whether i t is normal.

	Voltage standard value: 0V J Confirm whether the voltage value meets the standard val ue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the ground wire harness of the front wiper motor and linkage assembly.	
EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the fro nt wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring ha rness connector EL079 for the front wiper motor and linkag e assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assemb ly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

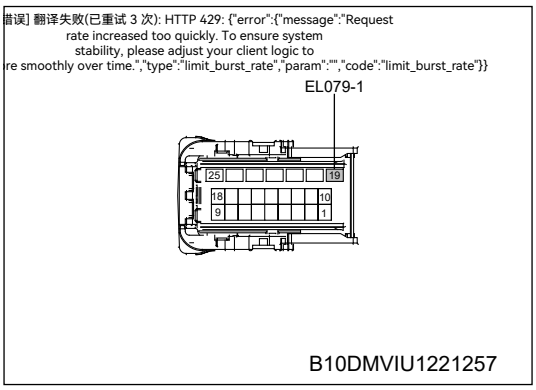
DTC: B162F11-VIU

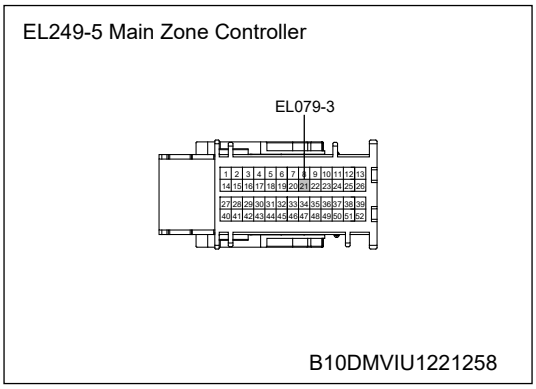
Fault code	Description
B162F11	Front wiper high speed output short to ground

1. Simplified Circuit Diagram

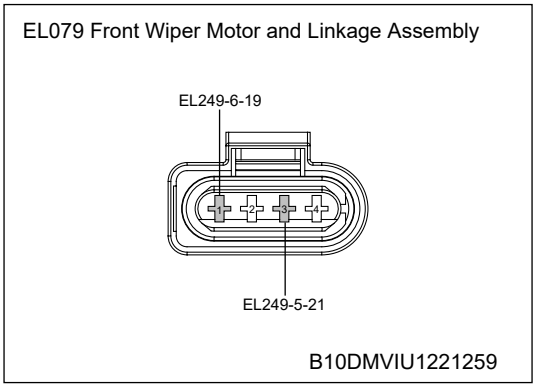
2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



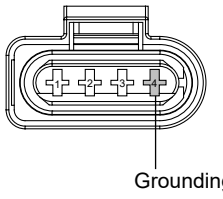
© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the front wiper motor and linkage assembly.



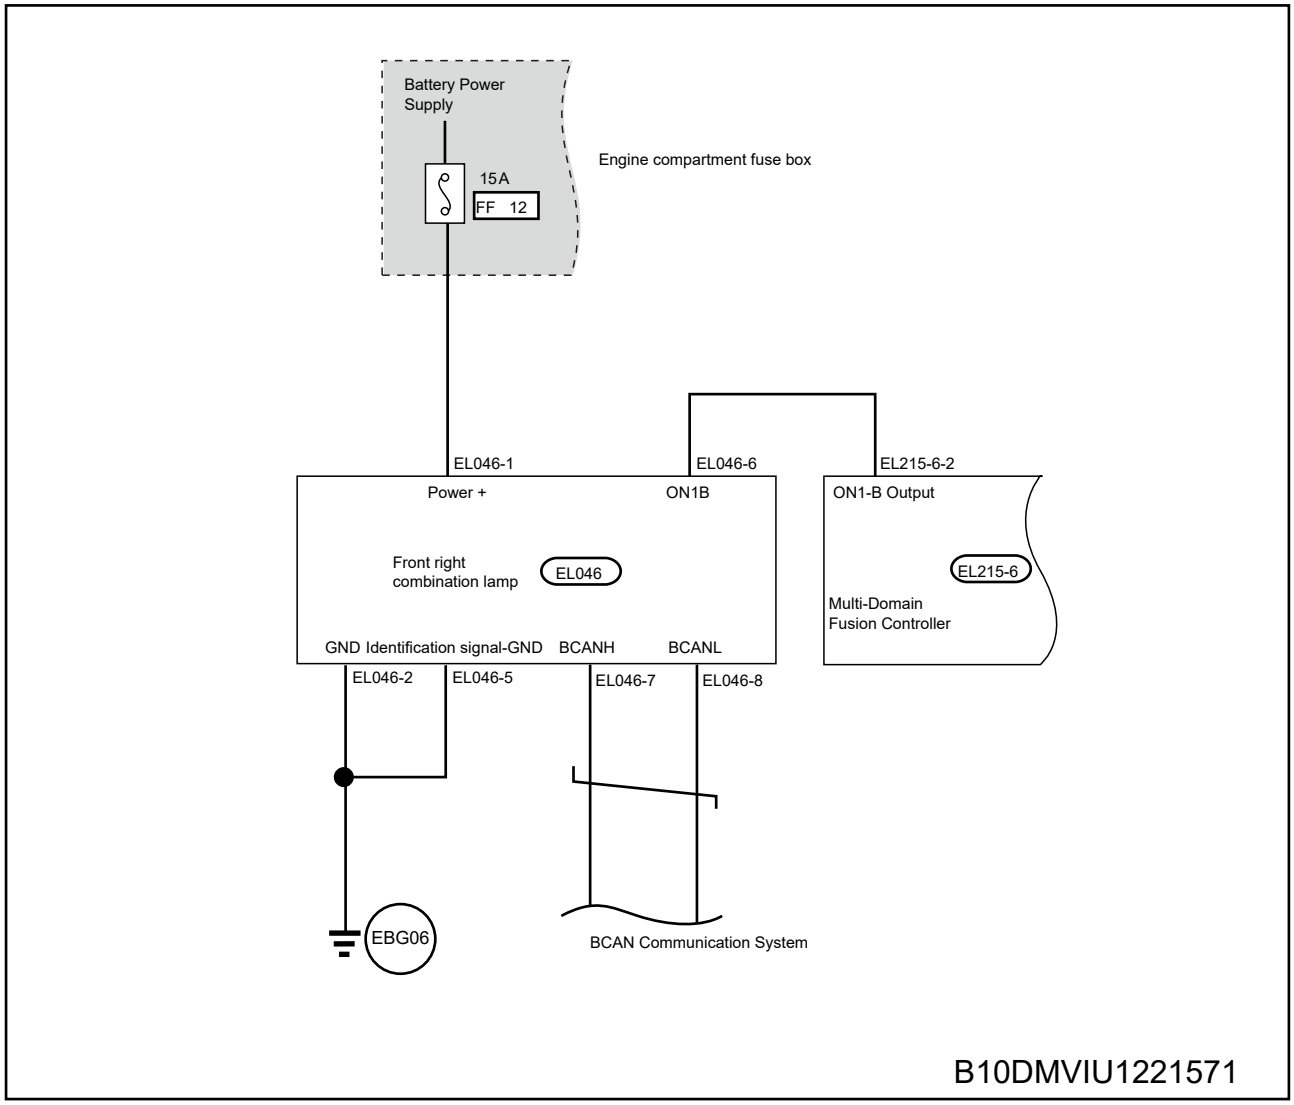
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 19 of harness connector EL249-6 of the main zone controller and terminal 1 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between the body ground and terminals 1 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the front wiper motor and linkage assembly.

© 2026, All rights reserved



EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring harness connector EL079 for the front wiper motor and linkage assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

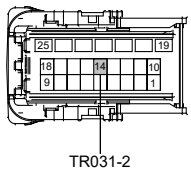
DTC: B160011-VIU

Fault code	Description
B160011	Left exterior rearview mirror adjustment common terminal shorted to ground

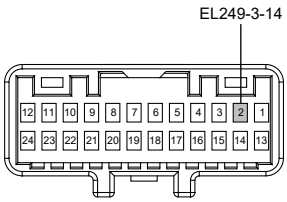
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the left exterior rearview mirror assembly.

EL249-3 Main Zone Controller

B10DMVIU1221213

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221214

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main zone controller.
C Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 14 of harness connector EL249-3 of the main zone controller and terminal 2 of harness connector TR031 of the left outside rearview mirror assembly is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the wiring harness connector EL249-3 of the main zone controller and the vehicle body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror adjustment motor assembly and the left exterior rearview mirror assembly.
A Check the wiring harness between the mirror glass adjustment motor assembly and the left exterior rearview mirror assembly for a short or open circuit.
Yes 》 》 》 Repair or replace the wiring harness.
No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.
A Replace the mirror glass adjustment motor assembly.

© 2026, All rights reserved

	B After replacing the mirror adjustment motor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

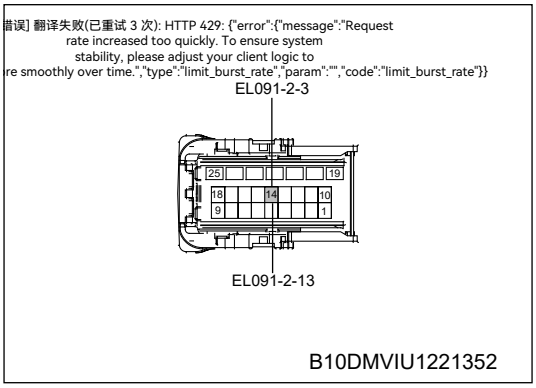
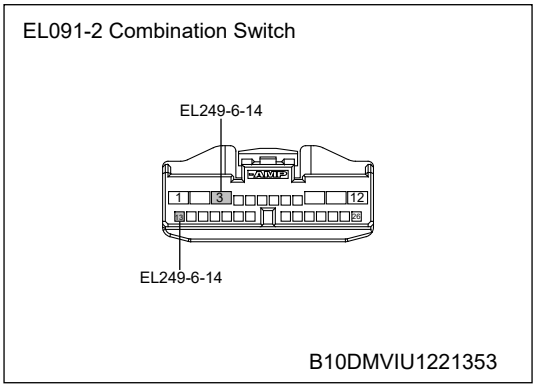
DTC: B145201-VIU

Fault code	Description
B145201	Steering wheel buttons + combination switch + interior rearview mirr or anti-glare power supply short to ground or overcurrent





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply harness between the main zone controller and the combination switch.	
 B10DMVIU1221352  B10DMVIU1221353	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-6 of the main z one controller. C Disconnect the harness connector EL091-2 of the combin ation switch. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 14 of harness connector EL249-6 of the main zone controller and terminal 3 of harn ess connector EL091-2 of the combination switch to check i f it is normal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 14 of harness connector EL249-6 of the main zone controller and terminal 13 of har ness connector EL091-2 of the combination switch to chec k whether it is normal. Resistance standard value: Less than 1 Ω F Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 14 of the Main Zone C ontroller harness connector EL249-6 and the body ground to check whether the resistance value is normal. Standard resistance value: 10kΩ or higher G Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the ground wire harness of the combination switch and the combination switch (steering whe el button assembly).	
	A Check whether the ground wire harness of the combinati on switch and the combination switch (steering wheel butt on assembly) is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the steering wheel button assembly and the combination switch.	

© 2026, All rights reserved

	A Check for a short circuit or open circuit between the terminals of combination switch EL091-2 (device side) and the terminals of the combination switch (mating with the steering wheel button assembly).
Yes 》 》 》 Replace the combination switch.	
No 》 》 》 Go to step 5.	
Step 5 Replace the combination switch or steering wheel button assembly.	
	A Replace the combination switch or steering wheel button assembly. B After replacing the combination switch or steering wheel button assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

Go to step 3.

Step 3 Check the wiring harness between the mirror adjustment motor assembly and the left exterior rearview mirror assembly.

A Check the wiring harness between the mirror glass adjustment motor assembly and the left exterior rearview mirror assembly for a short or open circuit.

Yes》》》 Repair or replace the wiring harness.

No》》》
Go to step 4.

Step 4 Replace the mirror glass adjustment motor assembly.

© 2026, All rights reserved

	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

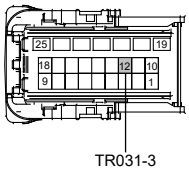
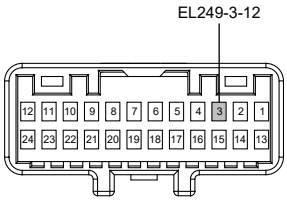
DTC: B160211-VIU

Fault code	Description
B160211	Left exterior mirror glass vertical adjustment short to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the left exterior rearview mirror ass embly.	
EL249-3 Main Zone Controller  B10DMVIU1221211 TR031 Left Exterior Rearview Mirror Assembly  B10DMVIU1221212	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the harness connector TR031 of the left exteri or rearview mirror assembly. D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 12 of harness c onnector EL249-3 of the main zone controller and terminal 3 of harness connector TR031 of the left exterior rearview mirror assembly is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 12 of harness connector EL249-3 of the main zone controller and body ground to ch eck if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the wiring harness between the mirror adjustment motor assembly and the left exterior rearvi ew mirror assembly.	
	A Check the wiring harness between the mirror glass adjust ment motor assembly and the left exterior rearview mirror assembly for a short or open circuit.
	Yes 》 》 》 Repair or replace the wiring harness.
	No 》 》 》 Go to step 4.
Step 4 Replace the mirror glass adjustment motor assembly.	
	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

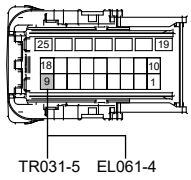
DTC: B160412-VIU

Fault code	Description
B160412	Left turn signal lamp shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

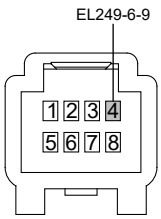
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

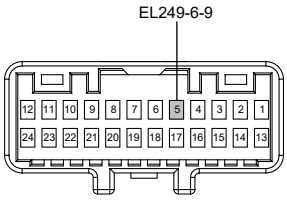
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the left turn signal lamp.

[错误] 翻译失败(已重试 3 次): HTTP 429:
{"error":{"message":"Request rate increased too quickly. To ensure system stability, please adjust your client logic to scale pre smoothly over time.","type":"limit_burst_rate","param":"","code":"limit_burst_rate"}}



B10DMVIU1221336

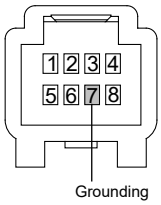
EL061 Left rear combination lamp with protective cover

B10DMVIU1221337

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221338

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the wiring harness connector EL061 of the lef t rear combination lamp strip cover.
D Disconnect the wiring harness connector TR031 of the lef t exterior rearview mirror assembly.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 9 of harness connector E L249-6 of the main zone controller and terminal 4 of harne ss connector EL061 of the left rear combination lamp strip cover to check whether the resistance is normal.
F Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 9 of harness connector EL249-6 of the main zone controller and terminal 5 of harn ess connector TR031 of the left exterior rearview mirror ass embly to check if it is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminal 9 of the harness connector EL249-6 of the main zone controller and the body ground t o check whether it is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the left turn signal lamp.

EL061 Left rear combination lamp with protective cover

B10DMVIU1221321

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221339

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL061 of the left rear combination lamp strip cover.
C Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 7 of the harness connector EL061 for the left rear combination lamp strip guard plate and the body ground is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of the wire harness connector TR031 of the left exterior rearview mirror assembly and the vehicle body ground to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the left turn signal lamp assembly and the left exterior rearview mirror assembly.

A Check the wiring harness between the left turn signal lamp assembly and the left exterior rearview mirror assembly for a short circuit or an open circuit.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the left rear combination lamp light strip cover or the left turn signal assembly.

A Replace the left rear combination lamp with light strip trim or left turn signal lamp assembly.
B After replacing the left rear combination lamp strip cover or left turn signal lamp assembly, is the fault cleared?

Yes 》》》 System normal.

No 》》》
Go to step 6.

Step 6 Replacement of master zone controller

© 2026, All rights reserved

	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
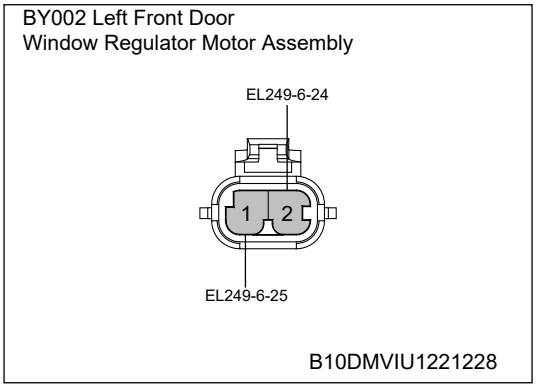
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the left rear door window regulator motor assembly.	
 B10DMVIU1221235  B10DMVIU1221236	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-6 of the main z one controller. C Disconnect the harness connector BY004 of the rear left window regulator motor assembly. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connect or EL249-6 of the main zone controller and terminal 1 of ha rness connector BY004 of the left rear door window regulat or motor assembly to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 21 of harness connect or EL249-6 of the main zone controller and terminal 2 of ha rness connector BY004 of the left rear door window regulat or motor assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the rear left door window regulator motor assembly.	
	A Replace the rear left door window regulator motor assem bly. B After replacing the left rear door window regulator motor assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller.

© 2026, All rights reserved

	B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 5.	
Step 5 Diagnosis complete.

DTC: B160720-VIU

Fault code	Description
B160720	Rear left window bias voltage out of range

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the rear left door window regulator motor assembly and the main zone controller.	
	A Check whether the wiring harness between the rear left door window regulator motor assembly and the main zone controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the rear left door window regulator motor assembly.	
	A Replace the rear left door window regulator motor assembly. B After replacing the left rear door window regulator motor assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

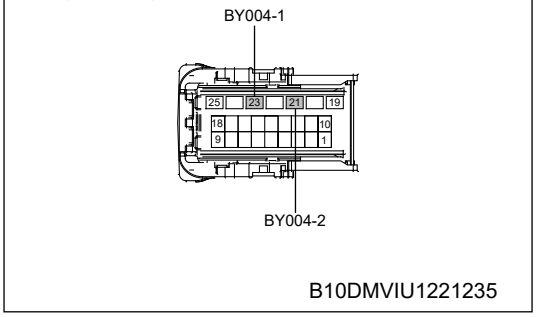
DTC: B160719-VIU

Fault code	Description
B160719	Rear left window overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

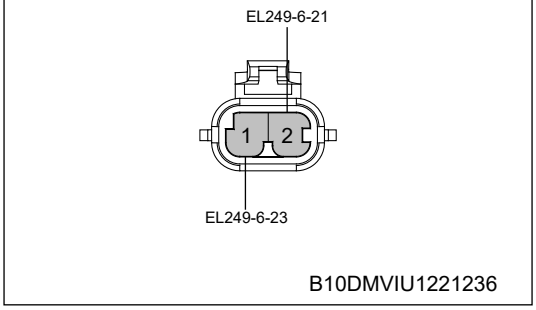
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the left rear door window regulator motor assembly.

[错误] 翻译失败(已重试 3 次): HTTP 429: {"error":{"message":"Request rate increased too quickly. To ensure system stability, please adjust your client logic to re smoothly over time.","type":"limit_burst_rate","param":"","code":"limit_burst_rate"}}

B10DMVIU1221235

BY004 Rear left door window regulator motor assembly

B10DMVIU1221236

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector BY004 of the rear left window regulator motor assembly.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 23 of harness connect or EL249-6 of the main zone controller and terminal 1 of ha rness connector BY004 of the left rear door window regulat or motor assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 21 of harness connect or EL249-6 of the main zone controller and terminal 2 of ha rness connector BY004 of the left rear door window regulat or motor assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measur e the resistance between terminals 21 and 23 of the harnes s connector EL249-6 of the main zone controller and the b ody ground to check whether it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 21 and 23 of the harness connector EL249-6 of the main zone controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the rear left door window regulator motor assembly.

© 2026, All rights reserved

	A Replace the rear left door window regulator motor assembly. B After replacing the left rear door window regulator motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 4.	
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 5.	
Step 5 Diagnosis complete.

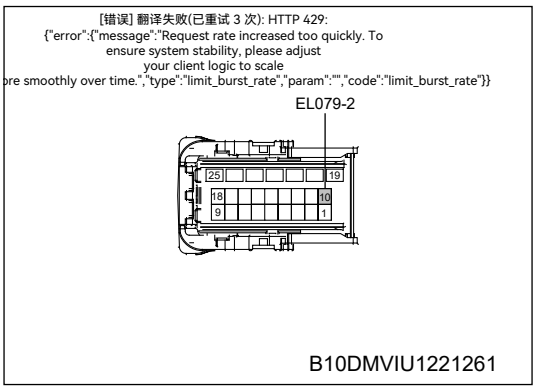
DTC: B163011-VIU

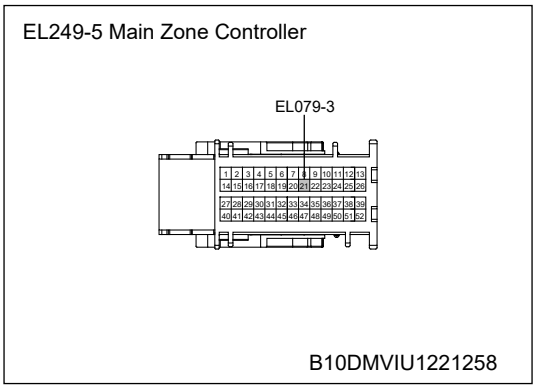
Fault code	Description
B163011	Front wiper low speed output short to ground

1. Simplified Circuit Diagram

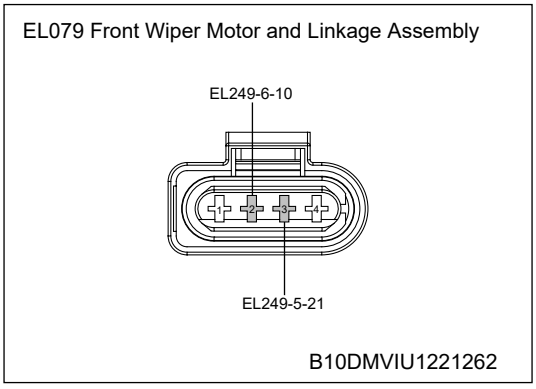
2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



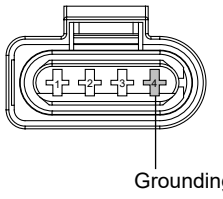
© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the front wiper motor and linkage assembly.



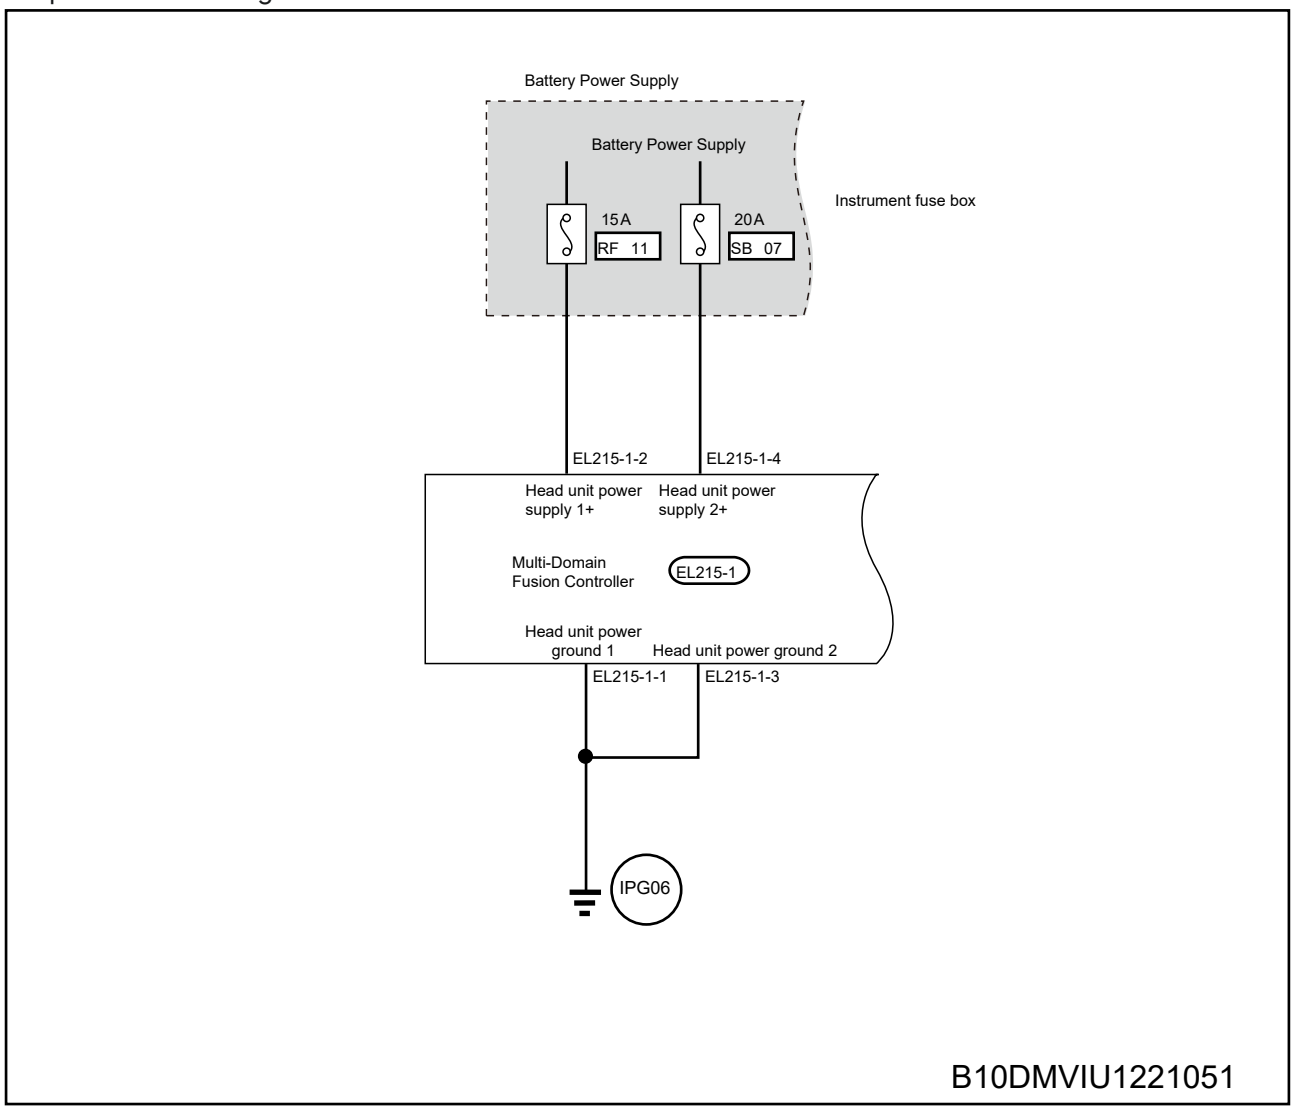
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connectors EL249-5 and EL249-6 of the main zone controller.
C Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 10 of harness connector EL249-6 of the main zone controller and terminal 2 of harness connector EL079 of the front wiper motor and linkage assembly to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 21 of harness connector EL249-5 of the main zone controller and terminal 3 of harness connector EL079 of the front wiper motor and linkage assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 2 and 3 of the wiring harness connector EL079 of the front wiper motor and linkage assembly and the body ground to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the ground wire harness of the front wiper motor and linkage assembly.

© 2026, All rights reserved



EL079 Front Wiper Motor and Linkage Assembly  B10DMVIU1221260	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL079 of the front wiper motor and linkage assembly. C Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wiring harness connector EL079 for the front wiper motor and linkage assembly and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the front wiper motor and linkage assembly.	
	A Replace the front wiper motor and linkage assembly. B After replacing the front wiper motor and linkage assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

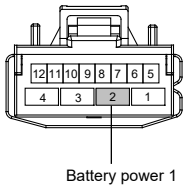
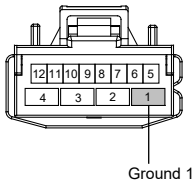
DTC: B180017-VIU

Fault code	Description
B180017	VIU 12V Power Supply 1 Overvoltage



1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check the Power Supply 1 fuse of the multi-domain fusion controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the Power 1 fuse RF11 of the multi-domain fusion controller. Fuse specification: RF11 15A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply 1 harness of the multi-domain fusion controller.	
EL215-1 Multi-Domain Fusion Controller  B10DMVIU1221095	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 2 of the harness connect or EL215-1 of the multi-domain fusion controller and the b ody ground to check whether the voltage is normal. Standard voltage: 11~14V

© 2026, All rights reserved

	E Confirm whether the voltage value meets the standard va lue.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Check the Power 1 ground wire harness of the multi-domain fusion controller.	
EL215-1 Multi-Domain Fusion Controller  B10DMVIU1221096	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller. C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 1 of the harness connec tor EL215-1 of the multi-domain fusion controller and the body ground to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

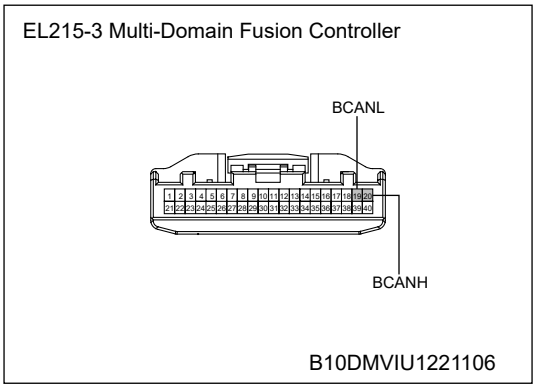
DTC: U007588-VIU

Fault code	Description
U007588	B_CAN Bus Off (Body)



1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the BCAN harness of the multi-domain fusion controller is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 19 and body ground, and between terminal 20 and body ground, respectively, at har ness connector EL215-3 of the multi-domain fusion control ler. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard va lue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CCAN harness of the multi-domain fusion controller is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage values between terminal 14 and vehicle body ground, and between terminal 13 and vehicle body ground, respectively, at the wire harness connector EL215-3 of the Multi-Domain Fusion Controller. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

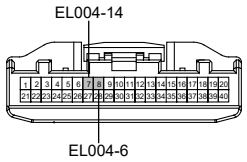
DTC: U007688-VIU

Fault code	Description
U007688	D_CAN Bus Off (Diagnostics)

1. Simplified Circuit Diagram

2. Diagnostic Steps

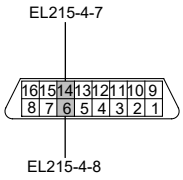
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the DCAN harness between the multi-domain fusion controller and the diagnostic por t is normal.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221101

EL004 Diagnostic Port

B10DMVIU1221102

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of the wire harness con nector EL215-4 of the multi-domain fusion controller and t erminal 6 of the diagnostic port EL004 to check whether it i s normal.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 7 of the multi-domain fu sion controller harness connector EL215-4 and terminal 14 of the diagnostic port EL004 to check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply ground of the multi-domain fusion controller.

A Check whether the power supply and ground of the multi -domain fusion controller are normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

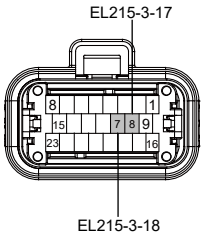
Yes》》》
Go to step 2.



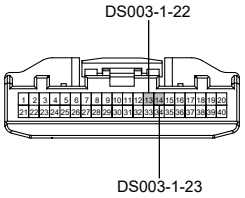
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

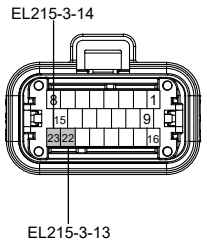


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.

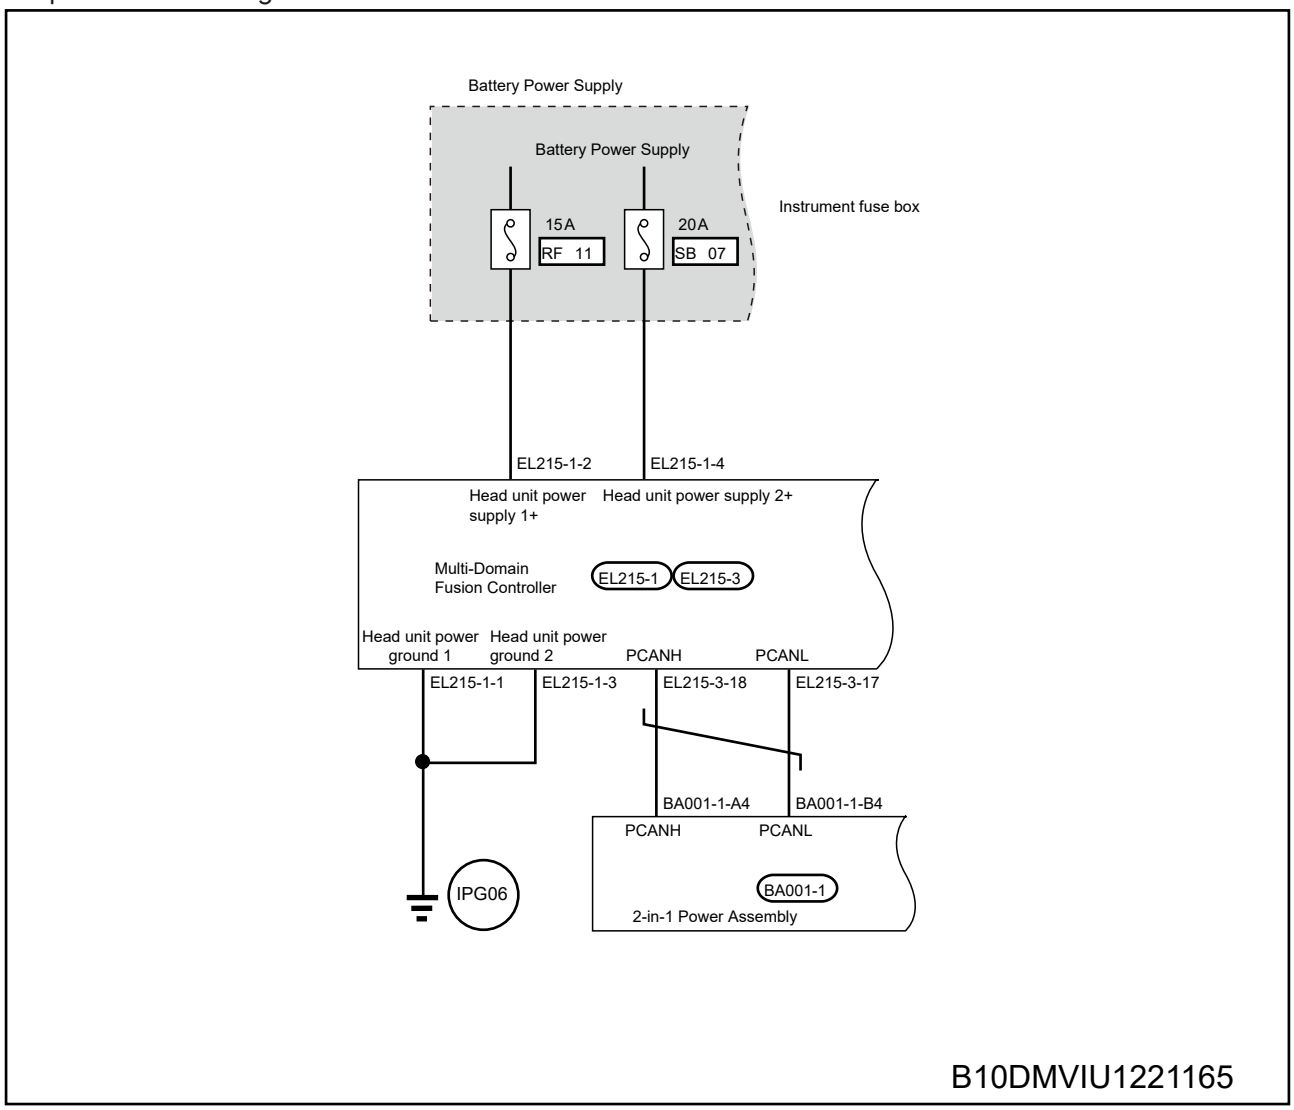


EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

© 2026, All rights reserved



DS003-1 Controller Assembly  B10DMVIU1221136	nal 22 of harness connector DS003-1 of the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

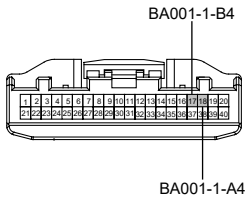
DTC: U130383-VIU

Fault code	Description
U130383	DCDC validation signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

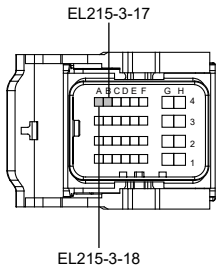
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

A Check whether the power ground circuit of the 2-in-1 power assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the 2-in-1 power supply assembly.

A Replace the 2-in-1 power supply assembly.
B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

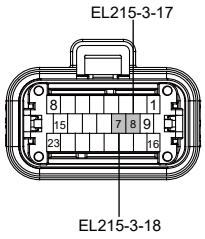
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



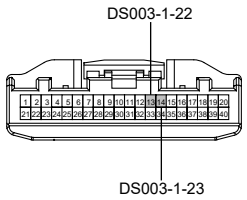
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

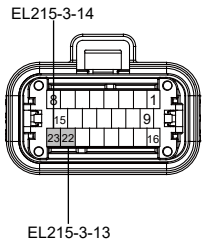


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 power assembly is normal.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.

	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 System normal.

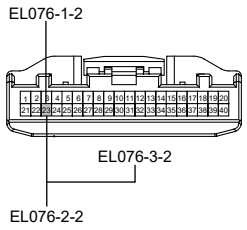
DTC: U110E87-VIU

Fault code	Description
U110E87	Air outlet motor communication lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

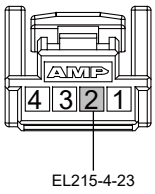
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

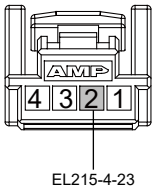
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



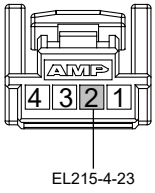
Step 2 Check the LIN communication harness between the multi-domain fusion controller and the air vent motor.

EL215-4 Multi-Domain Fusion Controller



B10DMVIU1221185

EL076-1 Left air outlet motor



B10DMVIU1221186

EL076-2 Center Air Outlet Motor

B10DMVIU1221187

EL076-3 Right Air Outlet Motor

B10DMVIU1221188

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wire harness connector EL076-1 of the left air outlet motor.
D Disconnect the wiring harness connector EL076-2 of the center air outlet motor.
E Disconnect the wiring harness connector EL076-3 of the right air outlet motor.
F Use a multimeter, select the resistance range, and check whether the resistance between terminal 23 of the multi-domain fusion controller harness connector EL215-4 and terminal 2 of the left air outlet motor harness connector EL076-1 is normal.
G Use a multimeter, select the resistance range, and check whether the resistance between terminal 23 of the multi-domain fusion controller harness connector EL215-4 and terminal 2 of the center air outlet motor harness connector EL076-2 is normal.
H Use a multimeter, select the resistance range, and check whether the resistance value between terminal 23 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 2 of the wire harness connector EL076-3 of the right air outlet motor is normal.
Resistance standard value: Less than 1 Ω
I Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the air outlet motor.	
	A. Check whether the power and ground circuit of the air o utlet motor is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the air outlet motor.	
	A Replace the air outlet motor. B After replacing the air outlet motor, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

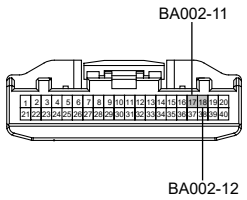
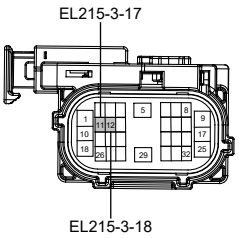
DTC: U130287-VIU

Fault code	Description
U130287	BMS Communication Lost





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the power battery pack assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221138 BA002 Power Battery Pack Assembly  B10DMVIU1221139	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the wiring harness connector BA002 of the power battery pack assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of harness connector BA002 of the power battery pack assembly to check whether the resistance value is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check whether it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the power battery pack assembly.	
	A Check whether the power ground circuit of the power battery pack assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.	
	A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
	Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

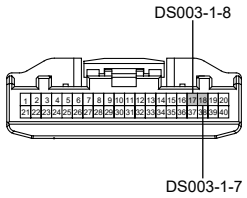
DTC: U130087-VIU

Fault code	Description
U130087	VCU Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

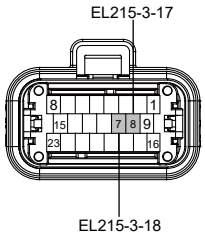
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



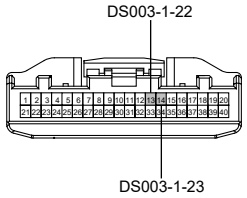
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

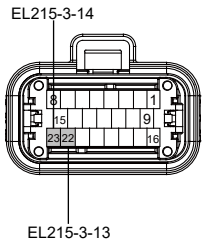


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.

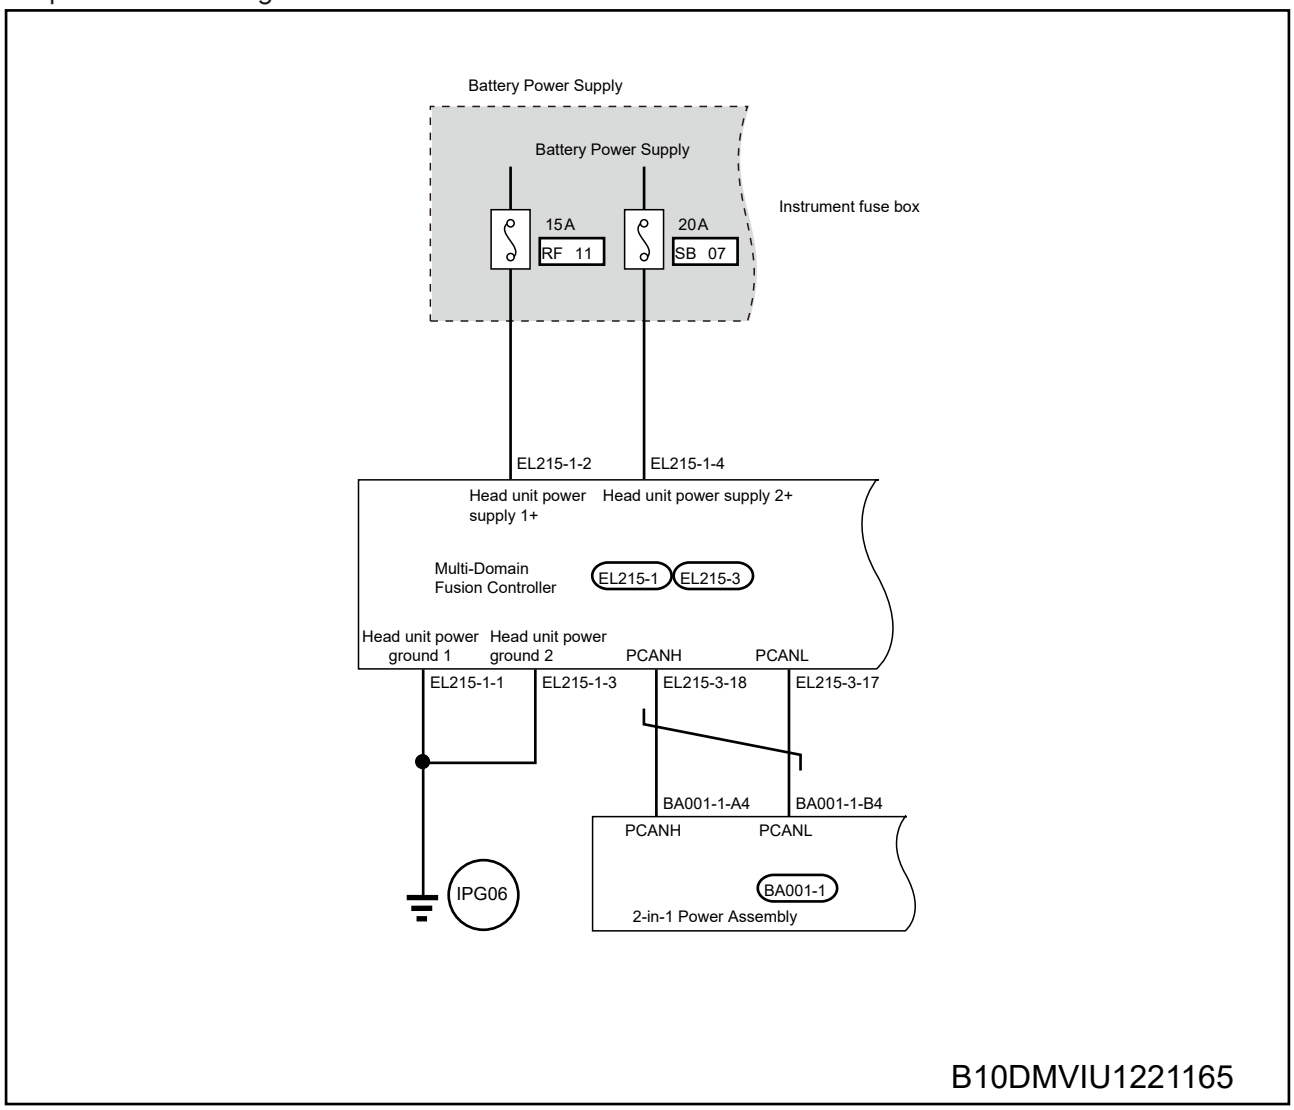


EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

© 2026, All rights reserved



DS003-1 Controller Assembly  B10DMVIU1221136	nal 22 of harness connector DS003-1 of the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

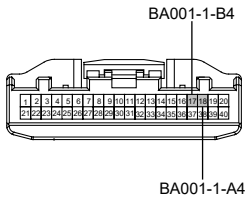
DTC: U130387-VIU

Fault code	Description
U130387	DCDC Communication Loss

1. Simplified Circuit Diagram

2. Diagnostic Steps

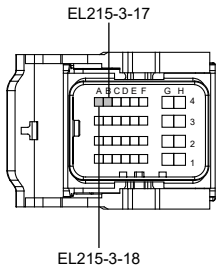
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

A Check whether the power ground circuit of the 2-in-1 power assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the 2-in-1 power supply assembly.

A Replace the 2-in-1 power supply assembly.
B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

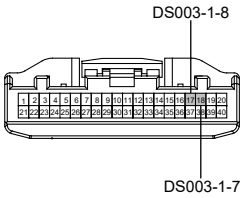
DTC: U130083-VIU

Fault code	Description
U130083	VCU validation signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

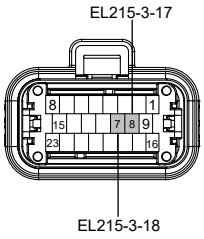
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



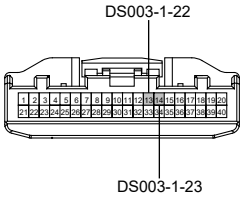
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

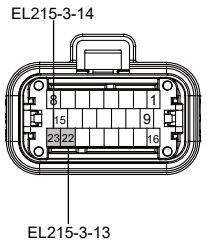


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.

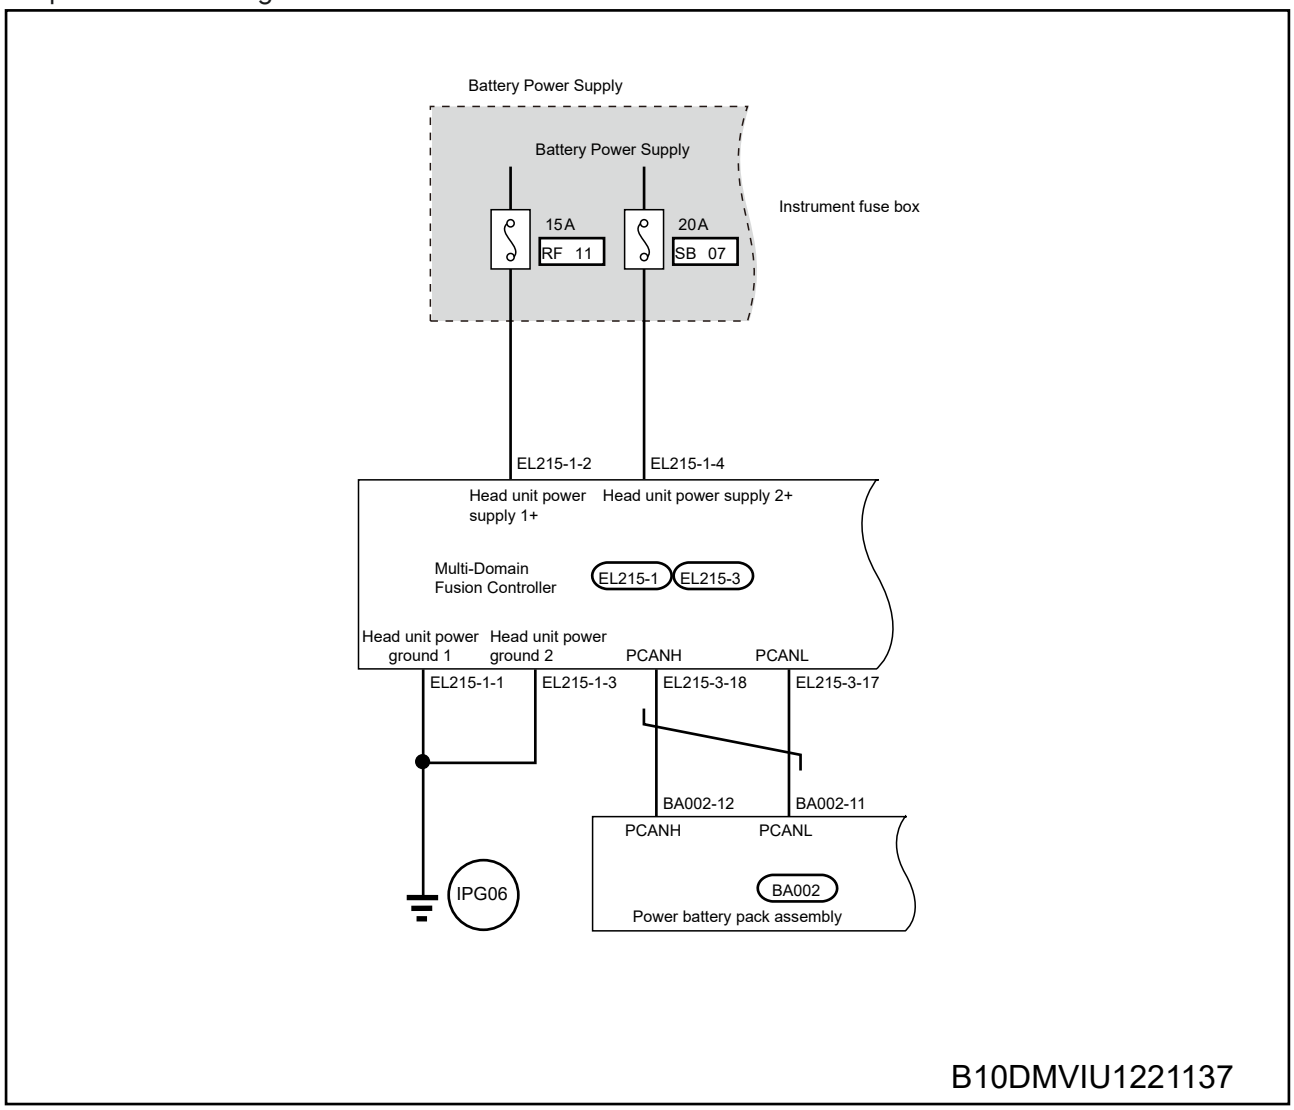


EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

© 2026, All rights reserved



DS003-1 Controller Assembly  B10DMVIU1221136	nal 22 of harness connector DS003-1 of the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

Fault code	Description
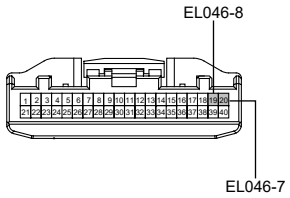
U130B87	AHLR communication lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

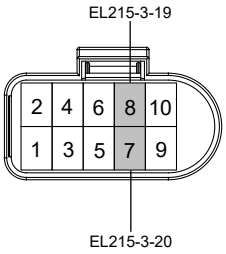
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the Multi-Domain Fusion Controller and the right front combinatio n lamp.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221124

EL046 Front right combination lamp

B10DMVIU1221125

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector EL046 for the ri ght front combination lamp.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 20 of harness connector EL 215-3 of the Multi-Domain Fusion Controller and terminal 7 of harness connector EL046 of the right front combination l amp to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 19 of the wire har ness connector EL215-3 of the multi-domain fusion control ler and terminal 8 of the wire harness connector EL046 of t he right front combination lamp is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the right front combination lamp.

A Check whether the power ground circuit of the front righ t combination lamp is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front right combination lamp.

A Replace the front right combination lamp.
B After replacing the right front combination lamp, is the fa ult cleared?

Yes》》》 System normal.

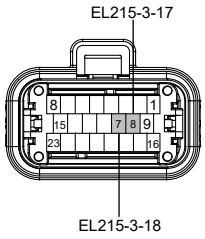
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



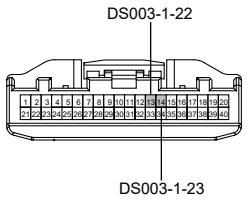
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

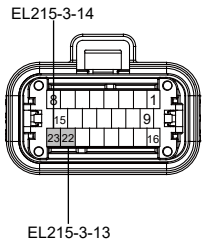


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

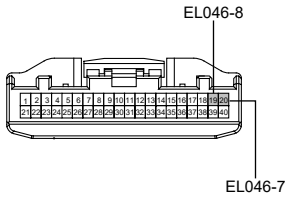
DTC: U130B82-VIU

Fault code	Description
U130B82	AHLR alive signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

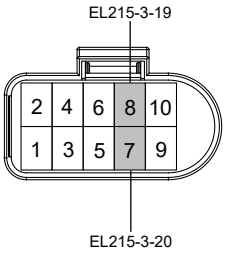
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the Multi-Domain Fusion Controller and the right front combinatio n lamp.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221124

EL046 Front right combination lamp

B10DMVIU1221125

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector EL046 for the ri ght front combination lamp.
D Use a multimeter set to the resistance range to measure t he resistance between terminal 20 of harness connector EL 215-3 of the Multi-Domain Fusion Controller and terminal 7 of harness connector EL046 of the right front combination l amp to check whether the resistance value is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 19 of the wire har ness connector EL215-3 of the multi-domain fusion control ler and terminal 8 of the wire harness connector EL046 of t he right front combination lamp is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the right front combination lamp.

A Check whether the power ground circuit of the front righ t combination lamp is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front right combination lamp.

A Replace the front right combination lamp.
B After replacing the right front combination lamp, is the fa ult cleared?

Yes》》》 System normal.

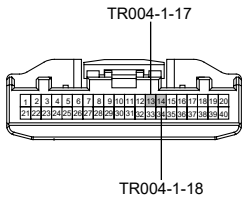
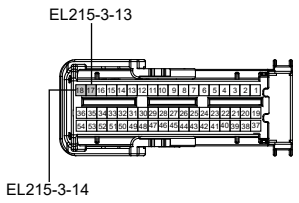
DTC: U130E82-VIU

Fault code	Description
U130E82	ACU Alive Signal Error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the multi-domain fusion controller and the airbag control module assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221141 TR004-1 Airbag Control Module Assembly  B10DMVIU1221142	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 18 of harness connector TR004-1 of the airbag control module assembly to check whether the resistance value is normal. E. Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

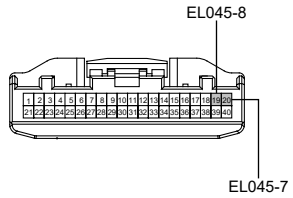
DTC: U130A87-VIU

Fault code	Description
U130A87	AHLL Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

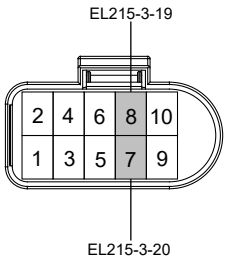
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the multi-domain fusion controller and the left front combination lamp.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221121

EL045 Front left combination lamp

B10DMVIU1221122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector EL045 of the left front combination lamp.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 20 of harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of harness connector EL045 of the left front combination lamp is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 19 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector EL045 of the left front combination lamp is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the front left combination lamp.

A Check whether the power ground circuit of the left front combination lamp is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front left combination lamp.

A Replace the front left combination lamp.
B After replacing the left front combination lamp, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

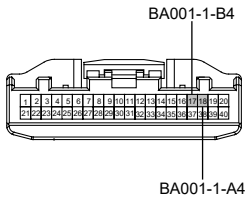
DTC: U130487-VIU

Fault code	Description
U130487	OBC Communication Lost

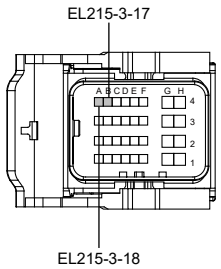
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.
A Check whether the power ground circuit of the 2-in-1 power assembly is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.
A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the fault cleared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

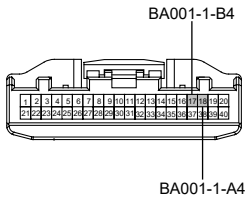
DTC: U130482-VIU

Fault code	Description
U130482	OBC Heartbeat Signal Error

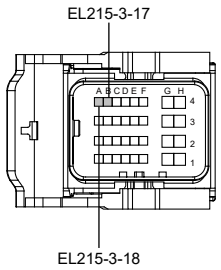
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 power assembly is normal.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.

	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

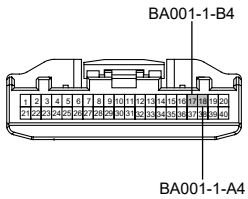
DTC: U130483-VIU

Fault code	Description
U130483	OBC verification signal error

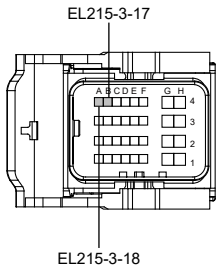
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the 2-in-1 power supply assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221166

BA001-1 2-in-1 Power Supply Assembly

B10DMVIU1221167

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 18 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal A4 of the wiring harness connector BA001-1 of the 2-in-1 power assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector EL215-3 of the multi-domain fusion controller and terminal B4 of the harness connector BA001-1 of the 2-in-1 power assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 power assembly is normal.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.

	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the fault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

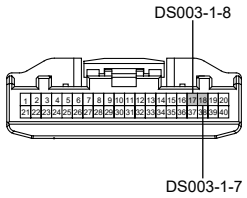
2. Diagnostic Steps

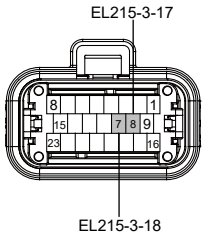
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



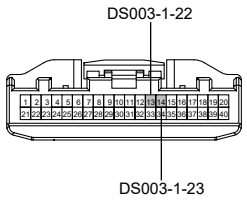
Step 2 Check the PCAN harness between the multi-domain fusion controller and the controller assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221133

DS003-1 Controller Assembly

B10DMVIU1221134

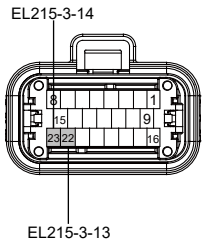


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 18 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector DS003-1 of the controller assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the controller assembly.

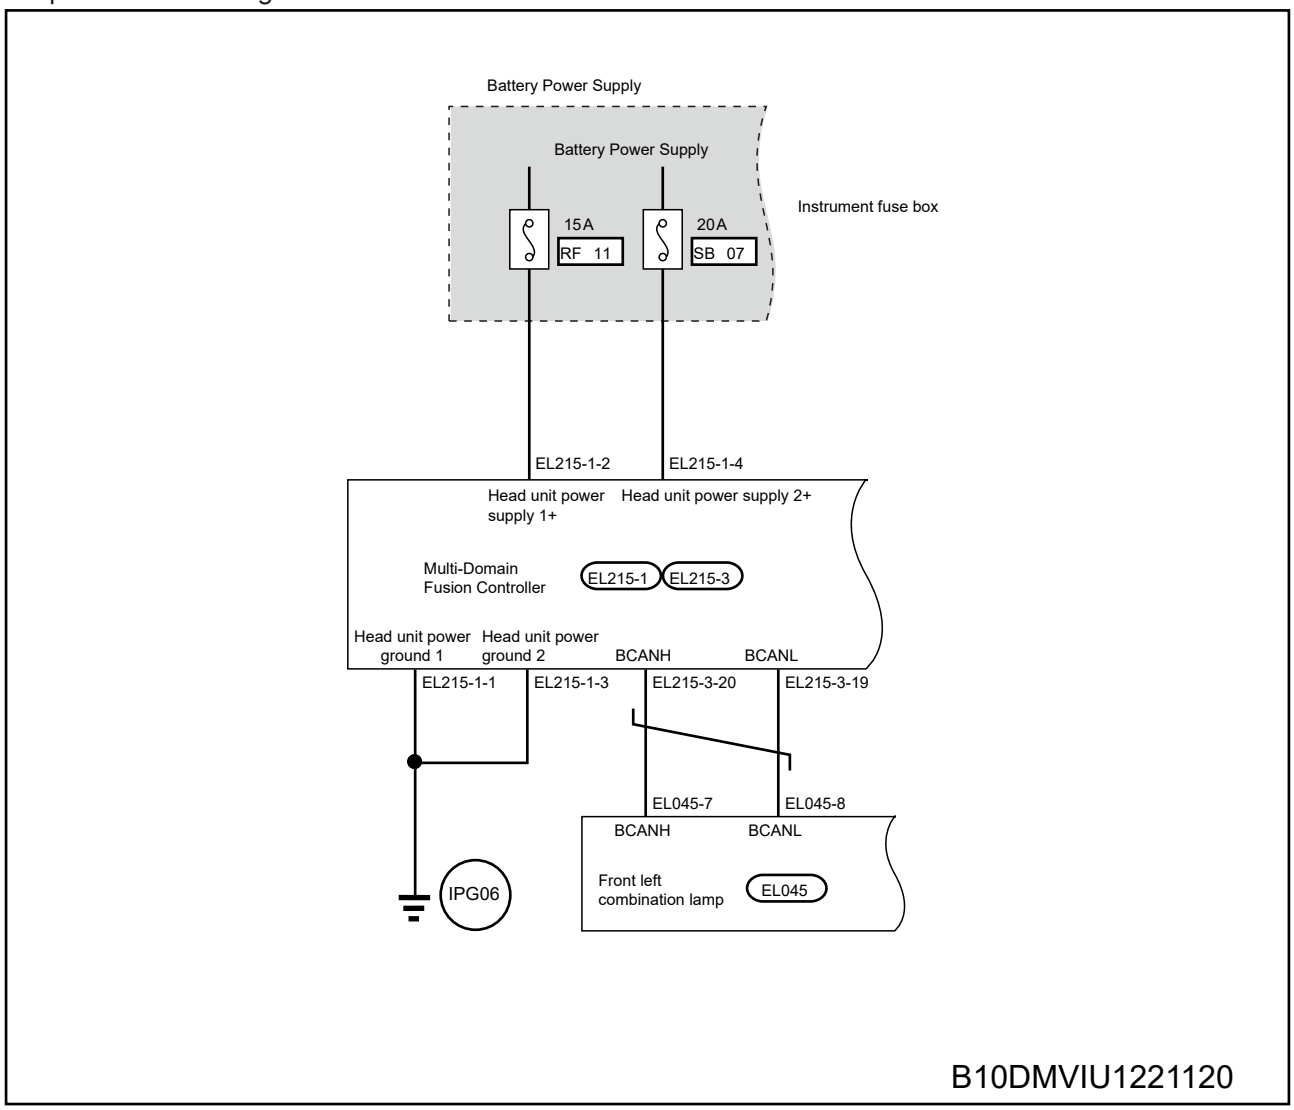


EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221135

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check whether it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and termi

© 2026, All rights reserved



DS003-1 Controller Assembly  B10DMVIU1221136	nal 22 of harness connector DS003-1 of the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 7.

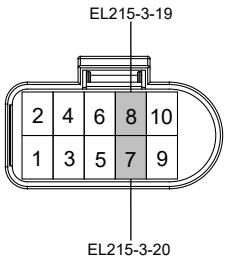
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the multi-domain fusion controller and the left front combination lamp.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221121

EL045 Front left combination lamp

B10DMVIU1221122

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector EL045 of the left front combination lamp.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 20 of harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of harness connector EL045 of the left front combination lamp is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 19 of harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of harness connector EL045 of the left front combination lamp is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the front left combination lamp.

A Check whether the power ground circuit of the left front combination lamp is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front left combination lamp.

A Replace the front left combination lamp.
B After replacing the left front combination lamp, is the fault cleared?

Yes》》》 System normal.

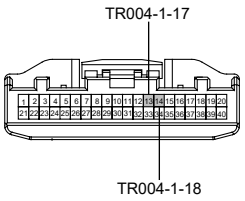
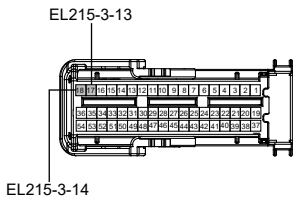
DTC: U130E87-VIU

Fault code	Description
U130E87	ACU Communication Lost





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the multi-domain fusion controller and the airbag control module assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221141 TR004-1 Airbag Control Module Assembly  B10DMVIU1221142	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 18 of harness connector TR004-1 of the airbag control module assembly to check whether the resistance value is normal. E. Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

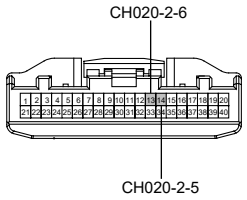
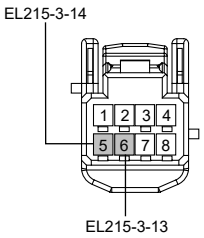
DTC: U131082-VIU

Fault code	Description
U131082	EPS alive signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the multi-domain fusion controller and the integrated motor contr oller.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221154 CH020-2 Integrated Motor Controller  B10DMVIU1221155	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the wiring harness connector CH020-2 of the integrated motor controller. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller a nd terminal 5 of the wire harness connector CH020-2 of th e integrated motor controller to check whether it is normal. E Use a multimeter, select the resistance range, and measur e the resistance between terminal 13 of harness connector EL215-3 on the multi-domain fusion controller and termina l 6 of harness connector CH020-2 on the integrated motor controller to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the Integrated Motor Controller.	
	A Check whether the power ground circuit of the integrate d motor controller is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of integrated motor controller.	
	Replacement of integrated motor controller. B After replacing the integrated motor controller and perfo rming the calibration procedure, end soft limit learning, conf iguration word writing, and VIN writing, is the fault eliminat ed?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

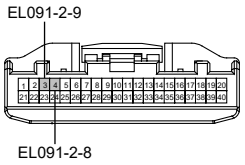
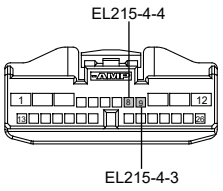
DTC: U132F82-VIU

Fault code	Description
U132F82	SWB Vital Signal Error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the combination switch and the multi-domain fusion controller.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221163 EL091-2 Combination Switch  B10DMVIU1221164	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller. C Disconnect the harness connector EL091-2 of the combination switch. D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 8 of the wire harness connector EL091-2 of the combination switch to check if it is normal. E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 9 of harness connector EL091-2 of the combination switch to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the CAN harness between the combination switch and the steering wheel button assembly.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the combination switch wiring harness connector EL091-2. C Disconnect the steering wheel switch assembly harness connector. D Use a multimeter, select the resistance range, and measure the resistance between the terminal of the combination switch EL091-2 (device side) and the terminal of the combination switch (where the combination switch connects to the steering wheel button assembly) to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》》》 Replace the combination switch.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the steering wheel button assembly.	
	A Check whether the power ground circuit of the steering wheel switch assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

DTC: U1F0000-VIU

Fault code	Description
U1F0000	Q&A: VIN code not written

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Rewrite the VIN of the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and rewrite the vehicle VIN accordi ng to the prompts of the diagnostic instrument. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

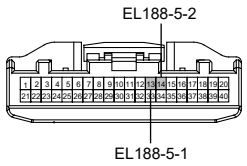
DTC: U1F8400-VIU

Fault code	Description
U1F8400	Q&A handshake with TBOX failed

1. Simplified Circuit Diagram

2. Diagnostic Steps

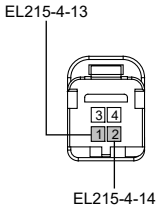
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the Ethernet wiring harness between the multi-domain fusion controller and the telematics h ost.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221081

EL188-5 Telematics Host

B10DMVIU1221082

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL188-5 of the telematics host.
D Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 13 of the multi-domain fusion controller wire harness connector EL215-4 a nd terminal 1 of the telematics host wire harness connector EL188-5 is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 14 of the wire harness connector EL215-4 of the multi-domain fusio n controller and terminal 2 of the wire harness connector E L188-5 of the vehicle networking host is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

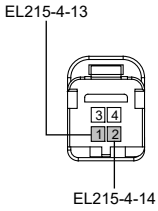
Yes》》》
Go to step 2.



Step 2 Check the Ethernet wiring harness between the multi-domain fusion controller and the telematics h ost.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221081

EL188-5 Telematics Host

B10DMVIU1221082

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL188-5 of the telematics host.
D Use a multimeter, set it to the resistance range, and chec k whether the resistance between terminal 13 of the multi-domain fusion controller wire harness connector EL215-4 a nd terminal 1 of the telematics host wire harness connector EL188-5 is normal.
E Use a multimeter, select the resistance range, and measur e whether the resistance value between terminal 14 of the wire harness connector EL215-4 of the multi-domain fusio n controller and terminal 2 of the wire harness connector E L188-5 of the vehicle networking host is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》

DTC: U141E00-VIU

Fault code	Description
U141E00	Abnormal communication with ICHS SPI

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Restart the multi-domain fusion controller.	
	A Restart the multi-domain fusion controller. B After restarting the multi-domain fusion controller, check whether the fault has been cleared?
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

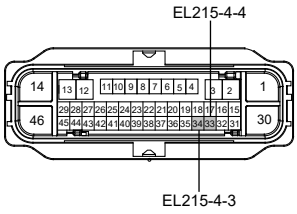
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



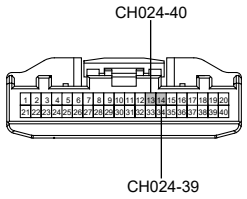
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221144

CH024 Intelligent Integrated Brake System Assembly

B10DMVIU1221145

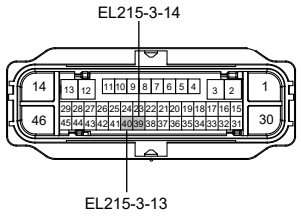


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 33 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 34 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221146

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 39 of harness connector CH024 of the intelligent integrated brake system assembly to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 13 of harness c

May be caused by an intermittent fault. Check for intermittent faults.

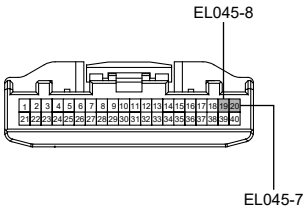
Yes》》》
Go to step 2.



Step 2 Check whether the CAN harness between the front left combination lamp and the multi-domain fusion controller is normal.

EL045 Front left combination lamp

B10DMVIU1221557

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221558

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL045 of the left front combination lamp.
C Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 7 of wire harness connector EL045 for the left front combination lamp and terminal 20 of wire harness connector EL215-3 for the multi-domain fusion controller.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 8 of harness connector EL045 of the left front combination lamp and terminal 19 of harness connector EL215-3 of the multi-domain fusion controller.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Domain Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

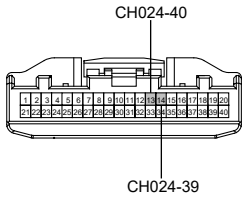
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221144

CH024 Intelligent Integrated Brake System Assembly

B10DMVIU1221145

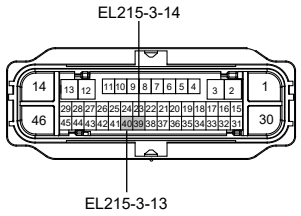


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 33 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 34 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221146

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 39 of harness connector CH024 of the intelligent integrated brake system assembly to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 13 of harness c

CH024 Intelligent Integrated Brake System Assembly  B10DMVIU1221147	onnector EL215-3 of the multi-domain fusion controller an d terminal 40 of harness connector CH024 of the intelligent integrated brake system assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power ground circuit of the intelligent integrated brake system assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

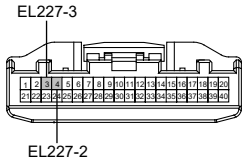
DTC: U137E82-VIU

Fault code	Description
U137E82	RPD Life Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

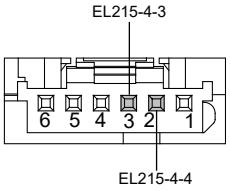
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



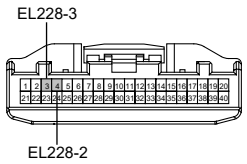
Step 2 Check the CAN harness between the multi-domain fusion controller and the front vital sign detection radar.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221169

EL227 Vital Sign Detection Radar - Front

B10DMVIU1221170

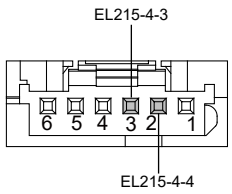


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL227 of the front vital signs detection radar.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of harness connector EL215-4 of the multi-domain fusion controller and terminal 2 of harness connector EL227 of the front vital sign detection radar to check whether it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of harness connector EL215-4 of the Multi-Domain Fusion Controller and terminal 3 of harness connector EL227 of the Front Vital Sign Detection Radar to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the multi-domain fusion controller and the rear vital sign detection radar.



EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221171

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL228 behind the vital sign detection radar.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 4 of the harness connector EL215-4 of the multi-domain fusion controller and terminal 2 of the harness connector EL228 of the rear vital sign detection radar is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 3 of the wire harn

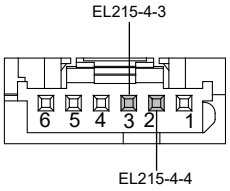
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



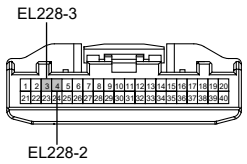
Step 2 Check the CAN harness between the multi-domain fusion controller and the front vital sign detectio n radar.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221169

EL227 Vital Sign Detection Radar - Front

B10DMVIU1221170

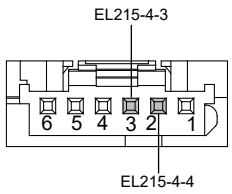


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL227 of the fro nt vital signs detection radar.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of harness connector E L215-4 of the multi-domain fusion controller and terminal 2 of harness connector EL227 of the front vital sign detecti on radar to check whether it is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of harness connector E L215-4 of the Multi-Domain Fusion Controller and terminal 3 of harness connector EL227 of the Front Vital Sign Detect ion Radar to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN wiring harness between the multi-domain fusion controller and the rear vital sign de tection radar.



EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221171

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL228 behind t he vital sign detection radar.
D Use a multimeter, select the resistance range, and measur e whether the resistance between terminal 4 of the harness connector EL215-4 of the multi-domain fusion controller a nd terminal 2 of the harness connector EL228 of the rear vi tal sign detection radar is normal.
E Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 3 of the wire harn

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the electric compressor assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221130

EL136-1 Electric Compressor Assembly

B10DMVIU1221131

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL136-1 of the electric compressor assembly.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 5 of the wire harness connector EL136-1 of the electric compressor assembly to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connector EL215-4 of the multi-domain fusion controller and terminal 1 of the harness connector EL136-1 of the electric compressor assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the electric compressor assembly.

A Check whether the power supply ground circuit of the electric compressor assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the electric compressor assembly.

A Replace the electric compressor assembly.
B After replacing the electric compressor assembly, is the fault cleared?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN harness between the multi-domain fusion controller and the telematics host.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221160

EL188-1 Telematics Main Unit

B10DMVIU1221161

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of harness connector EL188-1 of the T-Box host is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fusion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 5.

EL188-1 Telematics Main Unit

B10DMVIU1221161

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of harness connector EL188-1 of the T-Box host is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fusion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 5.

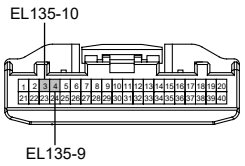
DTC: U137587-VIU

Fault code	Description
U137587	TMC Communication Lost

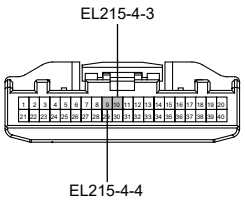
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the thermal management controller.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221127

EL135 Thermal Management Controller

B10DMVIU1221128

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL135 of the thermal management controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of wire harness connector EL215-4 of the Multi-Domain Fusion Controller and terminal 9 of wire harness connector EL135 of the Thermal Management Controller to check if the value is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 10 of harness connector EL135 of the thermal management controller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the thermal management controller.
A Check if the power ground circuit of the thermal management controller is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the thermal management controller.
A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes》》》 System normal.

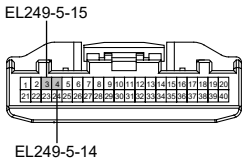
DTC: U138182-VIU

Fault code	Description
U138182	MZCU Heartbeat Signal Error

1. Simplified Circuit Diagram

2. Diagnostic Steps

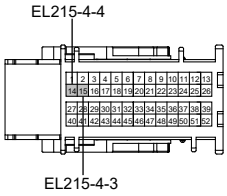
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



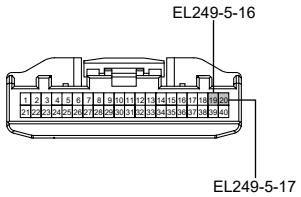
Step 2 Check the COM-CAN harness between the Multi-Domain Fusion Controller and the Main Zone Controller.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221113

EL249-5 Main Zone Controller

B10DMVIU1221114

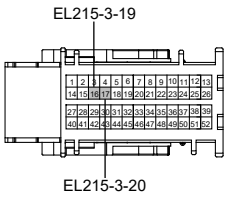


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of harness connector EL215-4 of the multi-domain fusion controller and terminal 14 of harness connector EL249-5 of the main zone controller to check if it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 15 of the wire harness connector EL249-5 of the main zone controller is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the BCAN harness between the multi-domain fusion controller and the main zone controller.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221115

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 20 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller and terminal 17 of the wire harness connector EL249-5 of the Main Zone Controller to check whether the resistance value is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 19 of the wire har

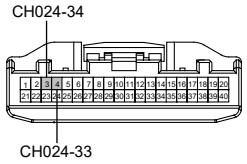
DTC: U138287-VIU

Fault code	Description
U138287	LMC communication loss

1. Simplified Circuit Diagram

2. Diagnostic Steps

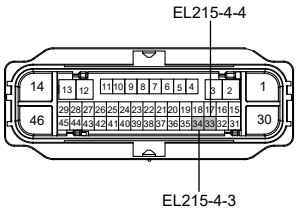
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



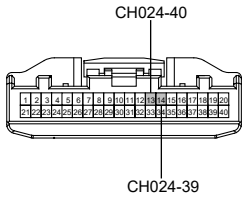
Step 2 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221144

CH024 Intelligent Integrated Brake System Assembly

B10DMVIU1221145

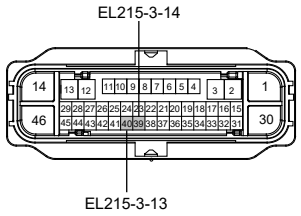


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 33 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 34 of the wire harness connector CH024 of the intelligent integrated brake system assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.



EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221146

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 39 of harness connector CH024 of the intelligent integrated brake system assembly to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 13 of harness c

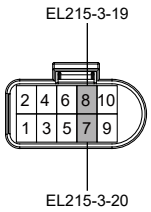
DTC: U153608-VIU

Fault code	Description
U153608	E2E fault in B-CANFD messages received from HPC (alive signal error or checksum error)

1. Simplified Circuit Diagram

2. Diagnostic Steps

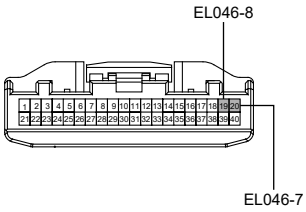
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check whether the CAN harness between the right front combination lamp and the multi-domain fu sion controller is normal.

EL046 Front right combination lamp

B10DMVIU1221577

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221578

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL046 of the right fron t combination lamp.
C Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
D Using a multimeter, select the resistance range, and meas ure the resistance between terminal 7 of harness connector EL046 for the right front combination lamp and terminal 20 of harness connector EL215-3 for the multi-domain fusion controller.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 8 of harness connector E L046 of the right front combination lamp and terminal 19 o f harness connector EL215-3 of the multi-domain fusion co ntroller.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the multi-domain fusion controller.

A Check whether the power ground circuit of the Multi-Do main Fusion Controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the right exterior rearview mirror assembly.

EL249-3 Main Zone Controller

B10DMVIU1221220

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221221

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main zone controller.
C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL249-3 of the main zone controller and terminal 2 of harness connector TR032 of the right outside rearview mirror assembly is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and measure the voltage between terminal 13 of the harness connector EL249-3 of the main zone controller and the body ground to check whether it is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the mirror glass adjustment motor assembly and the right exterior rearview mirror assembly.

A Check the wiring harness between the mirror adjustment motor assembly and the right exterior mirror assembly for a short or open circuit.

Yes》》》 Repair or replace the wiring harness.

No》》》
Go to step 4.

Step 4 Replace the mirror glass adjustment motor assembly.

© 2026, All rights reserved

	A Replace the mirror glass adjustment motor assembly. B After replacing the mirror adjustment motor assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

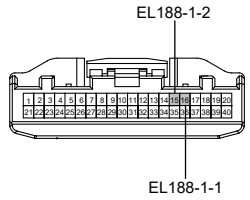
DTC: U137983-VIU

Fault code	Description
U137983	eCall validation signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

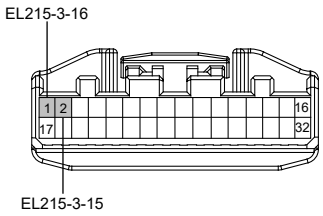
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the multi-domain fusion controller and the telematics host.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221160

EL188-1 Telematics Main Unit

B10DMVIU1221161

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of harness connector EL188-1 of the T-Box host is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fusion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

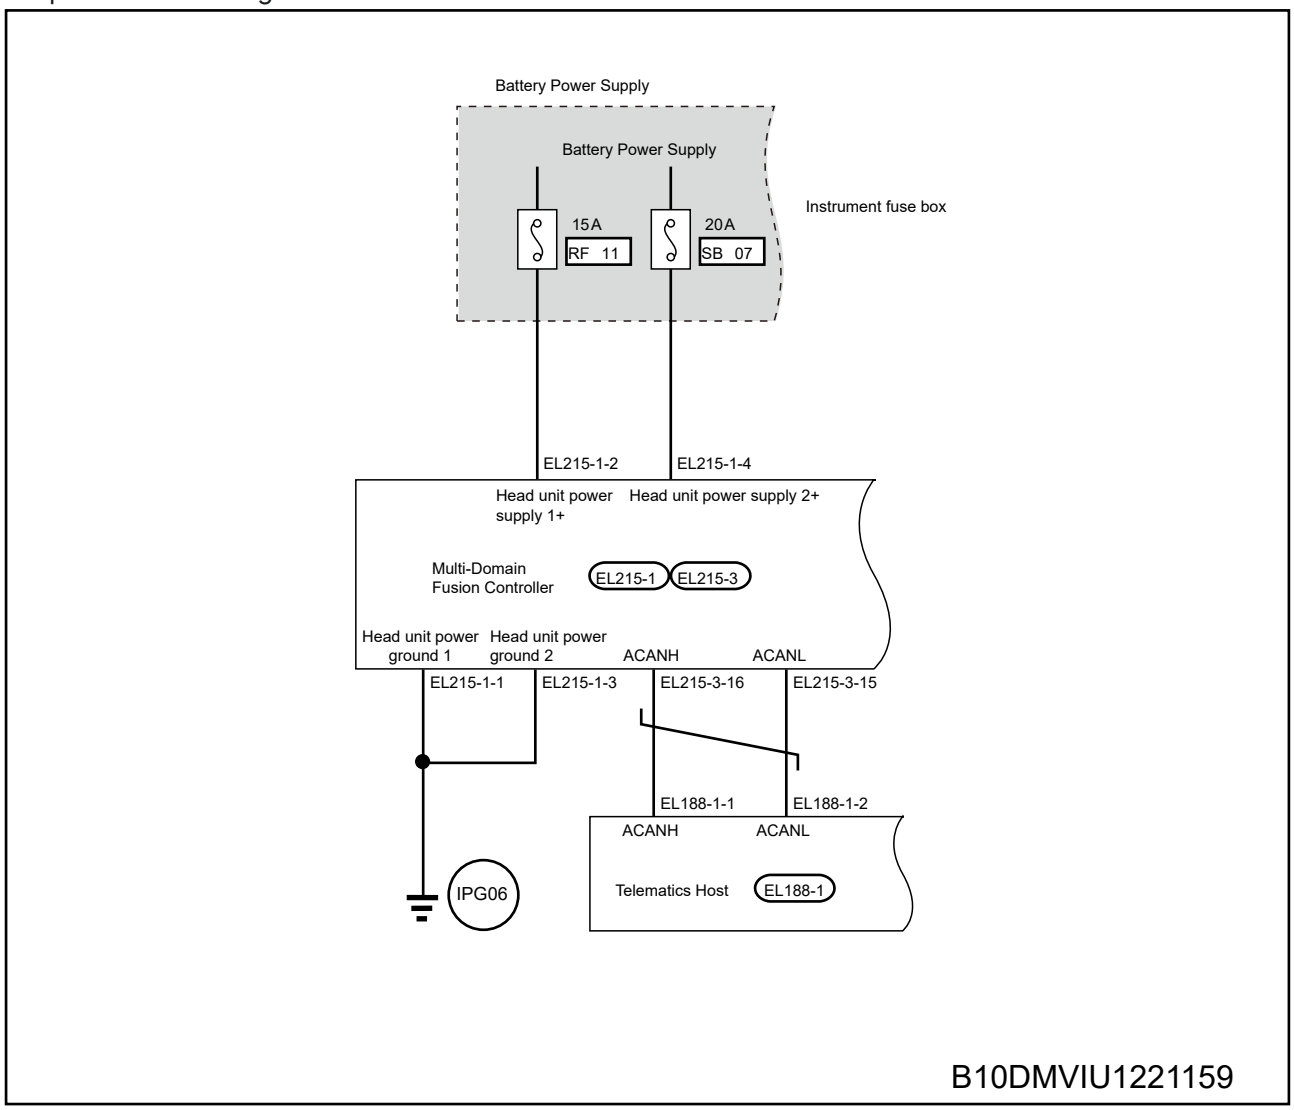
Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 5.

© 2026, All rights reserved



Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

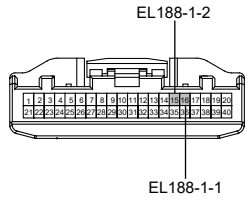
DTC: U137987-VIU

Fault code	Description
U137987	eCall Communication Lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

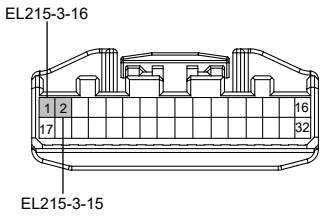
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the multi-domain fusion controller and the telematics host.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221160

EL188-1 Telematics Main Unit

B10DMVIU1221161

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of harness connector EL188-1 of the T-Box host is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fusion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

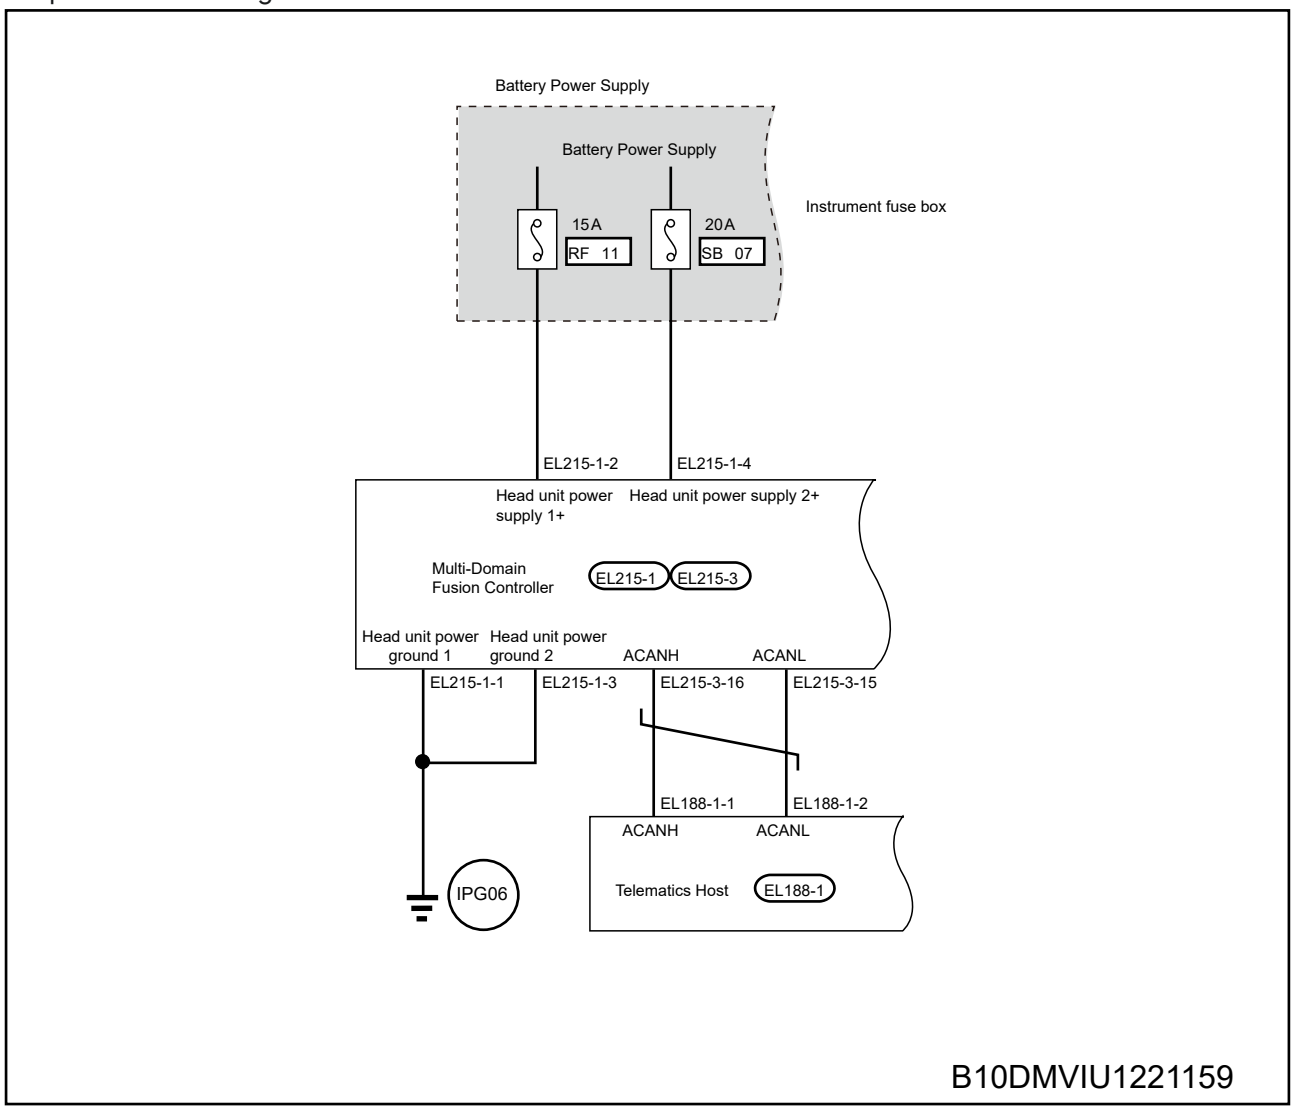
Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 5.

© 2026, All rights reserved



Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

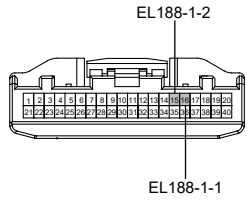
2. Diagnostic Steps

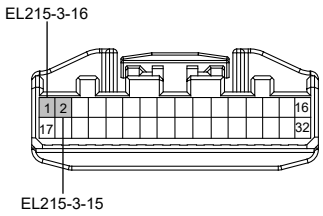
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the multi-domain fusion controller and the telematics host.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221160

EL188-1 Telematics Main Unit

B10DMVIU1221161

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of harness connector EL188-1 of the T-Box host is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 15 of the multi-domain fusion controller wire harness connector EL215-3 and terminal 2 of the telematics host wire harness connector EL188-1 to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the telematics host.

A Replace the telematics control unit.
B After replacing the telematics host, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 5.

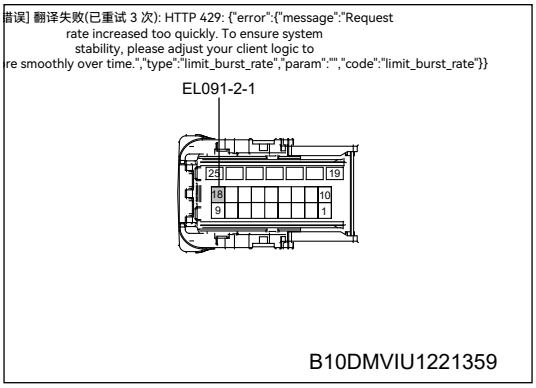
DTC: B161212-VIU

Fault code	Description
B161212	Steering wheel heating shorted to power

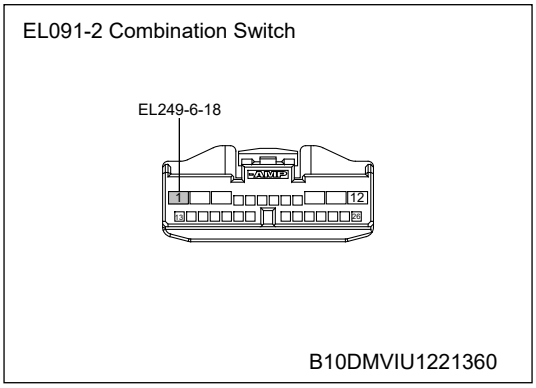
1. Simplified Circuit Diagram

2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

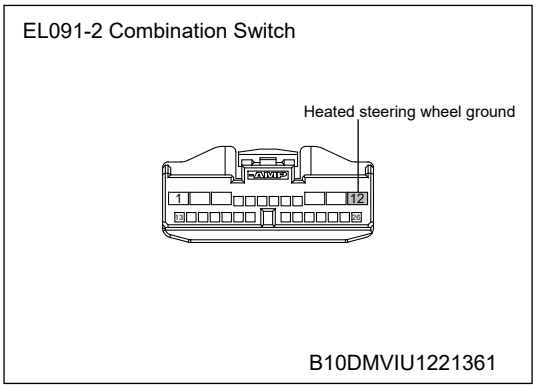


May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the combination switch.

B10DMVIU1221359



B10DMVIU1221360

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main z one controller.
C Disconnect the harness connector EL091-2 of the combin ation switch.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 18 of harness connector EL249-6 of the main zone controller and terminal 1 of harn ess connector EL091-2 of the combination switch to check i f it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 18 of the main zone contr oller wire harness connector EL249-6 and the body ground to check if it is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard v alue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the steering wheel heating ground wire harness of the combination switch.

B10DMVIU1221361

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL091-2 of the combin ation switch.
C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 12 of harness connector EL091-2 of the combination switch and the body ground to check whether it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

© 2026, All rights reserved

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the steering wheel body assembly and the combination switch.	
	A Check whether there is a short circuit or open circuit between the terminals of combination switch EL091-2 (device side) and the terminals of the combination switch (where the combination switch connects to the steering wheel body assembly).
	Yes 》 》 》 Replace the combination switch.
	No 》 》 》 Go to step 5.
Step 5 Replace the steering wheel body assembly.	
	A Replace the steering wheel main body assembly. B After replacing the steering wheel assembly, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

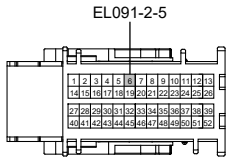
DTC: B161311-VIU

Fault code	Description
B161311	Steering wheel NTC sensor short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

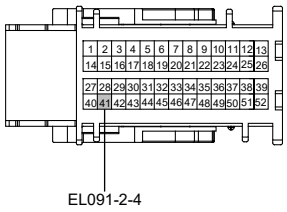
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

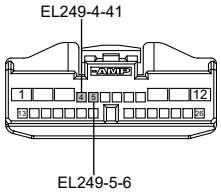
May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the combination switch.

EL249-5 Main Zone Controller



B10DMVIU1221380

EL249-4 Main Zone Controller

B10DMVIU1221381

EL091-2 Combination Switch

B10DMVIU1221382

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connectors EL249-4 and EL249-5 of the main zone controller.
C Disconnect the harness connector EL091-2 of the combination switch.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 41 of harness connector EL249-4 of the main zone controller and terminal 4 of harness connector EL091-2 of the combination switch to check whether it is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 6 of harness connector EL249-5 of the main zone controller and terminal 5 of harness connector EL091-2 of the combination switch is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and measure the resistance between terminals 4 and 5 of the combination switch harness connector EL091-2 and the body ground to check if it is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the steering wheel body assembly and the combination switch.

A Check whether there is a short circuit or open circuit between the terminals of combination switch EL091-2 (device side) and the terminals of the combination switch (where the combination switch connects to the steering wheel body assembly).

© 2026, All rights reserved

	Yes 》》》 Replace the combination switch.
	No 》》》 Go to step 4.
Step 4 Replace the steering wheel body assembly.	
	A Replace the steering wheel main body assembly. B After replacing the steering wheel assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

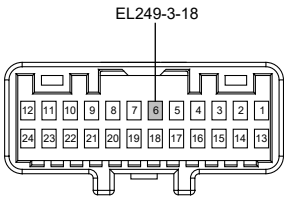
Step 2 Check the power wire harness for rearview mirror heating.

EL249-3 Main Zone Controller



B10DMVIU1221363

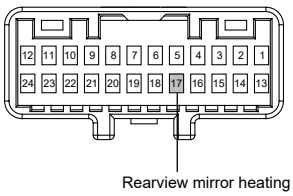
TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221364

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221365

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector TR031 of the left exteri or rearview mirror assembly.
D Disconnect the wire harness connector TR032 of the righ t exterior rearview mirror assembly.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 18 of harness con nector EL249-3 of the main zone controller and terminal 6 of harness connector TR031 of the left exterior rearview mi rror assembly is normal.
F Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the wire harness co nnector EL249-3 of the main zone controller and terminal 6 of the wire harness connector TR032 of the right exterior re arview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor EL249-3 of the main zone controller and the body grou nd to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for rearview mirror heating.

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221366

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221367

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 17 of harness connector TR031 for the left exterior mirror assembly and body ground is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector TR032 of the right exterior rearview mirror assembly and the body ground to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the rearview mirror glass and the exterior rearview mirror assembly.

A Check the wiring harness between the left mirror glass assembly and the left outside rearview mirror assembly for a short circuit or an open circuit.
B Check the wiring harness between the right mirror glass assembly and the right exterior rearview mirror assembly for short or open circuits.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the left or right mirror glass assembly.

A Replace the left mirror glass assembly or right mirror glass assembly.
B After replacing the left mirror glass assembly or the right mirror glass assembly, is the fault cleared?

Yes 》》》 System normal.

No 》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

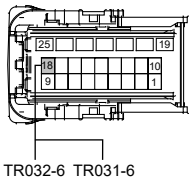
DTC: B1C5312-VIU

Fault code	Description
B1C5312	Rearview mirror heating shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

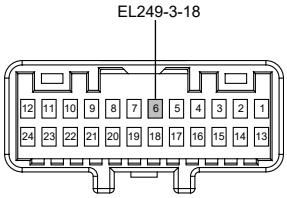
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

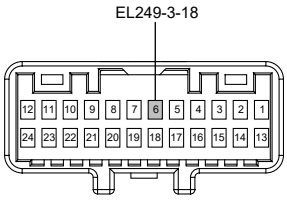
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the power wire harness for rearview mirror heating.

EL249-3 Main Zone Controller



B10DMVIU1221363

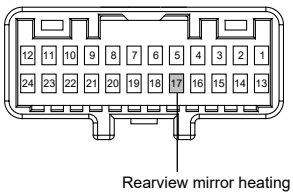
TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221364

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221365

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector TR031 of the left exteri or rearview mirror assembly.
D Disconnect the wire harness connector TR032 of the righ t exterior rearview mirror assembly.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 18 of harness con nector EL249-3 of the main zone controller and terminal 6 of harness connector TR031 of the left exterior rearview mi rror assembly is normal.
F Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the wire harness co nnector EL249-3 of the main zone controller and terminal 6 of the wire harness connector TR032 of the right exterior re arview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e the voltage between terminal 18 of the harness connecto r EL249-3 of the main zone controller and the vehicle body ground to check whether the voltage value is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for rearview mirror heating.

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221366

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221367

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 17 of harness connector TR031 for the left exterior mirror assembly and body ground is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector TR032 of the right exterior rearview mirror assembly and the body ground to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the rearview mirror glass and the exterior rearview mirror assembly.

A Check the wiring harness between the left mirror glass assembly and the left outside rearview mirror assembly for a short circuit or an open circuit.
B Check the wiring harness between the right mirror glass assembly and the right exterior rearview mirror assembly for short or open circuits.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the left or right mirror glass assembly.

A Replace the left mirror glass assembly or right mirror glass assembly.
B After replacing the left mirror glass assembly or the right mirror glass assembly, is the fault cleared?

Yes 》》》 System normal.

No 》》》

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221366

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221367

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 17 of harness connector TR031 for the left exterior mirror assembly and body ground is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector TR032 of the right exterior rearview mirror assembly and the body ground to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the rearview mirror glass and the exterior rearview mirror assembly.

A Check the wiring harness between the left mirror glass assembly and the left outside rearview mirror assembly for a short circuit or an open circuit.
B Check the wiring harness between the right mirror glass assembly and the right exterior rearview mirror assembly for short or open circuits.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the left or right mirror glass assembly.

A Replace the left mirror glass assembly or right mirror glass assembly.
B After replacing the left mirror glass assembly or the right mirror glass assembly, is the fault cleared?

Yes 》》》 System normal.

No 》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

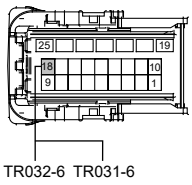
DTC: B1C5319-VIU

Fault code	Description
B1C5319	Rearview mirror heating overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

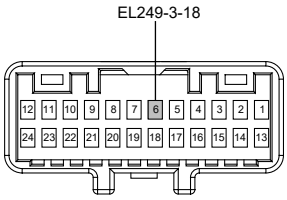
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

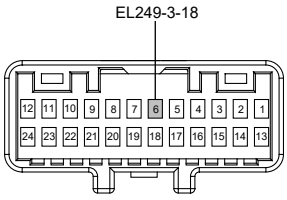
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the power wire harness for rearview mirror heating.

EL249-3 Main Zone Controller



B10DMVIU1221363

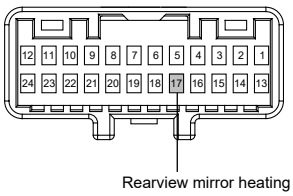
TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221364

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221365

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector TR031 of the left exteri or rearview mirror assembly.
D Disconnect the wire harness connector TR032 of the righ t exterior rearview mirror assembly.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 18 of harness con nector EL249-3 of the main zone controller and terminal 6 of harness connector TR031 of the left exterior rearview mi rror assembly is normal.
F Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the wire harness co nnector EL249-3 of the main zone controller and terminal 6 of the wire harness connector TR032 of the right exterior re arview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 18 of the harness connec tor EL249-3 of the main zone controller and the body grou nd to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.
I Connect the negative battery terminal, and power on the vehicle.
J Use a multimeter, select the DC voltage range, and measu re the voltage between terminal 18 of the harness connect or EL249-3 of the main zone controller and the body groun d to check whether it is normal.
Voltage standard value: 0V
K Confirm whether the voltage value meets the standard va lue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for rearview mirror heating.

TR031 Left Exterior Rearview Mirror Assembly

B10DMVIU1221366

TR032 Right Exterior Rearview Mirror Assembly

B10DMVIU1221367

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
C Disconnect the wiring harness connector TR032 of the right exterior rearview mirror assembly.
D Use a multimeter, select the resistance range, and check whether the resistance between terminal 17 of harness connector TR031 for the left exterior mirror assembly and body ground is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 17 of the harness connector TR032 of the right exterior rearview mirror assembly and the body ground to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

Step 4 Check the wiring harness between the rearview mirror glass and the exterior rearview mirror assembly.

A Check the wiring harness between the left mirror glass assembly and the left outside rearview mirror assembly for a short circuit or an open circuit.
B Check the wiring harness between the right mirror glass assembly and the right exterior rearview mirror assembly for short or open circuits.

Yes 》》》 Repair or replace the wiring harness.

No 》》》
Go to step 5.

Step 5 Replace the left or right mirror glass assembly.

A Replace the left mirror glass assembly or right mirror glass assembly.
B After replacing the left mirror glass assembly or the right mirror glass assembly, is the fault cleared?

Yes 》》》 System normal.

No 》》》

© 2026, All rights reserved

	Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 7.
Step 7 Diagnosis complete.

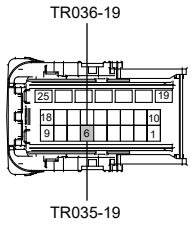
DTC: B1C4C01-VIU

Fault code	Description
B1C4C01	Front left/right seat ventilation fan power supply short to ground or o vercurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

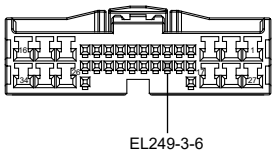
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

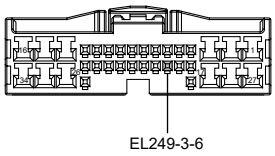
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the front seat connector.

EL249-3 Main Zone Controller



B10DMVIU1221275

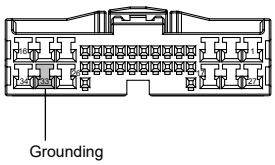
TR035 Front left seat connector

B10DMVIU1221276

TR036 Front right seat connector

B10DMVIU1221354

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector TR035 of the front left seat.
D Disconnect the right front seat harness connector TR036.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 6 of the main zone contr oller harness connector EL249-3 and terminal 19 of the left front seat harness connector TR035 to check if the resistan ce value is normal.
F Use a multimeter set to the resistance range to measure t he resistance between terminal 6 of harness connector EL2 49-3 of the main zone controller and terminal 19 of harness connector TR036 of the right front seat connector to check whether the resistance is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 6 of the wire harness con nector EL249-3 of the main zone controller and the vehicle body ground to check whether the resistance value is norm al.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the seat ventilation fan.

TR035 Front left seat connector

B10DMVIU1221269

TR036 Front right seat connector

B10DMVIU1221273

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C Disconnect the right front seat harness connector TR036.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 33 of harness connector TR035 for the left front seat connector and the body ground to check if the resistance value is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 33 of harness connector TR036 of the right front seat connector and the body ground is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

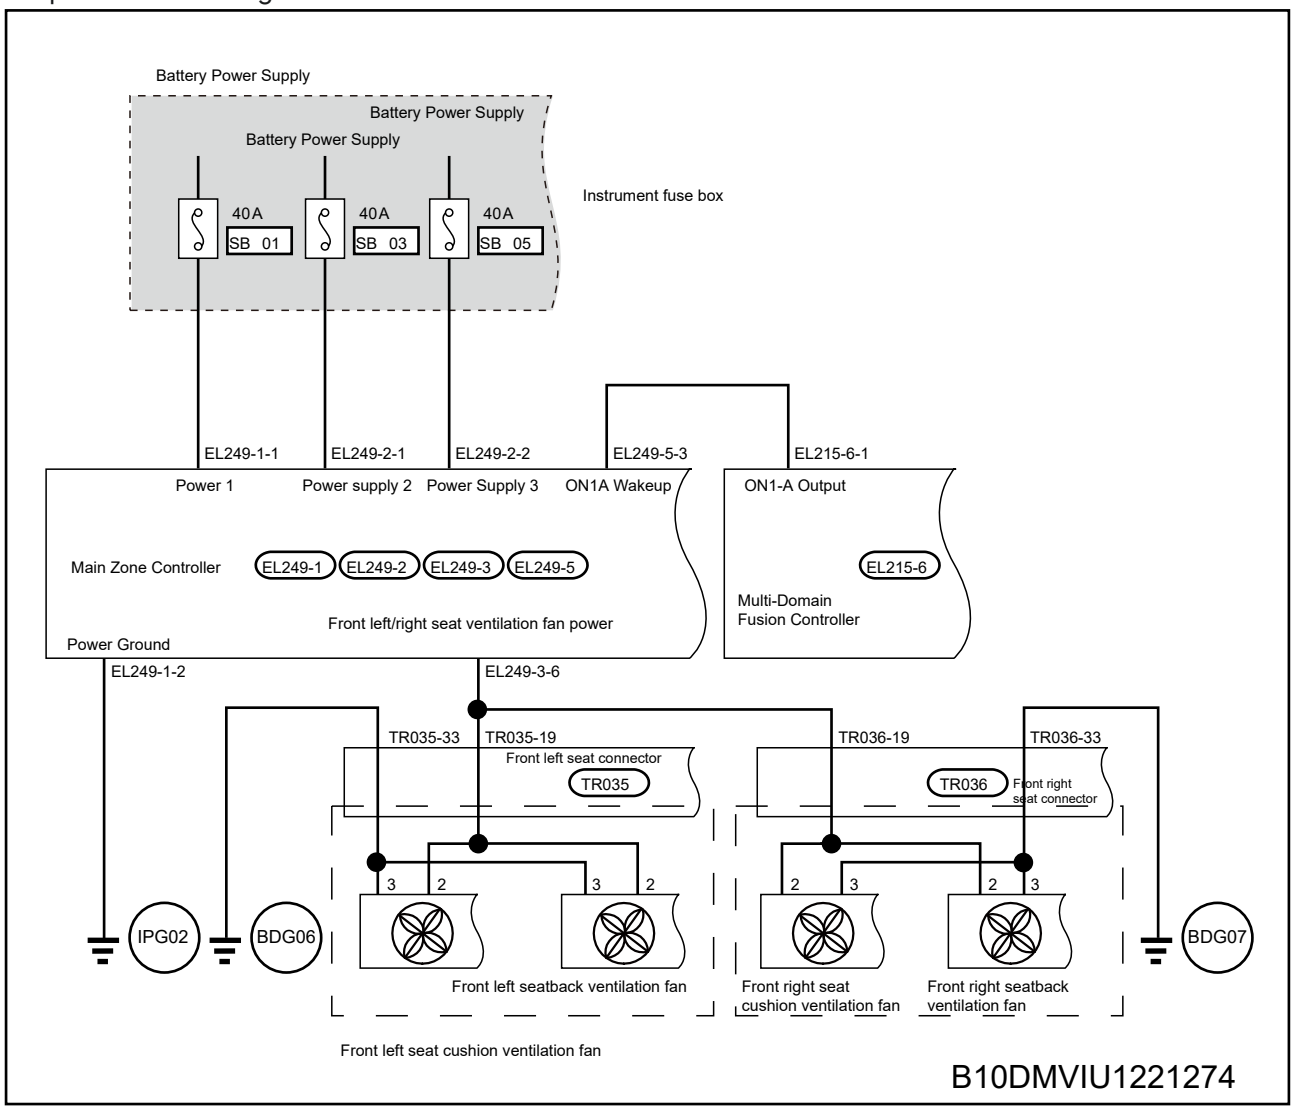
Step 4 Check the wiring harness between the front left seat ventilation fan and the front left seat connector (component side).

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C Disconnect the wiring harness connector for the front left seat cushion ventilation fan.
D Disconnect the wiring harness connector for the front left seat back ventilation fan.
E Use a multimeter, select the resistance range, and measure the resistance between the harness connector terminal of the front left seat connector (component side) and the harness connector terminal of the front left seat cushion ventilation fan to check if it is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance value between the harness connector terminal of the front left seat connector (component side) and the harness connector terminal of the front left backrest ventilation fan is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	G Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the wiring harness between the front right seat ventilation fan and the front right seat connec tor (component side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front righ t seat connector. C Disconnect the wiring harness connector of the front righ t seat cushion ventilation fan. D Disconnect the wiring harness connector for the front rig ht seat backrest ventilation fan. E Use a multimeter, select the resistance range, and measur e the resistance between the harness connector terminals o f the right front seat connector (component side) and the h arness connector terminals of the front right seat cushion v entilation fan to check whether the resistance is normal. F Use a multimeter, set it to the resistance range, and meas ure the resistance between the harness connector terminal of the front right seat connector (component side) and the harness connector terminal of the front right seatback venti lation fan to check if it is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard v alue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the front seat cushion ventilation fan or the front seat back ventilation fan.	
	A Replace the front seat cushion ventilation fan or front sea t backrest ventilation fan. B. After replacing the front seat cushion ventilation fan or t he front seat backrest ventilation fan, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 7.	

© 2026, All rights reserved



Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

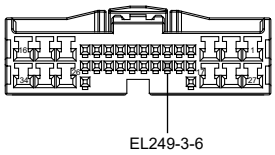
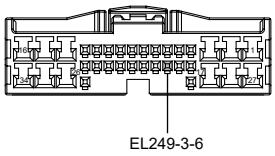
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the front seat connector.

EL249-3 Main Zone Controller



B10DMVIU1221275

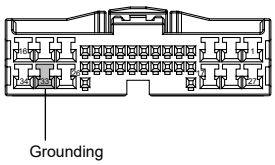
TR035 Front left seat connector

B10DMVIU1221276

TR036 Front right seat connector

B10DMVIU1221354

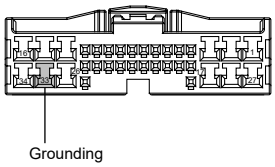
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main zone controller.
C Disconnect the harness connector TR035 of the front left seat.
D Disconnect the right front seat harness connector TR036.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the main zone controller harness connector EL249-3 and terminal 19 of the left front seat harness connector TR035 to check if the resistance value is normal.
F Use a multimeter set to the resistance range to measure the resistance between terminal 6 of harness connector EL249-3 of the main zone controller and terminal 19 of harness connector TR036 of the right front seat connector to check whether the resistance is normal.
Resistance standard value: Less than 1 Ω
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure whether the voltage between terminal 6 of the harness connector EL249-3 of the main zone controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the seat ventilation fan.



© 2026, All rights reserved

TR035 Front left seat connector

B10DMVIU1221269

TR036 Front right seat connector

B10DMVIU1221273

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C Disconnect the right front seat harness connector TR036.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 33 of harness connector TR035 for the left front seat connector and the body ground to check if the resistance value is normal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 33 of harness connector TR036 of the right front seat connector and the body ground is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》》》 Repair or replace the wiring harness.

Yes 》》》
Go to step 4.

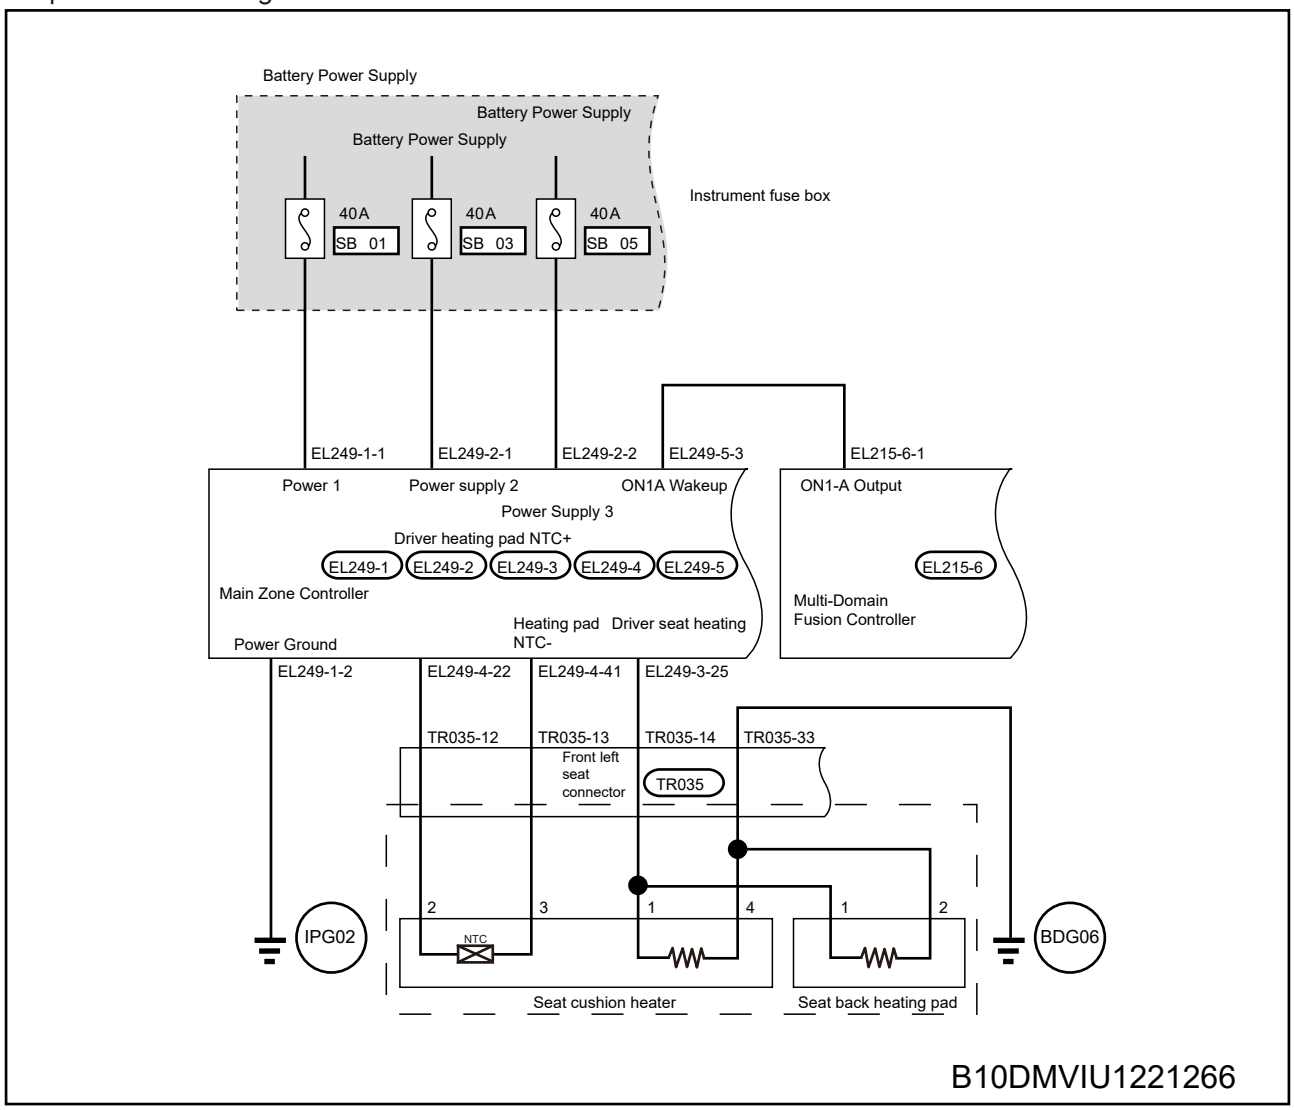
Step 4 Check the wiring harness between the front left seat ventilation fan and the front left seat connector (component side).

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C Disconnect the wiring harness connector for the front left seat cushion ventilation fan.
D Disconnect the wiring harness connector for the front left seat back ventilation fan.
E Use a multimeter, select the resistance range, and measure the resistance between the harness connector terminal of the front left seat connector (component side) and the harness connector terminal of the front left seat cushion ventilation fan to check if it is normal.
F Use a multimeter, select the resistance range, and measure whether the resistance value between the harness connector terminal of the front left seat connector (component side) and the harness connector terminal of the front left backrest ventilation fan is normal.
Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	G Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Check the wiring harness between the front right seat ventilation fan and the front right seat connector (component side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front right seat connector. C Disconnect the wiring harness connector of the front right seat cushion ventilation fan. D Disconnect the wiring harness connector for the front right seat backrest ventilation fan. E Use a multimeter, select the resistance range, and measure the resistance between the harness connector terminals of the right front seat connector (component side) and the harness connector terminals of the front right seat cushion ventilation fan to check whether the resistance is normal. F Use a multimeter, set it to the resistance range, and measure the resistance between the harness connector terminal of the front right seat connector (component side) and the harness connector terminal of the front right seatback ventilation fan to check if it is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 6.	
Step 6 Replace the front seat cushion ventilation fan or the front seat back ventilation fan.	
	A Replace the front seat cushion ventilation fan or front seat backrest ventilation fan. B. After replacing the front seat cushion ventilation fan or the front seat backrest ventilation fan, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 7.	

© 2026, All rights reserved



Step 7 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 8.	
Step 8 Diagnosis complete.

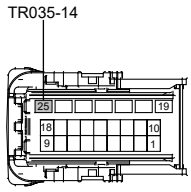
DTC: B1C4812-VIU

Fault code	Description
B1C4812	Driver seat heating short to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

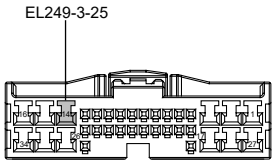
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



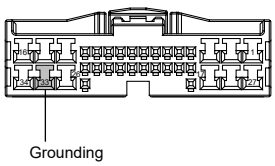
Step 2 Check the wiring harness between the main zone controller and the front left seat connector.

EL249-3 Main Zone Controller

B10DMVIU1221267

TR035 Front left seat connector

B10DMVIU1221268



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the harness connector TR035 of the front left seat.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 25 of harness connect or EL249-3 of the main zone controller and terminal 14 of h arness connector TR035 of the left front seat connector to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 25 of the main zone contr oller harness connector EL249-3 and the body ground to c heck whether the voltage is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the front left seat heating ground wire harness.

TR035 Front left seat connector

B10DMVIU1221269

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR035 of the front left seat connector.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 33 of harness connect or TR035 of the left front seat connector and the body gro und to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the seat heating pad and the front left seat connector (compone nt side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 of the front left seat connector. C Disconnect the wiring harness connector of the seat cush ion heating pad. D Disconnect the wiring harness connector for the backrest heating pad. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between the harness connector terminal of the left front seat connector (component side) and the h arness connector terminal of the seat cushion heating pad t o check whether the resistance value is normal. F. Use a multimeter, select the resistance range, and measur e whether the resistance value between the harness conne ctor terminal of the left front seat connector (component si de) and the harness connector terminal of the backrest hea ting pad is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the seat cushion heater or the seat back heater.	
	A Replace the seat cushion heating pad or the backrest hea ting pad. B After replacing the seat cushion heating pad or backrest heating pad, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller.

© 2026, All rights reserved

	B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

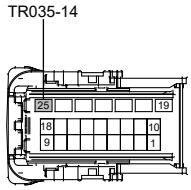
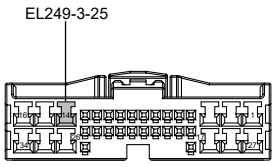
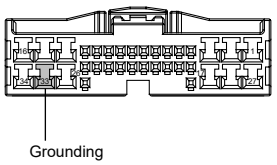
DTC: B1C4819-VIU

Fault code	Description
B1C4819	Driver's seat heating overcurrent





1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the main zone controller and the front left seat connector.	
EL249-3 Main Zone Controller  B10DMVIU1221267 TR035 Front left seat connector  B10DMVIU1221268	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-3 of the main z one controller. C Disconnect the harness connector TR035 of the front left seat. D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 25 of harness connect or EL249-3 of the main zone controller and terminal 14 of h arness connector TR035 of the left front seat connector to check if it is normal. Resistance standard value: Less than 1 Ω E Use a multimeter, select the resistance range, and measur e the resistance between terminal 25 of the harness connec tor EL249-3 of the main zone controller and the body grou nd to check if it is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value. G Connect the negative terminal of the battery, and power on the vehicle. H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 25 of the harness connec tor EL249-3 of the main zone controller and the vehicle bo dy ground to check whether it is normal. Voltage standard value: 0V I Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the front left seat heating ground wire harness.

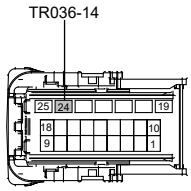
DTC: B1C4912-VIU

Fault code	Description
B1C4912	Front passenger seat heating shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

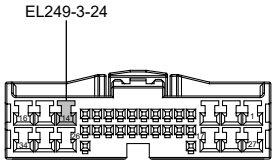
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



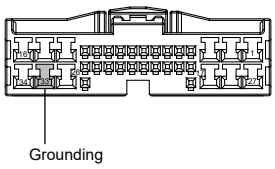
Step 2 Check the wiring harness between the main zone controller and the right front seat connector.

EL249-3 Main Zone Controller

B10DMVIU1221271

TR036 Front right seat connector

B10DMVIU1221272



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the right front seat harness connector TR036.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 24 of harness connector E L249-3 of the main zone controller and terminal 14 of harn ess connector TR036 of the right front seat connector, and check whether it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and meas ure whether the voltage between terminal 24 of the harnes s connector EL249-3 of the main zone controller and the ve hicle body ground is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for the front right seat heating.

TR036 Front right seat connector

B10DMVIU1221273

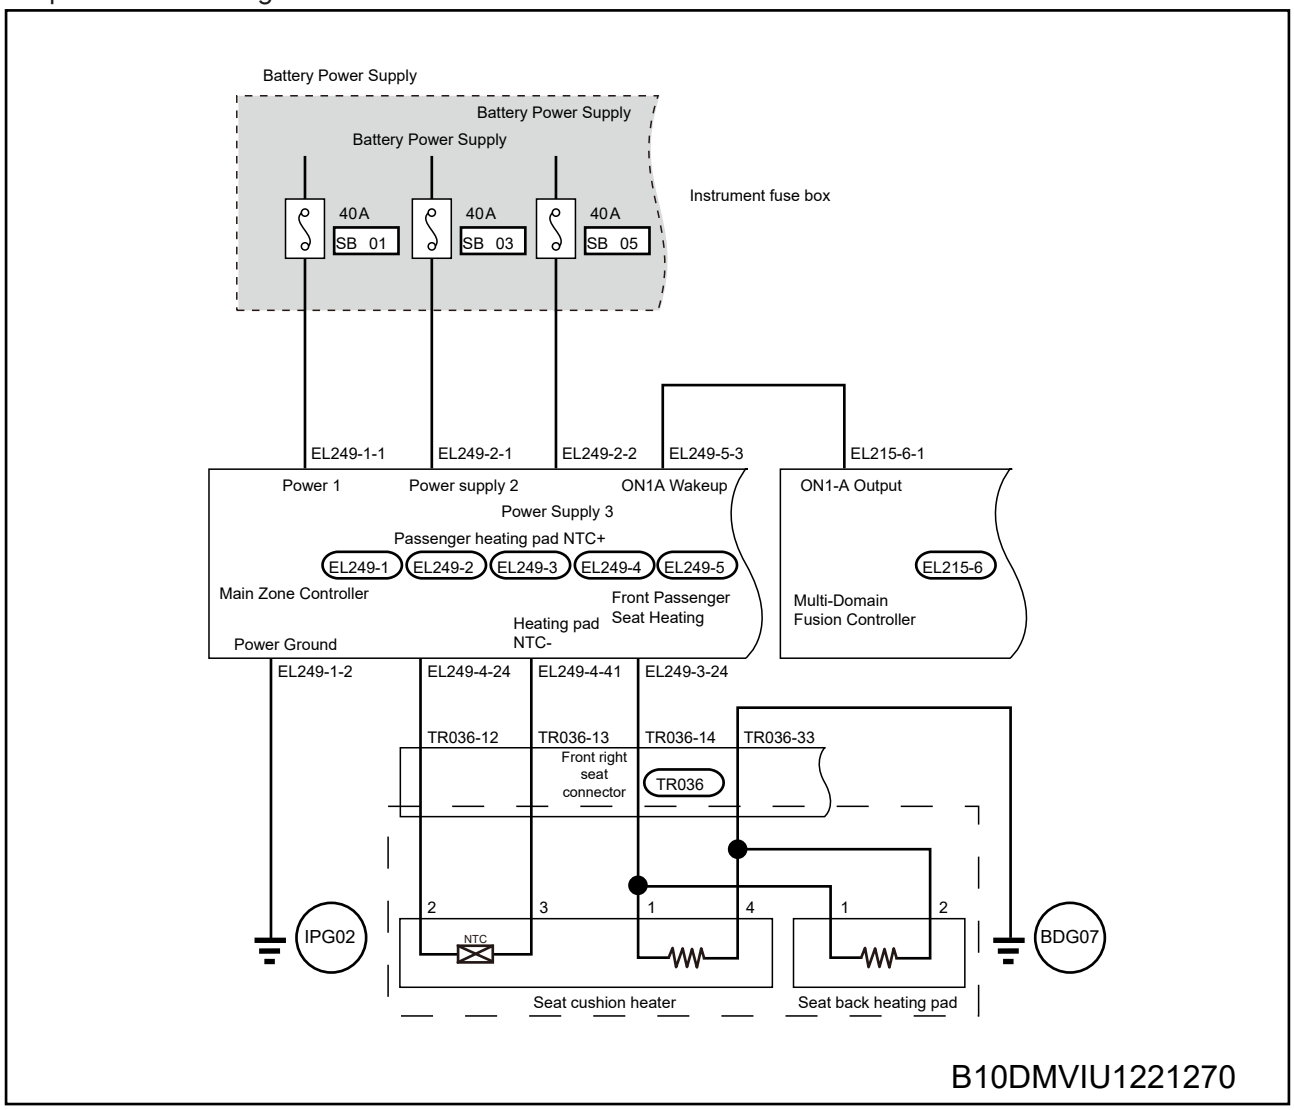
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR036 of the front righ t seat connector.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 33 of harness connect or TR036 for the right front seat connector and the body gr ound to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes 》 》 》 Go to step 4.
Step 4 Check the wiring harness between the seat heater pad and the front right seat connector (compone nt side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front righ t seat connector. C Disconnect the wiring harness connector of the seat cush ion heating pad. D Disconnect the wiring harness connector for the backrest heating pad. E Use a multimeter, select the resistance range, and measur e whether the resistance between the harness connector te rminal of the front right seat connector (component side) a nd the harness connector terminal of the seat cushion heati ng pad is normal. F. Use a multimeter, set it to the resistance range, and meas ure whether the resistance between the harness connector terminal of the right front seat connector (component side) and the harness connector terminal of the backrest heating pad is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard v alue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 5.
Step 5 Replace the seat cushion heater or the seat back heater.	
	A Replace the seat cushion heating pad or the backrest hea ting pad. B After replacing the seat cushion heating pad or backrest heating pad, is the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

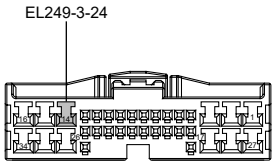
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



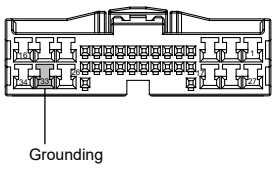
Step 2 Check the wiring harness between the main zone controller and the right front seat connector.

EL249-3 Main Zone Controller

B10DMVIU1221271

TR036 Front right seat connector

B10DMVIU1221272



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the right front seat harness connector TR036.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 24 of harness connector E L249-3 of the main zone controller and terminal 14 of harn ess connector TR036 of the right front seat connector, and check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 24 of the main zone cont roller harness connector EL249-3 and the body ground to c heck whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 24 of the harness connec tor EL249-3 of the main zone controller and the body grou nd to check whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for the front right seat heating.

© 2026, All rights reserved

TR036 Front right seat connector  B10DMVIU1221273	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front right seat connector. C Use a multimeter, set it to the resistance range, and measure the resistance between terminal 33 of harness connector TR036 for the right front seat connector and the body ground to check if the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Check the wiring harness between the seat heater pad and the front right seat connector (component side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR036 of the front right seat connector. C Disconnect the wiring harness connector of the seat cushion heating pad. D Disconnect the wiring harness connector for the backrest heating pad. E Use a multimeter, select the resistance range, and measure whether the resistance between the harness connector terminal of the front right seat connector (component side) and the harness connector terminal of the seat cushion heating pad is normal. F. Use a multimeter, set it to the resistance range, and measure whether the resistance between the harness connector terminal of the right front seat connector (component side) and the harness connector terminal of the backrest heating pad is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the seat cushion heater or the seat back heater.	

© 2026, All rights reserved

	A Replace the seat cushion heating pad or the backrest hea ting pad. B After replacing the seat cushion heating pad or backrest heating pad, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 7.

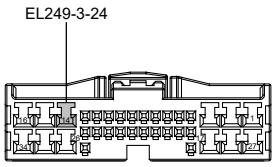
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



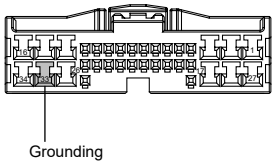
Step 2 Check the wiring harness between the main zone controller and the right front seat connector.

EL249-3 Main Zone Controller

B10DMVIU1221271

TR036 Front right seat connector

B10DMVIU1221272



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C Disconnect the right front seat harness connector TR036.
D. Use a multimeter set to the resistance range to measure the resistance between terminal 24 of harness connector E L249-3 of the main zone controller and terminal 14 of harn ess connector TR036 of the right front seat connector, and check whether it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 24 of the main zone cont roller harness connector EL249-3 and the body ground to c heck whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness for the front right seat heating.

TR036 Front right seat connector

B10DMVIU1221273

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector TR036 of the front righ t seat connector.
C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 33 of harness connect or TR036 for the right front seat connector and the body gr ound to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

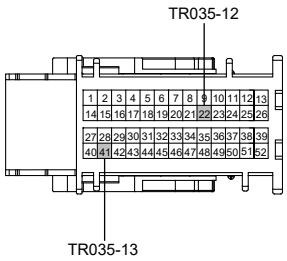
DTC: B1C551E-VIU

Fault code	Description
B1C551E	Abnormal NTC resistance of driver's seat heating pad

1. Simplified Circuit Diagram

2. Diagnostic Steps

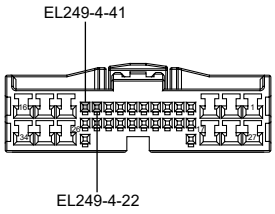
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes 》 》 》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the front left seat connector.

EL249-4 Main Zone Controller

B10DMVIU1221383

TR035 Front left seat connector

B10DMVIU1221384

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main z one controller.
C Disconnect the harness connector TR035 of the front left seat.
D. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 22 of harness connect or EL249-4 for the main zone controller and terminal 12 of harness connector TR035 for the left front seat to check if t he resistance is normal.
E Using a multimeter, select the resistance range and meas ure the resistance between terminal 41 of harness connect or EL249-4 for the main zone controller and terminal 13 of harness connector TR035 for the left front seat to check if t he resistance value is normal.
Resistance standard value: Less than 1 Ω
F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminals 22 and 41 of the main zone controller harness connector EL249-4 and the body g round to check whether the resistance value is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard v alue.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measur e whether the voltage between terminals 22 and 41 of the harness connector EL249-4 of the main zone controller and the vehicle body ground is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard val ue.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 3.

Step 3 Check the wiring harness between the seat cushion heating pad and the front left seat connector (c omponent side).

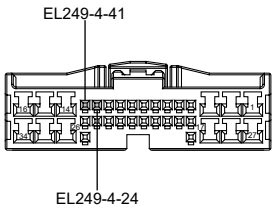
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the main zone controller and the right front seat connector.

EL249-4 Main Zone Controller

B10DMVIU1221385

TR036 Front right seat connector

B10DMVIU1221386

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B. Disconnect the harness connector EL249-4 of the main zone controller.
C Disconnect the right front seat harness connector TR036.
D Use a multimeter set to the resistance range to measure the resistance between terminal 24 of harness connector EL249-4 of the main zone controller and terminal 12 of harness connector TR036 of the right front seat connector to check if it is normal.
E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 41 of harness connector EL249-4 of the main zone controller and terminal 13 of harness connector TR036 of the right front seat connector to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Use a multimeter, select the resistance range, and check whether the resistance between terminals 24 and 41 of the harness connector EL249-4 of the main zone controller and the body ground is normal.
Standard resistance value: 10kΩ or higher
G Check whether the resistance value meets the standard value.
H. Connect the negative terminal of the battery, and power on the vehicle.
I Use a multimeter, select the DC voltage range, and measure the voltage between terminals 24 and 41 of the harness connector EL249-4 of the main zone controller and the vehicle body ground to check whether the voltage is normal.
Voltage standard value: 0V
J Confirm whether the voltage value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the wiring harness between the seat cushion heating pad and the right front seat connector (component side).

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.

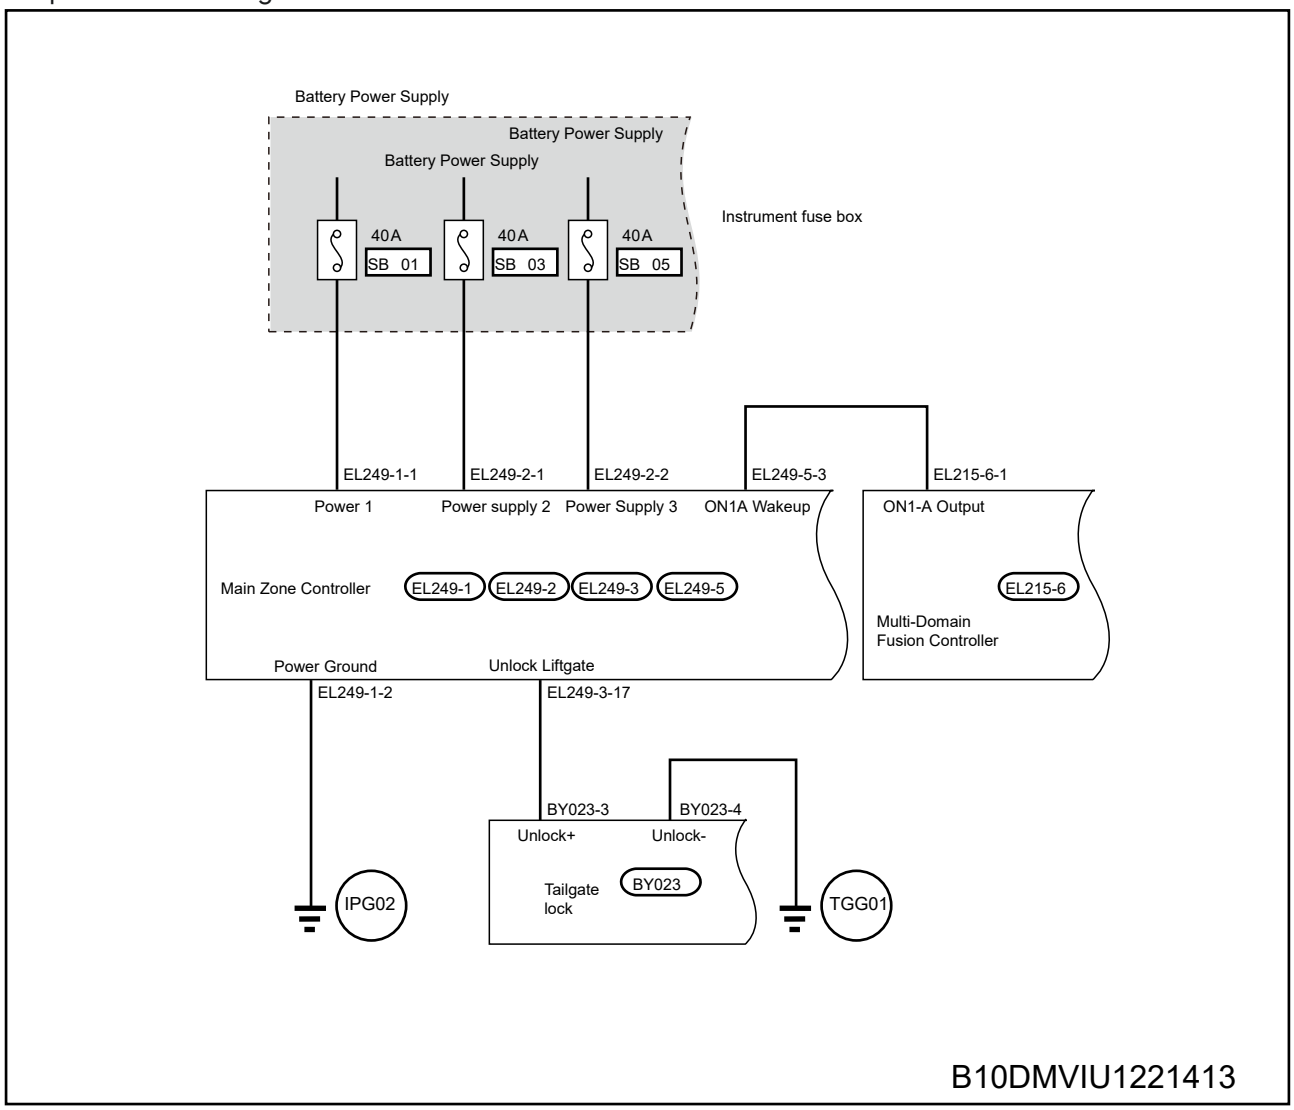
	Go to step 4.
Step 4 Check the wiring harness between the seat heating pad and the front left seat connector (compone nt side).	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector TR035 of the front left seat connector. C Disconnect the wiring harness connector of the seat cush ion heating pad. D Disconnect the wiring harness connector for the backrest heating pad. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between the harness connector terminal of the left front seat connector (component side) and the h arness connector terminal of the seat cushion heating pad t o check whether the resistance value is normal. F. Use a multimeter, select the resistance range, and measur e whether the resistance value between the harness conne ctor terminal of the left front seat connector (component si de) and the harness connector terminal of the backrest hea ting pad is normal. Resistance standard value: Less than 1 Ω G Check whether the resistance value meets the standard v alue.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the seat cushion heater or the seat back heater.	
	A Replace the seat cushion heating pad or the backrest hea ting pad. B After replacing the seat cushion heating pad or backrest heating pad, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 7.
Step 7 Diagnosis complete.

© 2026, All rights reserved

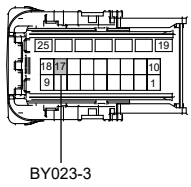
DTC: B1C2C12-VIU

Fault code	Description
B1C2C12	Trunk lid lock shorted to power

1. Simplified Circuit Diagram

2. Diagnostic Steps

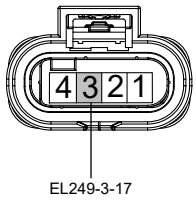
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



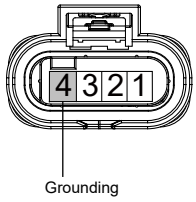
Step 2 Check the wiring harness between the main zone controller and the tailgate lock.

EL249-3 Main Zone Controller

B10DMVIU1221414

BY023 Liftgate Lock

B10DMVIU1221415



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C. Disconnect the harness connector BY023 of the liftgate l ock.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 17 of the main zone con troller harness connector EL249-3 and terminal 3 of the tail gate lock harness connector BY023 to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.
F. Connect the negative terminal of the battery and power on the vehicle.
G Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 3 of the wire harness con nector BY023 of the tailgate lock and the body ground to c heck whether the voltage is normal.
Voltage standard value: 0V
H Confirm whether the voltage value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the liftgate lock.

BY023 Liftgate Lock

B10DMVIU1221416

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY023 of the tailgate l ock.
C. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 4 of the tailgat e lock wire harness connector BY023 and the vehicle body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 4.
Step 4 Replace the tailgate lock.	
	A Replace the tailgate lock. B After replacing the tailgate lock, is the fault resolved?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

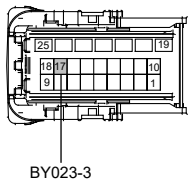
DTC: B1C2C11-VIU

Fault code	Description
B1C2C11	Liftgate lock shorted to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

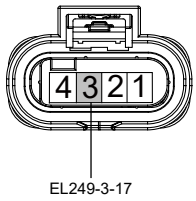
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



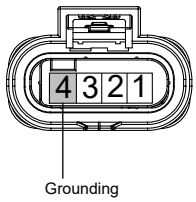
Step 2 Check the wiring harness between the main zone controller and the tailgate lock.

EL249-3 Main Zone Controller

B10DMVIU1221414

BY023 Liftgate Lock

B10DMVIU1221415



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-3 of the main z one controller.
C. Disconnect the harness connector BY023 of the liftgate l ock.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 17 of the main zone con troller harness connector EL249-3 and terminal 3 of the tail gate lock harness connector BY023 to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of the wire harness con nector BY023 for the tailgate lock and the vehicle body gro und to check whether it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wire harness of the liftgate lock.

BY023 Liftgate Lock

B10DMVIU1221416

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector BY023 of the tailgate l ock.
C. Use a multimeter, select the resistance range, and measu re whether the resistance between terminal 4 of the tailgat e lock wire harness connector BY023 and the vehicle body ground is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the tailgate lock.	
	A Replace the tailgate lock. B After replacing the tailgate lock, is the fault resolved?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

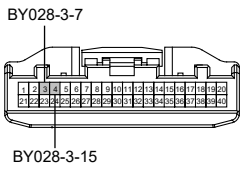
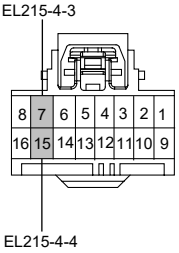
DTC: B1FD161-VIU

Fault code	Description
B1FD161	VIU and PTG authentication failed or timed out





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power liftgate controller key.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the key of the power liftgate c ontroller, and check whether it is correctly written.
	No》》》 Rewrite the power liftgate controller key.
	Yes》》》 Go to step 3.
Step 3 Restart the vehicle.	
	A After the vehicle is locked and enters sleep mode, restart the vehicle and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Check the CAN wiring harness between the multi-domain fusion controller and the power tailgate c ontroller.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221118 BY028-3 Power Tailgate Controller  B10DMVIU1221119	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller. C Disconnect the harness connector BY028-3 of the power tailgate controller. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of harness connector E L215-4 of the multi-domain fusion controller and terminal 15 of harness connector BY028-3 of the power tailgate con troller to check whether it is normal. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector BY028-3 of the power tailgate contr oller to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

	Yes》》》 Go to step 5.
Step 5 Check the power ground circuit of the power liftgate controller.	
	A Check whether the power ground circuit of the power lift gate controller is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 6.
Step 6 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
	Yes》》》 System normal.
	No》》》 Go to step 7.
Step 7 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 8.
Step 8 Diagnosis complete.

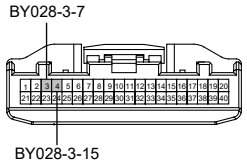
DTC: U136087-VIU

Fault code	Description
U136087	PTG Communication Lost

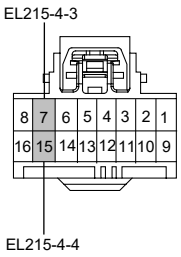
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the power tailgate c ontroller.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221118

BY028-3 Power Tailgate Controller

B10DMVIU1221119

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector BY028-3 of the power tailgate controller.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of harness connector E L215-4 of the multi-domain fusion controller and terminal 15 of harness connector BY028-3 of the power tailgate con troller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector BY028-3 of the power tailgate contr oller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the power liftgate controller.

	A Check whether the power ground circuit of the power lift gate controller is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the power liftgate controller.	
	A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.

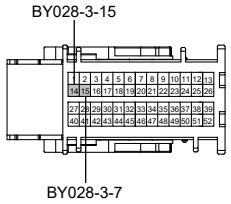
DTC: U140987-VIU

Fault code	Description
U140987	Sunshade communication lost

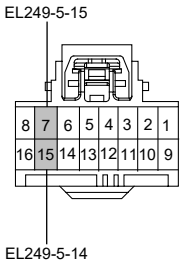
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the main zone controller and the power liftgate controller.

EL249-5 Main Zone Controller

B10DMVIU1221252

BY028-3 Power Tailgate Controller

B10DMVIU1221253

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the harness connector BY028-3 of the power tailgate controller.
D Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 14 of the wire harness connector EL249-5 of the main zone controller and termina l 15 of the wire harness connector BY028-3 of the power lif tgate controller to check whether the resistance value is no rmal.
E Use a multimeter, select the resistance range, and check whether the resistance between terminal 15 of harness con nector EL249-5 of the main zone controller and terminal 7 of harness connector BY028-3 of the power liftgate controll er is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the power liftgate controller.
A Check whether the power ground circuit of the power lift gate controller is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the power liftgate controller.
A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
	Yes 》》》 System normal.

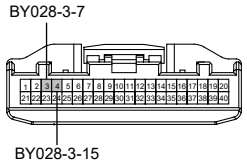
DTC: U136082-VIU

Fault code	Description
U136082	PTG Heartbeat Signal Error

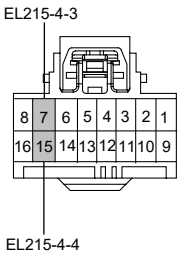
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN wiring harness between the multi-domain fusion controller and the power tailgate c ontroller.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221118

BY028-3 Power Tailgate Controller

B10DMVIU1221119

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector BY028-3 of the power tailgate controller.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 4 of harness connector E L215-4 of the multi-domain fusion controller and terminal 15 of harness connector BY028-3 of the power tailgate con troller to check whether it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector BY028-3 of the power tailgate contr oller to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the power liftgate controller.
A Check whether the power ground circuit of the power lift gate controller is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the power liftgate controller.
A Replace the power liftgate controller. B After replacing the power tailgate controller, is the fault cl eared?
Yes》》》 System normal.

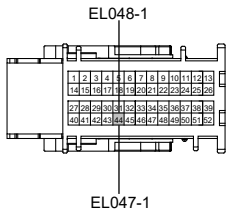
DTC: B1A1101-VIU

Fault code	Description
B1A1101	Reading lamp power supply short to ground or overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

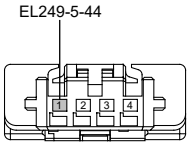
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

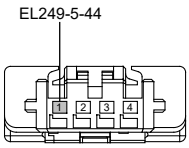
May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the power supply harness between the main zone controller and the reading lamp.

EL249-5 Main Zone Controller



B10DMVIU1221292

EL047 Front left reading lamp

B10DMVIU1221293

EL048 Front right reading lamp

B10DMVIU1221294

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the harness connector EL047 of the front left reading lamp.
D Disconnect the harness connector EL048 for the front rig ht reading lamp.
E Use a multimeter set to the resistance range to check wh ether the resistance between terminal 44 of harness conne ctor EL249-5 for the main zone controller and terminal 1 of harness connector EL047 for the front left reading lamp is normal.
F. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 44 of harness connect or EL249-5 of the main zone controller and terminal 1 of ha rness connector EL048 of the front right reading lamp to ch eck whether it is normal.
Resistance standard value: Less than 1 Ω
G Use a multimeter, select the resistance range, and measur e the resistance between terminal 44 of the harness connec tor EL249-5 of the main zone controller and the body grou nd to check whether it is normal.
Standard resistance value: 10kΩ or higher
H. Confirm whether the resistance value meets the standar d value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front left reading lamp or the front right reading lamp.

A Replace the front left reading lamp or front right reading lamp.
B After replacing the front left reading lamp or the front rig ht reading lamp, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

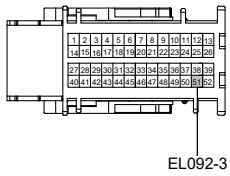
DTC: B161519-VIU

Fault code	Description
B161519	Hazard warning lamp indicator overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

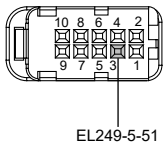
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



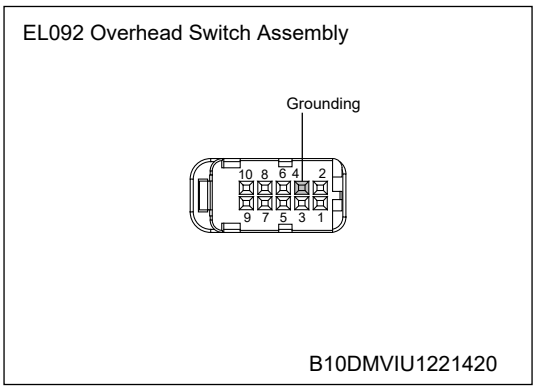
Step 2 Check the wiring harness between the main zone controller and the overhead switch assembly.

EL249-5 Main Zone Controller

B10DMVIU1221418

EL092 Overhead Switch Assembly

B10DMVIU1221419



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL092 of the ov erhead switch assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the main zone cont roller harness connector EL249-5 and terminal 3 of the ove rhead switch assembly harness connector EL092 to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the harness connec tor EL249-5 of the Main Zone Controller and the body grou nd to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 51 of the main zone contr oller harness connector EL249-5 and the body ground to c heck whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wiring harness of the overhead switch assembly.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL092 of the ov erhead switch assembly. C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 4 of harness connector EL092 of the overhead switch assembly and the body grou nd to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.

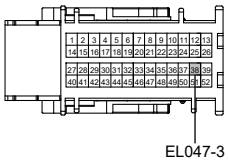
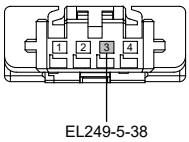
DTC: B161611-VIU

Fault code	Description
B161611	Front left reading lamp enable short to ground





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the enable harness between the main zone controller and the front left reading lamp.	
EL249-5 Main Zone Controller  B10DMVIU1221368 EL047 Front left reading lamp  B10DMVIU1221369	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Disconnect the harness connector EL047 of the front left reading lamp. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 38 of the main zone cont roller harness connector EL249-5 and terminal 3 of the fron t left reading lamp harness connector EL047 to check whet her the resistance value is normal. Resistance standard value: Less than 1 Ω E Use a multimeter set to the resistance range to check wh ether the resistance between terminal 38 of the main zone controller harness connector EL249-5 and the body groun d is normal. Standard resistance value: 10kΩ or higher F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front left reading lamp.	
	A Replace the front left reading lamp. B After replacing the front left reading lamp, is the fault cle ared?
	Yes》》》 System normal.
	No》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.

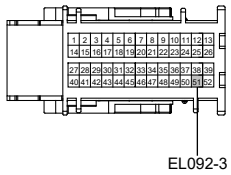
DTC: B161511-VIU

Fault code	Description
B161511	Hazard warning lamp indicator short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

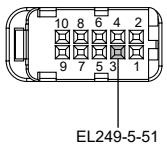
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



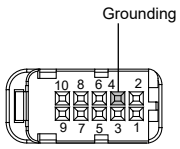
Step 2 Check the wiring harness between the main zone controller and the overhead switch assembly.

EL249-5 Main Zone Controller

B10DMVIU1221418

EL092 Overhead Switch Assembly

B10DMVIU1221419



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL092 of the ov erhead switch assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the main zone cont roller harness connector EL249-5 and terminal 3 of the ove rhead switch assembly harness connector EL092 to check if it is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the harness connec tor EL249-5 of the Main Zone Controller and the body grou nd to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wiring harness of the overhead switch assembly.

EL092 Overhead Switch Assembly

B10DMVIU1221420

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL092 of the ov erhead switch assembly.
C. Use a multimeter, select the resistance range, and measu re the resistance between terminal 4 of harness connector EL092 of the overhead switch assembly and the body grou nd to check if it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

DTC: U131E82-VIU

Fault code	Description
U131E82	ACC life signal error

1. Simplified Circuit Diagram

2. Diagnostic Steps

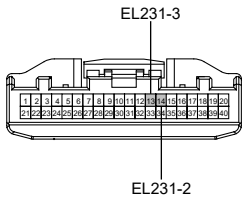
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

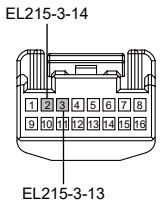
Step 2 Check the DTC of the front-view monocular camera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them.
C Check whether there is any fault related to the forward collision avoidance radar.

Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.

No》》》
Go to step 3.



Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221157

EL231 Front Mono Camera Assembly

B10DMVIU1221158

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231 of the front monocular camera assembly is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of the harness connector EL231 of the forward-facing monocular camera assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the multi-domain fusion controller and the front monocular camera assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221084

EL231 Front Mono Camera Assembly

B10DMVIU1221085

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector EL231 of the forward-facing monocular camera assembly is normal.
E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 17 of the multi-domain fusion controller wire harness connector EL215-4 and terminal 8 of the forward-facing monocular camera assembly wire harness connector EL231 is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.

A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front monocular camera assembly.

A Replace the forward-looking monocular camera assembly.

B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the DTC of the front-view monocular camera assembly.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check for any faults related to the blind spot monitoring radar.

Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.
No》》》 Go to step 3.
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.

EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221157 EL231 Front Mono Camera Assembly  B10DMVIU1221158	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. D Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231 of the front monocular camera assembly is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of the harness connector EL231 of the forward-facing monocular camera assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

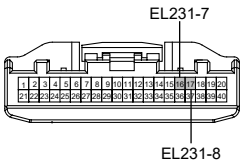
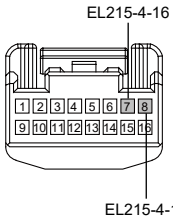
DTC: U1FC200-VIU

Fault code	Description
U1FC200	Q&A and FSC Handshake Timeout





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the front monocular camera assembly.	
EL215-4 Multi-Domain Fusion Controller  B10DMVIU1221084 EL231 Front Mono Camera Assembly  B10DMVIU1221085	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller. C. Disconnect the harness connector EL231 of the forward-facing monocular camera assembly. D Use a multimeter, select the resistance range, and measure whether the resistance value between terminal 16 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector EL231 of the forward-facing monocular camera assembly is normal. E Use a multimeter, select the resistance range, and measure whether the resistance between terminal 17 of the multi-domain fusion controller wire harness connector EL215-4 and terminal 8 of the forward-facing monocular camera assembly wire harness connector EL231 is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.	
	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

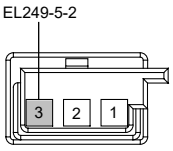
DTC: U140587-VIU

Fault code	Description
U140587	RLS communication lost

1. Simplified Circuit Diagram

2. Diagnostic Steps

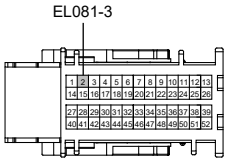
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the LIN communication harness between the rain/light sensor and the main zone controller.

EL081 Rain and Light Sensor

B10DMVIU1221438

EL249-5 Main Zone Controller

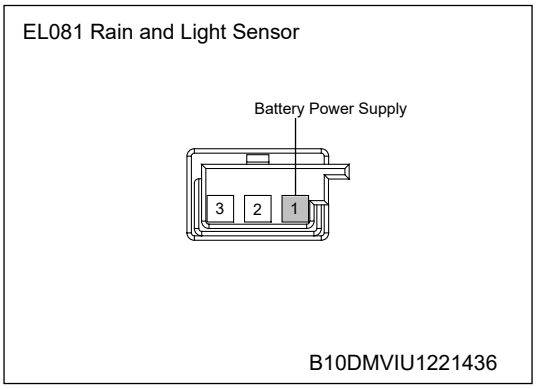
B10DMVIU1221439

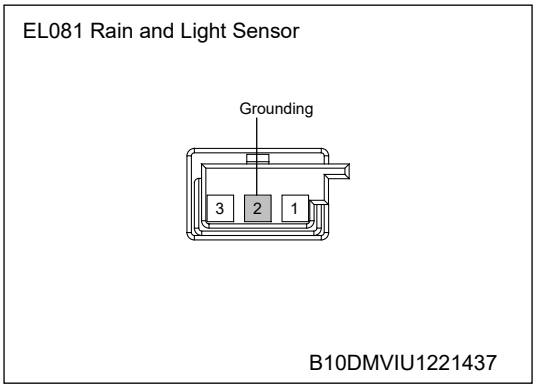
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the rain and light sensor harness connector E L081.
C Disconnect the wiring harness connector EL249-5 of the main zone controller.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 3 of harness connector EL081 for the rain and light sensor and terminal 2 of harnes s connector EL249-5 for the main zone controller to check i f it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply fuse for the rain and light sensor.





A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Check the rain and light sensor fuse RF12.
Fuse specification: RF12 5A
C. Confirm whether the fuse is blown.

Yes》》》 Replace the fuse with one of the same rating.

No》》》
Go to step 4.

Step 4 Check the power supply harness of the rain and light sensor.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the rain and light sensor harness connector E L081. C. Connect the negative terminal of the battery to power o n the vehicle. D. Using a multimeter set to the DC voltage range, measure the voltage between terminal 1 of the rain and light sensor harness connector EL081 and the body ground to check if i t is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ground harness of the rain/light sensor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the rain and light sensor harness connector E L081. C Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 2 of the wire harness c onnector EL081 for the rain and light sensor and the vehicl e body ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replace the rain and light sensor.	
	A Replace the rain and light sensor. B After replacing the rain and light sensor, is the fault cleare d?
Yes》》》 System normal.	
No》》》 Go to step 7.	
Step 7 Replacement of master zone controller	

© 2026, All rights reserved

	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.	

© 2026, All rights reserved

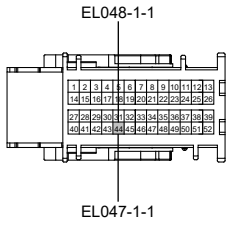
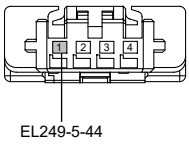
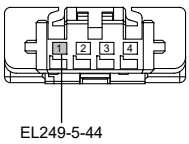
DTC: B1A1101-VIU

Fault code	Description
B1A1101	Reading lamp power supply short to ground or overcurrent







1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the power supply harness between the main zone controller and the reading lamp.	
EL249-5 Main Zone Controller  B10DMVIU1221529 EL047-1 Front left reading lamp  B10DMVIU1221530 EL048-1 Front right reading lamp  B10DMVIU1221531	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL249-5 of the main z one controller. C Disconnect the harness connector EL047-1 of the front le ft reading lamp. D Disconnect the right front reading lamp harness connect or EL048-1. E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 44 of harness connect or EL249-5 of the main zone controller and terminal 1 of ha rness connector EL047-1 of the front left reading lamp to c heck whether it is normal. F Use a multimeter, select the resistance range, and measur e the resistance between terminal 44 of the wire harness co nnector EL249-5 of the main zone controller and terminal 1 of the wire harness connector EL048-1 of the front right re ading lamp to check whether it is normal. Resistance standard value: Less than 1 Ω G Use a multimeter, select the resistance range, and measur e the resistance between terminal 44 of the harness connec tor EL249-5 of the main zone controller and the body grou nd to check whether it is normal. Standard resistance value: 10kΩ or higher H. Confirm whether the resistance value meets the standar d value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Replace the front left reading lamp or the front right reading lamp.	
	A Replace the front left reading lamp or front right reading lamp. B After replacing the front left reading lamp or the front rig ht reading lamp, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 4.
Step 4 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 5.
Step 5 Diagnosis complete.

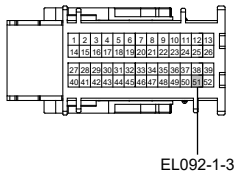
DTC: B161511-VIU

Fault code	Description
B161511	Hazard warning lamp indicator short to ground

1. Simplified Circuit Diagram

2. Diagnostic Steps

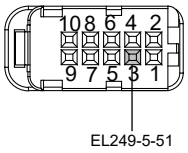
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



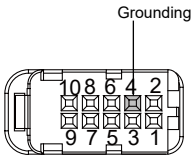
Step 2 Check the wiring harness between the main zone controller and the overhead switch assembly.

EL249-5 Main Zone Controller

B10DMVIU1221533

EL092-1 Overhead Switch Assembly

B10DMVIU1221534



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL092-1 from t he overhead console switch assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of harness connector EL249-5 of the main zone controller and terminal 3 of harn ess connector EL092-1 of the overhead switch assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the harness connec tor EL249-5 of the Main Zone Controller and the body grou nd to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wiring harness of the overhead switch assembly.

EL092-1 Overhead Switch Assembly

B10DMVIU1221535

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL092-1 of the overhe ad switch assembly.
C Use a multimeter, select the resistance range, and measur e the resistance value between terminal 4 of the harness co nnector EL092-1 of the overhead switch assembly and the body ground to check whether it is normal.
Resistance standard value: Less than 1 Ω
D Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

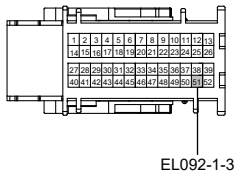
DTC: B161519-VIU

Fault code	Description
B161519	Hazard warning lamp indicator overcurrent

1. Simplified Circuit Diagram

2. Diagnostic Steps

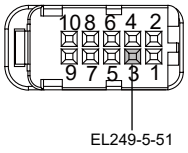
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



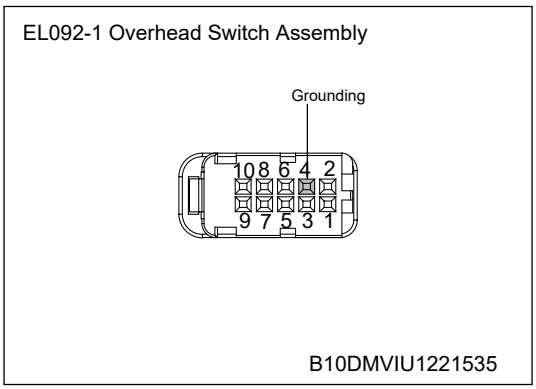
Step 2 Check the wiring harness between the main zone controller and the overhead switch assembly.

EL249-5 Main Zone Controller

B10DMVIU1221533

EL092-1 Overhead Switch Assembly

B10DMVIU1221534



A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-5 of the main z one controller.
C Disconnect the wiring harness connector EL092-1 from t he overhead console switch assembly.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of harness connector EL249-5 of the main zone controller and terminal 3 of harn ess connector EL092-1 of the overhead switch assembly to check whether the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 51 of the harness connec tor EL249-5 of the Main Zone Controller and the body grou nd to check if it is normal.
Standard resistance value: 10kΩ or higher
F Confirm whether the resistance value meets the standard value.
G Connect the negative terminal of the battery, and power on the vehicle.
H Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 51 of the main zone contr oller harness connector EL249-5 and the body ground to c heck whether it is normal.
Voltage standard value: 0V
I Confirm whether the voltage value meets the standard val ue.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the ground wiring harness of the overhead switch assembly.

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL092-1 of the overhead switch assembly. C Use a multimeter, select the resistance range, and measure the resistance value between terminal 4 of the harness connector EL092-1 of the overhead switch assembly and the body ground to check whether it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Replace the overhead console switch assembly.	
	A Replace the overhead console switch assembly. B After replacing the overhead switch assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 5.	
Step 5 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 6.	
Step 6 Diagnosis complete.

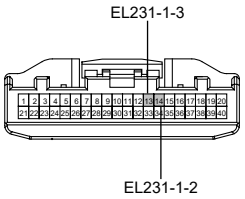
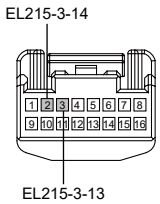
DTC: U131E82-VIU

Fault code	Description
U131E82	ACC life signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the DTC of the front-view monocular camera assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check whether there is any fault related to the forward collision avoidance radar.
Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.	
No》》》 Go to step 3.	
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.	

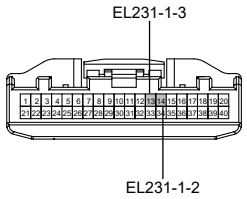
© 2026, All rights reserved

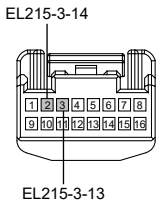
	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.	

© 2026, All rights reserved

DTC: U137F83-VIU

Fault code	Description
U137F83	Corresponding Message for BSD Checksum Signal Error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the DTC of the front-view monocular camera assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check for any faults related to the blind spot monitoring radar.
Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.	
No》》》 Go to step 3.	
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.	

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the DTC of the front-view monocular camera assembly.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check whether there is any fault related to the forward collision avoidance radar.

Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.
No》》》 Go to step 3.
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.

EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

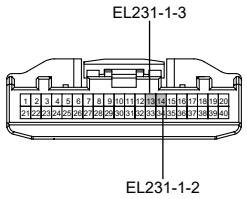
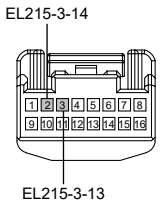
DTC: U131E87-VIU

Fault code	Description
U131E87	ACC communication loss





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.	
Yes》》》 Go to step 2.	
Step 2 Check the DTC of the front-view monocular camera assembly.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check whether there is any fault related to the forward collision avoidance radar.
Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.	
No》》》 Go to step 3.	
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.	

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 7.	
Step 7 Diagnosis complete.

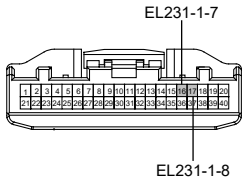
DTC: U1FC200-VIU

Fault code	Description
U1FC200	Q&A and FSC Handshake Timeout

1. Simplified Circuit Diagram

2. Diagnostic Steps

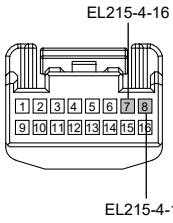
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the front monocular camera assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221601

EL231-1 Front Mono Camera Assembly

B10DMVIU1221602

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 16 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector EL231-1 of the front monocular camera assembly is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 17 of harness connector EL215-4 of the Multi-Domain Fusion Controller and terminal 8 of harness connector EL231-1 of the Forward Monocular Camera Assembly to check if the resistance value is normal
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.

A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front monocular camera assembly.

A Replace the forward-looking monocular camera assembly.

B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

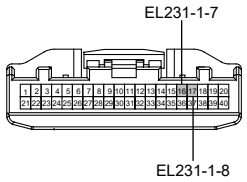
	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: U1F8200-VIU

Fault code	Description
U1F8200	Q&A and FSC Handshake Failure

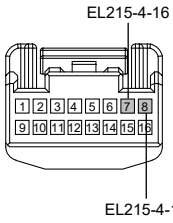
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the front monocular camera assembly.

EL215-4 Multi-Domain Fusion Controller

B10DMVIU1221601

EL231-1 Front Mono Camera Assembly

B10DMVIU1221602

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure whether the resistance between terminal 16 of harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of harness connector EL231-1 of the front monocular camera assembly is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 17 of harness connector EL215-4 of the Multi-Domain Fusion Controller and terminal 8 of harness connector EL231-1 of the Forward Monocular Camera Assembly to check if the resistance value is normal
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.	
Yes 》 》 》 Go to step 4.	
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

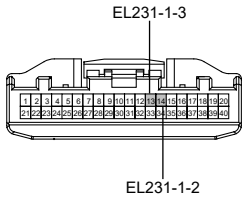
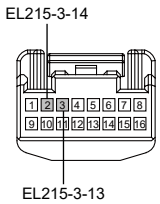
DTC: U137F87-VIU

Fault code	Description
U137F87	BSD communication lost

1. Simplified Circuit Diagram

2. Diagnostic Steps





Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the DTC of the front-view monocular camera assembly.

	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes of the front-view monocular camera assembly and record them. C Check for any faults related to the blind spot monitoring radar.

Yes》》》 Prioritize repair of faults related to the front-view monocular camera assembly.
No》》》 Go to step 3.
Step 3 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.

EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Check the power ground circuit of the forward-facing monocular camera assembly.

© 2026, All rights reserved

	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly . B After replacing the forward-facing monocular camera assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

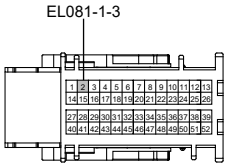
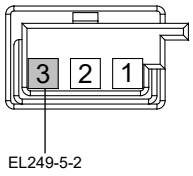
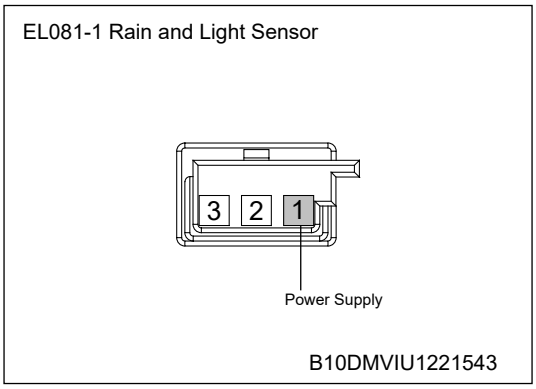
DTC: U140587-VIU

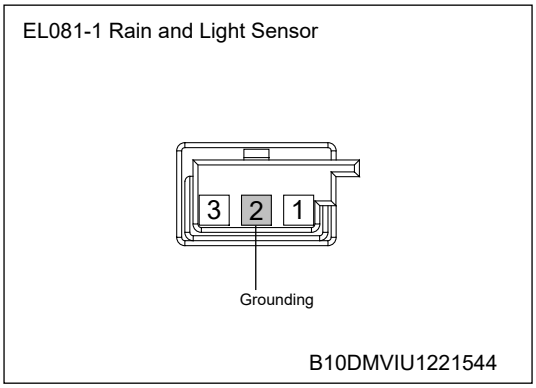
Fault code	Description
U140587	RLS communication lost





1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the LIN communication harness between the rain/light sensor and the main zone controller.	
EL249-5 Main Zone Controller  B10DMVIU1221541 EL081-1 Rain and Light Sensor  B10DMVIU1221542	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL081-1 of the rain an d light sensor. C Disconnect the wiring harness connector EL249-5 of the main zone controller. D Use a multimeter, select the resistance range, and check whether the resistance between terminal 3 of the rain and li ght sensor harness connector EL081-1 and terminal 2 of th e main zone controller harness connector EL249-5 is norma l. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Check the power supply fuse for the rain and light sensor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the rain and light sensor fuse RF12. Fuse specification: RF12 5A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 4.
Step 4 Check the power supply harness of the rain and light sensor.	

© 2026, All rights reserved

	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL081-1 of the rain and light sensor. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and check whether the voltage between terminal 1 of the rain and light sensor harness connector EL081-1 and the body ground is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 5.	
Step 5 Check the ground harness of the rain/light sensor.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL081-1 of the rain and light sensor. C Use a multimeter, select the resistance range, and measure whether the resistance between terminal 2 of the rain and light sensor harness connector EL081-1 and the body ground is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Replace the rain and light sensor.	
A Replace the rain and light sensor. B After replacing the rain and light sensor, is the fault cleared?	
Yes》》》 System normal.	
No》》》 Go to step 7.	
Step 7 Replacement of master zone controller	

© 2026, All rights reserved

	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 8.	
Step 8 Diagnosis complete.

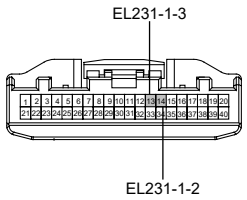
DTC: U138087-VIU

Fault code	Description
U138087	FSC Communication Lost

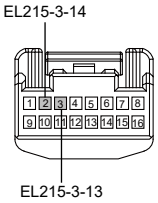
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMVIU1221179

EL231-1 Front Mono Camera Assembly

B10DMVIU1221180

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal.
E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.
A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 4.
Step 4 Replace the front monocular camera assembly.
A Replace the forward-looking monocular camera assembly. B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

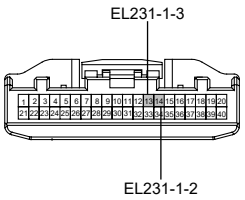
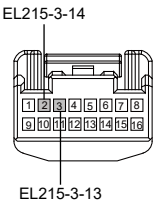
DTC: U138083-VIU

Fault code	Description
U138083	Message corresponding to FSC verification signal error





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the multi-domain fusion controller and the forward-facing monocular camera assembly.	
EL215-3 Multi-Domain Fusion Controller  B10DMVIU1221179 EL231-1 Front Mono Camera Assembly  B10DMVIU1221180	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector EL231-1 of the forward-looking monocular camera assembly. D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of harness connector EL215-3 of the multi-domain fusion controller and terminal 2 of harness connector EL231-1 of the forward-looking monocular camera assembly to check whether the resistance value is normal. E. Use a multimeter, set it to the resistance range, and check whether the resistance between terminal 13 of harness connector EL215-3 of the multi-domain fusion controller and terminal 3 of harness connector EL231-1 of the forward-looking monocular camera assembly is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.	
	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the forward-facing monocular camera assembly, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

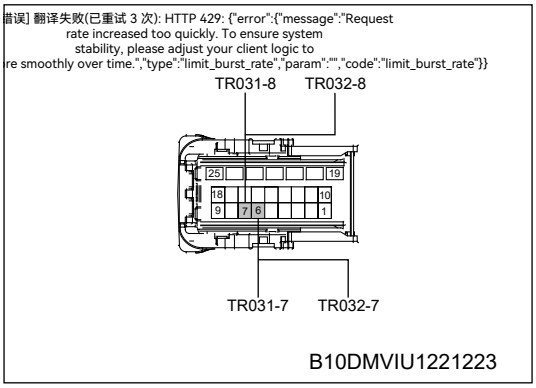
DTC: B1A0311-VIU

Fault code	Description
B1A0311	Rearview mirror folding and unfolding short to ground

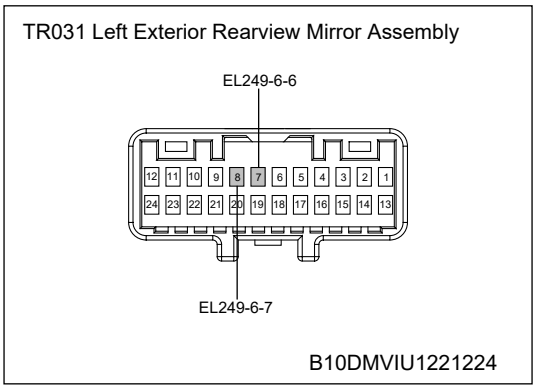
1. Simplified Circuit Diagram

2. Diagnostic Steps

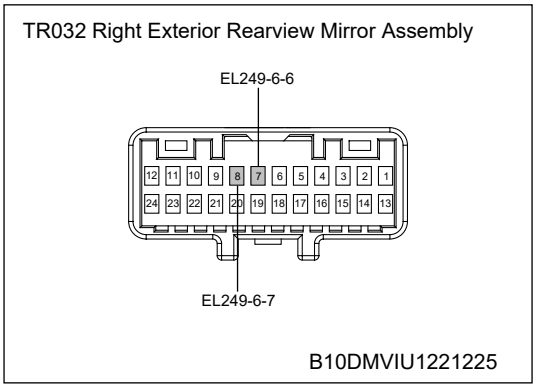
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code



© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.



Yes 》 》 》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the exterior rearview mirror assembly.

[错误] 翻译失败(已重试 3 次): HTTP 429: {"error":{"message":"Request rate increased too quickly. To ensure system stability, please adjust your client logic to re smoothly over time.","type":"limit_burst_rate","param":"","code":"limit_burst_rate"}}

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main zone controller.
C Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
D Disconnect the wire harness connector TR032 of the right exterior rearview mirror assembly.
E Use a multimeter set to the resistance range to check whether the resistance between terminal 6 of harness connector EL249-6 of the main zone controller and terminal 7 of harness connector TR031 of the left exterior rearview mirror assembly is normal.
F Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of harness connector EL249-6 of the main zone controller and terminal 8 of harness connector TR031 of the left exterior rearview mirror assembly to check if it is normal.
G Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the wire harness connector EL249-6 of the main zone controller and terminal 7 of the wire harness connector TR032 of the right exterior rearview mirror assembly to check whether the resistance value is normal.
H Use a multimeter, select the resistance range, and measure the resistance between terminal 7 of wire harness connector EL249-6 of the main zone controller and terminal 8 of wire harness connector TR032 of the right exterior rearview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
I Use a multimeter, select the resistance range, and measure whether the resistance value between terminals 6 and 7 of the harness connector EL249-6 of the main zone controller and the body ground is normal.
Standard resistance value: 10kΩ or higher
J Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》

© 2026, All rights reserved

	Go to step 3.
Step 3 Check the wiring harness between the left folding motor assembly and the left exterior rearview mirr or assembly.	
	A Check the wiring harness between the left folding motor assembly and the left exterior rearview mirror assembly for s hort or open circuits.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 4.	
Step 4 Check the wiring harness between the right folding motor assembly and the right exterior rearview mirror assembly.	
	A Check the wiring harness between the right folding moto r assembly and the right exterior rearview mirror assembly f or short circuit or open circuit.
Yes》》》 Repair or replace the wiring harness.	
No》》》 Go to step 5.	
Step 5 Replace the left or right folding motor assembly.	
	A Replace the left folding motor assembly or right folding motor assembly. B After replacing the left folding motor assembly or the rig ht folding motor assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes》》》 System normal.	
Next》》》 Go to step 7.	
Step 7 Diagnosis complete.

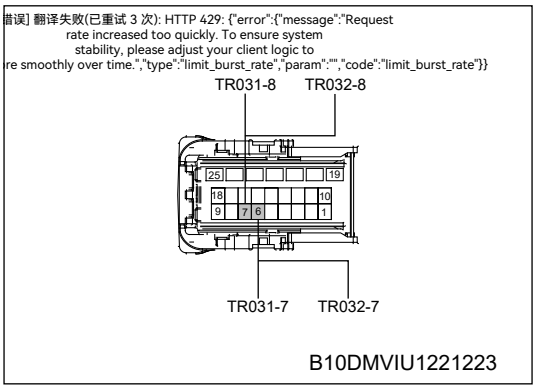
DTC: B1A0312-VIU

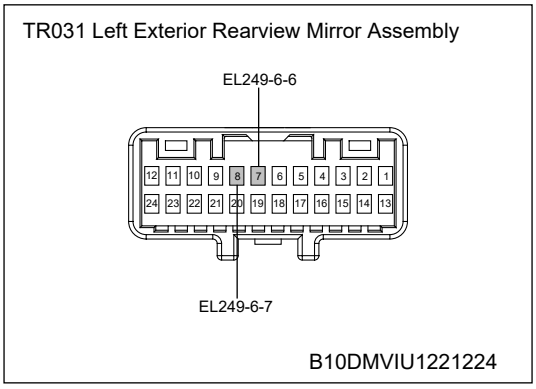
Fault code	Description
B1A0312	Exterior rearview mirror folding and unfolding short to power

1. Simplified Circuit Diagram

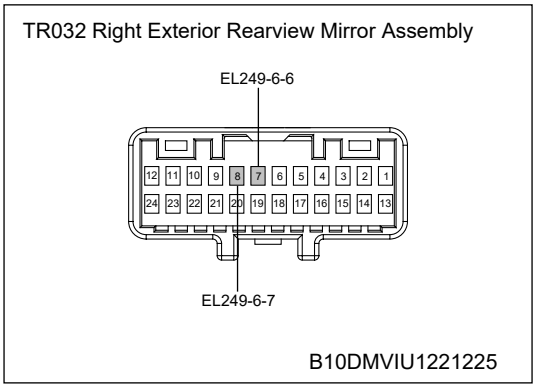
2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the wiring harness between the main zone controller and the exterior rearview mirror assembly.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL249-6 of the main zone controller.
C Disconnect the harness connector TR031 of the left exterior rearview mirror assembly.
D Disconnect the wire harness connector TR032 of the right exterior rearview mirror assembly.
E Use a multimeter set to the resistance range to check whether the resistance between terminal 6 of harness connector EL249-6 of the main zone controller and terminal 7 of harness connector TR031 of the left exterior rearview mirror assembly is normal.
F Use a multimeter, set it to the resistance range, and measure the resistance between terminal 7 of harness connector EL249-6 of the main zone controller and terminal 8 of harness connector TR031 of the left exterior rearview mirror assembly to check if it is normal.
G Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the wire harness connector EL249-6 of the main zone controller and terminal 7 of the wire harness connector TR032 of the right exterior rearview mirror assembly to check whether the resistance value is normal.
H Use a multimeter, select the resistance range, and measure the resistance between terminal 7 of wire harness connector EL249-6 of the main zone controller and terminal 8 of wire harness connector TR032 of the right exterior rearview mirror assembly to check whether it is normal.
Resistance standard value: Less than 1 Ω
I Check whether the resistance value meets the standard value.
J. Connect the negative battery terminal and power on the vehicle.
K Use a multimeter, select the DC voltage range, and check whether the voltage between terminals 6 and 7 of the harness connector EL249-6 of the main zone controller and the body ground is normal.
Voltage standard value: 0V

© 2026, All rights reserved

	L Verify whether the voltage value meets the standard valu e.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 3.	
Step 3 Check the wiring harness between the left folding motor assembly and the left exterior rearview mirr or assembly.	
	A Check the wiring harness between the left folding motor assembly and the left exterior rearview mirror assembly for s hort or open circuits.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 4.	
Step 4 Check the wiring harness between the right folding motor assembly and the right exterior rearview mirror assembly.	
	A Check the wiring harness between the right folding moto r assembly and the right exterior rearview mirror assembly f or short circuit or open circuit.
Yes 》》》 Repair or replace the wiring harness.	
No 》》》 Go to step 5.	
Step 5 Replace the left or right folding motor assembly.	
	A Replace the left folding motor assembly or right folding motor assembly. B After replacing the left folding motor assembly or the rig ht folding motor assembly, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of master zone controller	
	A Replace the main zone controller. B After replacing the main zone controller, is the fault elimin ated?
Yes 》》》 System normal.	
Next 》》》

DIAGNOSTIC INSTRUCTIONS-ICHS

A diagnostic tool can be used to read fault codes via the vehicle's OBD diagnostic port. By utilizing the ICHS data list and reading the data list displayed on the diagnostic tool, you can read switch and sensor values without disassembling any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION-ICHS

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

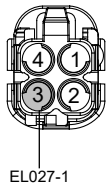
DTC: B130287-ICHS

Fault code	Description
B130287	Left Surround View signal offline

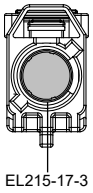
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the left surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221018

EL027 Left Surround View Camera Assembly

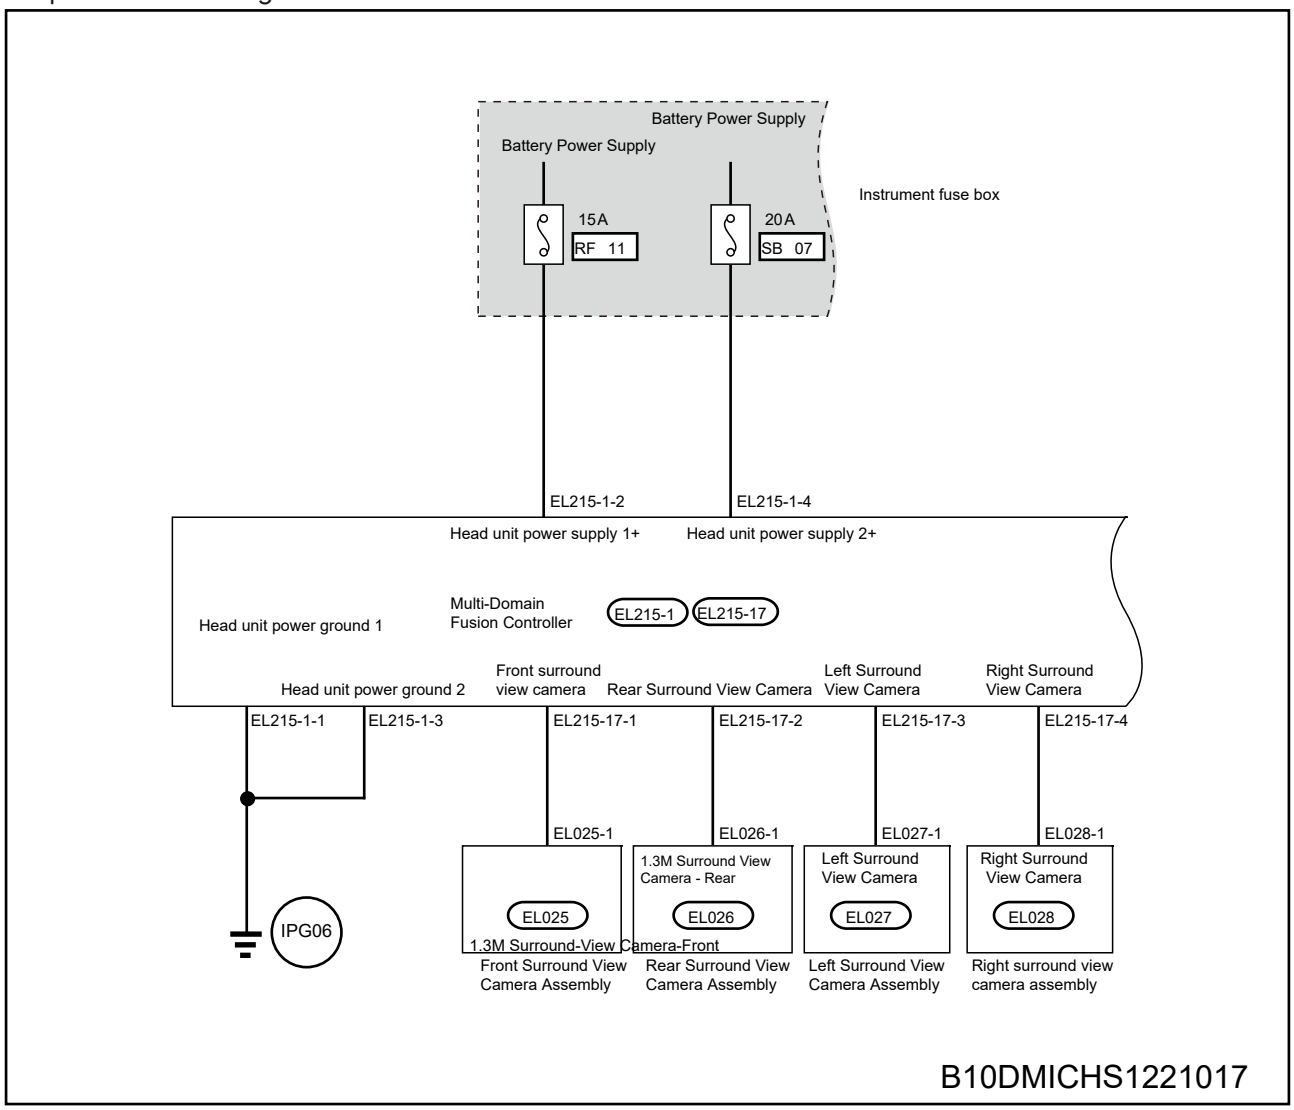
B10DMICHS1221019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the harness connector EL027 of the left surround-view camera assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 3 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL027 of the left surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the left surround view camera assembly.

	A Replace the left surround view camera assembly. B After replacing the left surround-view camera assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

© 2026, All rights reserved

DTC: B131B54-ICHS

Fault code	Description
B131B54	Front surround-view camera not calibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

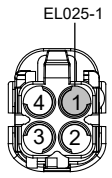
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

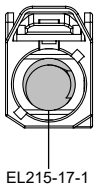
Step 2 Perform the front surround view camera assembly calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and perform the calibration procedure for the front surround-view camera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the multi-domain fusion controller and the front surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221020

EL025 Front Surround View Camera Assembly

B10DMICHS1221021

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL025 of the front surround-view camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL025 of the front surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front surround-view camera assembly.

© 2026, All rights reserved

	A Replace the front surround view camera assembly. B After replacing the front surround-view camera assembly , is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B131955-ICHS

Fault code	Description
B131955	Left surround-view camera lacks intrinsic parameters

1. Simplified Circuit Diagram

2. Diagnostic Steps

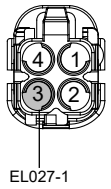
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

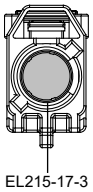
Step 2 Perform the calibration procedure for the left surround-view camera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diagnostic tool to perform the calibration procedure for the left surround view camera assembly.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the multi-domain fusion controller and the left surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221018

EL027 Left Surround View Camera Assembly

B10DMICHS1221019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the harness connector EL027 of the left surround-view camera assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 3 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL027 of the left surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the left surround view camera assembly.

© 2026, All rights reserved

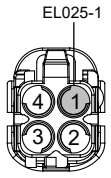
	A Replace the left surround view camera assembly. B After replacing the left surround-view camera assembly, i s the fault cleared?
	Yes 》 》 》 System normal.
	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B131487-ICHS

Fault code	Description
B131487	Front Surround View signal offline

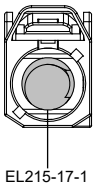
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the front surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221020

EL025 Front Surround View Camera Assembly

B10DMICHS1221021

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL025 of the front surround-view camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL025 of the front surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the front surround-view camera assembly.

	A Replace the front surround view camera assembly. B After replacing the front surround-view camera assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved

DTC: B15514B-ICHS

Fault code	Description
B15514B	CPU temperature exceeds threshold

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A Power off the vehicle, wait for a period of time, and then power it on again for inspection to check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the cooling system of the multi-domain fusion controller.	
	A Check whether the cooling system of the multi-domain fu sion controller is functioning normally.
	No》》》 Troubleshoot related faults.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi -domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B131B55-ICHS

Fault code	Description
B131B55	Front surround-view camera has no intrinsic parameters.

1. Simplified Circuit Diagram

2. Diagnostic Steps

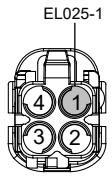
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

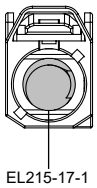
Step 2 Perform the front surround view camera assembly calibration procedure.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle and perform the calibration procedure for the front surround-view camera assembly as prompted by the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the multi-domain fusion controller and the front surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221020

EL025 Front Surround View Camera Assembly

B10DMICHS1221021

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL025 of the front surround-view camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL025 of the front surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the front surround-view camera assembly.

© 2026, All rights reserved

	A Replace the front surround view camera assembly. B After replacing the front surround-view camera assembly , is the fault cleared?
Yes 》 》 》 System normal.	
No 》 》 》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》 》 》 System normal.	
Next 》 》 》 Go to step 6.	
Step 6 Diagnosis complete.	

© 2026, All rights reserved

DTC: B131954-ICHS

Fault code	Description
B131954	Left surround view camera not calibrated

1. Simplified Circuit Diagram

2. Diagnostic Steps

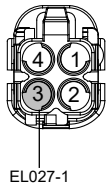
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

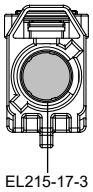
Step 2 Perform the calibration procedure for the left surround-view camera assembly.



A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and follow the prompts on the diagnostic tool to perform the calibration procedure for the left surround view camera assembly.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 3.



Step 3 Check the wiring harness between the multi-domain fusion controller and the left surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221018

EL027 Left Surround View Camera Assembly

B10DMICHS1221019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the harness connector EL027 of the left surround-view camera assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 3 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL027 of the left surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the left surround view camera assembly.

© 2026, All rights reserved

	A Replace the left surround view camera assembly. B After replacing the left surround-view camera assembly, i s the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 5.	
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes》》》 System normal.	
Next》》》 Go to step 6.	
Step 6 Diagnosis complete.

DTC: B110144-ICHS

Fault code	Description
B110144	EEPROM memory failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Execute the software upgrade procedure for the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to upgrade the multi-domain fusion controller software program. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B158600-ICHS

Fault code	Description
B158600	IMU Module Zero Bias Abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

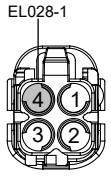
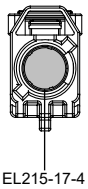
DTC: B156696-ICHS

Fault code	Description
B156696	Right surround view camera hardware failure

1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.

Step 2 Check the wiring harness between the multi-domain fusion controller and the right surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller  B10DMICHS1221024 EL028 Right Surround View Camera Assembly  B10DMICHS1221025	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-17 of the multi-domain fusion controller. C Disconnect the harness connector EL028 of the right surround view camera assembly. D. Use a multimeter, set to the resistance range, and measure the resistance between terminal 4 of the multi-domain fusion controller harness connector EL215-17 and terminal 1 of the right surround-view camera assembly harness connector EL028 to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 3.	

Step 3 Replace the right surround view camera assembly.

	A Replace the right surround-view camera assembly. B After replacing the right surround view camera assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	

Step 4 Replacement of Multi-Domain Fusion Controller.

	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

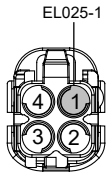
DTC: B156196-ICHS

Fault code	Description
B156196	Hardware fault in the front surround-view camera connection circuit inside the cabin

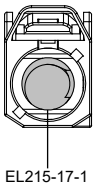
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record them. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the front surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221020

EL025 Front Surround View Camera Assembly

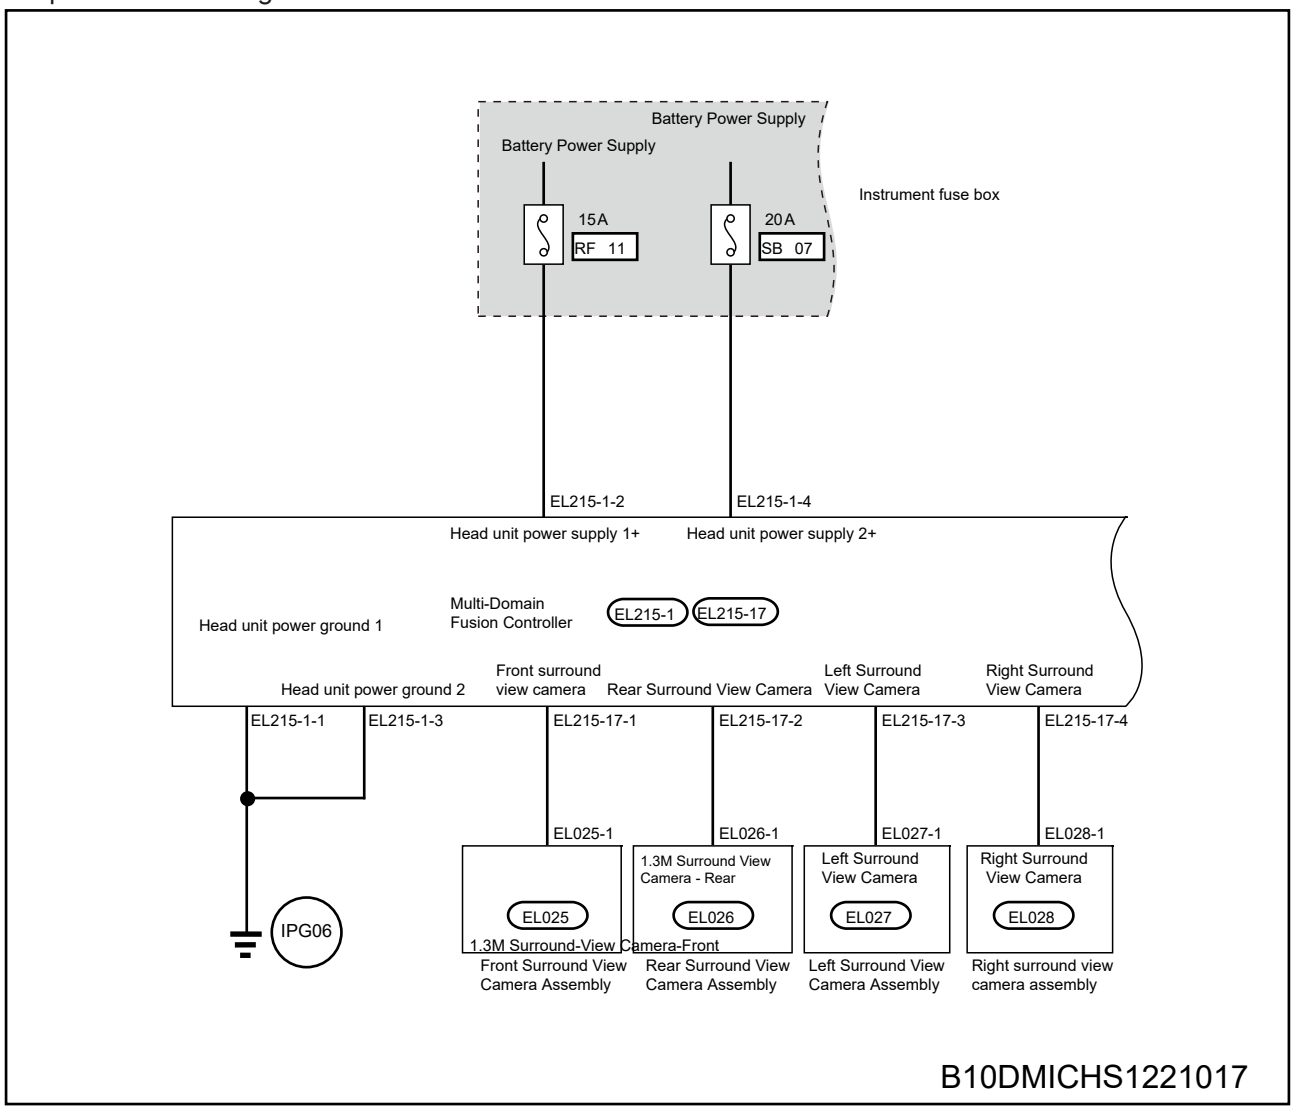
B10DMICHS1221021

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL025 of the front surround-view camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL025 of the front surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the front surround-view camera assembly.

	A Replace the front surround view camera assembly. B After replacing the front surround-view camera assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

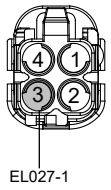
DTC: B156496-ICHS

Fault code	Description
B156496	Left Surround View Camera Hardware Failure

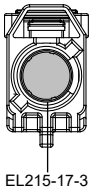
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the wiring harness between the multi-domain fusion controller and the left surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221018

EL027 Left Surround View Camera Assembly

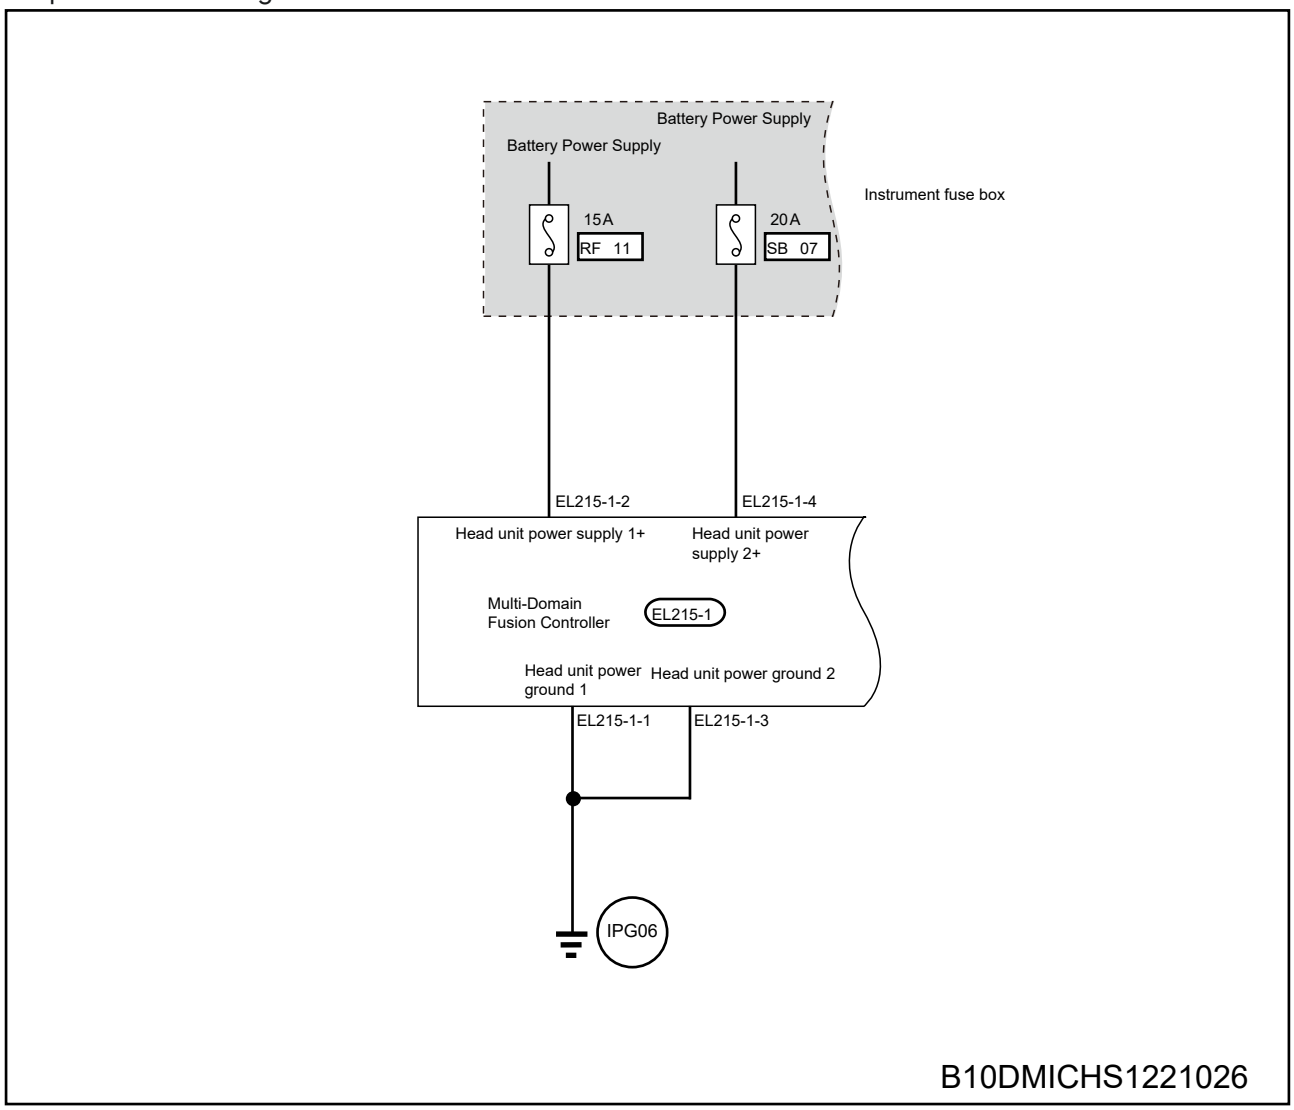
B10DMICHS1221019

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the harness connector EL027 of the left surround-view camera assembly.
D Use a multimeter set to the resistance range to measure the resistance between terminal 3 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL027 of the left surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Replace the left surround view camera assembly.

	A Replace the left surround view camera assembly. B After replacing the left surround-view camera assembly, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 4.	
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

DTC: B158000-ICHS

Fault code	Description
B158000	Head unit display chip abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Execute the software upgrade procedure for the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diagnostic tool to upgrade the multi-domain fusion controller software program. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

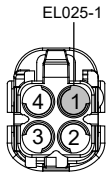
DTC: B156096-ICHS

Fault code	Description
B156096	Front Surround-View Camera Hardware Failure

1. Simplified Circuit Diagram

2. Diagnostic Steps

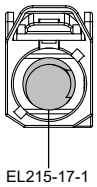
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the wiring harness between the multi-domain fusion controller and the front surround-view camera assembly.

EL215-17 Multi-Domain Fusion Controller

B10DMICHS1221020

EL025 Front Surround View Camera Assembly

B10DMICHS1221021

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-17 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL025 of the front surround-view camera assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of harness connector EL215-17 of the multi-domain fusion controller and terminal 1 of harness connector EL025 of the front surround-view camera assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Replace the front surround-view camera assembly.

A Replace the front surround view camera assembly.
B After replacing the front surround-view camera assembly, is the fault cleared?

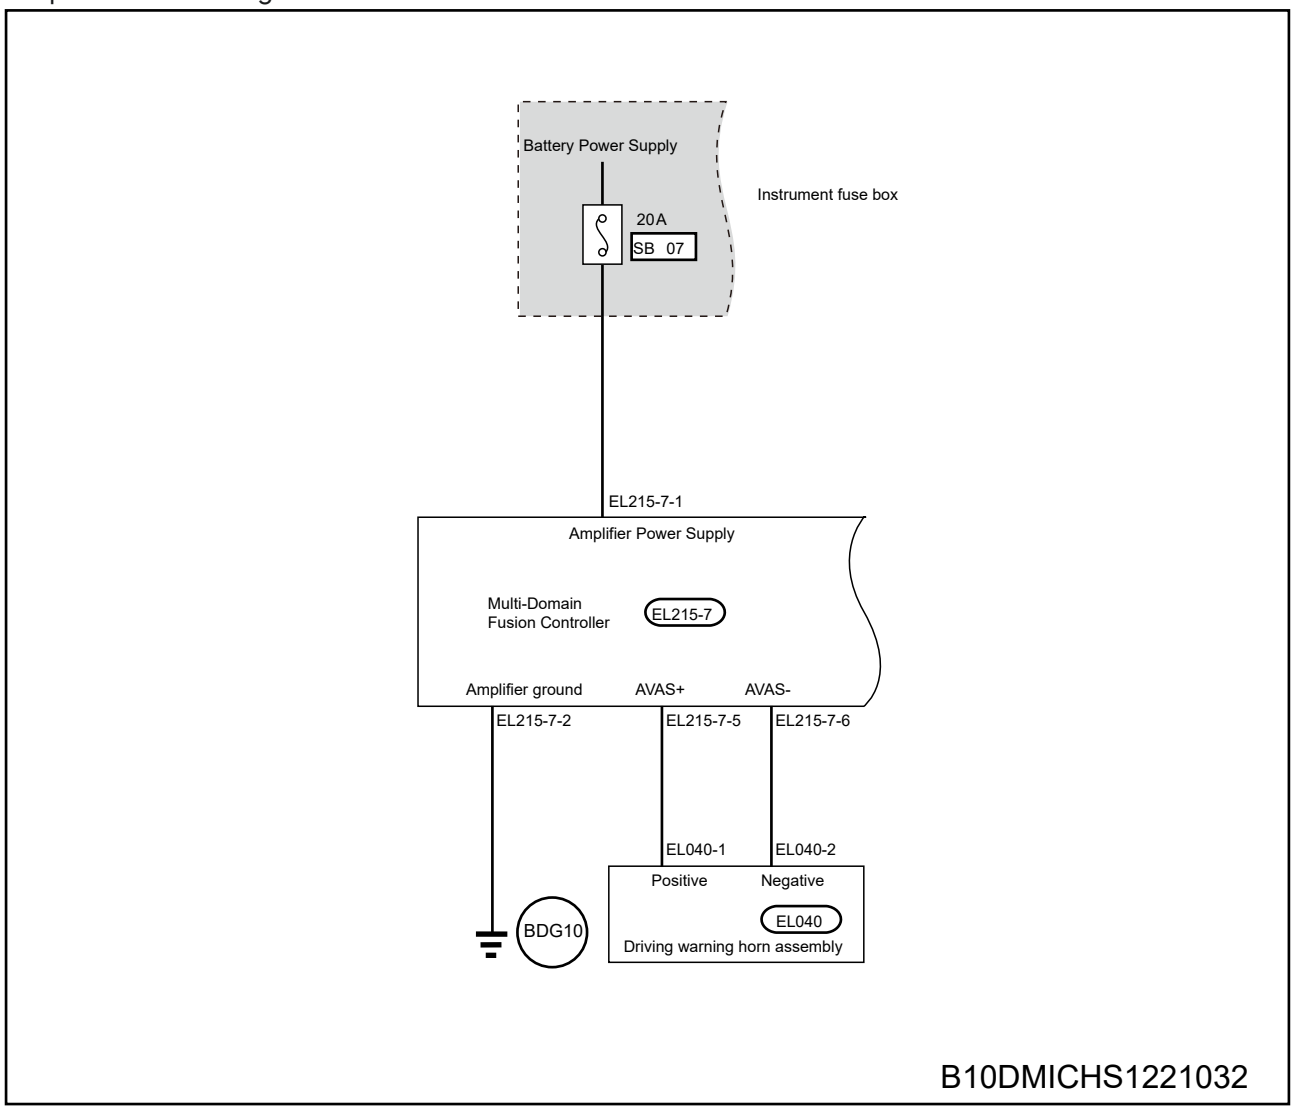
Yes》》》 System normal.

No》》》
Go to step 4.

Step 4 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

© 2026, All rights reserved



Yes 》 》 》 System normal.
Next 》 》 》 Go to step 5.
Step 5 Diagnosis complete.

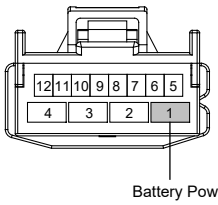
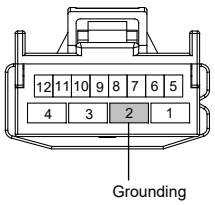
DTC: B156A00-ICHS

Fault code	Description
B156A00	Pedestrian Warning Amplifier Fault





1. Simplified Circuit Diagram

2. Diagnostic Steps

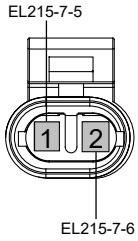
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply harness of the multi-domain fusion controller.	
EL215-7 Multi-Domain Fusion Controller  B10DMICHS1221030	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-7 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 of the harness connect or EL215-7 of the multi-domain fusion controller and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the grounding wire harness of the multi-domain fusion controller.	
EL215-7 Multi-Domain Fusion Controller  B10DMICHS1221031	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-7 of the Multi-Domain Fusion Controller. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-7 for the multi-domain fusion controller and the b ody ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No》》》 Repair or replace the wiring harness.

© 2026, All rights reserved

Yes》》》
Go to step 5.



Step 5 Check the wiring harness between the multi-domain fusion controller and the driving warning horn assembly.

EL215-7 Multi-Domain Fusion Controller

B10DMICHS1221033

EL040 Driving Warning Horn Assembly

B10DMICHS1221034

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-7 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL040 of the dri ving warning horn assembly.
D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 5 of harness connector EL215-7 of the multi-domain fusion controller and terminal 1 of harness connector EL040 of the driving warning horn a ssembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 6 of harness connector EL215-7 of the multi-domain fusion controller and terminal 2 of harness connector EL040 of the driving warning horn a ssembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 6.

Step 6 Replace the warning horn assembly.

A Replace the driving warning horn assembly.
B After replacing the driving warning horn assembly, is the fault cleared?

Yes》》》 System normal.

No》》》
Go to step 7.

Step 7 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the f ault eliminated?

Yes》》》 System normal.

DTC: B158A83-ICHS

Fault code	Description
B158A83	IMU Module Signal Validation Error (Monitored by Domain Controller)

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: U12D287-ICHS

Fault code	Description
U12D287	QNX lost communication with TBOX

1. Simplified Circuit Diagram

2. Diagnostic Steps

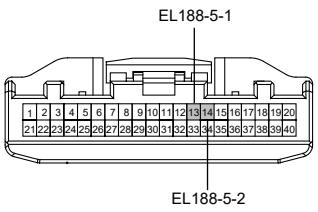
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

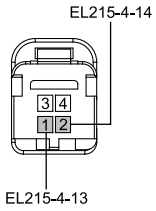
Step 2 Power-off and power-on test.



A After power cycling and operating for a period of time, check whether the fault is cleared.

Yes》》》 System normal.

No》》》
Go to step 3.



Step 3 Check the Ethernet wiring harness between the multi-domain fusion controller and the telematics host.

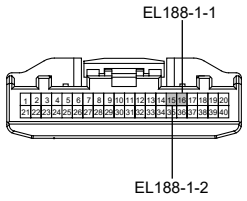
EL215-4 Multi-Domain Fusion Controller

B10DMICHS1221049

EL188-5 车联网主机

B10DMICHS1221050

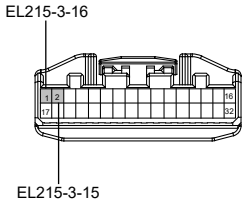
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL188-5 of the telematics host.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of harness connector EL215-4 of the multi-domain fusion controller and terminal 1 of harness connector EL188-5 of the telematics host to check if it is normal.
E. Use a multimeter set to the resistance range to measure the resistance between terminal 14 of harness connector EL215-4 on the multi-domain fusion controller and terminal 2 of harness connector EL188-5 on the telematics host to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the CAN wiring harness between the telematics host and the multi-domain fusion controller.



© 2026, All rights reserved

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221101

EL188-1 Telematics Main Unit

B10DMICHS1221102

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector EL188-1 of the telematics host.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 16 of the harness connector EL215-3 of the multi-domain fusion controller and terminal 1 of the harness connector EL188-1 of the telematics host to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 15 of harness connector EL215-3 on the multi-domain fusion controller and terminal 2 of harness connector EL188-1 on the telematics host to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 5.

Step 5 Execute the software upgrade program for the multi-domain fusion controller and the Internet of Vehicles host.

A. Connect the diagnostic tool to the OBD port.
B Power on the vehicle, and upgrade the software programs of the multi-domain fusion controller and the telematics host according to the prompts of the diagnostic tool.
C. Clear fault codes.
D Read the fault code again.
E Check if the same fault code is displayed.

No》》》 System normal.

Yes》》》
Go to step 6.

Step 6 Check the power ground circuit of the telematics control unit.

A Check whether the power ground circuit of the telematics host is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》

© 2026, All rights reserved

	Go to step 7.
Step 7 Replace the telematics host.	
	A Replace the telematics control unit. B After replacing the telematics host, is the fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 8.
Step 8 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to Step 9.
Step 9 Diagnosis complete.

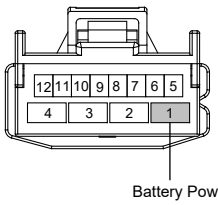
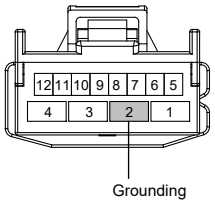
DTC: B158C00-ICHS

Fault code	Description
B158C00	Built-in amplifier malfunction

1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, ch eck whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Execute the software upgrade procedure for the multi-domain fusion controller.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, and follow the prompts on the diag nostic tool to upgrade the multi-domain fusion controller s oftware program. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 System normal.
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the multi-domain fusion controller.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the multi-domain fusion controller fuse SB07. Fuse specification: SB07 20A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the power supply harness of the multi-domain fusion controller.	

© 2026, All rights reserved

EL215-7 Multi-Domain Fusion Controller  B10DMICHS1221030	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-7 of the Multi-Domain Fusion Controller. C. Connect the negative terminal of the battery to power o n the vehicle. D Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 1 of the harness connect or EL215-7 of the multi-domain fusion controller and the v ehicle body ground to check if it is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard va lue.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 6.
Step 6 Check the grounding wire harness of the multi-domain fusion controller.	
EL215-7 Multi-Domain Fusion Controller  B10DMICHS1221031	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-7 of the Multi-Domain Fusion Controller. C Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of the harness connect or EL215-7 for the multi-domain fusion controller and the b ody ground to check if it is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 7.
Step 7 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 8.
Step 8 Diagnosis complete.

Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

DTC: U130687-ICHS

Fault code	Description
U130687	Lost communication with BCM

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

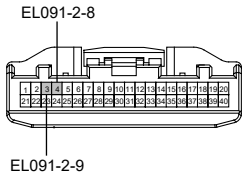
DTC: U132F87-ICHS

Fault code	Description
U132F87	Lost communication with SWB

1. Simplified Circuit Diagram

2. Diagnostic Steps

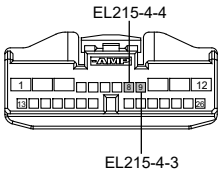
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



Step 2 Check the CAN harness between the combination switch and the multi-domain fusion controller.

EL215-4 Multi-Domain Fusion Controller

B10DMICHS1221078

EL091-2 Combination Switch

B10DMICHS1221079

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL091-2 of the combin ation switch.
D. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 4 of the wire harness connector EL215-4 of the multi-domain fusion controller a nd terminal 8 of the wire harness connector EL091-2 of the combination switch to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 3 of harness connector EL215-4 of the multi-domain fusion controller and terminal 9 of harness connector EL091-2 of the combination switch to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CAN harness between the combination switch and the steering wheel button assembly.

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the combination switch wiring harness conne ctor EL091-2.
C Disconnect the steering wheel switch assembly harness c onnector.
D Use a multimeter, select the resistance range, and measur e the resistance between the terminal of the combination s witch EL091-2 (device side) and the terminal of the combin ation switch (where the combination switch connects to the steering wheel button assembly) to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.

© 2026, All rights reserved

	No 》》》 Replace the combination switch.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the steering wheel button assembly.	
	A Check whether the power ground circuit of the steering wheel switch assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replace the steering wheel button assembly.	
	A Replace the steering wheel button assembly. B After replacing the steering wheel button assembly, is the fault cleared?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

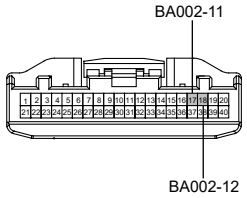
DTC: U130287-ICHS

Fault code	Description
U130287	Loss of communication with BMS

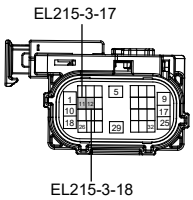
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the power battery pack assembly and the multi-domain fusion controller.

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221062

BA002 Power Battery Pack Assembly

B10DMICHS1221063

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector BA002 of the power battery pack assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of the harness connector EL215-3 of the multi-domain fusion controller and terminal 12 of the harness connector BA002 of the power battery pack assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of harness connector EL215-3 of the multi-domain fusion controller and terminal 11 of harness connector BA002 of the power battery pack assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the power battery pack assembly.
A Check whether the power ground circuit of the power battery pack assembly is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the power battery pack assembly.
A Replace the power battery pack assembly. B After replacing the power battery pack assembly, is the fault cleared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

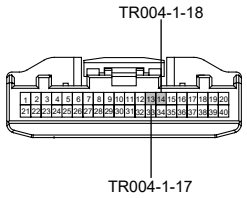
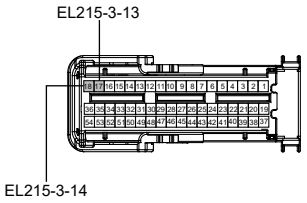
DTC: U130E87-ICHS

Fault code	Description
U130E87	Loss of communication with ACU





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN wiring harness between the airbag control module assembly and the multi-domain fusion controller.	
EL215-3 Multi-Domain Fusion Controller  B10DMICHS1221092 TR004-1 Airbag Control Module Assembly  B10DMICHS1221093	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-domain fusion controller. C Disconnect the harness connector TR004-1 of the airbag control module assembly. D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 14 of the Multi-Domain Fusion Controller harness connector EL215-3 and terminal 18 of the Airbag Control Module Assembly harness connector TR004-1 to check if it is normal. E. Use a multimeter, select the resistance range, and measure the resistance between terminal 13 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 17 of the wire harness connector TR004-1 of the airbag control module assembly to check if the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the airbag control module assembly.	
	A Check whether the power ground circuit of the airbag control module assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replacement of airbag control module assembly	
	A Replacement of airbag control module assembly. B After replacing the airbag control module assembly, is the fault eliminated?
	Yes 》 》 》 System normal.

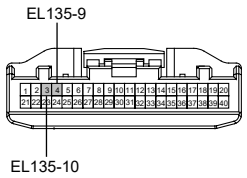
DTC: U137587-ICHS

Fault code	Description
U137587	Lost communication with TMS

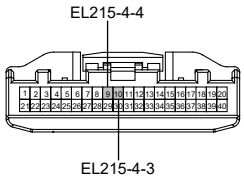
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the thermal management controller and the multi-domain fusion c ontroller.

EL215-4 Multi-Domain Fusion Controller

B10DMICHS1221084

EL135 Thermal Management Controller

B10DMICHS1221085

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector EL135 of the thermal management controller.
D. Use a multimeter, set it to the resistance range, and mea sure the resistance between terminal 4 of wire harness con nector EL215-4 of the multi-domain fusion controller and t erminal 9 of wire harness connector EL135 of the thermal m anagement controller to check whether the resistance valu e is normal.
E Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of harness connector E L215-4 of the multi-domain fusion controller and terminal 10 of harness connector EL135 of the thermal management controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the thermal management controller.
A Check if the power ground circuit of the thermal manage ment controller is normal.
No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 4.
Step 4 Replace the thermal management controller.
A Replace the thermal management controller. B After replacing the thermal management controller, is the fault cleared?
Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

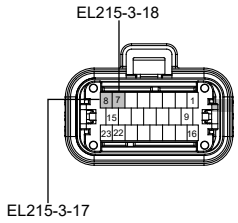
Yes》》》
Go to step 2.



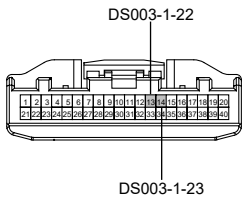
Step 2 Check the PCAN harness between the controller assembly and the multi-domain fusion controller.

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221057

DS003-1 Controller Assembly

B10DMICHS1221058

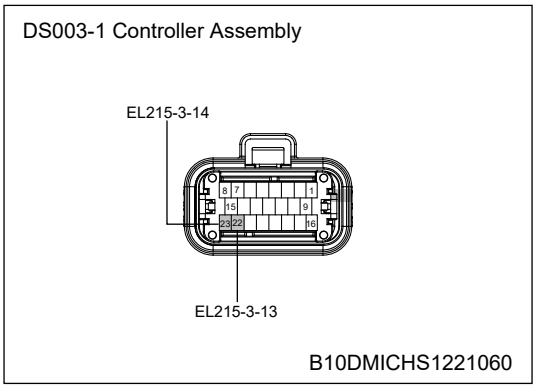


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of harness connector DS003-1 of the controller assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of the wiring harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the controller assembly and the multi-domain fusion controller.



EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221059

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 on the multi-domain fusion controller and termi

© 2026, All rights reserved

	nal 22 of harness connector DS003-1 on the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.

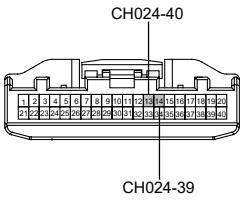
DTC: U131187-ICHS

Fault code	Description
U131187	Lost communication with IBC

1. Simplified Circuit Diagram

2. Diagnostic Steps

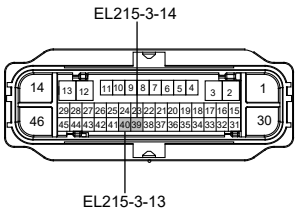
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



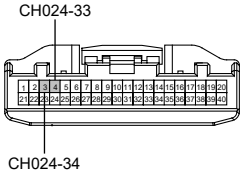
Step 2 Check the CCAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221065

CH024 Intelligent Integrated Brake System Assembly

B10DMICHS1221066

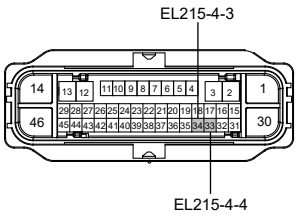


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller and terminal 39 of the wire harness connector CH024 of the Intelligent Integrated Brake System Assembly to check if it is normal.
E Use a multimeter set to the resistance range to measure the resistance between terminal 13 of the wire harness connector EL215-3 of the Multi-Domain Fusion Controller and terminal 40 of the wire harness connector CH024 of the Intelligent Integrated Brake System assembly to check if the resistance value is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the COM-CAN harness between the multi-domain fusion controller and the intelligent integrated braking system assembly.

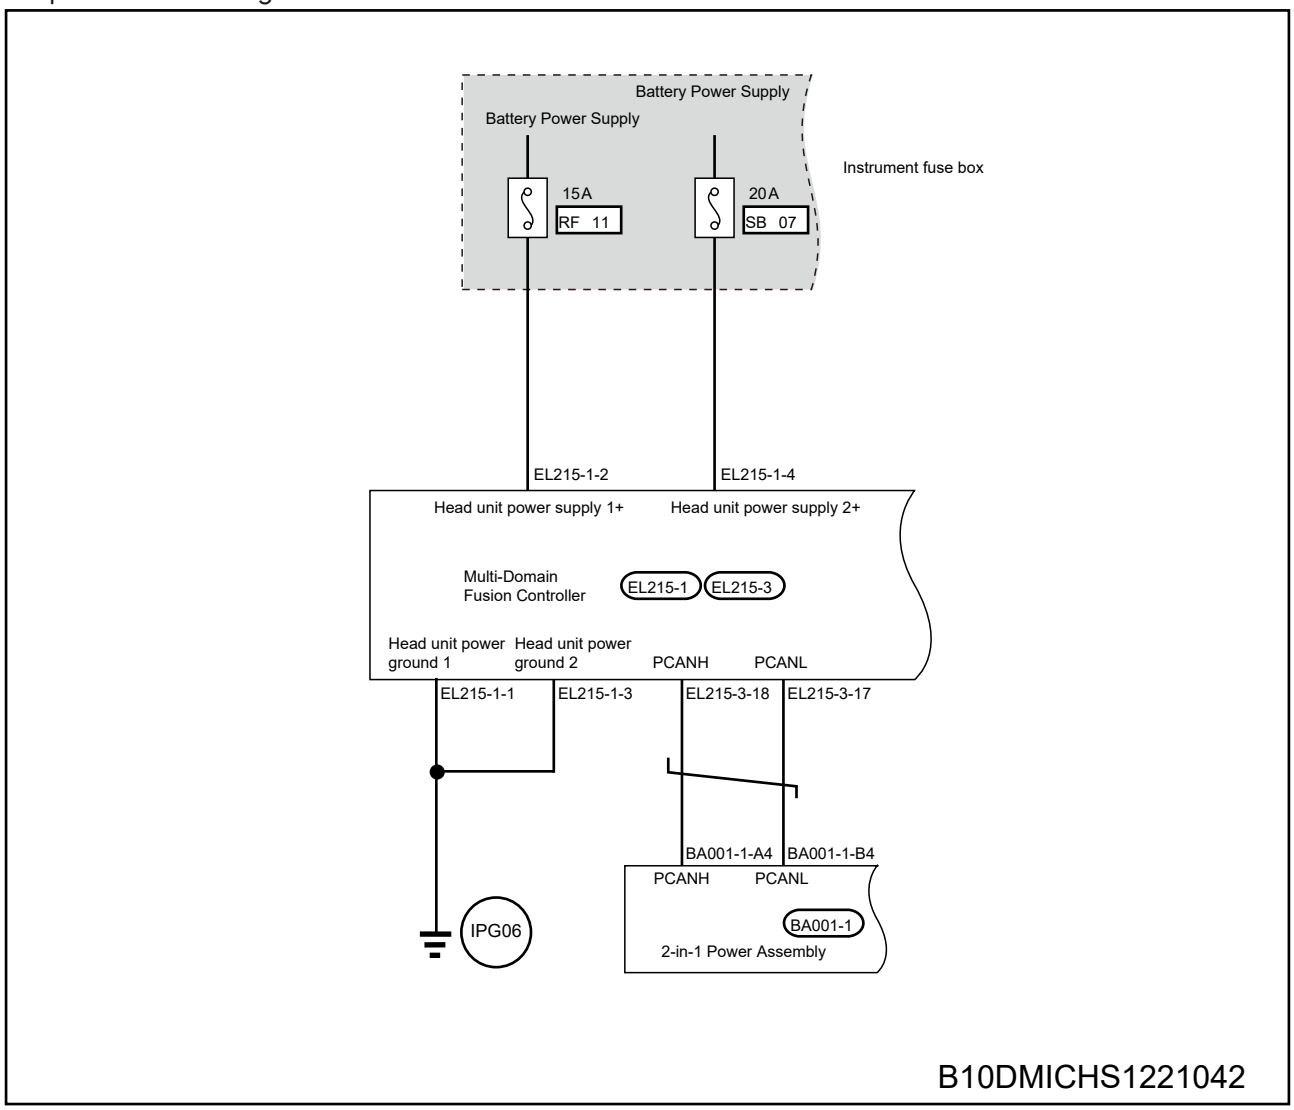


EL215-4 Multi-Domain Fusion Controller

B10DMICHS1221067

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector CH024 of the intelligent integrated brake system assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 4 of the harness connector EL215-4 of the multi-domain fusion controller and terminal 33 of the harness connector CH024 of the intelligent integrated brake system assembly to check whether the resistance value is normal.

© 2026, All rights reserved



CH024 Intelligent Integrated Brake System Assembly  B10DMICHS1221068	E. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of harness connector EL215-4 of the Multi-Domain Fusion Controller and terminal 34 of harness connector CH024 of the Intelligent Integrated Braking System assembly to check whether the resistance value is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 4.
Step 4 Check the power ground circuit of the intelligent integrated brake system assembly.	
	A Check whether the power ground circuit of the intelligent integrated brake system assembly is normal.
	No 》》》 Repair or replace the wiring harness.
	Yes 》》》 Go to step 5.
Step 5 Replacement of Intelligent Integrated Brake System Assembly.	
	A Replace the intelligent integrated brake system assembly. B After replacing the intelligent integrated braking system assembly, is the fault eliminated?
	Yes 》》》 System normal.
	No 》》》 Go to step 6.
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 7.
Step 7 Diagnosis complete.

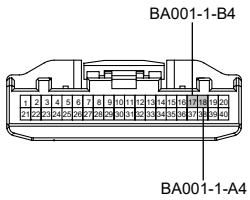
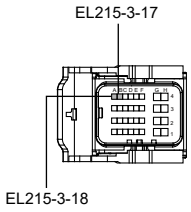
DTC: U130487-ICHS

Fault code	Description
U130487	Loss of communication with OBC

1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.
Yes》》》 Go to step 2.
Step 2 Check the CAN harness between the 2-in-1 power supply assembly and the multi-domain fusion co ntroller.

EL215-3 Multi-Domain Fusion Controller  B10DMICHS1221043 BA001-1 2-in-1 Power Supply Assembly  B10DMICHS1221044	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller. C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly. D Use a multimeter, select the resistance range, and measur e the resistance value between terminal 18 of the wire harn ess connector EL215-3 of the multi-domain fusion controll er and terminal A4 of the wire harness connector BA001-1 of the 2-in-1 power assembly to check if it is normal. E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of harness connect or EL215-3 on the multi-domain fusion controller and termi nal B4 of harness connector BA001-1 on the 2-in-1 power supply assembly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.
Yes》》》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 po wer assembly is normal.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 4.	
Step 4 Replace the 2-in-1 power supply assembly.	
	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the f ault cleared?
Yes》》》 System normal.

Fault code	Description
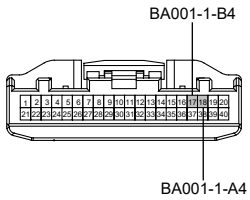
U130387	Loss of communication with DCDC

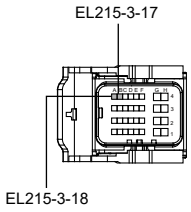
1. Simplified Circuit Diagram



2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved



May be caused by an intermittent fault. Check for intermittent faults.
Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the 2-in-1 power supply assembly and the multi-domain fusion co ntroller.

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221043

BA001-1 2-in-1 Power Supply Assembly

B10DMICHS1221044

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-d omain fusion controller.
C Disconnect the wiring harness connector BA001-1 of the 2-in-1 power assembly.
D Use a multimeter, select the resistance range, and measur e the resistance value between terminal 18 of the wire harn ess connector EL215-3 of the multi-domain fusion controll er and terminal A4 of the wire harness connector BA001-1 of the 2-in-1 power assembly to check if it is normal.
E. Use a multimeter, set it to the resistance range, and meas ure the resistance between terminal 17 of harness connect or EL215-3 on the multi-domain fusion controller and termi nal B4 of harness connector BA001-1 on the 2-in-1 power supply assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the 2-in-1 power supply assembly.

	A Check whether the power ground circuit of the 2-in-1 po wer assembly is normal.

No 》 》 》 Repair or replace the wiring harness.
Yes 》 》 》 Go to step 4.
Step 4 Replace the 2-in-1 power supply assembly.

	A Replace the 2-in-1 power supply assembly. B After replacing the 2-in-1 power supply assembly, is the f ault cleared?

Yes 》 》 》 System normal.

© 2026, All rights reserved

	No 》 》 》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》 》 》 System normal.
	Next 》 》 》 Go to step 6.
Step 6 Diagnosis complete.

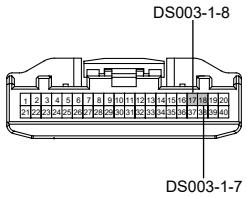
DTC: U130587-ICHS

Fault code	Description
U130587	Loss of communication with MCUM

1. Simplified Circuit Diagram

2. Diagnostic Steps

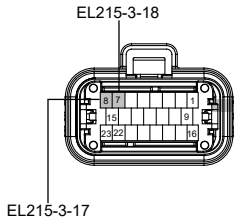
Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code



© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.



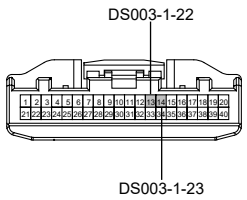
Step 2 Check the PCAN harness between the controller assembly and the multi-domain fusion controller.

EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221057

DS003-1 Controller Assembly

B10DMICHS1221058

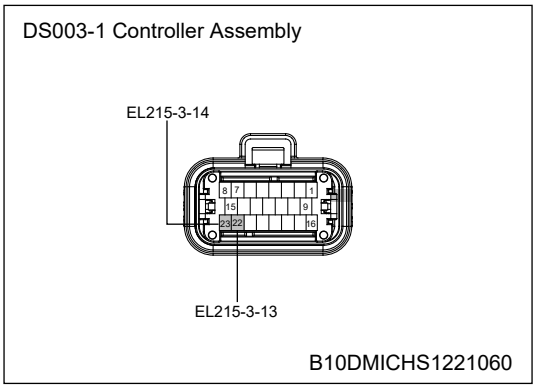


A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D. Use a multimeter, select the resistance range, and measure the resistance between terminal 18 of harness connector EL215-3 of the multi-domain fusion controller and terminal 7 of harness connector DS003-1 of the controller assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 17 of the wiring harness connector EL215-3 of the multi-domain fusion controller and terminal 8 of the wiring harness connector DS003-1 of the controller assembly to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the CCAN harness between the controller assembly and the multi-domain fusion controller.



EL215-3 Multi-Domain Fusion Controller

B10DMICHS1221059

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-3 of the multi-domain fusion controller.
C Disconnect the harness connector DS003-1 of the controller assembly.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 14 of the wire harness connector EL215-3 of the multi-domain fusion controller and terminal 23 of the wire harness connector DS003-1 of the controller assembly to check if it is normal.
E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 13 of harness connector EL215-3 on the multi-domain fusion controller and termi

© 2026, All rights reserved

	nal 22 of harness connector DS003-1 on the controller asse mbly to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power ground circuit of the controller assembly.	
	A Check whether the power ground circuit of the controller assembly is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the controller assembly.	
	A Replace the controller assembly. B After replacing the controller assembly, is the fault elimin ated?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

DTC: B156B00-ICHS

Fault code	Description
B156B00	A2B master node fault

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the power supply ground of the multi-domain fusion controller.	
	A Check whether the power supply and ground of the multi-domain fusion controller are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the fault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 5.
Step 5 Diagnosis complete.

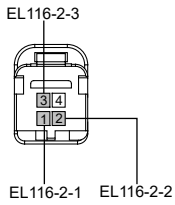
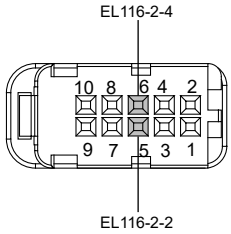
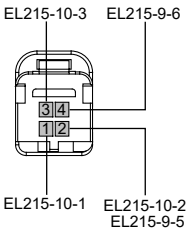
DTC: B156C00-ICHS

Fault code	Description
B156C00	A2B Slave Node Fault







1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A After power cycling and operating for a period of time, check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the power amplifier and the multi-domain fusion controller.	
EL215-10 Multi-Domain Fusion Controller  B10DMICHS1221036 EL215-9 Multi-Domain Fusion Controller  B10DMICHS1221037 EL116-2 Power Amplifier  B10DMICHS1221038	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the power amplifier wiring harness connector EL116-2. C Disconnect the harness connectors EL215-9 and EL215-10 of the multi-domain fusion controller. D Use a multimeter, select the resistance range, and measure the resistance between terminal 1 of the power amplifier harness connector EL116-2 and terminal 1 of the multi-domain fusion controller harness connector EL215-10 to check if it is normal. E Use a multimeter, set it to the resistance range, and measure the resistance between terminal 3 of the power amplifier harness connector EL116-2 and terminal 3 of the Multi-Domain Fusion Controller harness connector EL215-10 to check if it is normal. F Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of the power amplifier harness connector EL116-2 and terminal 2 of the multi-domain fusion controller harness connector EL215-10 to check if it is normal. G Use a multimeter, select the resistance range, and measure the resistance between terminal 2 of the power amplifier harness connector EL116-2 and terminal 5 of the Multi-Domain Fusion Controller harness connector EL215-9 to check if it is normal. H Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of the power amplifier wiring harness connector EL116-2 and terminal 6 of the multi-domain fusion controller wiring harness connector EL215-9 to check if it is normal. Resistance standard value: Less than 1 Ω

© 2026, All rights reserved

	I Check whether the resistance value meets the standard va lue.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 4.	
Step 4 Check the power supply and ground wire harness for the power amplifier.	
	A Check whether the power supply and ground wiring harn ess of the power amplifier is normal.
No 》》》 Repair or replace the wiring harness.	
Yes 》》》 Go to step 5.	
Step 5 Replace the power amplifier.	
	A Replace the power amplifier. B After replacing the power amplifier, is the fault cleared?
Yes 》》》 System normal.	
No 》》》 Go to step 6.	
Step 6 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to step 7.	
Step 7 Diagnosis complete.

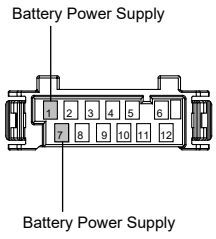
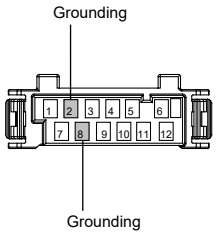
DTC: B156E00-ICHS

Fault code	Description
B156E00	External amplifier fault

1. Simplified Circuit Diagram





2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	A. Power cycle the vehicle, wait for a while, and check whether the fault is cleared.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measure whether the voltage between the positive and negative terminals of the battery is normal. Standard voltage: 11~14V C Confirm whether the voltage value meets the standard value.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 4.
Step 4 Check the power supply fuse of the power amplifier.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Check the power amplifier fuses SD05 and SD07. Fuse specification: SD05 25A, SD07 25A C. Confirm whether the fuse is blown.
	Yes》》》 Replace the fuse with one of the same rating.
	No》》》 Go to step 5.
Step 5 Check the power supply harness of the power amplifier.	

© 2026, All rights reserved

EL116-1 Power Amplifier  B10DMICHS1221046	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL116-1 of the power amplifier. C. Connect the negative terminal of the battery to power on the vehicle. D Use a multimeter, select the DC voltage range, and measure the voltage between terminals 1 and 7 of the power amplifier harness connector EL116-1 and the body ground to check whether the voltage is normal. Standard voltage: 11~14V E Confirm whether the voltage value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 6.	
Step 6 Check the ground harness of the power amplifier.	
EL116-1 Power Amplifier  B10DMICHS1221047	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL116-1 of the power amplifier. C. Use a multimeter, set it to the resistance range, and measure the resistance between terminals 2 and 8 of the power amplifier wiring harness connector EL116-1 and the body ground to check if the resistance value is normal. Resistance standard value: Less than 1 Ω D Confirm whether the resistance value meets the standard value.
No》》》 Repair or replace the wiring harness.	
Yes》》》 Go to step 7.	
Step 7 Replace the power amplifier.	
	A Replace the power amplifier. B After replacing the power amplifier, is the fault cleared?
Yes》》》 System normal.	
No》》》 Go to step 8.	
Step 8 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller.

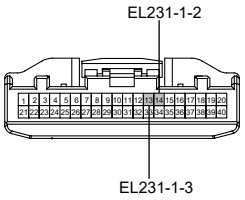
© 2026, All rights reserved

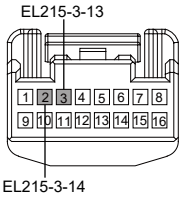
	B After replacing the multi-domain fusion controller, is the fault eliminated?
Yes 》》》 System normal.	
Next 》》》 Go to Step 9.	
Step 9 Diagnosis complete.	

© 2026, All rights reserved

DTC: U132B87-ICHS

Fault code	Description
U132B87	Lost communication with FSC





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes 》 》 》 Go to step 2.
Step 2 Check the CAN harness between the front monocular camera assembly and the multi-domain fusion controller.	
EL215-3 Multi-Domain Fusion Controller  B10DMICHS1221121 EL231-1 Front Mono Camera Assembly  B10DMICHS1221122	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL231-1 of the front view monocular camera assembly. C Disconnect the harness connector EL215-3 of the multi-domain fusion controller. D. Use a multimeter, set it to the resistance range, and measure the resistance between terminal 2 of the harness connector EL231-1 of the forward-facing monocular camera assembly and terminal 14 of the harness connector EL215-3 of the multi-domain fusion controller to check if it is normal. E Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the harness connector EL231-1 of the forward monocular camera assembly and terminal 13 of the harness connector EL215-3 of the Multi-Domain Fusion Controller to check if it is normal. Resistance standard value: Less than 1 Ω F Confirm whether the resistance value meets the standard value.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 3.
Step 3 Check the power ground circuit of the forward-facing monocular camera assembly.	
	A Check whether the power ground circuit of the forward-facing monocular camera assembly is normal.
	No 》 》 》 Repair or replace the wiring harness.
	Yes 》 》 》 Go to step 4.
Step 4 Replace the front monocular camera assembly.	
	A Replace the forward-looking monocular camera assembly. B After replacing the front monocular camera assembly and performing the calibration procedure, is the fault cleared?

© 2026, All rights reserved

	Yes 》》》 System normal.
	No 》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

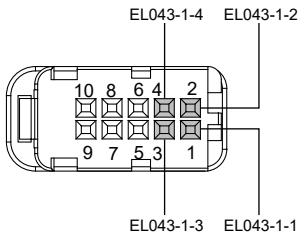
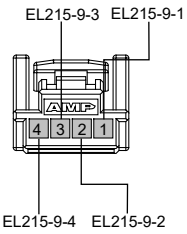
DTC: B156D00-ICHS

Fault code	Description
B156D00	Microphone malfunction





1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the multi-domain fusion controller and the active dual microphon e assembly.	
EL215-9 Multi-Domain Fusion Controller  B10DMICHS1221113 EL043-1 Active Dual Microphone Assembly  B10DMICHS1221114	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the harness connector EL215-9 of the multi-domain fusion controller. C Disconnect the harness connector EL043-1 of the active dual microphone assembly. D. Use a multimeter, select the resistance range, and measu re the resistance between terminal 3 of harness connector EL215-9 of the multi-domain fusion controller and terminal 3 of harness connector EL043-1 of the active dual microph one assembly to check if it is normal. E. Use a multimeter set to the resistance range to measure the resistance between terminal 4 of harness connector EL 215-9 for the multi-domain fusion controller and terminal 4 of harness connector EL043-1 for the active dual micropho ne assembly to check if it is normal. F Use a multimeter, select the resistance range, and measur e the resistance between terminal 1 of harness connector E L215-9 of the multi-domain fusion controller and terminal 1 of harness connector EL043-1 of the active dual microph one assembly to check if it is normal. G Use a multimeter, select the resistance range, and measur e the resistance between terminal 2 of harness connector E L215-9 of the multi-domain fusion controller and terminal 2 of harness connector EL043-1 of the active dual microph one assembly to check if it is normal. Resistance standard value: Less than 1 Ω H. Confirm whether the resistance value meets the standar d value.
	No》》》 Repair or replace the wiring harness.
	Yes》》》

© 2026, All rights reserved

	Go to step 4.
Step 4 Replace the active dual microphone assembly.	
	A Replace the active dual microphone assembly. B After replacing the active dual microphone assembly, is t he fault cleared?
	Yes》》》 System normal.
	No》》》 Go to step 5.
Step 5 Replacement of Multi-Domain Fusion Controller.	
	A Replace the multi-domain fusion controller. B After replacing the multi-domain fusion controller, is the f ault eliminated?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

DTC: B158200-ICHS

Fault code	Description
B158200	Display backlight abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

May be caused by an intermittent fault. Check for intermittent faults.

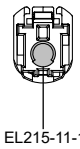
Yes》》》
Go to step 2.

Step 2 Power-off and power-on test.

	Power cycle the vehicle and check if the fault is eliminated.

Yes》》》 System normal.

No》》》
Go to step 3.



Step 3 Check the wiring harness between the central control display and the multi-domain fusion controller.

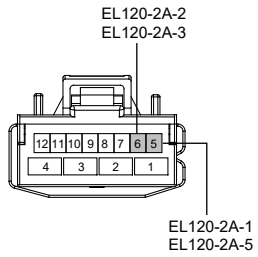
EL215-11 Multi-Domain Fusion Controller

B10DMICHS1221116

EL120-1A Central Control Display

B10DMICHS1221117

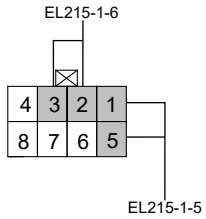
A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL215-11 of th e multi-domain fusion controller.
C Disconnect the harness connector EL120-1A of the centr al control display.
D Use a multimeter, select the resistance range, and measur e the resistance between terminal 1 of the harness connect or EL215-11 of the multi-domain fusion controller and term inal 1 of the harness connector EL120-1A of the central con trol display to check if it is normal.
Resistance standard value: Less than 1 Ω
E Check whether the resistance value meets the standard v alue.



No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Check the power ground wiring harness of the central control display.



© 2026, All rights reserved

EL215-1 Multi-Domain Fusion Controller

B10DMICHS1221118

EL120-2A Central Control Display

B10DMICHS1221119

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-1 of the Multi-Domain Fusion Controller.
C Disconnect the wiring harness connector EL120-2A of the central control display.
D Use a multimeter, select the resistance range, and measure the resistance between terminal 5 of the harness connector EL215-1 of the multi-domain fusion controller and terminals 1 and 5 of the harness connector EL120-2A of the central control display to check if it is normal.
E Use a multimeter, select the resistance range, and measure the resistance between terminal 6 of the wire harness connector EL215-1 of the multi-domain fusion controller and terminals 2 and 3 of the wire harness connector EL120-2A of the central control display to check whether it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No 》 》 》 Repair or replace the wiring harness.

Yes 》 》 》
Go to step 5.

Step 5 Replace the central control display.

A Replace the central control display.
B. After replacing the center display, is the fault cleared?

Yes 》 》 》 System normal.

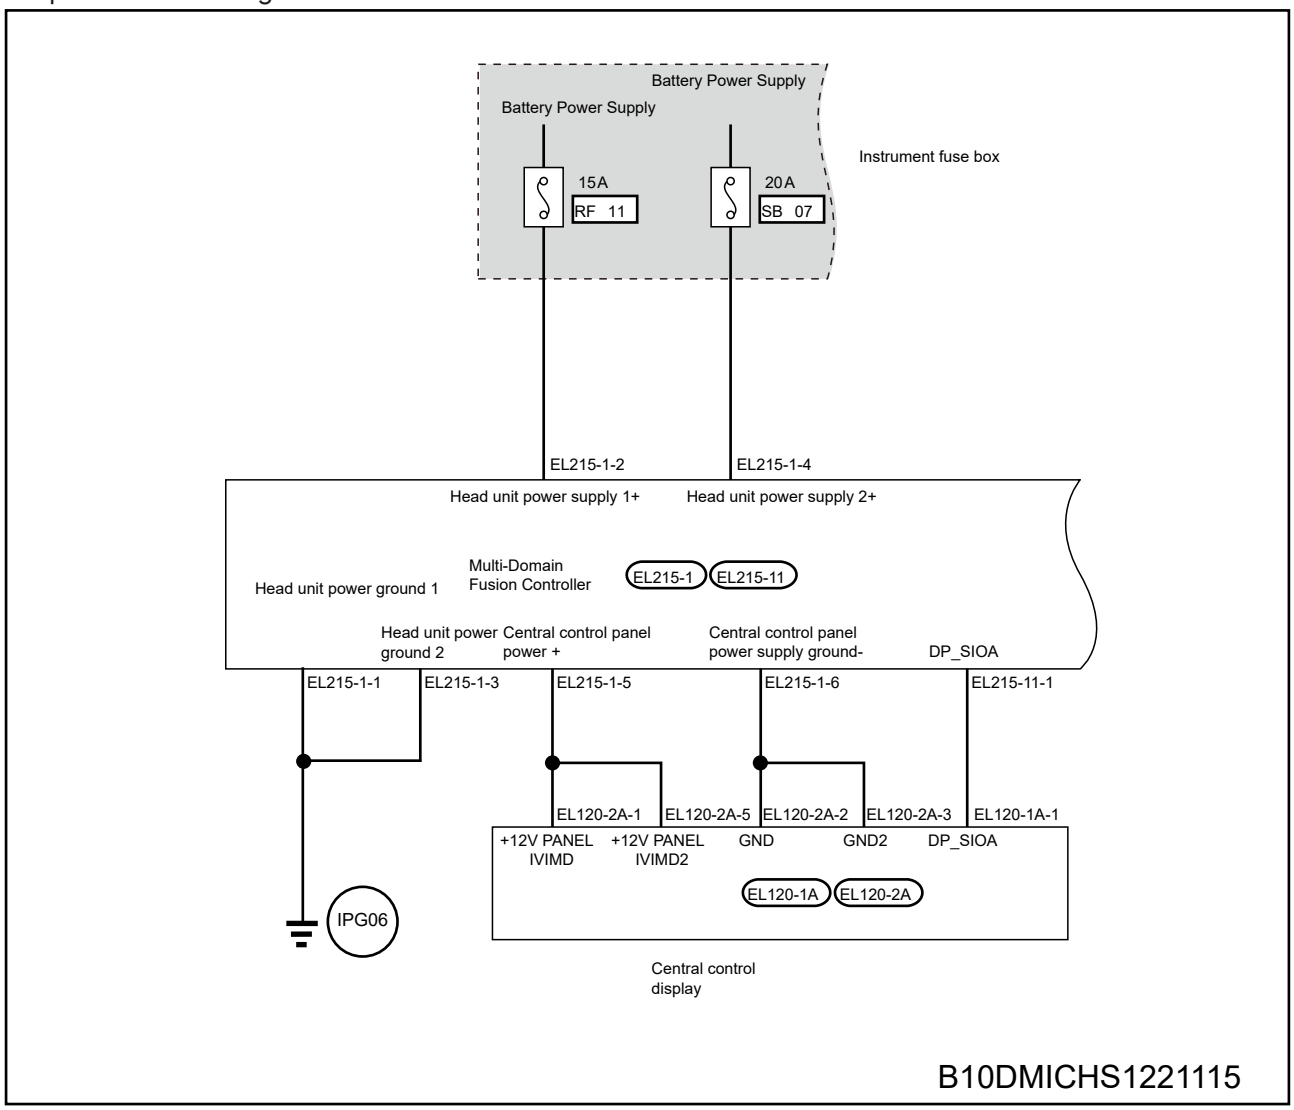
No 》 》 》
Go to step 6.

Step 6 Replacement of Multi-Domain Fusion Controller.

A Replace the multi-domain fusion controller.
B After replacing the multi-domain fusion controller, is the fault eliminated?

Yes 》 》 》 System normal.

Next 》 》 》
Go to step 7.



Step 7 Diagnosis complete.

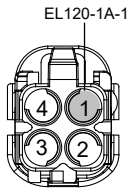
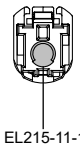
DTC: B158100-ICHS

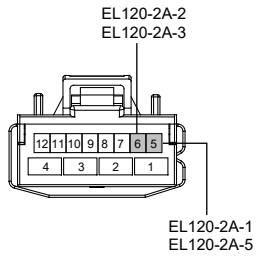
Fault code	Description
B158100	Display chip or communication error





1. Simplified Circuit Diagram

2. Diagnostic Steps



Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No 》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Power-off and power-on test.	
	Power cycle the vehicle and check if the fault is eliminated.
	Yes》》》 System normal.
	No》》》 Go to step 3.
Step 3 Check the wiring harness between the central control display and the multi-domain fusion controller.	
EL215-11 Multi-Domain Fusion Controller  B10DMICHS1221116 EL120-1A Central Control Display  B10DMICHS1221117	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL215-11 of th e multi-domain fusion controller. C Disconnect the harness connector EL120-1A of the centr al control display. D Use a multimeter, select the resistance range, and measur e the resistance between terminal 1 of the harness connect or EL215-11 of the multi-domain fusion controller and term inal 1 of the harness connector EL120-1A of the central con trol display to check if it is normal. Resistance standard value: Less than 1 Ω E Check whether the resistance value meets the standard v alue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power ground wiring harness of the central control display.

May be caused by an intermittent fault. Check for intermittent faults.

Yes》》》
Go to step 2.

Step 2 Check the CAN harness between the power liftgate controller and the multi-domain fusion controller.

EL215-4 Multi-Domain Fusion Controller

B10DMICHS1221081

BY028-3 Power Tailgate Controller

B10DMICHS1221082

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the harness connector EL215-4 of the Multi-Domain Fusion Controller.
C Disconnect the harness connector BY028-3 of the power tailgate controller.
D Use a multimeter, set it to the resistance range, and measure the resistance between terminal 4 of the multi-domain fusion controller harness connector EL215-4 and terminal 15 of the power liftgate controller harness connector BY028-3 to check if it is normal.
E. Use a multimeter, select the resistance range, and measure the resistance between terminal 3 of the wire harness connector EL215-4 of the multi-domain fusion controller and terminal 7 of the wire harness connector BY028-3 of the power liftgate controller to check if it is normal.
Resistance standard value: Less than 1 Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power ground circuit of the power liftgate controller.

A Check whether the power ground circuit of the power liftgate controller is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the power liftgate controller.

A Replace the power liftgate controller.
B After replacing the power tailgate controller, is the fault cleared?

Yes》》》 System normal.

DIAGNOSTIC DESCRIPTION-RPDF

Using a diagnostic tool, fault codes can be read through the vehicle's OBD diagnostic port. By utilizing the RPDF data table and reading the data table displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without disassembling any components. Reading the data table is the first step in troubleshooting and one of the methods to reduce diagnostic time.

VISUAL INSPECTION-RPDF

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.

DTC: B16C400-RPDF

Fault code	Description
B16C400	Radar Address Line Abnormality

1. Simplified Circuit Diagram

2. Diagnostic Steps

Step 1 Check the fault code status.	
	A. Connect the diagnostic tool to the OBD port. B Power on the vehicle, read the fault codes and record the m. C. Clear fault codes. D Read the fault code again. E Check if the same fault code is displayed.
	No》》》 Trigger cause of the fault code

© 2026, All rights reserved

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the power supply ground of the front vital signs detection radar.	
	A Check whether the power supply and ground of the vital signs detection radar - front are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 3.
Step 3 Replace the front vital signs detection radar.	
	A Replace the front vital signs detection radar. B Replace the front and rear vital sign detection radar. Is th e fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 4.
Step 4 Diagnosis complete.

	May be caused by an intermittent fault. Check for intermittent faults.
	Yes》》》 Go to step 2.
Step 2 Check the battery voltage.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Use a multimeter, select the DC voltage range, and measu re whether the voltage between the positive and negative t erminals of the battery is normal. Voltage standard value: 11~14V C Confirm whether the voltage value meets the standard va lue.
	No》》》 Replace the battery, check the charging system; Measure the sleep current to check whether the vehicle body leaks electricity.
	Yes》》》 Go to step 3.
Step 3 Check whether the CAN harness of the front vital signs detection radar is normal.	
	A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes. B Disconnect the wiring harness connector EL227 of the fro nt vital signs detection radar. C. Connect the negative terminal of the battery to power on the vehicle. D. Use a multimeter, select the DC voltage range, and meas ure the voltage between terminal 2 and body ground, and b etween terminal 3 and body ground, respectively, at the har ness connector EL227 of the front vital sign detection radar. Voltage standard value: approximately 5V in total. E Confirm whether the voltage value meets the standard val ue.
	No》》》 Repair or replace the wiring harness.
	Yes》》》 Go to step 4.
Step 4 Check the power supply ground of the front vital signs detection radar.	
	A Check whether the power supply and ground of the vital signs detection radar - front are normal.
	No》》》 Repair or replace the wiring harness.
	Yes》》》

© 2026, All rights reserved

	Go to step 5.
Step 5 Replace the front vital signs detection radar.	
	A Replace the front vital signs detection radar. B Replace the front and rear vital sign detection radar. Is th e fault cleared?
	Yes》》》 System normal.
	Next》》》 Go to step 6.
Step 6 Diagnosis complete.

May be caused by an intermittent fault. Check for intermittent faults.

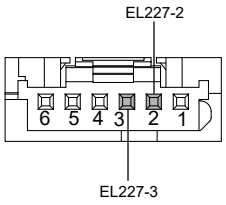
Yes》》》
Go to step 2.



Step 2 Check the CAN communication harness between the front vital sign detection radar and the rear vita l sign detection radar.

EL227 Vital Sign Detection Radar - Front

B10DMRPDF1211007

EL228 Rear Vital Signs Detection Radar

B10DMRPDF1211008

A Power off the vehicle, disconnect the negative terminal of the battery and wait for more than 5 minutes.
B Disconnect the wiring harness connector EL227 of the fro nt vital signs detection radar.
C Disconnect the wiring harness connector EL228 behind th e vital sign detection radar.
D Use a multimeter, set it to the resistance range, and meas ure whether the resistance between terminal 2 of the front vital signs detection radar wiring harness connector EL227 and terminal 2 of the rear vital signs detection radar wiring harness connector EL228 is normal.
E. Use a multimeter, select the resistance range, and measur e the resistance between terminal 3 of wire harness connec tor EL227 for the front vital sign detection radar and termin al 3 of wire harness connector EL228 for the rear vital sign detection radar to check if it is normal.
Resistance standard value: Less than 1Ω
F Confirm whether the resistance value meets the standard value.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 3.

Step 3 Check the power supply ground circuit of the rear vital signs detection radar.

A Check whether the power and ground circuit of the rear v ital signs detection radar is normal.

No》》》 Repair or replace the wiring harness.

Yes》》》
Go to step 4.

Step 4 Replace the rear vital signs detection radar.

A Replace the rear vital signs detection radar.
B After replacing the rear vital signs detection radar, is the f ault cleared?

Yes》》》 System normal.

© 2026, All rights reserved

	No 》》》 Go to step 5.
Step 5 Replace the front vital signs detection radar.	
	A Replace the front vital signs detection radar. B Replace the front and rear vital sign detection radar. Is th e fault cleared?
	Yes 》》》 System normal.
	Next 》》》 Go to step 6.
Step 6 Diagnosis complete.

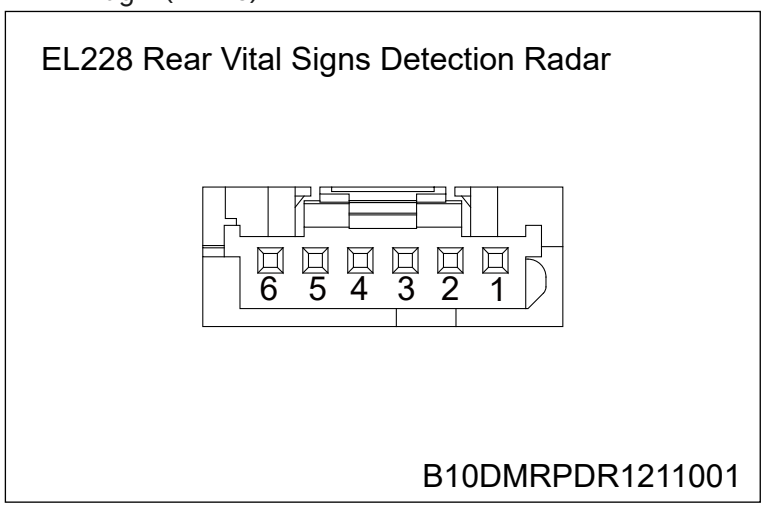
DIAGNOSTIC DESCRIPTION-RPDR

Fault codes can be read via the vehicle's OBD diagnostic port using a diagnostic tool. By utilizing the RPDR data list and reading the data list displayed on the diagnostic tool, the function of reading switch and sensor values can be performed without removing any components. Reading the data list is the first step in troubleshooting and one of the methods to reduce diagnostic time.

© 2026, All rights reserved



VISUAL INSPECTION-RPDR

1. Confirm fault symptoms
   a. The most challenging situation in troubleshooting is when no symptoms are present. In such cases, the fault described by the customer must be thoroughly analyzed. Then, simulate the same or similar conditions and environments under which the fault occurred in the customer's vehicle. Regardless of the technician's experience and skill level, if troubleshooting is conducted without confirming the fault symptoms, important details may be overlooked during the repair, and incorrect assumptions may be made in certain areas. This will prevent the troubleshooting process from proceeding.
2. Check the system components that are easily accessible or visible to determine if there is any obvious damage or conditions that may cause malfunctions.
3. Connector terminals and vibration fulcrums are the main areas that should be thoroughly inspected. If a failure may be caused by vibration, it is recommended to use the vibration method.
   a. Gently tap the potentially faulty sensor component with your finger and check if a fault occurs.
   b. Gently shake the connection in vertical and horizontal directions.
   c. Gently shake the wire harness vertically and horizontally.
